SUBJECT: FINAL REMEDIAL DESIGN/REMEDIAL ACTION WORK PLAN, INSTALLATION RESTORATION SITE 2, ALAMEDA POINT, ALAMEDA, CALIFORNIA

Dear Ms. Tran, Mr. Fyfe, and Mr. West:

Enclosed is the Final Remedial Design/Remedial Action Work Plan, IR Site 2, Alameda Point, Alameda, California, dated April 2013. The Response-to-Comments matrix documenting the Navy's responses to reviewer's comments on the 90% Draft Remedial Design/Remedial Work Plan document package is enclosed as Attachments 13 and 14.

If you have questions, please contact Jacques Lord at (619) 532-0902 or me at (619) 532-0905.

Sincerely,

DEREK J. ROBINSON
BRAC Environmental Coordinator
By direction of the Director

1.0 INTRODUCTION

This Remedial Action Work Plan (RAWP) describes the activities and procedures for implementing the remedial action (RA) at Installation Restoration (IR) Site 2, at the former Naval Air Station (NAS) Alameda (now referred to as Alameda Point) in Alameda, California (Figure 1-1). This RAWP describes the activities that will implement the soil and groundwater remedies selected for IR Site 2 in the approved final Record of Decision (ROD) (DON 2010). This work will be conducted under Contract No. N62473-10-D-0809, Contract Task Order (CTO) No. 0009 and in conjunction with Tetra Tech EC, Inc.'s (TtEC's) United States Nuclear Regulatory Commission (NRC) Service Provider Radioactive Materials License.

The 100% Remedial Design (RD) is included as Attachment 1 of this submittal. The 100% RD presents the design drawings, specifications, and geotechnical analysis for implementation of the ROD remedy for soil. This RAWP expands on the 100% RD to describe the historical background, regulatory framework, and specific activities that must take place once the final RD and this RAWP have been approved in order to implement the remedy for soil and groundwater at IR Site 2.

A Radiological Work Plan (RadWP) is included as Attachment 2 and is to be used in conjunction with this RAWP. The RadWP provides a summary of previous radiological investigations and describes procedures for radiological scanning, soil sampling, and dose and risk modeling.

An Accident Prevention Plan/Site Safety and Health Plan for all fieldwork associated with the RAWP will be submitted under separate cover.

The Federal Facility Agreement (FFA) signatories who provide regulatory oversight for the IR Site 2 RA are the U.S. Environmental Protection Agency (EPA), the California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control (DTSC), and the San Francisco Bay Regional Water Quality Control Board (Water Board). Other local and/or state agencies may also provide some degree of oversight and/or guidance during various phases of the RA work. The Naval Sea Systems Detachment Radiological Affairs Support Office (RASO) provides technical oversight for the radiological aspects of the IR Site 2 RA.

1.1 SITE LOCATION AND DESCRIPTION

IR Site 2 is located at the southwestern edge of Alameda Point and encompasses approximately 110 acres bordered by San Francisco Bay to the south and west (Figure 1-1). IR Site 2 consists of a former landfill, wetlands area, the interior margin, and the coastal margin. The former landfill covers approximately 60 acres and is bounded to the north by the interior margin and the east by runways and tarmacs. The former landfill was reportedly used for disposal of wastes generated by former NAS Alameda activities from 1956 through early 1978 (DON 2010).The wetland covers approximately 33 acres and is bounded by the landfill to the north and east and by the coastal margin adjacent to the San Francisco Bay on the south and west. The remaining 17 acres within the IR Site 2 boundary is known as the interior margin and the coastal margin.

1.2 SCOPE OF WORK

To achieve the selected remedies for soil and groundwater, the scope of the RA in IR Site 2 consists of the following tasks:

- Radiological site control and safety monitoring during site activities
- Mobilization and site preparation
- Destruction of existing soil gas monitoring wells
- Demolition of existing weir structures, and perimeter fencing
- Site grading to subgrade elevation as specified in the 100% RD
- Radiological surface scan of subgrade surface and removal of radiologically impacted surface soil if readings are greater than 2 times background levels
- Collection of soil samples from the subgrade surface for radiological dose and risk modeling
- Installation of soil cover, including animal intrusion barrier, and final grading as specified in the 100% RD
- Radiological surface scan of the finished cover to document effective remedy in place
- Wetlands creation/restoration
- Installation of access roads and new landfill soil gas monitoring probes
- Implementation of institutional controls (ICs)
- Demobilization of equipment and personnel
- Production of a Remedial Action Completion Report (RACR) to document the implementation of the RA

1.3 POINTS OF CONTACT

The following is a list of the key project, Department of the Navy (DON), and regulatory points of contact:

1.4 PROJECT SCHEDULE

The project schedule is presented as Figure 1-3. Field activities are anticipated to commence in early 2013.

1.5 WORK PLAN ORGANIZATION

This RAWP is organized as follows:

- **Section 1.0** provides the introduction, scope of work, project points of contact, and plan organization.
- **Section 2.0** describes the site background, history, and selected RA for soil and groundwater.
- **Section 3.0** describes preconstruction activities.
- **Section 4.0** describes the project plans to be used in conjunction with this RAWP.
- **Section 5.0** describes the construction activities associated with the implementation of the RA.
- **Section 6.0** describes sustainability measures to be used during construction activities.
- **Section 7.0** describes the final reporting and landfill certification procedures.
- **Section 8.0** presents the references.
- **Tables and figures** are included after the text.
- **Attachment 1** presents the 100% RD.
- **Attachment 2** presents the RadWP.
- **Attachment 3** presents the Radiation Protection Plan (RPP).
- **Attachment 4** presents the Sampling and Analysis Plan (SAP).
- **Attachment 5** presents the Project Contractor Quality Control (PCQC) Plan.
- **Attachment 6** presents the Environmental Protection Plan (EPP).
- **Attachment 7** presents the Wetland Mitigation Plan.
- **Attachment 8** presents the Stormwater Pollution Prevention Plan (SWPPP).
- **Attachment 9** presents the Dust Control and Air Monitoring Plan (DCAMP).
- **Attachment 10** presents the Waste Management Plan (WMP).
- **Attachment 11** presents the Post-Closure Operations, Maintenance, and Monitoring Plan (PCOMMP).
- **Attachment 12** presents the Land-Use Control (LUC) RD.
- **Attachments 13 and 14** present the responses to comments on the Draft RAWP, dated May 4, 2012.

This page intentionally left blank.

2.0 SITE BACKGROUND

Former NAS Alameda was an active military installation from the 1930s to the 1990s, which primarily provided facilities and support for fleet aviation activities. The area of present day IR Site 2 was originally open water until 1956 when a sea wall was constructed along the southern and western shorelines to confine and protect the area. Dredged fill was hydraulically placed within the seawall creating the area encompassed by IR Site 2.

The IR Site 2 landfill, also called the West Beach Landfill, was used as the main disposal area for the Alameda Point from approximately 1952 through 1978. An estimated 1.6 million tons of waste was deposited (E&E 1983). Historical waste disposal methods at the site generally consisted of trench-and-fill operations. Wastes included municipal solid waste, waste chemical drums (contents unknown), solvents, oily waste and sludge, paint waste, plating wastes, industrial strippers and cleaners, acids, mercury, polychlorinated biphenyl (PCB)-containing liquids, batteries, low-level radioactive waste (LLRW) including but not limited to radioluminescent dials and dial painting, scrap metal, inert ordnance, asbestos, several pesticides (solid and liquid), tear gas agent, biological waste from the Oak Knoll Naval Hospital, creosote, dredge spoils, and waste medicines and reagents (E&E 1983). Munitions and explosives of concern (MEC), may have also been deposited in the 2.5-acre (approximate) Possible Ordnance and Explosives Waste (OEW) Burial Site located in the southern part of the landfill. Previously identified areas of buried waste are shown on Figure 2-1.

In 1978, the DON developed plans to close the landfill in accordance with the requirements of the Water Board's *Minimum Criteria for Proper Closure of Class II Solid Waste Disposal Sites* (Resolution No. 77-7). In 1983, the Water Board issued Order No. 83-35 to implement a final cover, leachate cutoff barrier, methane gas control, earthquake damage control, drainage control, and erosion control, and to generate compliance reports for the former landfill. Between 1983 and 1995, the DON responded by placing a partial clay-soil cover, installing an 820-foot-long, 2-foot-wide and 20- to 30-foot-deep slurry wall to restrict potential contaminant migration to San Francisco Bay. A gas venting system was installed for methane gas control, and repairs were made to the seawall also during this time period. In 1986, 20,000 cubic yards of imported fill soil was spread on the former landfill, which was insufficient in achieving a uniform cover layer of appropriate thickness over the landfill area. Also in 1986, the landfill was graded to prevent ponding, and an earthen perimeter berm was constructed around the landfill.

In August 1999, IR Site 2 was officially added to the EPA's National Priority List of Superfund sites and assigned Comprehensive Environmental Response, Compensation, and Liability Information System identification number CA2170023236.

2.1 SITE CHARACTERISTICS

In addition to the former landfill, IR Site 2 has been historically divided into the West Beach Wetlands, coastal margin, and interior margin (Figure 2-2). Based on disposal history, IR Site 2 is considered a Radiologically Controlled Area. A fence surrounds the northern and eastern sides of the site and access is controlled via a locked gate. Within IR Site 2, an earthen perimeter berm, 16 feet high and 25 feet wide, surrounds a majority of the former landfill.

The West Beach Wetlands contains two perennial ponds. The northern pond (North Pond) is connected to the bay by a culvert installed in the seawall to hydraulically connect San Francisco Bay to waters within the seawall. The southern pond (South Pond) was created by removal of dredged materials for use as landfill cover. Freshwater has since filled the excavation area and created the pond. The only material known to have been deposited in the West Beach Wetlands is scrap metal (E&E 1983).

A thin strip of land between the western margin of the landfill and West Beach Wetlands and the bay is referred to as the coastal margin. It is composed of the perimeter berm and riprap seawall constructed of large boulders. The narrowest width of the coastal margin is 100 feet at the southeast corner of IR Site 2.

The interior margin lies outside the landfill and West Beach Wetlands to the north and east. It also contains part of the perimeter dike and includes all areas outside the dike to the north and east. Two earthen former ammunition bunkers and two guard shacks are located in a fenced area to the north of the landfill in the interior margin. To the west of the fenced area, also in the interior margin, is the location of a former radioactive waste storage shack known as the RadShack Area.

The RadShack Area was the site of a former small wood frame structure surrounded by a security fence that was used to store radioactive material while awaiting disposal (Weston Solutions, Inc. 2007). It was in use as early as 1973 and remained in use until 1980. Between 1980 and 1983 the structure was emptied. It was demolished except for the support posts prior to 1998, and in 1999 the remaining support posts were removed and the soil beneath and surrounding the shack was excavated and replaced with clean backfill (Weston Solutions, Inc. 2007).

2.1.1 Topography

IR Site 2 topography gently slopes overall from the north and east to the south and west towards San Francisco Bay. Elevations across the site range from 5 to 15 feet above mean sea level.

2.1.2 Geology

There are no known faults directly at or in the near vicinity of IR Site 2. No earthquake fault zones (Alquist-Priolo Zones) have been designated at the sites. The nearest active fault is the Hayward Fault, which is about 6.5 miles east of the site. Another nearby active fault is the San Andreas Fault within the hills on the west side of San Francisco Bay at a distance of about 12 miles. Other major faults in the region include the Calaveras Fault system on the east side of the East Bay Hills and the Green Valley and Greenville Fault systems, which are located farther to the east.

Quaternary-time (within the past 2 million years) sedimentary rock units have been identified as underlying IR Site 2. These sedimentary units record a sequence of fillings and evacuations of San Francisco Bay in response to global glacial/climate changes and local tectonics. The rock units, from youngest to oldest, are the Young Bay Mud/Bay Sediment Unit (BSU), Posey/Merritt/San Antonio Formation, and the Yerba Buena Mud. These sedimentary units are overlain by artificial fill deposited by mechanical processes.

2.1.2.1 Artificial Fill

The fill encountered at most of the site is composed of mixtures of sand, silt, and clay dredged from the surrounding bay and a rock dike to retain the fill in place. The fill ranges in thickness from about 25 feet in the northwest to 45 feet in the southwest part of IR Site 2. The varying thickness is a result of natural variation in the depth of the estuary before filling, which began in the late 1800s. The BSU and upper Posey/Merritt/San Antonio Formation served as primary sources of the fill. The fill typically has abundant shell fragments and debris including gravel. The strength of the fill varies widely because of the wide variety of materials it contains.

The existing waste material in the fill is not entirely defined due to lack of sufficient information on the waste disposal history at the site. Solid wastes deposited in the disposal area included dredge spoils, batteries, ordnance, radiological materials (instrument dials with radium paint), asbestos, scrap metal, and spent sandblast abrasives. Liquid wastes placed in the disposal area include solvents, paints, plating bath sludge, waste oil, PCBs, pesticides, and medical wastes (TtEMI 1999; E&E 1983). Also, the existence of material potentially posing an explosive hazard at the site has been a major concern and a critical part of recent investigation and remediation activities.

2.1.2.2 Young Bay Mud/Bay Sediment Unit

The Young Bay Mud is thinnest in the eastern and southern parts of IR Site 2 and is thickest in the northern part of IR Site 2 where it appears to represent an ancient channel fill. In previous reports (TtEMI 1999), the Young Bay Mud unit was considered to consist of both the mud (clay, silty clay, clayey silt) and some of the underlying sands, and these were combined into a unit called the BSU. Recent geotechnical investigations revealed that most of the sands underlying the upper soft mud are generally soft to moderately dense sands, silts, and clayey sands, and these appear to also be Holocene-age bay deposits. Adopting the terminology from previous reports, these are the BSU and range from about zero to 50 feet thick and also appear to represent an ancient channel. Both the Young Bay Mud and the BSU appear to pinch out to the south, where they may have been removed by dredging in the offshore area (TtFW 2004).

2.1.2.3 Merritt Sand (Posey/Merritt/San Antonio Formation)

The Posey/Merritt/San Antonio Formation consists of contemporaneous non-marine sediments that underlie younger (Young Bay Mud/BSU) and overlie older (Yerba Buena Mud) marine sediments (Rogers and Figuers 1991). The upper part of the unit has been ubiquitously referred to as the Merritt Sand in previous Alameda Point investigations; however, the lithologies observed in the western part of Alameda Point are more consistent with the Posey and San Antonio Formations than with the Merritt Sand. Merritt Sand is described in literature as an aeolian sand deposit and immature blow sand, and the lithologies encountered below the Young Bay Mud/BSU at IR Site 2 were dense sands with silt, silty sands, and clayey sands.

2.1.2.4 Yerba Buena Mud (Old Bay Mud)

The Yerba Buena Mud was deposited during an interglacial period and traditionally has been referred to as the "Old Bay Mud," a homogeneous, widespread stratigraphic marker of the erosional surface of the underlying Alameda Formation (developed during previous glacial periods). The unit is composed primarily of dark greenish gray marine clay. The clay is generally very plastic and commonly very stiff to hard. However, a thin (10 to 15 feet thick) sandy, shell-rich zone is commonly found in the middle of the unit. The Yerba Buena Mud reportedly occurs at depths between approximately 80 feet below ground surface (bgs) in the southern portion of the site to approximately 110 feet bgs in the northern portion of the site.

2.1.3 Hydrogeology

Two distinct aquifers have been defined at IR Site 2, a shallow and deep. The deep aquifer occurs below the Yerba Buena Mud in the Alameda Formation.

The shallow aquifer is composed of the first and second water-bearing zones, and the general groundwater flow direction is towards San Francisco Bay (to the west and southwest). The first water-bearing zone (FWBZ) beneath IR Site 2 is an unconfined (i.e., water table) aquifer, generally occurring in the artificial fill material and above the BSU aquitard. Depth to groundwater ranges from 2 to 8 feet bgs. Groundwater in this water-bearing zone is typified by shallow gradients and low hydraulic conductivities, indicating relatively low groundwater velocities. Therefore, groundwater discharge rates from this zone are also relatively low. Based on tidal studies performed at the site, the FWBZ is influenced by tidal fluctuations of San Francisco Bay (Shaw 2005).

The second water-bearing zone (SWBZ) is semi-confined and generally occurs in the Posey/Merritt/ San Antonio Formation where these units exist and/or in the lower portion of the BSU where this unit consists of coarser-grained material. The SWBZ is confined from the FWBZ by the BSU aquitard where present and varies in thickness up to approximately 50 feet, with greater thicknesses appearing to result from historical erosion associated with a northeast-to-west-trending paleochannel at Alameda Point.

A tidal influence study was conducted in 2004 at IR Sites 1 and 2 in an attempt to quantify the influence of tides on water levels in Alameda Point wells (Shaw 2005). The magnitude of tidal influence measured was quantified in terms of tidal range and tidal efficiency. Tidal range is the absolute difference in water elevation between low and high tide at a given point. Tidal efficiency is the tidal range in the groundwater at a specific groundwater monitoring well location divided by the tidal range at the adjacent shoreline. Wells located along the shoreline, in the interior of the former landfill, and on the eastern boundary of IR Site 2 were included in the study and were either shallow (above 15 feet bgs) or intermediate (ranging between 32 to 40 feet bgs) in depth. Tidal efficiencies for the shallow wells ranged from 0.15 percent to 83.3 percent. Tidal efficiencies for the intermediate wells were greater and ranged from 2 percent to 100 percent. Tidal influence was greatest at the shoreline, decreasing with distance with little to no influence recorded at wells in the central portion and on the eastern boundary of IR Site 2.

2.1.4 Ecological Setting

Alameda Point was originally created by filling existing tidelands, marshlands, and sloughs with dredged material from the San Francisco Bay and Oakland Inner Harbor. The site is generally considered "highly disturbed" due to historical filling and landfilling activities. The site is ecologically isolated (particularly for mammals that may use the site), bordered by San Francisco Bay to the south and west and by roads, runways, and other hardened or impermeable (e.g., concrete) surfaces to the north and east. The site is fenced along its entire onshore boundary. Certain higher trophic-level species that exist at the site are managed to ensure protection of a least tern colony at a nearby runway.

The surface soils and sediments at the site consist largely of coarser-grained, well drained sands. The site generally consists of three distinct habitat types—upland, non-inundated persistent emergent salt marsh wetlands (i.e., wetlands), and wetland ponds. It is important to note that the areas defined as upland, wetland, and wetland pond demonstrate variability in their extent, depending on changes in water levels resulting from seasonal rainfall and tidal variability.

In general, the upland portion of IR Site 2 is considered a disturbed environment due to historical filling and landfilling activities. Under current conditions, this area of the site does not support a large diversity or density of wildlife species. The wetland areas support a variety of wetland plant species and avian species that use the site for breeding, foraging, and/or refuge. However, the wetlands themselves do not support a high diversity or density of invertebrates or mammals. Similarly, the wetland ponds may be used by a variety of avian species but do not appear to support aquatic vegetation or significant invertebrate and fish populations (Battelle and BBL 2008).

Further details on the ecological setting are provided in the Wetland Mitigation Plan (Attachment 7).

2.2 SUMMARY OF PREVIOUS INVESTIGATIONS

Numerous investigations have been conducted at IR Site 2. Table 2-1 summarizes the investigation activities, objectives, and findings for previous investigations and reports. A summary of previous radiological, OEW, and landfill and wetlands delineation investigations is provided below.

2.2.1 Radiological Investigations

In 1983, a DON Initial Assessment Study (E&E 1983) reported the use of radioactive materials at Alameda Point starting in the 1940s, particularly at the dial painting section of the instrument shop at Building 5. Dial painting consisted of a two-step process. First, refurbished old aircraft dials were scraped and cleaned in solvent. Then the dials were repainted with radioluminescent paint containing radium-226 (^{226}Ra). Radium-impacted waste (e.g., scraping solids, rags, and used paint brushes from refurbishing dials and gauges) was collected from the shop and discarded at IR Sites 1 and 2. The radium painting shop was closed in the early 1960s (exact date unknown), and a contractor decontaminated the facility.

Disposal of radioluminescent devices containing radium was not controlled by specific procedures until the late 1960s. Before that time, it was common practice throughout private industry and the military to dispose of radioluminescent instruments and articles by burial in landfills. Other radionuclides were used in radioluminescent devices, but ^{226}Ra is the primary radionuclide of concern (ROC). This survey and previous radiation surveys by PRC Environmental Management, Inc. (1997) and Supervisor of Shipbuilding, Conversion and Repair, Portsmouth (1999) substantiated these conclusions.

Preliminary radiological surveys were completed at IR Site 2 in September 1995. One anomaly was recovered from the landfill based on this survey. In 1998/1999, a gamma radiation survey using 2-inch by 2-inch sodium iodide (NaI) scintillation detectors was conducted at the landfill. Fifty locations with the highest readings were excavated and discrete anomalies removed. In 2004, Tetra Tech FW, Inc. conducted radiological characterization surveys at IR Site 2 (TtFW 2005). Soil samples collected indicated ^{226}Ra at levels above background concentrations.

In 2006, TtEC performed additional radiological surveys of the shoreline and the interior margin. The results of these surveys were used to determine the location of radiological anomalies, which were subsequently removed under a time-critical removal action (TCRA) scope of work (TtEC 2009). The primary objective of the TCRA was to mitigate the potential risk posed by material potentially presenting an explosive hazard and radiological contamination at IR Sites 1, 2, and 32 and the threatened release of hazardous substances to the environment. The radiological removal action objectives were: 1) To prevent ingestion, dermal contact, or inhalation of radiological anomalies with concentrations that significantly exceed background concentrations (6,000 counts per minute) and 2) To ensure that the total effective dose equivalent received through all potential pathways from the radium-impacted waste in the surface and subsurface to any member of the public does not exceed 15 millirems per year. During the TCRA, items and soils contaminated with ^{226}Ra were identified and removed from IR Site 2. However, the horizontal and vertical extent of contamination was greater than expected and complete removal was not feasible. Field conditions indicated that ^{226}Ra contamination is still present throughout IR Site 2.

The RadShack Area is an approximately 32-foot by 42-foot area formerly the site of a small structure (RadShack) used to store radioactive material while awaiting disposal. The RadShack Area was originally a small wood frame structure surrounded by a locked security fence north of the former landfill and west of the ammunition bunkers. At various points throughout its operation from approximately 1973 to 1980, the RadShack was used as a turn-in point for radioactive items to be disposed of either within IR Site 2 or at an off-site location. A number of remediations to remove ^{226}Ra devices were conducted. Soil samples in the area of the RadShack indicate that ^{226}Ra levels are above background concentrations.

2.2.2 Munitions and Explosives of Concern Investigations

In 2002, Foster Wheeler Environmental Corporation conducted a surface ordnance explosives waste characterization across IR Site 2, exclusive of the West Beach Wetlands (FWENC 2003). The surface characterization was accomplished by sweeping the site in 200- by 200-foot grids using a Schonstedt GA-52CX, a handheld sensor that can detect large, subterranean ferromagnetic items at depths approaching 3 meters. In the area identified as the Possible OEW Burial Site (discussed separately below), the grid size was reduced to 20 by 20 feet. During the surface characterization of IR Site 2, one inert land mine and one 20 millimeter (mm) target practice projectile were found. None of the MEC encountered contained any explosives or energetics. The 20mm projectile was subsequently demilitarized and disposed of as nonhazardous scrap metal. The inert land mine was transferred to the DON for disposal.

Based on the results of the surface scan at the Possible OEW Burial Site, a 2.3-acre area located at the southern part of IR Site, a TCRA was performed (FWENC 2002). The identification of this site was based on the results of a geophysical survey of the area, the previous use of the site, and interviews conducted with former NAS Alameda Weapons Department personnel. Attempts to geophysically discriminate several large, subsurface masses and anomalies as ordnance or construction debris/waste were unsuccessful due to the high background noise of the area and the large amount of debris present. Information from survey results, personnel interviews, and archive data indicate that the area was once used as a burial site for inert ordnance and that buried MEC/unexploded ordnance might be present at the site (SSPORTS 1999). The TCRA, which involved the removal and sifting of topsoil to a depth of 1 foot bgs, resulted in the removal and demilitarization of 8,882 20mm target practice rounds and some miscellaneous ordnance and explosives scrap in the form of casing fragments. Although no live MEC was located, MEC items recovered verified that the Possible OEW Burial Site was used to bury MEC as documented in Alameda Point historical records. All of the target practice projectiles found were demilitarized and shipped to a Class III landfill facility for disposal as nonhazardous scrap steel.

2.2.3 Landfill and Wetlands Boundary Delineation

In addition to radiological and MEC investigations, the landfill and West Beach Wetlands were the subject of extensive sampling during the remedial investigation (RI) in 2004 (Battelle and BBL 2006). The RI included a geophysical survey of the landfill and West Beach Wetlands (exclusive of the two ponds) to determine the extent of waste, exploratory trenching to determine waste type, soil and groundwater sampling in both landfill and wetlands areas to determine the nature and extent of soil and groundwater contamination, sediment and surface water sampling in the wetlands area, and tissue sampling of flora and fauna. Based on the results of the RI and previous site history and investigations, the extent of the landfill was defined in the ROD (See Figure 2-2). However, it was noted in the ROD that the specific boundaries for the multilayer soil cover would be finalized after additional trenching northeastern and northwestern corners of the site to determine if the cover should be extended to those areas (DON 2010).

As part of the development of the 60% RD (KCH 2011) and pursuant to the ROD, 39 exploratory trenches were completed in the interior margin, adjacent to the north and south ponds, and along the eastern margin to investigate for the presence of landfill waste and to determine the extent of the cover. Trenches in the northeastern corner of IR Site 2 in the vicinity of the ammunition bunkers did not contain any waste. Locations in the northeastern corner of IR Site 2, west of the ammunition bunkers and in the vicinity of the former RadShack Area, reported the presence of waste in all the trenches. Waste was reported in trenches completed at three of the four locations adjacent to the eastern margins of both the north and south ponds.

Based on the results of exploratory trenching in the RadShack area and adjacent to the ponds, and the potential presence of soil with ^{226}Ra levels above background concentrations around the former ammunition bunkers, the extent of the cover has been expanded to include the northern portion of IR Site 2 and the area between the former landfill (as presented in the ROD) and a small area along the eastern margins of the north and south ponds. The current extent of the landfill cover is shown on Figure 2-3 and encompasses 78.8 acres.

Also as part of the development of the 60% RD, a wetlands delineation to determine the extent of tidal and seasonal wetlands was conducted west of the landfill in the West Beach Wetlands and north of the landfill in the interior margin. The results of the wetlands delineation identified the presence of 9.4 acres of open water and 11.91 acres of wetlands (KCH 2011). The tidal and seasonal wetlands as mapped during the delineation are shown on Figure 2-3. Additional information on the wetlands delineation is provided in the Wetland Mitigation Plan (Attachment 7).

2.2.4 Geotechnical and Seismic Evaluation

A geotechnical and seismic evaluation was performed as part of the OEW Investigation (FWENC 2003). For the geotechnical evaluation, subsurface information was collected via 21 cone penetrometer tests, 12 test pits, and 15 soil borings (nine upland borings and six offshore borings). Representative disturbed and relatively undisturbed soil samples were retrieved for geotechnical analyses. Standard penetration test blow counts for granular soils were recorded for liquefaction evaluations. The seismic evaluation included field testing to determine static and dynamic soil parameters. Data generated from this previous study were used in the geotechnical and seismic evaluation presented in the Geotechnical Report included in Attachment 1.

2.3 CURRENT AND FUTURE LAND USE

IR Site 2 was used as a landfill between the mid-1950s and late 1970s. There was no land use at the site prior to 1956, when the perimeter sea wall was constructed and the site was first formed by using dredged fill. Due to its historical use solely as a landfill, no persons have resided or currently reside at the site.

IR Site 2 has been designated for federal agency (DON) to federal agency (Office of Veterans Affairs) transfer. The proposed future use at IR Site 2 includes low-impact recreational uses such as a recreational trail around the site. Land use and activity restrictions are detailed in the LUC RD (Attachment 12).

2.4 BASIS FOR REMEDIAL ACTION

Potentially significant risk to human and ecological receptors due to exposure to contaminants of concern (COCs) in soil under a recreational use scenario is the basis for this Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) remedial action being undertaken by the DON. The DON, EPA, Cal/EPA DTSC, and Water Board considered the factors in accordance with the remedy selection criteria and concluded that a remedial action is necessary to minimize exposure of sensitive habitats and species to impacted soil at IR Site 2. The DON developed the following remedial action objectives to address the human health and ecological risk:

- Protect sensitive human receptors, avian species, and mammal species from exposure to COCs in surface soil in the landfill and wetland portions of the site
- Protect viable wetland area in the southwest portion of the site from impacts associated with the landfill
- Protect sensitive human receptors from exposure through external radiation from surface soil in the landfill and wetland portions of the site
- Protect beneficial uses of the surface water in San Francisco Bay from the potential for discharge of site groundwater containing COCs

2.5 CONTAMINANTS OF CONCERN

Potential sources of contamination in soil and groundwater at IR Site 2 include general household waste and several industrial process wastes, including, but not limited to, asbestos, pesticides, sandblasting grit, waste oils and solvents, painting and plating wastes, ordnance, low-level radioactive waste, and medical waste.

Specific COCs identified for soil in the ROD (DON 2010) include benzo(a)pyrene, cadmium, chromium, lead, molybdenum, total DDx (represented by the sum of the 4,4′-isomers of dichlorodiphenyltrichloroethane [DDT], dichlorodiphenyldichloroethane [DDD], and dichlorodiphenyldichloroethene [DDE]), total PCBs, and zinc.

Specific COCs for groundwater were not identified in the ROD. Groundwater beneath IR Site 2 is not considered a potential drinking water source; however, groundwater was assessed for potential impacts to surface water in San Francisco Bay. Chemicals historically detected in FWBZ groundwater monitoring wells in excess of California Toxics Rule surface water quality criteria (40 *Code of Federal Regulations* Section 131.38) and background metals concentrations include arsenic, copper, nickel, pesticides (aldrin, alpha chlordane, a-hexachlorocyclohexane [HCH], b-HCH, 4,4′-DDE, 4,4′-DDT, dieldrin, endrin, gamma chlordane, heptachlor, and heptachlor epoxide), and diethylhexyl phthalate (DON 2010).

2.6 RADIONUCLIDES OF CONCERN

ROCs identified in the ROD for soil at IR Site 2 include cesium-137 (^{137}Cs), cobalt-60 (^{60}Co), ^{226}Ra, strontium-90 (^{90}Sr), thorium-232 (^{232}Th), and uranium-238 (^{238}U) (DON 2010). The radiological aspects of IR Site 2, including history and release criteria, are provided in Attachment 2, the RadWP.

2.7 SELECTED REMEDIAL ACTION

The DON conducted a feasibility study (Battelle and BBL 2008) to evaluate potential remedial alternatives for IR Site 2 and prepared a ROD (DON 2010) to document the selected remedy for the site. The DON and the FFA signatories (the EPA, Cal/EPA DTSC, and Water Board) concurred on the selected remedy for the site. The decision agreed to in the ROD is based on information contained in the administrative record file as well as extensive field investigations, laboratory analyses, interpretation of the data, review of current and future conditions, and assessment of the potential human health and ecological risks, and an evaluation of potential remedial alternatives.

The selected remedy for soil, as outlined in the ROD, is Alternative 2, a multilayer soil cover, engineering controls and ICs, and monitoring. This alternative consists of installation of an engineered soil cover over the former landfill to isolate buried waste and soil contaminants and prevent animal burrowing; implementation of engineering controls and LUCs to protect human health and soil cover integrity; provision for any necessary wetlands mitigation if impacts to wetlands occurs; monitoring of the soil cleanup action and wetlands mitigation to ensure their proper construction and long-term effectiveness; and conducting of methane gas monitoring as necessary.

The selected remedy for groundwater, as outlined in the ROD, is Alternative 2 – Monitored Natural Attenuation. This alternative consists of regularly monitoring groundwater quality using shoreline groundwater monitoring wells to ensure that there are continued stable to decreasing trends in contaminant concentrations; protection of the beneficial uses of surface water in San Francisco Bay; and implementation of engineering controls and ICs to protect human health and the groundwater remedy.

This page intentionally left blank.

3.0 PRE-REMEDIAL ACTION ACTIVITIES

A number of pre-remedial action activities will be completed prior to mobilization. The pre-remedial action activities will include providing appropriate notifications, establishing necessary permits and agreements, securing base access, and holding a pre-remedial action conference. These activities will be performed in coordination with Base Realignment and Closure (BRAC)/Naval Facilities Engineering Command Southwest (NAVFAC SW), RASO, and the regulatory agencies.

Each of the pre-remedial action tasks is described in greater detail below.

3.1 SUBCONTRACTING AND PROCUREMENT

Subcontracting and procurement will be performed prior to initiating on-site activities. As needed, staff in the field may also perform subcontracting and/or procurement activities, which may include:

- Delivery, setup, and maintenance of an on-site office trailer, utilities, and sanitation facilities
- Analytical laboratory coordination
- Survey coordination
- Temporary fencing delivery and installation
- General material and supply delivery
- Waste transportation and disposal coordination
- Soil delivery, stockpile management, and geonet delivery

Materials and supplies that will be procured for the field include daily expendables, construction and support materials, tools and small equipment, and other items as necessary.

The Army Joint Munitions Command, on behalf of the DON, will separately contract with a licensed radiological waste broker who will be solely responsible for the handling and disposal of all LLRW identified through the course of the IR Site 2 RA. The licensed radiological waste broker will provide appropriate LLRW storage containers, which will be filled by IR Site 2 RA workers. LLRW, once placed in appropriate containers, will be relinquished to the sole custody of the licensed radiological waste broker for storage, management, and disposal separate from the IR-02 Landfill project. LLRW waste management is further described in the RadWP (Attachment 2). Non-LLRW waste generated during the IR Site 2 RA will be handled, managed, and disposed of, if necessary, as a direct component of the project as detailed in the WMP (Attachment 10).

3.2 NOTIFICATIONS AND PERMITS

Prior to field activities, the DON Remedial Project Manager (RPM), Alameda Point Caretaker Site Office (CSO) representative, Resident Officer in Charge of Construction (ROICC), the RASO Environmental Program Manager, appropriate City of Alameda representative, and regulatory agency (i.e., EPA, Cal/EPA DTSC, Water Board, and California Department of Public Health [CDPH]) representatives will be notified of the planned field activities and the associated schedule at least 2 weeks in advance of initiating site work.

All necessary authorizations will be obtained from the BRAC/NAVFAC SW, RASO, and/or regulatory agencies prior to mobilization of any equipment and personnel and before conducting any on-site project activities.

Because the IR Site 2 RA is being performed under CERCLA, no permits are specifically required for the on-site elements of the project. However, substantive provisions of federal and state applicable or relevant and appropriate requirements (ARARs) will be adhered to as required by CERCLA and the NCP. Section 121(e) of CERCLA provides that no federal, state, or local permit shall be required for on-site remedial actions.

All radiological components of the IR Site 2 RA will be performed under a valid NRC or California Agreement State license maintained by TtEC. Appropriate and timely notification will be given to the NRC or CDPH, as applicable, that the corresponding TtEC NRC or California Agreement State license will be invoked in support of the IR Site 2 RA.

3.3 PRECONSTRUCTION MEETING

Prior to beginning field activities, a preconstruction meeting will be held on-site, as described in Attachment 5 (PCQC Plan). The purpose of the preconstruction meeting, typically attended by key contractor site management personnel, the RPM, the ROICC, the RASO, and the CSO representative, is to discuss and develop a mutual understanding of the project requirements and arrange for weekly contractor quality control meetings during construction. Minutes of the meeting will be prepared by TtEC and submitted to the DON.

4.0 APPLICABLE PROJECT PLANS

IR Site 2 RA activities will be implemented in accordance with this RAWP, including a stand-alone Accident Prevention Plan/Site Safety and Health Plan and the supporting plans included as attachments to this RAWP and discussed briefly below. Controlled copies of all plans will be maintained at the project site during the execution of the remedial action.

4.1 REMEDIAL DESIGN DRAWINGS, SPECIFICATIONS, CALCULATIONS

The 100% RD (Attachment 1) provides the 100 percent level of design documents for the selected soil remedy. The 100% RD presents the drawings, specifications, and geotechnical analysis for the implementation of the cover at IR Site 2.

4.2 RADIOLOGICAL WORK PLAN

The RadWP (Attachment 2) provides the radiological procedures and methodologies for radiological control, surveys and implementation, release criteria, decontamination, radioactive materials management, documentation, and reporting.

4.3 RADIOLOGICAL PROTECTION PLAN

The RASO-approved RPP (Attachment 3) identifies the day-to-day management of radiologically impacted sites, remediation, surveys, training requirements, health and safety concerns, and material handling requirements for this CTO.

4.4 SAMPLING AND ANALYSIS PLAN

The SAP (Attachment 4) specifies the radiological soil sampling, data quality objectives, waste characterization sampling, and laboratory analytical and reporting requirements. Sampling requirements for waste characterization are further discussed in the WMP (Attachment 10).

4.5 PROJECT CONTRACTOR QUALITY CONTROL PLAN

The PCQC Plan (Attachment 5) provides project-specific quality assurance (QA)/quality control (QC) information. This plan discusses the QA/QC organization and management system, requirements for handling and managing project-related QC records, requirements for testing laboratory certification, and QC inspection and testing, reporting, and documentation.

4.6 ENVIRONMENTAL PROTECTION PLAN

The EPP (Attachment 6) describes the applicable or relevant and appropriate environmental regulatory requirements for the implementation of the RA for soil and groundwater at IR Site 2.

4.7 WETLAND MITIGATION PLAN

The Wetland Mitigation Plan (Attachment 7) provides the design for mitigation of the wetland areas that will be impacted during the construction of the multilayer soil cover.

4.8 STORMWATER POLLUTION PREVENTION PLAN

The SWPPP (Attachment 8) provides the activities that will be undertaken to protect against stormwater spills or releases and sediment discharges during construction activities.

4.9 DUST CONTROL AND AIR MONITORING PLAN

The DCAMP (Attachment 9) describes the dust control measures to control fugitive dust during construction activities at the site and also provides procedures for air monitoring during construction activities. The air monitoring described in this plan is in direct support of the radiological control activities described in the RadWP and the RPP (Attachments 2 and 3, respectively).

4.10 WASTE MANAGEMENT PLAN

The WMP (Attachment 10) provides details for the management of potential hazardous waste, nonhazardous waste, and Toxic Substances Control Act waste, as well as the transportation and disposal of the waste. This plan will ensure that wastes are managed in a manner protective of human health, worker safety, and the environment in full compliance with applicable state and federal regulations. Radiological waste management is addressed in Attachment 2.

4.11 POST-CLOSURE OPERATIONS, MAINTENANCE, AND MONITORING PLAN

The PCOMMP (Attachment 11) describes the groundwater monitoring strategy for the site, post-closure landfill monitoring plan, operations and maintenance for the cover, a post-closure cost estimate, and the schedule, documentation, and reporting requirements.

4.12 LAND-USE CONTROLS REMEDIAL DESIGN

The LUC RD (Attachment 12) describes the IC activity and land use restrictions as designated in the ROD (DON 2010).

4.13 ACCIDENT PREVENTION PLAN

A separate Accident Prevention Plan, containing a Site Safety and Health Plan and Activity Hazard Analyses, has been developed for the project (TtEC 2012). The plan discusses health and safety procedures to be followed while conducting activities associated with the RA. The plan addresses worker health and safety; chemical, physical, and biological hazards and associated mitigation measures; training requirements; and general spill prevention and response procedures.

5.0 REMEDIAL ACTION IMPLEMENTATION

The following sections describe construction activities associated with the construction of the cover.

5.1 MOBILIZATION

Mobilization for construction activities for this project is anticipated to begin in early 2013, and earthwork activities are anticipated to begin shortly thereafter. Mobilization activities are described in the following subsections. Figure 5-1 shows locations of site features that will be used to support the RA.

5.1.1 Field Support Facilities

The field support facilities will be located north of IR Site 2 at the west end of the runway area (Figure 5-1). The field support facilities will include parking for construction personnel and visitors, a temporary field office trailer, and storage containers. The support area will have temporary sanitary facilities (lavatory and hand washing), electrical power, and telecommunications capabilities. Electrical power will be provided by an appropriately sized portable generator. Site water will be acquired via a temporary pipeline running from a water hydrant located at the southeast corner of the runway. Drinking water will be supplied by a water service.

5.1.2 Barge Unloading Area

A fenced area to the southeast of the remediation area will be designated for the transfer of backfill from a material barge to trucks, which will transport the material to either a staging area or directly to the landfill (Figure 5-1).

5.1.3 Site Access Controls

Access to the support and work areas will be controlled by a network of fences, barricades, and signage to prevent entry by unauthorized personnel and vehicles. Figure 5-1 reflects the plan for fencing the site and shows the access and egress from the work areas. All work taking place within radiologically controlled areas (RCAs) will be subject to radiological controls in accordance with the RadWP and the RPP (Attachments 2 and 3, respectively).

5.2 ECOLOGICAL RESOURCE SURVEYS AND MONITORING

A pre-construction ecological resource survey will be performed no sooner than 30 days prior to ground disturbance activities in order to identify sensitive, threatened, or endangered species in the work area and will consist of four separate site visits. Survey activities and required monitoring actions before and during construction are provided in the EPP (Attachment 6).

5.3 UTILITY LOCATION

Existing above- or belowground utilities including gas, electrical, communication, and pressurized water lines are not present within the former landfill and wetlands area bounded by the constructed perimeter berm or the ammunition bunker area. Geophysical utility surveys have been conducted in association with the numerous historic site investigations at the site and those data, along with generator's knowledge, confirm the area free of energized utilities. Underground Service Alert of Northern California was notified regarding field work by TtEC in 2002, 2004, and 2007, and for each notification they confirmed that there are no municipal services in the area. Additionally, the Caretaker Site Office for Alameda has also confirmed that there are no energized Navy utilities in the area. Aboveground vaults and exposed conduits in the area have been investigated in the past and confirm the lack of energized systems. Although historic geophysical investigations by others may have identified lineaments suspected to be utility lines, these likely represent abandoned utility conduits. TtEC will not perform additional geophysical surveys prior to excavations based on historic findings and the fact that the site is a former landfill area and abundant documentation exists indicating the site contains metal debris that interferes with geophysical surveys.

There are known aboveground and subsurface stormwater conveyance channels in the area that have been identified by past surveys. These systems will be protected and maintained during the construction period.

The approximate locations of known surface features are shown on Sheet C-1 of the design drawings (Attachment 1).

5.4 EROSION AND DRAINAGE CONTROLS

Erosion and drainage control measures will be implemented per the EPP (Attachment 6) and the SWPPP (Attachment 8). Stormwater best management practices will be implemented during the entire duration of the RA activities per the SWPPP.

5.5 DEMOLITION OF EXISTING FEATURES

IR Site 2 includes existing soil gas monitoring wells, passive perimeter gas vents, a weir structure, and site chain-link fencing. Prior to landfill cover construction, well destruction and demolition of these existing features will be necessary. See Sheet C-2 of the 100% RD (Attachment 1) for locations of features to be demolished. Waste disposal for these materials is discussed in the WMP (Attachment 10). All work taking place within RCAs will be subject to radiological controls in accordance with the RadWP and the RPP (Attachments 2 and 3, respectively). Neither the ammunition bunkers nor the associated guard towers will be demolished; however, the doors to the bunkers will be welded shut. The existing groundwater monitoring wells within the footprint of the cover will be protected during construction.

5.5.1 Soil Gas Monitoring Well Destruction

There are 5 multi-depth soil gas monitoring wells existing at IR Site 2 that will be destroyed. The soil gas monitoring wells that will be destroyed are listed below and are shown in Figure 5-2. Multi-depth soil gas monitoring wells proposed for destruction are the following:

- MG2-01-S,D
- MG2-02-S,D
- MG2-03-S,D
- MG2-04-S,D
- MG2-05-S,D

The soil gas monitoring wells will be destroyed by pressure grouting per California Well Standards Bulletin 74-90 and Alameda County Water District requirements. Specifications for well destruction are provided in Attachment 1.

5.5.2 Passive Perimeter Gas Collection System Destruction

If the existing passive gas collection system located along the northern margin of the former landfill is impractical to save during cover placement, it will be destroyed (see Sheet C-2 of the 100% RD [Attachment 1]). The existing system consists of buried horizontal 4-inch slotted pipe backfilled with gravel material connected to a series of 4-inch riser pipes. The 4-inch riser pipes connected to the slotted pipe will be cut and capped with appropriate polyvinyl chloride fitting below grade so as to remain undamaged during fill activities. If the gas collection system is usable after grading, the risers will be reconnected. If not usable, the system will be replaced with a similar system as shown in Sheet C-16 of the 100% RD (Attachment 1).

5.5.3 Removal of Weir

The weir structure is located on the northeast area of the landfill and is composed of wood and steel materials. The weir connects a drainage swale on the east side of IR Site 2 to the interior drainage area of IR Site 2 (see Sheet C-2 of the 100% RD [Attachment 1]). A 36-inch corrugated metal pipe (CMP) connects the weir structure to the drainage swale and passes through the perimeter berm. The weir structure is no longer required to maintain water levels inside the landfill and will be removed during the initial phase of construction.

The structure will be dismantled starting at the top and sections removed in manageable pieces. The pieces will be laid out on plastic material with the perimeter of the landfill in order that radiological surveys can be performed on the pieces in accordance with the appropriate radiological standard operating procedures (SOPs). Once the pieces are characterized, they will be placed in appropriate bins for off-site disposal or recycling. The CMP pipe will be excavated from within the berm using large excavator type equipment and that material will be processed in a similar manner to the structure material. The berm soil will be incorporated into the subgrade. The drainage swale on the east side of the berm will be preserved, and any damage incurred during the CMP removal will be repaired.

5.5.4 Removal of Site Fencing

Currently, there are chain-linked fences on the east and north side of IR Site 2, around the RadShack Area, and surrounding the ammunition bunkers. To perform the RA, the permanent fence will be removed and replaced with temporary fencing during the construction phase of the project. The existing fence will be cut off at the base to avoid removal of soil material and cut into manageable sections.

The temporary fence used during the construction phase of the work will be of such quality to ensure control of site access and radiological screening activities (Figure 5-1).

At the same time the fencing is removed from around the bunkers, the doors to the bunkers will be welded shut.

5.6 MULTILAYER SOIL COVER CONSTRUCTION

Specifications and design drawings for cover construction are included in the 100% RD (Attachment 1).

5.6.1 Vegetation Clearance

Construction of the cover will require the clearing of vegetation within the extent of the planned boundary. Clearing is expected to occur immediately prior to placement of the soil cover. The designated limits of the cover will be cleared of large rocks and debris. Trees, shrubs, and grasses will be cut flush with the land surface. Vegetation that has been radiologically screened and cleared will be disposed of off-base at a local composting facility. Trucks hauling cleared vegetation will be passed through the radiological portal monitor prior to leaving the site. The radiological portal monitor will be operated in accordance with the RadWP (Attachment 2) and the appropriate SOPs. Vegetation that fails radiological screening will be handled and disposed of per procedures described in the RadWP and the WMP (Attachments 2 and 10, respectively).

5.6.2 Dust Control

Dust control measures will be implemented throughout field activities. Dust control measures will consist of keeping the work areas moist and covering or stabilizing soil stockpiles. Work with heavy equipment will be terminated in high wind conditions. Real-time air monitoring and dust control measures are described in the DCAMP (Attachment 9).

5.6.3 Surveying

An aerial topographic survey of IR Site 2 was conducted in 2002 and is the basis for the engineering design. The project engineer will establish grade fills for the subgrade prior to grading. Field survey controls will be established by a California-licensed professional land surveyor. A combination of trained grade checkers, surveyors, and global positioning system (GPS)-equipped grading equipment will be used by the project to build each soil layer to the design grade. The GPS equipment incorporates a base station at the site established by the surveyors. Earth-moving equipment including motorgraders used during construction will be equipped with GPS equipment on the equipment blades that automatically adjusts the height of the blade allowing the operators to traverse the fill area and place the fill to final grade. The 100% RD (Attachment 1) includes a series of construction drawings that will be used to establish grades for earthwork activities.

5.6.4 Barge Delivery and Stockpile of Soils

There are currently two methods by which import soil and rock material for the filling operations will be delivered to the site. The DON is currently stockpiling soil and rock material generated by other Alameda projects in the runway areas north and east of IR Site 2. Fill material imported from off-base will be transferred to the site by barges operated by an experienced dredging subcontractor. This import material (Decker Island Aggregates) has been chemically and radiologically tested for use on other Navy projects including Hunters Point Naval Shipyard, and testing results will be provided prior to use. Moisture density, sieve analyses, Atterberg limits, and soil classification will be performed on the import material daily or for every 8,000 cubic yards for the first week and weekly or for every 40,000 cubic yards after the first 5 consecutive passing tests (Attachment 1, Specification 31 00 00). Visual inspection will be conducted continuously. The IR Site 2 area is bordered by the San Francisco Bay on the west and south sides and is separated from the water by a riprap seawall. These areas have been inspected by the subcontractor, and docking areas to spud the off-loading barge are available.

The import fill material will be loaded onto product barges at the borrow site located on the Sacramento River near Rio Vista, California. The product barges then will be moved down the Sacramento River into the San Francisco Bay and dock to a temporary off-loading barge spudded at the northwest portion of IR Site 2. The off-loading barge will be equipped with a loader and telescoping radial conveyor system. The loader will unload the soil from the product barges and feed the conveyor which will stockpile the soil material on shore. The material transferred from the barge will be stockpiled temporarily at the off-loading area and moved onto the fill area by use of conveyors, front end loaders, dump trucks, and scrapers as appropriate. Deliveries of materials will be coordinated with the subcontractor to match fill production to avoid long-term stockpiling of materials.

5.6.5 Reuse of Material from Previous Alameda Projects

It is anticipated that approximately 100,000 cubic yards of suitable fill material from previous Alameda or other projects will be available for subgrade preparation only and will not be used on the cover soil. The material is currently stockpiled near IR Site 2 as shown on Figure 5-1. The material has been characterized as nonhazardous and radiologically screened. The material will also be tested for geotechnical properties per Specification 31 00 00 (Attachment 1) and compared with the design specifications to confirm suitability for fill.

5.6.6 General Site Grading and Multilayer Soil Cover Construction

The proposed cover will be 2 feet thick to provide required isolation from the waste, and will consist of three distinct layers—220-mil-thick high-density polyethylene (HDPE) geonet used as an animal intrusion barrier, a 1.5-foot-thick layer of fill to provide adequate soil moisture holding capacity, and a 6-inch-thick layer of top soil amended to help establish vegetation. Fill added to achieve the subgrade elevation is not considered as part of the proposed cover.

Prior to commencing site grading in the ammunition bunker area, existing structures will be assessed for structural integrity. Grading in the ammunition bunker area will accomplished by placing and compacting approved soil around the structures without any modifications being made to the structures themselves. Grades established for the cover system are 1.5 percent to account for potential settlement and maintain positive drainage over the cover system. Several drainage channels will be within the limits of the cover to collect and convey the sheet flow off the landfill cover. These channels are designed for a minimum slope of 1 percent with the exception of the northern perimeter channel draining from west to east at 0.5 percent. Grading and drainage details are included in the 100% RD (Attachment 1).

Four phases of work are incorporated into the site grading task. These include:

- Subgrade preparation and fill
- Installation of the animal intrusion barrier layer
- Installation of the cover soil
- Installation of the vegetative layer

5.6.6.1 Subgrade Preparation and Fill

At the completion of grubbing and demolition activities discussed above, fill activities will begin for the subgrade. The subgrade will consist of fill materials, in situ soils, and material from previous Alameda Point projects. The 100% RD has eliminated cuts into the existing subgrade except for the perimeter berm. This reduces the need for additional radiological controls. Limited shallow cut areas may be required to provide drainage. Fill material will be placed in 6-inch lifts to obtain the specified compaction values. The majority of the earthwork placement will use combination of tracked equipment and rubber-tired scrapers. Additionally, the existing perimeter berm on the north and east side of the landfill will be incorporated into the fill. The berm is composed of soil and rock material dredged from the San Francisco Bay and not considered to contain waste or to be radiologically impacted. However, radiological control technicians will monitor work and assess if the material requires further controls as discussed in the RadWP (Attachment 2).

The subgrade will be compacted to a minimum of 90 percent of the maximum dry density based on American Society for Testing and Materials 1557 where there is a minimum of 6 inches of fill overlying the subgrade. Where there is less than 6 inches of fill overlying the subgrade, the compaction will be at 85 percent. The existing subgrade and fill will be compacted using vibrating sheepsfoot rollers, steel rollers, or heavy equipment and receive moisture conditioning as necessary to meet compaction criteria. Compaction testing will be conducted at the specified frequency for each 6 inches of compacted fill. Subgrade elevations will be achieved by use of grade checkers, surveyors, and GPS technology as discussed above.

As required by the RadWP (Attachment 2), the final subgrade surface will have an initial radiological survey performed to evaluate a baseline for radiological dose and risk. This survey is described in subsequent sections of this RAWP. To efficiently maintain schedule and eliminate long-term stockpiles, the filling operation will be conducted at a fill rate that approximates import rates.. As subgrade is achieved, the initial radiological surveys will be performed. This will allow the areas where surveys are completed to receive the next layer of cover material.

5.6.6.2 Installation of Animal Intrusion Barrier Layer

The animal intrusion barrier layer will be installed once the radiological surface scan has been completed, any hot-spots removed to a depth of 1 foot and backfilled, and samples collected as described below and in the RadWP (Attachment 2). A 220-mil layer of HDPE geonet with approximately half-inch openings will be used. The material is delivered in rolls and requires no specialized seaming. The material will be placed using a loader with a special attachment that will allow the material to be unrolled as it transverses the surface. The geonet will be sealed around pipe penetrations pursuant to detail in the 100% RD (Attachment 1). The specifications for the material and the installation are provided in the 100% RD (Attachment 1).

The HDPE geonet was selected as an alternative to a rock layer for the following reasons:

- High strength and durability
- An approximately half-inch opening size, which is too small for burrowing animals
- Consistent barrier quality—no variety in rock or crushed concrete size or thickness as with a rock layer, uniformity in installation and at seams and penetrations
- Reduced mass for increased seismic stability of cover
- Lower profile
- Sustainability (lower fuel use, less to transport, no compaction necessary)
- EPA's Technical Guidance Document: Final Covers on Hazardous Waste Landfills and Surface Impoundments, July 1989 indicated "There also is little evidence that insects or burrowing animals destroy polymer liners or cover materials. In tests done with rats placed in lined boxes, none of the animals were able to chew their way through the FMLs [flexible membrane liners]. Thus, degradation from a wide spectrum of biological sources seems highly unlikely."
- Specification sheets from a geonet manufacturer (Tenax) circulated in January 2009 indicated that the example geonet materials had a hardness of about 68 on "Shore D" scale. This hardness is in the same class as some soft, non-ferrous metals, or the covering on a golf ball, or a typical hard hat (approximately 75).
- Precedents and technical basis exist for the use of geonets and other polymeric materials to impede animals in cover systems for solid waste containment:
  - HDPE geonet was the EPA-recommended design for Casmalia Resources Disposal Site, and was agency-approved for use at the Concord Site 1 landfill.
  - HDPE geonet was approved for a burrowing animal barrier in 2010 by DTSC in a landfill cover at Naval Air Weapons Station China Lake (TtEC 2010).
  - HDPE geonet was used for a CERCLA action at the Site 300 landfill located at the U.S. Department of Energy facility, Lawrence Livermore National Laboratory (U.S. Department of Energy 1997).

5.6.6.3 Cover Soil

After the animal intrusion barrier is placed, filling operations of the cover soil will begin. The soil for this 18-inch layer will be exclusive to the import material that will be barged to the site. Previously stockpiled material from other Alameda projects will not be used. The import material will be delivered to the site already meeting geotechnical specifications and conditioned for moisture. This material will be transported and stockpiled at the completed edge of the animal intrusion barrier, and low ground pressure tracked equipment will push the soil out over the geonet in a lift size that will be protective of the geonet and still achieve compaction and lift requirements. As an appropriate layer is placed for the geonet protection, other pieces of heavy equipment will be used to place and compact the fill in accordance with the specifications. The cover soil layer will be compacted to a minimum of 90 percent of the maximum dry density based on American Society for Testing and Materials 1557. Grade elevations will be achieved by use of grade checkers, surveyors, and GPS technology.

5.6.6.4 Vegetative Layer

The vegetative layer is a 6-inch lift that requires only 85 percent compaction and is amended with a higher percentage of fine material to help establish vegetation. This material is similar to the cover material and will be delivered by barges from the same borrow site. As cover material is placed and certified as meeting compaction, the vegetative layer placement will immediately follow. The placement will be similar to the cover placement except for lower compaction requirements. Grade elevations will be achieved by use of grade checkers, surveyors, and GPS technology.

The vegetative layer will be protected from erosion by covering with native vegetation using hydroseeding. The hydroseed mixture will contain native species of grasses and other plants suitable for the location, and will be applied during the rainy season to promote growth. The hydroseed mixture and application details are included in the design specifications in the 100% RD (Attachment 1). Erosion damage, if it occurs, will be monitored and repaired as described in the PCOMMP (Attachment 11).

The vegetative surface will contain an access road composed of 6 inches of California Department of Transportation-type aggregate base at locations as shown in the 100 % RD (Attachment 1). These roads will be surveyed and staked as the cover is being placed to avoid excavations at the end of the filling operations. The material will be placed and compacted in accordance with the design specifications.

5.6.7 Drainage and Swale Installation

The final surface will be graded to sheet flow surface water toward the perimeter of the cover. Two reinforced turf mat channels will be constructed to provide drainage swales. An existing concrete channel located on the eastern boundary of the site will be maintained throughout construction and incorporated into the final drainage system. The reinforced turf mat channels will consist of a geosynthetic matting that prevents soil erosion while allowing vegetation to grow through the matting. The matting is anchored into the final cover. The drainage and swale design is presented on Sheet C-14 of the 100% RD (Attachment 1), and the materials for the reinforced turf mat channels are included on Sheet D-5.

5.6.8 Settlement Monuments

Four settlement monuments will be installed on the final grade of the multilayer soil cover system as specified in the 100% RD (Attachment 1). Locations are shown on Sheets C-9, C-10 and C-12 of the 100% RD (Attachment 1). Markers will be located where the depth of fill is the greatest and therefore settlement potential the highest. The monuments will be located so that settlement rate and trends can be monitored and assessed. Construction details are shown on Sheet D-1 of the 100% RD (Attachment 1). Settlement monitoring is described in Section 3.5 of the PCOMMP (Attachment 11).

5.7 RADIOLOGICAL SURFACE SCANNING AND SAMPLING

Radiological surface scans and soil sampling are detailed in the RadWP (Attachment 2) and are summarized below. Where applicable, radiological survey activities will be conducted in accordance with the guidelines in the Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM), NRC NUREG-1575 (DoD et al. 2000).

5.7.1 Initial MARSSIM Survey of Subgrade Prior to Installation of Cover

Upon completing the initial site grading and establishing subgrade elevation and prior to placement of the animal intrusion barrier HDPE and cover, an initial MARSSIM survey of the subgrade surface will be performed. The entire footprint of the subgrade surface will be subdivided into survey units no larger than 2,000 square meters in surface area. Each survey unit will be 100-percent gamma surveyed.

Hot spots that indicate levels greater than twice background during the gamma survey will be remediated to a depth of 1 foot and then filled in to subgrade as described in Attachment 2. Remediated materials will be turned over to the sole custody of the radiological waste broker selected and contracted separately by the Army Joint Munitions Command on behalf of the DON.

Once the gamma surveys and any subsequent remediations are performed, soil will be collected and analyzed from each survey unit so as to perform baseline dose and risk assessments using RESRAD. Samples will be analyzed by gamma spectroscopy for ^{137}Cs, ^{60}Co, and ^{226}Ra at a Department of Defense (DoD) Environmental Laboratory Accreditation Program (ELAP) accredited laboratory per the SAP (Attachment 4). Additionally, 10 percent of the samples from each survey unit will be analyzed by alpha spectroscopy for ^{238}U and ^{232}Th and total strontium (Sr)/^{90}Sr analysis for ^{90}Sr. Furthermore, any soil sample exceeding the ^{137}Cs release criterion will be analyzed for total Sr/^{90}Sr analysis for ^{90}Sr. Scan equipment and specifications, number of samples, sample locations, and survey units are further discussed in the RadWP (Attachment 2).

5.7.2 Final MARSSIM Survey of Finished Cover

Once the final cover is in place, a final MARSSIM survey will be performed. The entire footprint of the cover will be subdivided into survey units no larger than 2,000 square meters in surface area. Each survey unit will be 100-percent gamma surveyed. Areas indicating levels exceeding the reference area mean + 3σ, where σ is the standard deviation of the gamma readings in the reference area, will be further investigated to ensure no further action is needed. Characterization samples will be collected and analyzed from each source of material used for the cover to ensure that the cover material meets release criteria as discussed in the RadWP (Attachment 2). Samples will be analyzed by gamma spectroscopy for ^{137}Cs, ^{60}Co, and ^{226}Ra at a DoD ELAP accredited laboratory per the SAP. Additionally, 10 percent of the samples from each survey unit will be analyzed by alpha spectroscopy for ^{238}U and ^{232}Th, and total Sr/^{90}Sr analysis for ^{90}Sr. Scan equipment and specifications, number of samples, sample locations, and survey units are further discussed in the RadWP (Attachment 2).

5.8 POST-COVER-PLACEMENT CONSTRUCTION

The following sections describe the features that will be installed once the cover has been completed. LUCs are additionally discussed in Attachment 12. The proposed access roads, landfill gas monitoring probes are shown on Sheets C-9 through C-13 of the 100% RD (Attachment 1).

5.8.1 Installation of Access Roads

As described above, the access roads will be constructed of a 6-inch-thick aggregate base and placed within the vegetative cover (see Sheet D-4, Attachment 1). The roads will provide access to the landfill area during the operation and maintenance period and includes roads leading to groundwater monitoring wells located within the cover. Travel on unpaved portions of the cover will be restricted to eliminate the formation of preferential drainage channels that would erode the cover in a manner that would impact the cover performance. Portions of the access road may be used as a recreational trail after construction is completed.

5.8.2 Installation of Landfill Gas Monitoring Probes

New landfill gas monitoring probes will be installed to support post-closure monitoring. Post-closure monitoring is discussed in the Post-closure Monitoring Plan (Attachment 11).

Nine new landfill gas monitoring probes installed around the perimeter of the multi-layer soil cover will be constructed as shown in the100% RD (Sheets C-9 through C-11, Sheet D-2, Attachment 1). The probes will be installed in accordance with local and state requirements. Drilling will be accomplished with the use of direct-push equipment and the appropriate well casing, filter pack, and bentonite materials installed in accordance with the specifications included in the 100% RD (Attachment 1).

5.8.3 Installation of Landfill Gas Passive Vent System

The existing landfill gas passive vent system is shown on Sheet C-16 of the 100% RD (Attachment 1). The existing system will be left in place to the maximum extent possible. If vent risers or other venting system components are required to be removed during cover construction; the components will be replaced. Then after cover construction, as a part of Operations and Maintenance, methane monitoring will be performed to determine the minimum venting system required, after which unnecessary risers and components will be removed, and riser height will be reduced, if warranted. Visual impacts will be reduced to the extent possible by using materials and colors that blend with vegetation and landscape. Anti-perching devices will be installed on all vent risers. Construction details and specifications are provided in Attachment 1.

5.8.4 Installation of Institutional Controls

At the completion of all work activities, the temporary fencing will be removed from the site. Signage will be placed where appropriate to protect the soil cover and the hydroseeding and wetlands restoration areas.

The DON will enforce LUCs that include land use restrictions and ICs to limit the exposure to hazardous substances by current and future landowner(s) and user(s) of the property and to maintain the integrity of the remedial action. The LUCs are detailed in the LUCs RD (Attachment 12).

5.9 GEOTECHNICAL RECOMMENDATION

The geotechnical recommendation is provided in the revised Geotechnical Report included with the 100% RD (Attachment 1). The purpose of the Geotechnical Report is to review and evaluate prior geotechnical reports and associated site-specific data and discusses seismic hazards including slope instability, large permanent deformations, and liquefaction.

The Draft Geotechnical Report included in Attachment 1 of the 90% Remedial Design (May 4, 2012) indicated that a wide range of permanent seismic deformations and liquefaction-induced flow failures were predicted for a potential maximum credible earthquake (MCE) event at IR Site 2. That report recommended ground improvement including cement deep soil mixing to mitigate the predicted seismic deformation and flow failure. In order to confirm that those ground improvements provided best value for this project, the Navy performed additional analyses and focused modeling of permanent seismic deformations and flow run-outs to more accurately quantify the impact of an MCE event. The Final Geotechnical Report presents these additional analyses, and indicates that ground improvements are not required because:

- Solid refuse is not anticipated to be released into the San Francisco Bay by the predicted permanent seismic deformations and /or flow run-outs; and

- The site will remain isolated from and will not be flooded by waters of the San Francisco Bay.

The predicted nature and magnitude of the seismic displacements and deformations are quantified in the attached revised Geotechnical Report, and summarized in Section 12 of that report. Since the waste will still be isolated from the San Francisco Bay following an MCE event and therefore the cover integrity to act as a pathway interruption between the landfill waste and human and environmental receptors is expected to remain effective; the MCE would not compromise the CERCLA remedy and ground improvements such as cement deep soil mixing are not warranted. However, some level of damage to the cover and seawall should be anticipated after an MCE event, and will require repair.

5.10 WETLANDS RESTORATION

Although most of the wetland area in the southwest corner of the site will not be disturbed, approximately 3 acres of mostly seasonal and some tidal wetlands will be destroyed during construction. They will be replaced with high-quality tidal wetlands outside the cover but within the IR Site 2 boundary. Wetlands protection and restoration are detailed in the Wetland Mitigation Plan included in Attachment 7. The report of wetland delineation performed in 2010 for IR Site 2 (KCH 2011) is included as Appendix A to Attachment 7.

The DON recognizes that the existing culvert that connects the North Pond to San Francisco Bay is critical to the life of the IR Site 2 tidal wetlands, as without the culvert, there would be no tidal circulation. As a part of defining successful hydrology for the tidal wetlands, the DON will perform a qualified structural engineering evaluation of the culvert (as it is known to be significantly rusted and damaged) as soon as is practical during cover construction activities. The DON will make necessary repairs, modifications or replacement to maintain tidal circulation as recommended by the structural assessment of the culvert, and do so during remedy construction if warranted.

5.11 FINAL CLEANUP AND DEMOBILIZATION

The following sections describe final cleanup and demobilization field activities.

5.11.1 Final Topographic Survey

At the completion of work activities, an aerial photographic survey will be completed over the entire IR Site 2 area. A California licensed surveyor will set the control for the survey and work with the aerial photography vendor to produce a site map with 1-foot contours.

5.11.2 Site Inspection

A preliminary final inspection will be conducted to ensure adherence to design requirements and to produce final closure documentation. The Project Quality Control Manager (PQCM) will be responsible for developing a specific punch list of incomplete and/or unacceptable work, and will provide this list to the ROICC office. Any outstanding items will be noted in the punch list and will be corrected prior to the final inspection. The final inspection will be scheduled by the PQCM and attended by CSO,ROICC, and regulatory agency representatives.

5.11.3 Demobilization

Demobilization will consist of decontaminating equipment, policing the project site, and completing final inspections. The activities will include decontamination and removal of construction equipment and materials as well as collection and disposal of contaminated material, including decontamination water, disposable equipment and items for which decontamination is inappropriate. Waste management and disposal procedures are provided in the WMP (Attachment 10). LLRW will be managed pursuant to procedures described in the RadWP (Attachment 2).

Equipment decontamination will be conducted as required based on the usage requirements of each piece of heavy equipment. Heavy equipment will be decontaminated using dry decontamination or, alternatively, by using a pressure washer and/or steam cleaner. Special attention will be paid to the removal of material on and within the bucket and undercarriage of the excavator. Prior to removal from the site, all decontaminated equipment and material will be inspected and accepted by the Site Safety and Health Officer and the Project Superintendent. These individuals will ensure that the decontamination is performed for all equipment and materials. Decontamination and management of potentially radiologically impacted equipment are described in the RadWP (Attachment 2).

Site restoration will include repair of any erosion or runoff-related damage, finish grading of laydown and support areas, removal of excess construction materials, and removal of construction equipment. The site trailer will be disconnected and office, storage trailers, and portable generators will be removed.

5.12 LAND-USE CONTROLS

The DON is responsible for implementing, inspecting, reporting, maintaining, and enforcing LUCs, including land use restrictions and activity restrictions (or ICs), as described in the Final ROD (DON 2010).

The DON will implement the land use restrictions, ICs, and associated maintenance actions with frequency and requirements for periodic inspections as presented in the LUC RD (Attachment 12). Procedures for the LUCs, which include landfill maintenance, monitoring, inspection, and reporting activities, are included in the PCOMMP (Attachment 11). As required by the ROD, the LUC RD (Attachment 12) includes the following:

- Requirements for CERCLA 5-year remedy review
- Frequency and requirements for periodic monitoring and/or visual inspections
- Annual reporting for monitoring and inspections
- Notification procedures to the regulators for planned property conveyance, changes, and/or corrective action required for the remedy
- Identification of land use restrictions and parties to be provided copies of the deed language once executed
- Identification of responsibilities for the FFA signatories, other government agencies, and the new property owner for implementation, monitoring, reporting, and enforcement of ICs
- A list of ICs with the expected duration
- Maps identifying where ICs are to be implemented

This page intentionally left blank.

6.0 SUSTAINABILITY MEASURES

This section describes sustainability measures that will be used to minimize the carbon footprint of remediation and support activities during implementation of the RA. These measures are based on the Executive Order for Federal Leadership in Environmental, Energy, and Economic Performance dated October 5, 2009. Implementation of the sustainability measures is subject to a number of factors including practicality, availability of facilities, regulatory and DON approvals, and cost and schedule impact. The impact of these factors will determine the effectiveness of the sustainability initiative on this project.

The proposed measures are included within the appropriate sections of this RAWP, and are summarized in this section as follows:

- Reduction of imported soil and reuse of material from other Alameda projects in cover foundation layers
- Barging for material delivery
- Conservation of vehicle and equipment fuel
- Water conservation
- Reduction and recycling of miscellaneous wastes

6.1 MINIMIZATION OF IMPORTED SOIL

Reduction of the cover thickness by one-half foot from the 60% Design eliminates approximately 63,000 cubic yards of import material and associated fuel usage for transportation and placement. In addition, and after DON approval, approximately 100,000 cubic yards of confirmed nonhazardous and non-radiologically impacted soil material excavated from previous Alameda Point projects (notably IR Site 17) will be recycled and used as subgrade material, saving on both off-site disposal and import from off-site.

6.2 USE OF BARGING FOR DELIVERY OF MATERIALS

The sustainability and community impact advantages of barging are significant compared to trucking on a project of this magnitude. Over 22,000 semi-truckloads would be needed to deliver the estimated fill material required. The U.S. Army Corps of Engineers has determined that barging is over eight times more fuel efficient, and produces 90 percent less greenhouse gasses than trucking. Trucking to the site would also disrupt communities, including Alameda, creating congestion, additional road maintenance, and potential accidents. Barges travel by water and often at night, virtually unnoticed by most residents.

6.3 CONSERVATION OF VEHICLE AND EQUIPMENT FUEL

Fuel usage can be minimized through the following:

- Reducing slope and thickness of the cover design resulting in placement and compaction of less material
- Use of barge for delivery of material
- Shortened distance for hauling backfill to site
- Reduced engine idling of equipment and vehicles
- Downsized job site vehicles
- Reduced usage of portable generators
- Carpooling

The most significant fuel savings results from reducing the slope and thickness of the cover as well as using barges to deliver import materials as described in the previous section. Fuel consumption by construction equipment and trucks will be reduced through an engine idling policy, where engines are shut off unless work activities are in progress (except for warm-up). The use of biodiesel will also be evaluated. Mid-size pickup trucks and vans will be used as practicable instead of typical full-size vehicles. If available, temporary electric power for the site trailer and other equipment will be connected to existing electrical service to eliminate the need for portable generators, which are not fuel efficient. Carpooling to the site will also be encouraged.

6.4 WATER CONSERVATION

Water conservation measures will be employed during dust control and soil moisture conditioning required during soil consolidation, stockpiling, backfilling, and loading activities. Imported soil will be moisture conditioned at the borrow facility using a pugmill, where the operator will be able to accurately control and monitor the moisture content. This method is more efficient than using water trucks and hoses in the field because moisture conditioning is completely uniform, with no excess water added to soil or water runoff. Based on the approximately 400,000 to 600,000 cubic yards of soil that will be imported, thousands of gallons of water will be diverted to the source quarry via moisture conditioning. In addition, using moisture conditioned soil reduces the on-site water needs for dust control and during stockpiling and loading. Stockpiling will be minimized by matching delivery rates with production rates to the extent practicable. The Project Superintendent and field engineer will monitor these water-intensive activities to ensure water use is minimized. Decontamination procedures will also emphasize water conservation using dry methods where practicable.

6.5 REDUCTION AND RECYCLING OF MISCELLANEOUS WASTES

Reduction and recycling of miscellaneous wastes include recycling of paper, plastic, and other products; use of 5-gallon water dispensers instead of single-serving bottles of drinking water; and minimization of personal protective equipment (PPE) (e.g., reducing disposable PPE and reusing hard hats, safety glasses, and vests), containers, and other wastes.

Recycling containers for paper (e.g., office waste paper and newspaper), cardboard, glass, plastic, and aluminum will be placed in the office and in the lunch/break areas. Use of the recycling containers will be discussed during site orientation meetings and will be reviewed periodically during morning tailgate meetings. Recyclable material will be brought to a recycling center as needed and at the end of the project.

This page intentionally left blank.

7.0 REPORTING AND CERTIFICATION

TtEC will submit a RACR to the DON, EPA, DTSC, and Water Board for approval and certification that the IR Site 2 remedy has been implemented according to the requirements of the approved final design and according to appropriate sections of the *California Code of Regulations* (CCR) Title 27, Section 21880. The RACR will include certification and final design drawings completed by a registered civil engineer and will include a construction completion report with supporting documentation. The report will include a final Construction Quality Assurance Report pursuant to 27 CCR Sections 20323 and 20324, and any other documentation necessary to support the certification. The RACR will meet the criteria provided in the DoD and EPA Joint Guidance Recommended Streamlined Site Closeout and NPL Deletion Process for DoD Facilities.

Preparation of the RACR will begin immediately following the completion of field activities. The report will be prepared pursuant to DON guidance, and will provide a record of activities conducted under the project, document decisions regarding work options, and describe the basis for considering the work complete. In addition, as-built drawings of site features will be included.

This page intentionally left blank.

TABLE 2-1

SUMMARY OF PREVIOUS INVESTIGATIONS AND REPORTS FOR IR SITE 2

Date	Reference Title	Author	Objective	Summary of Findings
Apr-83	Initial Assessment Study	Ecology and Environment, Inc. (E&E)	Identify and assess sites posing a potential threat to human health or to the environment due to contamination from past use of hazardous materials.	IR Site 2 was used for disposal of wastes generated by former Naval Air Station (NAS) Alameda activities from 1956 through early 1978. Low-level radioactive wastes (mainly radium-226 [Ra-226] from the rework of dials and gauges) were deposited at Installation Restoration (IR) Sites 1 and 2.
Aug-99	Alameda Naval Air Station Landfill #1 and #2 Final Radiological Survey Report	Supervisor of Shipbuilding, Conversion, and Repair, Portsmouth (SSPORTS) Environmental Detachment Vallejo	To report the results of comprehensive characterization surveys at IR Sites 1 and 2.	A total of 66 acres were surveyed at IR Sites 1 and 2. The area to the north and the east of the berm was surveyed at IR Site 2 and consisted of approximately 17.2 acres. There were 1.5 acres of land located north and east of the berm that could not be surveyed.
Aug-98	IR Sites 1, 2, 5 and 10 Radiological Removal Action, Action Memorandum/Final Interim Remedial Action Plan	Tetra Tech EM, Inc. (TtEMI)	Evaluate and recommend an alternative to address materials contaminated with Ra-226 and document Navy's decision to undertake a removal action at subject sites.	A 1995 survey identified radioactive materials at IR Site 2 above background levels (walkover transect survey not conducted in "wetland area" [outside of bermed landfill]). A 1996 survey of jogging trail at IR Site 2 and former Radiological Shack (RadShack) area was performed. Eight anomalies were found in RadShack area. Seventeen sources were recovered and removed.

TABLE 2-1

SUMMARY OF PREVIOUS INVESTIGATIONS AND REPORTS FOR IR SITE 2

Date	Reference Title	Author	Objective	Summary of Findings
Sep-99	Removal of Buried Radioactive Devices and Adjacent Contaminated Soil	SSPORTS Environmental Detachment Vallejo	To resolve 30 indicated anomalies of greater than 20,000 counts per minute and to resolve the overall RadShack site.	Hand digging was performed at 50 locations. Soil samples were collected. Removal continued until no levels above 20,000 counts per minute and all soil samples were below 5 picocuries per gram (pCi/g). Eight drums of material, including soil, rock, and concrete, were removed from the RadShack area.
Oct-99	Unexploded Ordnance Site Investigation Final Summary Report, Operable Unit 3	SSPORTS Environmental Detachment Vallejo	To investigate and determine if buried unexploded ordnance exists at IR Sites 1 and 2.	Walkover grid survey of entire site. Identified an area of concern at IR Site 2 of approximately 2.25 acres in size (ordnance and explosives waste [OEW] disposal area).
Apr-00	Historical Radiological Assessment – Naval Air Station, Alameda – Volume 1	Pearl Harbor Naval Shipyard	To investigate and report on radioactive materials associated with the Navy Nuclear Propulsion Program and NAS Alameda.	Until 1978, dredge spoils (primarily from the pier areas), turning basin, and entrance channel were disposed of in the West Beach Landfill.

TABLE 2-1

SUMMARY OF PREVIOUS INVESTIGATIONS AND REPORTS FOR IR SITE 2

Date	Reference Title	Author	Objective	Summary of Findings
Jan-04	Final Ordnance and Explosives Waste/Geotechnical Characterization Report	Tetra Tech Foster Wheeler, Inc. (TtFW)	Complete a surface OEW characterization and to complete geotechnical and seismic evaluations of IR Site 2.	The upland areas of the site were cleared of vegetation and a surface sweep for OEW was performed within the bermed landfill. The possible OEW burial site was swept using a 20-by-20-foot grid. One M56 anti-tank/anti-personnel inert land mine and one 20–millimeter target practice projectile were found during surface characterization. An additional 8,675 target practice projectiles were uncovered during the Time-Critical Removal Action (TCRA). None of the OEW encountered contained any explosives or energetics. Liquefaction potential and seismic slope instability were identified as seismic hazards for IR Site 2. Additionally, geotechnical improvements are needed to increase the static factors of safety for site stability.
Mar-04	Final Geotechnical Feasibility Study Report for Installation Restoration Site 2	TtFW	Evaluate options for remedial actions to address geotechnical hazards at IR Site 2.	Soil cement gravity wall and stone columns were determined to be the most feasible remedial option.
Feb-05	Fall 2004 Tidal Study for Installation Restoration Sites 1 and 2	Shaw Environmental, Inc. (Shaw)	Determine the effect of tidal influences in monitoring wells at the sites.	The study concluded that groundwater monitoring wells near the San Francisco Bay are moderately to strongly influenced by tidal fluctuations in San Francisco Bay.

TABLE 2-1

SUMMARY OF PREVIOUS INVESTIGATIONS AND REPORTS FOR IR SITE 2

Date	Reference Title	Author	Objective	Summary of Findings
Aug-05	Final Installation Restoration Site 2 Radiological Characterization Survey Report	TtFW	Characterize the extent and depth (to approximately 20 inches) of Ra-226 contamination. Performed 100 percent surface scan and collected soil samples (could not survey berm side slopes, under some trees, or in areas covered with water).	Twenty-three areas were identified at IR Site 2 with counts above two times background. Areas with elevated readings are generally located in the north and east portions of IR Site 2 around the magazines. Four of the five soil samples had Ra-226 above background (maximum concentration was 0.397 pCi/g compared to 0.365 pCi/g).
Jun-06	Final Remedial Investigation Report, IR Site 2 West Beach Landfill and Wetlands	Battelle and Blasland, Bouck, and Lee, Inc. (BBL), Inc.	Document characterization and investigation methods employed at the site, provide and summarize the data generated and data interpretation and evaluation completed, and develop conclusions regarding the nature and extent of contamination and the human health and ecological risk posed by the contamination.	Polychlorinated biphenyls (PCBs), certain metals, polycyclic aromatic hydrocarbons, pesticides, radionuclides, and polychlorinated dibenzodioxins/polychlorinated dibenzofurans are the primary human health and/or ecological risk drivers in soil at the site.
Jun-07	Final Historical Radiological Assessment – Volume 2	Weston Solutions, Inc.	Assess the likelihood of potential radioactive contamination and migration pathways. Designate sites as impacted or non-impacted.	IR Site 2 was designated as impacted.

TABLE 2-1

SUMMARY OF PREVIOUS INVESTIGATIONS AND REPORTS FOR IR SITE 2

Date	Reference Title	Author	Objective	Summary of Findings
Sep-07	Radiological Characterization Survey Report, Radiological Survey at IR Site 32 and the Shorelines of IR Sites 1 and 2	TtEC	To document removal of previously identified surface and subsurface radiological anomalies at IR Site 2. To survey areas previously considered inaccessible (shorelines of IR Sites 1 and 2 and the former RadShack area).	Three areas of elevated radiological counts were identified during the scan survey of the former RadShack area within IR Site 2. No elevated readings were identified in the shoreline areas of IR Site 2.
Oct-08	Final Feasibility Study Report, IR Site 2, West Beach Landfill and Wetlands	Battelle and BBL	The Feasibility Study (FS) provides an evaluation of potential remedial alternatives for IR Site 2.	The areas of IR Site 2 potentially requiring remediation based on the remedial action objectives are the majority of the landfill area inside the berm, two isolated areas in the northwestern interior margin, four isolated areas in the northeastern margin, three isolated areas in the wetland, and two transitional areas between the landfill and the wetland. The preferred remedy for soil is a multilayer soil cover, engineering and institutional controls (ICs), and monitoring. The preferred alternative for groundwater is monitored natural attenuation (MNA) and engineering and ICs.
Feb-09	Technical Memorandum – Data Gap Investigation Results, Installation Restoration Sites 2, 4, 34,and 35 (Draft)	SulTech	To provide additional data to assess the potential for methane migration beyond the boundary of IR Site 2.	Seven soil gas samples were collected and analyzed in the field. Detections of methane in the samples were low (0.0 to 0.1 percent by volume) in all seven samples. Samples could not be collected at three of the planned locations.

TABLE 2-1

SUMMARY OF PREVIOUS INVESTIGATIONS AND REPORTS FOR IR SITE 2

Date	Reference Title	Author	Objective	Summary of Findings
Jul-09	Alameda Basewide 2008 Annual Groundwater Monitoring Report (Final) – Volume 2	Innovative Technical Solutions, Inc.	Collect basewide groundwater monitoring data from monitoring wells and soil gas sampling wells (five points with wells screens at two or three different depths) at regular intervals.	Groundwater and soil gas sample concentrations have been fairly consistent during recent monitoring events.
Aug-09	Proposed Plan for IR Site 2 (Final)	Navy	To present the preferred soil and groundwater cleanup remedy to the public and solicit comments.	The Proposed Plan was distributed to more than 700 households; businesses; local, state, and federal agencies; and regulatory agencies in August 2009. A public meeting was held on August 27, 2009, and a public review period was open from August 4 to September 14, 2009.
Sep-09	Final Time-Critical Removal Action Post-Construction Report for Installation Restoration Sites 1, 2, and 32, Alameda Point, Alameda, California	TtEC	Mitigate the potential risk posed by material potentially presenting an explosive hazard and radiological contamination at IR Sites 1, 2, and 32.	IR Site 2 activities focused on confirming elevated areas identified in 2004 and 2006 and removing discrete items outside of the bermed area. Ten discrete items were recovered from IR Site 2, one along the shoreline and the others from the area north of the berm. Surface survey for gamma-emitting radionuclides was conducted after the removal activities along the shoreline area and to the north of the bermed landfill. On October 11, 2007, the Navy agreed that excavation activities would not be required inside the perimeter of the IR Site 2 berm because the area is largely a seasonal wetland.

GENERAL NOTES

1. EXISTING UTILITIES SHOWN ARE BASED ON BEST AVAILABLE INFORMATION. THE CONTRACTOR SHALL VERIFY THE EXACT LOCATION, SIZE, TYPE, AND ELEVATION OF ALL UTILITIES PRIOR TO CONSTRUCTION. THE CONTRACTOR SHALL CONTACT USA NORTH FOR IDENTIFICATION OF EXISTING UTILITIES PRIOR TO THE START OF CONSTRUCTION.
2. EXCAVATION LIMITS SHOWN IN THE DETAILS ARE GRAPHICAL REPRESENTATIONS ONLY AND DO NOT REPRESENT ACTUAL EXCAVATION LIMITS NECESSARY TO COMPLETE THE WORK.
3. SHEET C–1 SHOWS SURVEY CONTROL MONUMENTS IN THE PROJECT AREA AND PROVIDES REFERENCE TO THE SURVEY DOCUMENTS WHERE COORDINATES CAN BE OBTAINED FOR GROUND CONTROL. ALL COORDINATES AND STATIONS SHOWN ON THE DRAWINGS ARE GROUND.
4. REPLACEMENT AND RECONSTRUCTION OF ANY EXISTING FACILITIES DAMAGED DURING CONSTRUCTION SHALL BE COMPLETED AT THE CONTRACTOR'S EXPENSE.
5. THE CONTRACTOR SHALL APPLY VEGETATIVE EROSION CONTROL, PER SPECIFICATIONS AND DRAWINGS, TO AREAS DISTURBED BY CONSTRUCTION ACTIVITIES AND DRAINAGE COURSES.
6. ANY DISCREPANCIES FOUND BETWEEN THE DRAWINGS AND ACTUAL SITE CONDITIONS OR ANY INCONSISTENCIES OR AMBIGUITIES BETWEEN THE DRAWINGS AND OTHER COMPONENTS OF THE CONTRACT DOCUMENTS SHALL BE IMMEDIATELY REPORTED IN WRITING TO THE ENGINEER. THE ENGINEER WILL PROMPTLY CORRECT INCONSISTENCIES OR AMBIGUITIES IN WRITING IN COORDINATION WITH THE CLIENT.
7. ALL DRAINAGE DITCHES SHALL BE GRADED TO DRAIN IN THEIR ORIGINAL DIRECTION AND PROTECTED FROM EROSION BY THE CONTRACTOR BY HYDROSEEDING, UNLESS OTHERWISE NOTED. ALL DRAINAGE DITCHES SHALL REMAIN OPERABLE AT THE END OF EACH WORKDAY.
8. THE CONTRACTOR SHALL PROVIDE TEMPORARY FENCING AROUND THE OUTER LIMITS OF THE PERMANENT AND TEMPORARY CONSTRUCTION AREAS PRIOR TO ANY WORK. THIS INCLUDES, BUT IS NOT LIMITED TO,OFFICE AND STAGING AREAS, LIMITS OF EXCAVATION, AND STOCKPILE AREAS.
9. ALL DIMENSIONS, INCLUDING, BUT NOT LIMITED TO ELEVATIONS, STATIONS, AND DISTANCES ARE IN STANDARD ENGLISH UNITS.
10. NOMINAL SCALES (1"=X') PROVIDED ARE FOR FULL SIZE DRAWINGS (22"x34"). BAR SCALES PROVIDE THE NECESSARY SCALE ADJUSTMENT FOR ANY SIZE DRAWING.
11. THE CONTRACTOR SHALL TAKE ALL PRECAUTIONARY MEASURES NECESSARY TO PROTECT IMPROVEMENTS FROM DAMAGE.
12. CONTRACTOR SHALL IMPLEMENT BEST MANAGEMENT PRACTICES FOR SEDIMENT AND EROSION CONTROL, INCLUDING HYDROSEEDING, STRAW MULCH, AND EROSION CONTROL BLANKET OVER FINAL GRADES, AND FIBER ROLLS, SILT FENCES, AND HAY BALE AS NECESSARY TO CONTROL SEDIMENT FROM LEAVING THE SITE OR IMPACTING WETLANDS.
13. CONTRACTOR PERSONNEL SHALL BE ADEQUATELY TRAINED TO IMPLEMENT THE REQUIREMENTS OF THE STORMWATER POLLUTION PREVENTION PLAN.
14. TEMPORARY SEDIMENT AND EROSION CONTROL MEASURES SHALL BE INSTALLED PRIOR TO START OF CONSTRUCTION.
15. CONTRACTOR SHALL MINIMIZE EROSION DURING CONSTRUCTION USING STANDARD CONSTRUCTION TECHNIQUES, SILT FENCE, AND CHECK DAMS.
16. CONSTRUCTION WITHIN WETLANDS SHOWN IS ACCEPTABLE WITHIN THE LIMITS OF THE COVER SYSTEM, BUT WETLANDS MUST BE PRESERVED OUTSIDE THE LIMITS OF THE COVER.
17. WASTES AT OR NEAR SURFACE MAY BE RADIOLOGICALLY CONTAMINATED. SURFACE VEGETATION WILL BE REMOVED. HOWEVER, GRUBBING OR OTHER EXCAVATION WILL BE LIMITED AND WILL BE SUBJECT TO PROJECT RADIOLOGICAL CONTROLS.
18. ANY MATERIALS AND EQUIPMENT IN THE RADIOLOGICAL AREA WILL BE SUBJECT TO RADIOLOGICAL RELEASES.
19. IR SITE 2 IS A DESIGNATED CERCLA SITE. NO PERMITS ARE REQUIRED, BUT ALL WORK WILL COMPLY WITH SUBSTANTIAL REQUIREMENTS UNDER CERCLA.

CONSTRUCTION NOTES

1. REMOVE AND DISPOSE OF EXISTING CHAIN LINK FENCE
2. REMOVE AND DISPOSE OF EXISTING WEIR STRUCTURE PER 2/D-3
3. PROTECT GAS VENT IN PLACE, REPLACE AS NECESSARY PER 1/C-17
4. ABANDON EXISTING SOIL GAS MONITORING PROBE PER SPECIFICATIONS
5. CLEAR VEGETATION
6. PROTECT IN PLACE
7. EXCAVATE/FILL TO CONTOURS SHOWN
8. CONSTRUCT FINAL COVER PER 1/D-1
9. CONSTRUCT ACCESS ROAD PER 5/D-4
10. INSTALL LANDFILL GAS MONITORING PROBE PER 1/D-2
11. INSTALL SETTLEMENT MONUMENT PER 3/D-1
12. NOT USED
13. CONVERT EXISTING MANHOLE TO DRAINAGE INLET PER 1/D-3
14. NOT USED
15. CONSTRUCT SILT FENCE PER 4/D-4
16. CONSTRUCT FIBER ROLLS PER 2/D-4
17. HYDRO SEED PER SPECIFICATIONS
18. TEMPORARY CONSTRUCTION/SECURITY FENCE
19. CONSTRUCT CHAIN LINK GATE PER 1/D-6
20. CONSTRUCT TURF REINFORCEMENT MAT TERMINATION AT EDGE OF ACCESS ROAD PER 6/D-4
21. CONSTRUCT TURF REINFORCEMENT MAT ANCHOR TRENCH PER 2/D-5
22. INSTALL PASSIVE GAS VENTING PER 1/D-4
23. CONSTRUCT TURF REINFORCEMENT MAT PER 1/D-5

BASIS OF SURVEY:

THIS MAP WAS PREPARED USING COMPUTER ASSISTED, PHOTOGRAMMETRIC METHODS BY HJW GEOSPATIAL, INC. IN OAKLAND, CALIFORNIA. CONTROL SURVEY PERFORMED BY KISTER, SAVIO & REI, RICHMOND, CA. IN AREAS OF DENSE VEGETATION, ACCURACY OF CONTOURS MAY DEVIATE FROM ACCEPTED ACCURACY STANDARDS.

SURVEY CONTROL IS BASED ON THE MONUMENT DESIGNATED "MAIN/ATL" AS DESCRIBED BY THE NATIONAL GEODETIC SURVEY. THE MONUMENT IS LOCATED AT THE NORTHWEST CORNER OF MAIN STREET AND ATLANTIC AVENUE.

COORDINATES ARE BASED ON THE CALIFORNIA COORDINATE SYSTEM ZONE III NORTH AMERICAN DATUM OF 1927. THE NAD27 VALUE FOR "MAIN/ATL" WAS DERIVED FROM THE NADCON CONVERSION OF THE PUBLISHED NAD83 COORDINATES. THE COMPUTED NAD27 COORDINATES ARE:
NORTH 471,068.97'
EAST 1,482,604.56'
ELEVATIONS ARE BASED THE NATIONAL GEODETIC VERTICAL DATUM OF 1929. THE PUBLISHED ELEVATION OF "MIN/ATL" = 6.69' NGVD29.

COORDINATES AND ELEVATIONS WERE OBTAINED USING RTK GPS TECHNIQUES AND CONVENTIONAL GROUND CONTROL SURVEY METHODS.

EROSION CONTROL NOTES

1. CONTRACTOR SHALL COMPLY WITH PROVISIONS AND BEST MANAGEMENT PRACTICES INCLUDED IN THE STORMWATER POLLUTION PREVENTION PLAN (SWPPP) PREPARED BY THE CONTRACTOR.
2. BEST MANAGEMENT PRACTICES (BMP) REFERENCE NUMBERS REFER TO CALIFORNIA STORMWATER BMP HANDBOOK–CONSTRUCTION BY THE CALIFORNIA STORMWATER QUALITY ASSOCIATION (CASQA), DATED NOVEMBER, 2009.
3. ALL EROSION CONTROLS WILL BE INSTALLED AS NECESSARY PRIOR TO THE BEGINNING OF WORK AND BE MAINTAINED THROUGHOUT CONSTRUCTION IN ACCORDANCE WITH THE SWPPP.
4. CONTROL OFF SITE RUN–ON BY DIVERTING STORMWATER FLOWS AWAY FROM SITE TO EXISTING STORM DRAIN SEWERS AND DRAINAGE CHANNELS.
5. CONTROL SITE RUN–OFF FROM ACTIVE AREA USING FIBER ROLLS AND GRAVEL BAG BERMS AT DOWN GRADIENT AREAS.
6. ONLY ESSENTIAL VEHICLES SHOULD ENTER SOIL EXCAVATION AND FILL AREAS.
7. VEHICLES WILL ENTER AND LEAVE SITE ONLY THROUGH DESIGNATED LOCATIONS.
8. VEHICLES WILL BE INSPECTED FOR SOIL ON TIRES AT THE VEHICLE INSPECTION AREA. SOIL WILL BE BRUSHED CLEAN TO PREVENT TRACKING ONTO PUBLIC ROADS. RADIATION CONTROLS IN EFFECT, SEE RPP ATTACHMENTS 2 AND 3.
9. TRASH CONTAINERS WILL BE PROVIDED ON SITE, ALL TRASH WILL BE PLACED INTO APPROPRIATE WASTE CONTAINERS. THE SITE WILL BE KEPT CLEAR OF TRASH AND DEBRIS.

SECTION A–A

NOTES IF RIP-RAP IS ENCOUNTERED:
1. REMOVE RIPRAP AS NEEDED FOR LGMT CONSTRUCTION
2. FOLD BACK OR REMOVE EXISTING GEOTEXTILE AS NEEDED.
3. INSTALL NEW GEOTEXTILE OVER NEW BACKFILL. PROVIDE LAP SEAM OVER EXISTING GEOTEXTILE.
4. REPLACE RIPRAP.

RISER VENT DETAIL (1)

NOT TO SCALE C-16

NOTES:
1. THE COLLECTION PIPE SHALL BE 4 INCH DIAMETER PERFORATED SCHEDULE 40 (ASTM D1785) POLYVINYL-CHLORIDE (PVC).
2. VERTICAL VENT PIPES SHALL BE SCHEDULE 40 PVC AND SHALL EXTEND A MINIMUM OF 10 FEET ABOVE THE GROUND SURFACE. THE TOP OF THE PIPE SHALL PROVIDE AN INVERTED "J" CONFIGURATION TO PREVENT PRECIPITATION AND ANIMAL ENTRY INTO THE PIPE.
3. GRAVEL USED FOR GAS COLLECTION SHALL HAVE A UNIFORM GRADATION WITH <5% PASSING THE #16 SIEVE TO MAXIMIZE PORE SPACE FOR GAS TRANSMISSION AND SHALL BE FREE OF FINES. TO PREVENT CLOGGING, THE GRAVEL MUST HAVE A D85 ≥ 0.375" OR BE PROTECTED BY GEOTEXTILE FILTER.
4. GROUND SURFACE IS TO BE RESTORED TO ORIGINAL GRADE AND RESTORED TO THE ORIGINAL CONDITION BY VEGETATING OR PLACING GEOTEXTILE AND RIPRAP. SURFACE SHALL BE SLOPED TO DRAIN AWAY FROM RISER PIPES.
5. COAT EXPOSED PVC WITH LATEX PAINT
6. GAS VENT TRENCH SHALL BE REPLACED IN KIND.
7. INSTALL ANTI-PERCH DEVICE ON TOP OF EACH GAS VENT. INSTALLATION METHOD TO BE APPROVED BY THE ENGINEER.

SECTION 01 10 00

GENERAL PARAGRAPHS
November 2011

PART 1 GENERAL

1.1 SUBMITTALS

Submit the following to the Remedial Project Manager/Resident Officer in Charge of Construction (RPM/ROICC) in accordance with Section 01 33 00 SUBMITTAL PROCEDURES and the following:

SD-01 Preconstruction Submittals

After receipt of the Notice to Proceed, the Contractor shall submit to the RPM/ROICC the preconstruction submittals identified in the basic Contract and as defined herein. Commencement of site work shall not occur until all preconstruction submittals have been approved by the RPM/ROICC.

Remedial Action Work Plan (RAWP)
90% Remedial Design (including Geotechnical Report)
Radiological Work Plan
Radiological Protection Plan
Sampling and Analysis Plan
Accident Prevention Plan/Site Safety and Health Plan (APP/SSHP)
Quality Control Plan (QC)
Environmental Mitigation Plan
Wetlands Mitigation Plan
Stormwater Pollution Prevention Plan
Dust Control and Air Monitoring Plan
Spill Prevention, Control, and Countermeasure Plan
Waste Management Plan
Post-Closure Monitoring Plan
Land Use Controls Remedial Design
Waste Management Plan
Well Destruction Plan
Traffic Control Plan

SD-11 Closeout Submittals

As-Built Drawings
QC Testing Plan and Log
QC Test Results Summary Report
Rework Items List
Remedial Action Closure Report (RACP)

1.2 REMEDIAL ACTION WORK PLAN (RAWP)

The Contractor shall prepare a RAWP for all field activities to be conducted under this project. The RAWP shall include the following elements:

a. Construction Schedule: The schedule shall be a time-scaled logic diagram displaying project activities and shall identify Schedule Activity Numbers.

1.3 ENVIRONMENTAL PROTECTION PLAN

Submit as an attachment to the RAWP in accordance with the basic Contract. The RAWP will discuss the current environmental conditions of the site.

1.4 ACCIDENT PREVENTION PLAN/SITE SAFETY AND HEALTH PLAN (APP/SSHP)

The Contractor shall prepare an APP/SSHP that provides health and safety information for all aspects of construction associated with this project.

1.5 QUALITY CONTROL PLAN (QC)

The Contractor shall use skilled workers, an adequate number of which are thoroughly trained and have experience in the necessary crafts and who are familiar with the specified requirements and the methods needed for the proper performance of the work in each section of these Specifications.

1.6 RADIOLOGICAL WORK PLAN

Submit as an attachment to the RAWP in accordance with the basic Contract.

1.7 RADIOLOGICAL PROTECTION PLAN

Submit as an attachment to the RAWP in accordance with the basic Contract.

1.8 WETLANDS MITIGATION PLAN

Submit as an attachment to the RAWP in accordance with the basic Contract.

1.9 STORM WATER POLLUTION AND CONTROL PLAN

See requirements in Article 1.6 of Section 31 32 11 SOIL SURFACE AND EROSION CONTROL.

1.10 DUST CONTROL AND AIR MONITORING PLAN

Submit as an attachment to the RAWP in accordance with the basic Contract.

1.11 SPILL PREVENTION, CONTROL, AND COUNTERMEASURE PLAN

Submit Spill Prevention, Control, and Countermeasure Plan in compliance with 40 CFR 112 and as described at the following website: http://www.epa.gov/oem/content/spcc/spcc_qf.htm

1.12 RADIOLOGICAL PROTECTION PLAN

Submit as an attachment to the RAWP in accordance with the basic Contract.

1.13 POST-CLOSURE MONITORING PLAN

Submit in accordance with the basic Contract.

1.14 LAND USE CONTROLS REMEDIAL DESIGN

Submit in accordance with the basic Contract.

1.15 WASTE MANAGEMENT PLAN

Submit in accordance with the basic Contract.

1.16 SAMPLING AND ANALYSIS PLAN

Comprised of Field Sampling Plan (FSP) and Quality Assurance Project Plan (QAPP), and in conformance with Southwest Division, Naval Facilities Engineering Command, Environmental Work Instructions (EWIs). The plan shall be submitted and approved by the Navy's Quality Assurance Officer (QAO).

1.17 BARRICADES

Erect and maintain temporary barricades to limit access to hazardous areas.

1.18 ADMINISTRATIVE AND CLOSE-OUT SUBMITTALS

1.18.1 Administrative Submittals

The following Administrative Submittals shall be made by the Contractor as specified in applicable sections of these Specifications and within the time frame outlined herein:

a. Submittals as required by each Section of these Specifications and which are not included in the RAWP shall be made prior to the respective item of work to begin or to be ordered from the supplier, whichever applies.

1.19.2 Closeout Submittals

a. As-Built Drawings and Record of Materials shall be submitted by the Contractor with the basic Contract.

b. Remedial Action Closure Report (RACR): At the conclusion of field activities, the Contractor shall prepare a RACR which shall summarize all field activities conducted. The RACR shall evaluate the data collected during the remedial action and shall draw a conclusion regarding whether the Contractor has achieved the objectives of the original design with approved deviations. This report shall include the following:

   (1) A narrative of construction activities describing the procedures implemented and any deviations from the procedures proposed in the RAWP.

   (2) A summary of all sampling and analyses conducted at the site and from borrow sources (i.e., the QC Test Log).

   (3) As-Built Drawings and design data (including final site survey results, survey of buried components, and cover system thickness verification.

   (4) Copies of all laboratory data generated during the remedial action (including geotechnical and chemical test results.)

1.20 PROJECT INFORMATION

In the case of conflict between the project Drawings and Specifications, the Specifications shall take precedence.

1.21 PROJECT SCHEDULE, PHASING, AND TIME CONSTRAINTS

1.21.1 Commencement, Prosecution, and Completion of Work

The Contractor shall submit to the RPM/ROICC all required preconstruction submittals as defined under paragraph entitled "SD-01 Preconstruction Submittals" above.

1.22 TRAFFIC CONTROL PLAN

At Contractor’s expense, construct access and haul roads necessary for proper prosecution of the work under this contract. Construct with suitable grades and widths; sharp curves, blind corners, and dangerous cross traffic are be avoided. Provide necessary lighting, signs, barricades, and distinctive markings for the safe movement of traffic.

PART 2 PRODUCTS

NOT USED.

PART 3 EXECUTION

3.1 GENERAL

The PQAE will be allowed to assign certain functions to site quality control inspectors.

-- End of Section --

SECTION 01 11 00

SUMMARY OF WORK
November 2011

PART 1 GENERAL

1.1 SUMMARY

The Remedial Action involves site screening and removal of surficial radiological contamination, installation of a multilayer soil cover over the former landfill; implementation of engineering and institutional controls; wetland mitigation; construction monitoring; methane gas monitoring; air monitoring during activities that could produce dust from soil containing PCBs, pesticides, and other constituents of concern in addition to radiological control activities; and groundwater monitoring to confirm natural attenuation.

1.2 WORK COVERED

1.2.1 Project Description

The work includes furnishing all labor, materials, and equipment to perform the following:

a. Mobilization and setting up of environmental controls at the site;

b. Verifying the location and status of subsurface utilities that may be impacted by construction activities;

c. Providing site access roads and temporary safety fencing around the project;

d. Removal/destruction of groundwater monitoring wells located within the landfill cap footprint area, if required;

e. Protection or the removal/destruction of gas monitoring probes located within the landfill cap footprint area;

f. Removal of above-surface portions of gas venting system, if required;

g. Removal of an existing fence per Drawings and weir structure located on the eastern edge of landfill boundary;

h. Modification of existing storm drain manholes to inlet structures;

i. Clearing the designated work area;

j. Establishing erosion control measures that will remain in place throughout the duration of construction activities;

k. Site-wide surficial radiological screening;

l. Excavation, removal, and disposal of radiological contamination (as necessary);

m. Site grading and preparation of subgrade;

n. Installation of the multilayer soil cover system;

o. Installation of a geonet to serve as a biotic layer;

p. Installation of groundwater monitoring wells, if required;

q. Installation of landfill gas perimeter probes;

r. Construction of an access road;

s. Construction of perimeter storm water drainage controls;

t. Re-vegetation of the work area;

u. Establishing final erosion control measures;

v. Installation of a new permanent chainlink fence;

w. Managing and disposing of wastes generated during construction activities; and

x. Demobilization; including final site clean-up.

1.2.2 Location

The work shall be located at the Installation Restoration Site 2, Former Naval Air Station Alameda Point, Alameda, California, as shown in the Project Drawings.

PART 2 PRODUCTS

NOT USED.

PART 3 EXECUTION

3.1 FACILITIES AND SERVICES

3.1.1 Availability of Utilities Services

a. The Contractor shall provide his own utilities.

b. The Contractor shall be responsible for supplying their own potable water and electricity.

c. The Contractor shall mobilize and maintain temporary sanitary facilities for the field crew; the Contractor shall remove the sanitary facilities from the site at the conclusion of construction activities.

3.1.2 Contractor’s Storage Area

Storage Size and Location: During the course of field activities, the Contractor shall be allowed to store equipment adjacent to the site in the location as shown on the plans. The Contractor shall be responsible for securing the storage area from unauthorized access.

3.2 RESTRICTIONS ON OPERATIONS

3.2.2 Security Requirements

The Contractor shall erect temporary security equipment consisting, at a minimum, of fencing, barriers, and signs to prevent unauthorized access to construction area. This equipment shall be erected prior to commencement of work at the site. Fencing and other barriers shall remain in place until construction activities are concluded; all temporary fencing shall be removed during demobilization.

3.3 ACTIONS REQUIRED OF THE CONTRACTOR

3.3.1 Location of Underground Facilities

The Contractor shall verify any type of underground obstruction indicated on the project plans or specified to be removed. There are no live utilities in the area but caution will be maintained during any excavation.

3.3.2 Permits and Approvals

The Contractor shall be responsible for obtaining all permits/permissions, approvals, and/or authorization as required.

3.3.3 Fugitive Dust

The Contractor shall monitor construction, and provide dust suppression and controls, in accordance with the work plans.

3.3.4 Not Used

3.3.5 Daily Site Cleanup

During site grading and subgrade preparation, no exposed waste (radiation impacted soils are not considered waste under this requirement) shall be left uncovered at the end of each day. The Contractor shall ensure that the construction site is secured at the end of each work day. All equipment and materials shall be stored in the Contractor's storage area or within the project construction area. No loose debris, trash, or project materials shall be present outside of the Contractor's storage or work areas at the end of each working day.

-- End of Section --

SECTION 01 33 00

SUBMITTAL PROCEDURES
November 2011

PART 1 GENERAL

Units of weights and measures used on all submittals are to be the same as those used in the Contract Drawings.

Submittals will be reviewed to ensure completeness, accuracy, and Contract compliance. Submittal of a certification will be inspected and approved for conformance with the project Specifications or certification criteria. All items will be checked and approved by the Project Quality Control Manager (PQCM) or designated representative. Any submittals requiring modifications or changes will be returned to the originating organization for correction and then resubmitted for review and approval prior to acceptance. Approved submittals will be stamped, signed or initialed, and dated. During the preparatory phase of the QC inspections, the PQCM or designated representative will ensure that all materials and equipment have been tested and approved. No field activities will be performed without the required approval of applicable submittals.

Required submittals will be provided to project personnel as determined by the distribution schedule. Each submittal will be assigned a unique document control number.

A transmittal form will accompany each submittal. Each transmittal will be identified with: Contract and Contract Task Order (CTO) number; name and address of the submitting organization; date of submittal; description of item being submitted, including reference to Specification Section (if applicable); and approval of submitting organization indicating conformance to the requirements. The PQCM will update the submittal register regularly (See Article 1.7 of this Section).

The submittal log will be updated to indicate status. Nonconforming submittals may be returned to the submitter for correction, resolution of comments, and resubmittal, if required (See subparagraph 1.8.3 of this Section). Revised submittals will be logged, reviewed, and processed in a manner identical to the initial submittal. Revisions to a submittal will be identified using an alphabetic suffix to the original submittal number, e.g., submittal 18 will be revised to 18(a).

1.1 DEFINITIONS

1.1.1 Submittal Descriptions (SD)

Submittals requirements are specified in the technical sections. Submittals are identified by Submittal Description (SD) numbers and titles as follows:

SD-01 Preconstruction Submittals

Submittals which are required prior to start of construction (Work) issuance of notice to proceed or commencing Work on site or the start of the next major phase of the construction on a multi-phase Contract.

Includes schedules, tabular list of data, or tabular list including location, features, or other pertinent information regarding products, materials, equipment, or components to be used in the work, submitted prior to start of construction work start of construction work Contract notice to proceed or next major phase of construction.

SD-02 Shop Drawings

Drawings, diagrams and schedules specifically prepared to illustrate some portion of the work.

Drawings prepared by or for the Contractor to show how multiple systems and interdisciplinary work will be coordinated.

SD-03 Product Data

Catalog cuts, illustrations, schedules, diagrams, performance charts, instructions and brochures illustrating size, physical appearance and other characteristics of materials, systems or equipment for some portion of the work.

SD-06 Test Reports

Report signed by authorized official of testing laboratory that a material, product or system identical to the material, product or system to be provided has been tested in accord with specified requirements. (Testing must have been within three years of date of Contract award for the project.)

Report which includes findings of a test required to be performed by the Contractor on an actual portion of the work or prototype prepared for the project before shipment to job site.

Report which includes finding of a test made at the job site or on sample taken from the job site, on portion of work during or after installation.

SD-07 Certificates

Statements printed on the manufacturer's letterhead and signed by responsible officials of manufacturer of product, system or material attesting that product, system or material meets Specification requirements. Must be dated after award of project Contract and clearly name the project.

Document required of Contractor, or of a manufacturer, supplier, installer or Subcontractor through Contractor, the purpose of which is to further quality of orderly progression of a portion of the work by documenting procedures, acceptability of methods or personnel qualifications.

SD-08 Manufacturer Instructions

Preprinted material describing installation of a product, system or material, including special notices and (MSDS) concerning impedances, hazards and safety precautions.

SD-11 Closeout Submittals

Documentation to record compliance with technical or administrative requirements or to establish an administrative mechanism.

Special requirements necessary to properly close out a construction Contract. For example, as-built Drawings. Also, submittal requirements necessary to properly close out a major phase of construction on a multi-phase Contract.

1.1.2 Approving Authority
Not used.

1.1.3 Work

As used in this section, on- and off-site construction required by Contract documents, including labor necessary to produce submittals, except those SD-01 Pre-Construction Submittals noted above, construction, materials, products, equipment, and systems incorporated or to be incorporated in such construction.

1.2 SUBMITTALS

Not Used

1.3 SUBMITTAL CLASSIFICATION

1.3.4 Designer of Record Approved/Conformance Review (DA/CR)

1.3.4.1 Deviations to the Accepted Design

The PQAE, PQCM, Landfill Engineer, Site Engineer, Construction Manager, and Project Manager concurrence are required for any proposed deviation from the accepted design which still complies with the Contract before the Contractor is authorized to proceed with material acquisition or installation. A Field Change Request must be approved by the aforementioned in addition to the RPM/ROICC. If necessary to facilitate the project schedule, the Contractor and the RPM/ROICC may discuss a submittal proposing a deviation prior to officially submitting it.

1.3.4.2 Substitutions

Not used.

1.3.5 Project Manager Approved

In addition to the above-stated requirements for proposed deviations to the accepted design, the Project Manager approval is required, if a Contract modification is required before the Contractor is authorized to proceed with material acquisition or installation for any proposed variation to the Contract (the solicitation and/or the accepted proposal), which constitutes a change to the Contract terms.

1.4 PREPARATION

1.4.1 Transmittal Form

Transmit each submittal, except sample installations and sample panels to office of approving authority. Transmit submittals with transmittal form prescribed by RPM/ROICC and standard for project. On the transmittal form, identify Contractor, indicate date of submittal, and include information prescribed by transmittal form and required in paragraph entitled, "Identifying Submittals," of this section. Process transmittal forms to record actions regarding samples and installations.

1.4.2 Identifying Submittals

When submittals are provided by a subcontractor, the Prime Contractor is to prepare, review, and stamp with Contractor's approval all specified submittals.

Identify submittals, except sample installations and sample panels, with the following information permanently adhered to or noted on each separate component of each submittal and noted on transmittal form. Mark each copy of each submittal identically, with the following:

a. Project title and location.

b. Construction Contract number.

c. Date of the Drawings and revisions.

d. Name, address, and telephone number of subcontractor, supplier, manufacturer and any other subcontractor associated with the submittal.

e. Section number of the Specification section by which submittal is required.

f. Submittal description (SD) number of each component of submittal.

g. When a resubmission, add alphabetic suffix on submittal description, for example, submittal 18 would become 18A, to indicate resubmission.

h. Product identification and location in project.

1.4.3 Format for SD-02 Shop Drawings

Shop Drawings are not to be less than 8 1/2 by 11 inches nor more than 30 by 42 inches, except for full size patterns or templates. Prepare Drawings to accurate size, with scale indicated, unless other form is required. Drawings are to be suitable for reproduction and be of a quality to produce clear, distinct lines and letters with dark lines on a white background.

Dimension Drawings, except diagrams and schematic Drawings; prepare Drawings demonstrating interface with other trades to scale. Use the same unit of measure for shop Drawings as indicated on the Contract Drawings. Identify materials and products for work shown.

Include the nameplate data, size and capacity on Drawings. Also include applicable federal, military, industry and technical society publication references.

1.4.4 Format of SD-03 Product Data and SD-08 Manufacturer's Instructions

Present product data submittals for each section as a complete, bound volume. Include table of contents, listing page and catalog item numbers for product data.

Indicate, by prominent notation, each product which is being submitted; indicate Specification section number and paragraph number to which it pertains.

Supplement product data with material prepared for project to satisfy submittal requirements for which product data does not exist. Identify this material as developed specifically for project, with information and format as required for submission of SD-07 Certificates.

Include the manufacturer's name, trade name, place of manufacture, and catalog model or number on product data. Also include applicable federal, military, industry and technical society publication references. Should manufacturer's data require supplemental information for clarification, submit as specified for SD-07 Certificates.

Where equipment or materials are specified to conform to industry and technical society reference standards of the organizations such as American National Standards Institute (ANSI), ASTM International (ASTM), National Electrical Manufacturer's Association (NEMA), Underwriters Laboratories (UL), and Association of Edison Illuminating Companies (AEIC); and submit proof of such compliance. The label or listing by the specified organization will be acceptable evidence of compliance. In lieu of the label or listing, submit a certificate from an independent testing organization, competent to perform testing, and approved by the RPM/ROICC. State on the certificate that the item has been tested in accordance with the specified organization's test methods and that the item complies with the specified organization's reference standard.

Collect required data submittals for each specific material, product, unit of work, or system into a single submittal and marked for choices, options, and portions applicable to the submittal. Mark each copy of the product data identically. Partial submittals will not be accepted for expedition of construction effort.

Submit manufacturer's instructions prior to installation.

1.4.5 Format of SD-04 Samples

Not used.

1.4.6 Format of SD-05 Design Data and SD-07 Certificates

Provide design data and certificates on 8 1/2 by 11 inches paper. Provide a bound volume for submittals containing numerous pages.

1.4.7 Format of SD-06 Test Reports and SD-09 Manufacturer's Field Reports

Provide reports on 8 1/2 by 11 inches paper in a complete bound volume.

Indicate by prominent notation, each report in the submittal. Indicate Specification number and paragraph number to which it pertains.

1.4.8 Format of SD-01 Preconstruction Submittals and SD-11 Closeout Submittals

When submittal includes a document, which is to be used in project or become part of project record, other than as a submittal, do not apply Contractor's approval stamp to document, but to a separate sheet accompanying document.

1.5 QUANTITY OF SUBMITTALS

1.5.1 Number of Copies of SD-02 Shop Drawings

Submit one copy of submittals of shop Drawings requiring review and approval only by QC organization and two copies of shop Drawings requiring review and approval by RPM/ROICC.

1.5.2 Number of Copies of SD-03 Product Data and SD-08 Manufacturer's Instructions

Submit in compliance with quantity requirements specified for shop Drawings.

1.6 VARIATIONS

Variations from Contract requirements require Designer of Record (DOR) approval.

1.7 SUBMITTAL REGISTER AND DATABASE

1.7.1 Use of Submittal Register

Submit submittal register as an electronic database, using submittals management program furnished to Contractor. Verify that all submittals required for project are listed and add missing submittals. Coordinate and complete the following fields on the register submitted with the QC plan and the project schedule:

Column (a) Activity Number: Activity number from the project schedule.

Column (g) Contractor Submit Date: Scheduled date for approving authority to receive submittals.

Column (h) Contractor Approval Date: Date Contractor needs approval of submittal.

Column (i) Contractor Material: Date that Contractor needs material delivered to Contractor control.

1.8 SCHEDULING

Schedule and submit concurrently, submittals covering component items forming a system or items that are interrelated. Include certifications to be submitted with the pertinent Drawings at the same time. No delay damages or time extensions will be allowed for time lost in late submittals.

a. Coordinate scheduling, sequencing, preparing and processing of submittals with performance of work so that work will not be delayed by submittal processing. Allow for potential resubmittal of requirements.

b. Submittals called for by the Contract documents will be listed on the register. If a submittal is called for but does not pertain to the Contract work, the Contractor is to include the submittal in the register and annotate it "N/A" with a brief explanation. Approval by the RPM/ROICC does not relieve the Contractor of supplying submittals required by the Contract documents but which have been omitted from the register or marked "N/A."

c. Re-submit register and annotate monthly by the Contractor with actual submission and approval dates. When all items on the register have been fully approved, no further re-submittal is required.

d. Carefully control procurement operations to ensure that each individual submittal is made on or before the Contractor scheduled submittal date shown on the approved "Submittal Register."

e. Except as specified otherwise, allow review period, beginning with receipt by approving authority, that includes at least 15 working days for submittals for QC Project Manager approval and 20 working days for submittals for RPM/ROICC approval. Period of review for submittals with RPM/ROICC approval begins when RPM/ROICC receives submittal from QC organization.

f. Period of review for each resubmittal is the same as for initial.

1.8.1 Reviewing, Certifying, Approving Authority

The PQA or QC Project Manager is responsible for reviewing and certifying that submittals are in compliance with Contract requirements. Approving authority on submittals is the PQA or QC Project Manager unless otherwise specified for specific submittal.

1.8.2 Constraints

Not used.

1.8.3 QC Organization Responsibilities

a. Note date on which submittal was received from Contractor on each submittal.

b. Review each submittal; and check and coordinate each submittal with requirements of work and Contract documents.

c. Review submittals for conformance with project design concepts and compliance with Contract documents.

d. Act on submittals, determining appropriate action based on QC organization's review of submittal.

(1) When QC Project Manager is approving authority, take appropriate action on submittal.

e. Ensure that material is clearly legible.

f. Each submittal transmittal letter must have a QC certifying statement or approving statement.

SECTION 02 41 00

DEMOLITION
November 2011

PART 1 GENERAL

1.1 REFERENCES

Not used.

1.2 PROJECT DESCRIPTION

This Section includes procedures for demolition work shown on the plans. See Section 02 41 10 for destruction of monitoring wells, probes, and boreholes.

1.2.1 Demolition/Deconstruction Plan

Not used.

1.2.2 General Requirements

Do not begin demolition or deconstruction until authorization is received from the RPM/ROICC during the preconstruction meeting. Rubbish and debris removed from the site shall be controlled by the RSOR.

1.3 ITEMS TO REMAIN IN PLACE

Take necessary precautions to avoid damage to existing items to remain in place (i.e., existing gas trenches outside of the limits of waste) or to be reused. Repair or replace damaged items as approved by the RPM/ROICC. Coordinate the work of this section with all other work indicated. Existing gas trenches outside of the limits of waste that are damaged shall be installed, repaired, and/or replaced as shown on the Drawings and as described in Sections 31 00 00, 31 05 22, and 31 21 00.

1.3.1 Weather Protection

Not used.

1.3.2 Utility Service

Not used.

1.4 BURNING

The use of burning at the project site for the disposal of refuse and debris will not be permitted.

1.5 SUBMITTALS

Submit the following in accordance with Section 01 33 00, Submittal Procedures:

SD-01 Preconstruction Submittals

RAWP which discusses Existing Conditions

1.6 QUALITY ASSURANCE

1.6.1 Dust Control

Prevent the spread of dust and avoid the creation of a nuisance or hazard in the surrounding area. See Section 01 10 00, Article 1.9 and Section 01 11 00, subparagraph 3.3.3.

1.7 PROTECTION

See Article 1.3 of this Section.

1.8 EXISTING CONDITIONS

Before beginning any demolition or deconstruction work, survey the site and examine the Drawings and Specifications to determine the extent of the Work. Photographs sized 4 inch will be acceptable as a record of existing conditions.

PART 2 PRODUCTS

2.1 FILL MATERIAL

Comply with excavating, backfilling, and compacting procedures for soils used as backfill material to fill, voids, depressions or excavations resulting from demolition or deconstruction of structures. Fill material shall be placed in conformance with Articles 3.11 TESTING and Article 3.16 FILLING AND BACKFILLING of Section 31 00 00 EARTHWORK.

PART 3 EXECUTION

3.1 EXISTING FACILITIES TO BE DEMOLISHED

Not used.

3.1.1 Landfill Gas Vents

Deconstruct existing landfill gas vents, as required. Remove and dispose of materials off-site.

3.1.2 Monitoring Well Destruction

Destruction of monitoring wells, if required, will be performed in accordance with Section 02 41 10 MONITORING WELL DESTRUCTION.

3.1.3 Chain Link Fencing

Remove chain link fencing, gates and other related salvaged items scheduled for removal and transport to designated areas. Remove gates as whole units.

3.1.4 Weir Structure

Remove weir structure from within the limits of the landfill. Remove weir structure lateral pipe as shown in the project Drawings.

-- End of Section --

SECTION 02 41 10

MONITORING WELL DESTRUCTION
November 2011

PART 1 GENERAL

1.1 REFERENCES

The publications listed below form a part of this Specification to the extent referenced. The publications are referred to within the text by the basic designation only.

U.S. ARMY CORPS OF ENGINEERS (USACE)

EM 385-1-1	(2008; Change 1-2010; Change 3-2010; Errata 1-2010) Safety and Health Requirements Manual

1.2 SUBMITTALS

SD-01 Preconstruction Submittals

Water Well Contractor’s License

PART 2 PRODUCTS

Not Used.

PART 3 EXECUTION

3.1 Monitoring Well Destruction

For destruction of groundwater monitoring wells, the Contractor must have a C-57 Water Well Contractor's License per Section 13750.5 of the California Water Code. California Water Code destruction standards are at the following website:
<http://www.water.ca.gov/groundwater/well_info_and_other/california_well_standards/wws/wws_combined_sec23.html#sec23>

Destruction must be done in compliance with the California Water Code and Alameda County Water District requirements in the County of Alameda Ordinance No. 73-68 entitled "An Ordinance to Regulate the Construction, Repair, Reconstruction, Destruction or Abandonment of Wells within the Boundaries of the County of Alameda; and Construction, Operation, or Destruction of Wells.”

Any well/probe decommissioned/destructed by the Contractor for any reason shall be decommissioned/destructed with regard to the requirements of the State of California, ASTM D 5299, and the requirements of Section 02 41 10 MONITORING WELL DESTRUCTION of these Specifications. Well/probe decommissioning/destruction includes pressure grouting of the well or probe. Maintain a well/probe decommissioning/destruction record as specified in paragraph Well/Probe Decommissioning/Destruction Records. Measure groundwater levels, if encountered before the decision is made for decommissioning/destruction, in all borings prior to backfilling. Include these water levels in the well/probe decommissioning/destruction records.

General requirements for destroying monitoring wells and exploration holes are contained in Section 23 of the Water Well Standards. Special considerations for monitoring wells and exploration holes are as follows:

(1) Preliminary Work. A monitoring well shall be investigated before it is destroyed to determine its condition and details of its construction. The well shall be sounded immediately before it is destroyed to make sure no obstructions exist that will interfere with filing and sealing.

Due to the radiological issues at the site, all boreholes and probes requiring abandonment/destruction may only be pressure grouted. No drilling is permitted in the landfill.

(2) Sealing Conditions. The following minimum requirements shall be followed when various conditions are encountered:

The monitoring well casing, and any other significant voids within the well, shall, at a minimum, be completely filled with sealing material, if the following conditions exist:

The monitoring well is located in an area of known or potential pollution or contamination, and,

Sealing material may have to be placed under pressure to ensure that the monitoring well is properly filled and sealed.

(3) Casing, filter pack, and annular seal materials shall be left in place during sealing operations based on site contamination. Sealing material may have to be applied under pressure to ensure its proper distribution.

a. Sealing and Fill Materials. Materials used for sealing exploratory borings and monitoring wells shall have low permeabilities so that the volume of water and possible pollutants and contaminants passing through them will be of minimal consequence. Sealing material shall be compatible with the chemical environment into which it is placed, and shall have mechanical properties consistent with present and future site uses.

Suitable sealing materials include neat cement, sand-cement, and bentonite, all of which are described in Section 9 of these standards. Bentonite shall not be used as a sealing material opposite zones of fractured rock, unless otherwise approved by the enforcing agency. Drilling mud or drill cuttings are not acceptable as any part of sealing material for well destruction. Concrete may be used as a sealing material at the approval of the enforcing agency.

Fill material, if any, shall meet the requirements of Section 23 of the Water Well Standards. Fill material shall be free of pollutants and contaminants and shall not be subject to decomposition or consolidation after placement. Drilling mud or cuttings with less than 50 percent moisture content are acceptable as random fill as defined in subparagraph 1.2.6 of Section 31 00 00.

3.1.1 Suggested Methods for Sealing the Annual Space and for Sealing-Off Strata

3.1.1.1 General

The use of the tremie or grout pipe for the introduction of the sealing material into the casing forcing material into annular space is preferred.

Gravity installation without a grout pipe or tremie should not be attempted when the sealing interval contains water or cannot be visually inspected (with the aid of a mirror or light). Where sealing material is to be introduced under water or the interval cannot be observed from the surface, methods involving positive placement (by a tremie or grout pipe, pumping or other application of pressure) must be used.

The sealing material must always be introduced at the bottom of the interval to be sealed. This prevents bridging (jamming) or segregation (separation of large aggregate from the mixture in sand-cement or concrete grouts) of the sealing material and eliminates gaps.

Sealing should be accomplished in one continuous operation. Where the sealing interval will exceed 100 feet in length, consideration must be given to the collapse strength of the casing. Further, because of the weight of such extensive seals, consideration must also be given to the installation of stronger retaining devices and to staging the placement of the seal (as, for example, the installation of a short segment of rapid-setting sealant in advance of the main body of sealing material; the former becomes a foundation to support the extensive seal).

3.1.1.2 Sealing Methods

The following methods can be used to seal the upper portion of the annular space. The first method is frequently used where short seals, under 20 feet deep, are placed in dry material.

Gravity Installation (Without Tremie). In this method sealing material is poured into the annular space without the use of a tremie or grout pipe. It cannot be used where the annular space contains water and is limited to intervals less than 30 feet deep. When used, visual observation (with the aid of a mirror or light) should be made during placement of the seal.

Continuous Injection. This method, called the Normal Displacement Method in the oil industry (which developed it), involves pumping grout through a tube or pipe centered in the casing. The grout is forced up into the annular space to the ground surface. The tube is detached and flushed. Because there is the possibility that coarse aggregate will jam the grout pipe, concrete cannot be used with this method.

Materials Engineering and Testing Services - California Test Methods (California Test)

California Test 217 Method of Test for Sand Equivalent

California Test 229 Method of Test for Durability Index

1.2 DEFINITIONS

1.2.1 Degree of Compaction

Degree of compaction is expressed as a percentage of the maximum density obtained by the test procedure presented in ASTM D 1557, for general soil types, abbreviated as percent laboratory maximum density.

1.2.2 Waste

Discarded materials including Portland cement concrete (PCC) and asphalt concrete (AC) rubble, equipment, municipal solid waste, green waste, and other miscellaneous waste materials that may be contained within a soil matrix.

1.2.3 Biotic Layer

This layer of the cover system provides a barrier against burrowing animals and protects the underlying material from burrowing animals. The biotic layer will consist of HDPE Geonet (See Section 31 05 20).

1.2.4 Satisfactory Materials

Satisfactory materials shall consist of soils identified in Section 2.2 Soil Materials.

1.2.5 Unsatisfactory Materials

Materials which do not comply with the requirements for the various soils listed below will be considered unsatisfactory. Soil will not be considered unsuitable based on moisture content.

1.2.6 Topsoil

Material suitable for topsoils obtained from offsite areas is defined as: Natural, friable soil representative of productive, well-drained soils in the area, free of subsoil, stumps, rocks larger than one inch diameter, brush, weeds, toxic substances, and other material detrimental to plant growth. Amend topsoil pH range to obtain a pH of 5.5 to 7.

1.2.5 Random Fill Material

Random fill material is composed of existing material onsite, from vegetative material from clearing, and borrow soil(See Section 31 11 00).

1.2.6 Select Random Fill

Select random fill is fill placed as the topmost 1 foot or less (when placed directly on the original subgrade) to form the subgrade of the 2-foot thick cover system.

1.2.7 Aggregate Base for Access Road

Aggregate base material is imported material to be placed as shown on the Drawings.

1.3 SYSTEM DESCRIPTION

It is the intent of the Drawings and these Specifications to provide for the construction of a 2-foot thick cover system which will approximate the line and grades indicated on the Drawings. The cover system includes construction of a fill layer composed of onsite or borrow soils which shall moisture conditioned, and compacted to form the foundation layer for soil cover. The topomost 1 foot, where possible, of this foundation layer will be composed by select random fill and overlain by a geonet biotic layer to form the subgrade of the 2-foot thick cover system. The biotic layer will be covered with an additional 24 inches of soil cover, consisting of an 18-inch thick layer of compacted fill and 6-inch thick layer of vegetative cover. The site will also have a gas vent system made of PVC pipe encased in a gravel trench lined with a 12-oz nonwoven geotextile as shown on the Drawings. Access roads composed of aggregate base with a 12-oz nonwoven geotextile separation layer will be above the soil cover.

When completed, the final landfill surface shall be graded such that no slope area within the landfill footprint exceeds a ratio of 2-foot horizontal to 1-foot vertical, nor shall any areas have a gradient less than 1 percent unless specifically designated or shown on the Drawings. Due to potential landfill settlement during construction, modifications of line and grades are anticipated to meet field conditions.

Modification of line and grades indicated on the Drawings, which conform to the design intent, may be recommended by the Contractor.

1.3 SUBMITTALS

SD-01 Preconstruction Submittal

Remedial Action Work Plan (RAWP), G

SD-06 Test Reports

Borrow Site Testing

Density tests

Aggregate Base Testing

SD-07 Certificates

Source Certification of Topsoil Properties

Source Certification of Vegetative Layer

Source Certification of Compacted Cover Fill

Source Certification of Select Random Fill

Source Certification of Random Fill

Source Certification of Aggregate Base Properties

Source Certification of Gravel for Gas Vent

Laboratory and field test results within 24 hours of the completion of the test. Borrow site testing results shall be obtained from the site prior to delivery of material. Copies of test reports within 5 days of completion of the test.

1.4 DELIVERY, STORAGE, AND HANDLING

Perform in a manner to prevent contamination or segregation of materials.

PART 2 PRODUCTS

2.1 WASTE

Materials which do not comply with the requirements for soil materials. Waste also includes man-made fills, trash, or refuse, as well as surficial debris collected during clearing.

2.2 SOIL MATERIALS

Soils, other than random fill material, shall be free of debris, roots, wood, scrap material, vegetation, refuse, visible organics, soft unsound particles, and deleterious, or objectionable materials.

In order to determine the properties of the borrow soil, samples shall be obtained from the potential borrow area for laboratory analysis prior to actual delivery. Samples may be obtained in several ways. No material shall be brought onsite until Borrow Site Testing results have been approved by the PQCM.

2.2.1 Compacted Cover Fill

Approved unclassified material shall be a soil or soil-rock mixture, free from clods or rock larger than 2 inches in greatest dimension, free from organic matter or other deleterious substances, and with the characteristics required to compact the soil to the density specified for the intended location. Compacted cover fill testing frequency and properties are in Table 1

.

2.2.1.1 Random Fill

Random fill shall be used below the 2-foot thick layer of compacted cover fill in the landfill area, , as fill beneath drainage control structures, and for bringing waste excavation areas to subgrade.

Random fill may contain onsite material including chipped vegetative material, concrete debris, and other construction related debris. Random fill shall meet the following requirements:

a. No particle shall exceed 12 inches in the greatest dimension.

b. Random fill testing frequency and properties are in Table 1.

2.2.1.2 Select Random Fill

Select random fill shall be placed as the topmost 1 foot or less (when placed directly on the original subgrade) of the random fill to form the subgrade of the 2-foot thick compacted cover fill.. Select random fill shall meet the following requirements:

a. No particle shall exceed 6 inches in the greatest dimension.

b. Random fill testing frequency and properties are in Table 1.

2.2.2 Vegetative Layer (6-Inch Thick)

The vegetative layer is the uppermost 6 inches of the 2-foot thick soil cover. Vegetative layer testing frequency and properties are in Table 1.

Samples of vegetative layer soils must be taken for laboratory testing to ensure conformance with Specifications for parameters such as grain size distribution, Atterberg limits, and compaction curve. Material shall be continuously visually inspected.

2.2.3 Vegetative Topsoil

Topsoil shall be placed above Turf Reinforcement Mat areas shown on the Drawings and as described in Section 31 32 11. Natural, friable soil representative of productive, well-drained soils in the area, free of subsoil, stumps, rocks larger than one inch diameter, brush, weeds, toxic substances, and other material detrimental to plant growth. Amend topsoil pH range to obtain a pH of 5.5 to 7. . Vegetative topsoil properties and testing frequency are the same as for vegetative layer in Table 1.

2.3 AGGREGATE BASE FOR ACCESS ROAD

Aggregate shall be as specified in Section 26 of the 2010 Caltrans Standard Specifications, for Class 2 aggregate, 3/4-inch maximum gradation. The Contractor shall submit a source certification of the gradation and quality including Sand Equivalent (California Test 217), and Durability Index (California Test 229).

2.4 GRAVEL FOR GAS VENT

Gravel shall conform to properties in Table 2. Gravel shall be clean, hard, sound, durable, uniform in quality, and free of any detrimental quantity of soft, friable, thin, elongated or laminated pieces, disintegrated material, organic matter, oil, alkali, or other deleterious substance.

Gravel shall be subrounded to rounded as described in ASTM D 2488.

PART 3 EXECUTION

3.1 PROTECTION

3.1.1 Drainage

Provide for the collection and disposal of surface water encountered during construction.

3.1.1.1 Drainage

So that construction operations progress successfully, adequately drain the construction site during periods of construction to keep soil materials sufficiently dry. Grade the construction area to provide positive surface water runoff away from the construction activity and/or provide temporary ditches, swales, and other drainage features and equipment as required to maintain dry soils. When unsuitable working platforms for equipment operation and unsuitable soil support for subsequent construction features develop, rework unsuitable material or area as specified herein. Excavated slopes and backfill surfaces shall be protected to prevent erosion and sloughing. Excavation shall be performed so that the site, the area immediately surrounding the site, and the area affecting operations at the site shall be continually and effectively drained. The Stormwater Pollution Prevention Plan shall address the method and timing of localized controls.

3.1.2 Underground Utilities

Not used.

3.1.3 Machinery and Equipment

Not used.

3.2 SURFACE PREPARATION

3.2.1 Clearing

Unless indicated otherwise, remove trees, stumps, logs, shrubs, brush and vegetation and other items that would interfere with construction operations within the limits of grading per Section 31 11 00 CLEARING.

3.3 EXCAVATION

Excavate to contours, elevation, and dimensions indicated. Reuse excavated materials that meet the specified requirements for the material type required at the intended location. Keep excavations free from water. Rework soil disturbed or weakened by Contractor's operations, soils softened or made unsuitable for subsequent construction due to exposure to weather. Excavations below indicated depths will not be permitted.

Refill with clean soil cover outside of the limits of waste. Refill with random fill within the limits of waste and compact to 85% minimum compaction. Where practicable without over-excavating below the existing grade, refill with 1-foot thick layer of select random fill below compacted cover fill and compact to 90% minimum compaction.

3.3.1 Monitoring

During excavation, emissions of VOCs, methane and other gases, fugitive dust, activities that could produce dust from soil containing PCBs, pesticides, and other constituents of concern, will be monitored. Proper personal protection equipment shall be used for protection of onsite workers in accordance with the approved Site Safety and Health Plan. Air quality monitoring shall be conducted in compliance with the Site Safety and Health Plan.

3.4 SUBGRADE PREPARATION

Subgrade shall consist of the existing ground surface with minimized cut areas. Surface preparation methods which break the surface including but not necessarily limited to over-excavating, scarifying, and disking shall be avoided.

Oversized material (greater than 12 inches) or other material that will prevent competent placement of soils on surfaces to receive fill or in excavated areas shall be removed and disposed in random fill or offsite.. Material shall not be placed on surfaces that are muddy.

Subgrade preparation shall be observed by a Geotechnical Engineer to observe whether any undesirable material is encountered in the construction area.

3.5 WASTE REMOVAL

The Contractor may encounter refuse during subgrade development at various designated areas of the project to establish revised slope gradients and/or to accommodate construction of various improvements. All refuse within the limits of proposed work shall be excavated and transported to an area established by the RSOR.

3.6 WASTE DEPTH VERIFICATION

Not used.

3.7 RECONSOLIDATION/SOIL RECOVERY/OPERATIONS PLAN

Not used.

3.7.1 Drainage

The Contractor shall provide for the collection and disposal of surface and subsurface water encountered during construction. Completely drain construction site during periods of construction to keep soil materials sufficiently dry. Construct storm drainage features (ponds/basins) at the earliest stages of site development, and throughout construction, grade the construction area to provide positive surface water runoff away from the construction activity or provide temporary ditches, swales, and other drainage features and equipment as required to maintain dry soils. When unsuitable working platforms for equipment operation and unsuitable soil support for subsequent construction features develop, remove unsuitable material and provide new soil material as specified herein. Drainage must be diverted away from exposed non-inert waste. Cover non-inert waste with a minimum of one foot thick cover soil to maintain separation from water and wastes. Surface water shall be controlled to avoid damage to adjoining wetlands or to finished work on the site.

3.8 GEONET AND GEOTEXTILE (GEOSYNTHETIC) SUBGRADE LAYER PREPARATION

The geosynthetic subgrade layer preparation shall consist of backfill and compaction of erosion gullies and rills, grading and placement of fill material to remove surface irregularities, placement and compaction of fill material to achieve the minimum subgrade layer thickness, and conditioning of the existing surface in preparation for receiving the cover material.

The geosynthetic subgrade shall be prepared to create a generally uniform surface, upon which the geosynthetics and protective layers can be constructed and its final thickness accurately verified. The Contractor's proposed sequencing and methods for achieving the design intent for development of the geosynthetic subgrade shall be outlined in the submitted Reconsolidation Areas/Operations Plan.

All earthwork shall conform to the following requirements, where applicable, unless otherwise noted in these Specifications:

A. Equipment used in the excavation, transport, stockpiling, processing, placement and compaction of all materials used in construction of the final cover system will be standard-of-practice grading machinery of known Specifications suitable for performing the required work in a timely and efficient manner.

B. All material considered by PQA or PCQM to be unsuitable for use in the construction of the final cover system components shall be removed. All materials incorporated as part of the compacted fill must be inspected and placement must be observed by PQA or PQCM.

C. All clearing, stripping, and site preparation for the Project shall be accomplished to the satisfaction of PQA or PCQM prior to placement of fill material.

D. Material deemed unlikely to meet the performance Specification and not disposed of during clearing of demolition shall be removed from the stockpiles, borrow and/or fill as directed by PQA or PCQM.

E. The existing cover surface to receive fill shall be prepared (cleared) to the satisfaction of the PQAE and the fill shall be placed, spread, mixed, watered, and compacted in accordance with the project Specifications.

F. The surface prepared to receive fill shall not be disturbed for existing landfill cover surface, and moisture conditioned to at least the optimum moisture content, mixed as required, and compacted to 90 percent minimum for subgrade fill surface as determined by ASTM D 6938. The compaction test shall be conducted at a frequency shown on Table 1. The prepared surface shall be firm and unyielding. Prior to fill placement, the ground surface to receive fill shall be inspected by the PQA or PCQM.

G. Irreducible rock or rock fragments in excess of three 6 inches in maximum dimension shall not be utilized for the Geosynthetic subgrade layer.

H. Suitable and sufficient processing and compaction equipment shall be on the job site to handle the amount of fill being stockpiled, processed, mixed and/or placed. If necessary, excavation or import equipment will be shut down temporarily in order to allow time for proper preparation and/or compaction of fills. Sufficient water supply apparatus will be provided with due consideration to the type of fill material, compaction characteristics, rate of placement, and time of year.

I. All materials incorporated as part of compacted fill must be inspected and placement must be observed by the PQA or PCQM.

J. Fill material shall be placed in thin horizontal lifts with a maximum uncompacted thickness not to exceed the limits shown on Table 1. Each layer shall be spread evenly and thoroughly mixed to obtain a near uniform condition in each layer. In areas of excess lift thickness, re-grading of the surface to the maximum lift thickness will be completed prior to construction of additional lifts.

K. The minimum compaction for select random fill in the final cover subgrade shall be 90 percent of the maximum dry density as determined by ASTM D 1557 and the specified moisture content is at least the optimum moisture content as determined by ASTM D 1557.

L. The cover soils shall contain sufficient fine-grained constituents such that gravel size and larger fragments do not cluster during construction.

M. At the beginning of each grading day the active fill pad will be inspected. Any previously placed soils which have moisture content below the specified minimum shall be thoroughly watered and processed in preparation for receiving additional fill. If necessary, additional moisture shall be added until the moisture content is within the limits required so as to assure an adequate bonding and compaction of all soil materials. Any previously compacted materials which are disturbed (aerated, bladed, etc.), to reduce or increase the moisture content must be recompacted to the project Specifications.

N. In the designated processing/stockpile areas, cover soils shall be processed to obtain a uniform soil condition and moisture conditioned (or dried) as necessary to at least the optimum moisture content as determined by ASTM D 1557.

O. Cover placement shall not exceed the capability of the processing operation necessary to meet the project Specifications.

P. Representative samples of fill material will be tested in the laboratory in order to determine the physical characteristics of the material. During processing and/or grading operations, no soils, or soil types, other than those previously analyzed may be used.

Q. Where tests by PQA or PCQM indicate that the moisture content or density of any layer of fill, or portion thereof, is below the Project requirements, the particular layer or portion thereof will be reworked until the required moisture/density has been attained. The moisture/density of the reworked fill will be verified by re-testing. No additional fill shall be placed over an area until the prior fill has been tested horizontally and vertically and meets the requirements of these Specifications.

R. Where work is interrupted by heavy rains, fill operations shall not be resumed until observations and field tests by PQA or PCQM indicate the moisture content and density of the in-place fills and/or materials intended for placement are within the limits previously specified. This requirement does not preclude the Contractor from disking or aerating excessively wet areas to enhance drying.

S. Throughout construction, all fill areas shall be graded to provide positive drainage to collection/transport features and to prevent ponding of water.

3.9 GEOSYNTHETIC MATERIAL SURFACE PREPARATION

3.9.1 General Requirements

Prior to placement of the geosynthetics (geonet and geotextile), the Contractor shall prepare the subgrade to provide a uniform surface, free of defects, or imperfections that may result in damage to the geosynthetic material.

The finished surface shall be free from abrupt breaks, sharp objects, or other foreign material that may inhibit placement of the geosynthetic material. All construction stakes, hubs, or other items used for grade control shall be removed and the void filled with processed material. The subgrade shall be unyielding, smooth, and uniform. The surface shall not be pebbly, or tracked and rutted by equipment. Pockets, holes, or discontinuities shall be repaired. No loose, coarse-grained material shall remain on the surface of the subgrade.

3.9.2 Subgrade Layer Tolerances

Not used.

3.10 COMPACTED SOIL COVER ABOVE GEOSYNTHETIC BIOTIC LAYER

Soil cover layer material shall be obtained from import borrow sources as approved by PQA or PQCM. Borrow materials shall be stockpiled outside the limits of waste.

Soil cover material shall be placed in a manner, and with appropriate equipment, such that damage does not occur to the underlying surface or materials. Soil shall be placed from the bottom of the slope upward. Equipment loading shall not exceed that recommended by the geosynthetic manufacturer. The uppermost six inches of the soil cover layer above the biotic layer shall be a vegetative layer material. The first lift above biotic layer shall be 10 to 12 inches in loose thickness. Subsequent lifts shall be as shown on Table 1.

The soil cover shall meet the compaction requirements shown on Table 1.

Topsoil placed above turf reinforcement mat shall be placed as specified and not compacted.

3.10.1 Soil Cover Layer Tolerances

Depth verification will be performed on an ongoing basis to verify that the minimum cover thickness is met. Areas found to be deficient in thickness by (greater than † 0.2 feet) will require regrading. Variances from a uniform plane shall not exceed † 0.20 feet vertical, measured in any direction for a horizontal distance of 20 feet. The thickness specified is a minimum; therefore a negative tolerance is not permitted.

3.11 TESTING

Perform off-site testing by a commercial testing laboratory. When test results indicate, as determined by PQA or PQCM, that compaction is not as specified, remove the material (uppermost 1 foot of the 2-foot thick soil cover above the biotic layer, vegetative layer, and fill areas in compacted subgrade), replace and recompact to meet Specification requirements. Perform tests on recompacted areas to determine conformance with Specification requirements.

3.11.1 Testing Frequency for Earthwork Materials

Table 1
Summary of Material Specification, CQA Testing and Frequency

Material (from bottom to top)	**Description**	**Material Specification**	**Testing**	**Testing Frequency**
Subgrade	Pre-existing, pre-construction grade in fill areas; cut grade in cut areas	• No material specification other than restriction on particles greater than 12 inches • The subgrade is formed by what is actually there	• No testing specified. Recompaction of the subgrade to practicable uniform compaction to the satisfaction of the CQA personnel (i.e., testing by probe penetration) • Note: Particles greater than 12 inches in largest dimension shall be removed and disposed.	
Random Fill	Variable thickness material to bring the grade to within 1 foot of the cover subgrade elevations. This layer may not exist in areas where engineered cover soil subgrade is located near the subgrade.	• Any USCS soil classification except PT, OH, and OL • Scattered debris (e.g., liner, refuse, etc.) is acceptable • Maximum particle size **12 inches**	• Manual visual procedure ASTM D2488	• Continuous inspection
		• Compact to 85% RC • Uncompacted lift thickness: 12 inches • Prevent nesting of sizes greater than 6 inches	• Maximum density and optimum moisture content (ASTM D1557)	• 1 test per week or when soil changes
			• RC per ASTM D6938 (nuke) to at least optimum moisture content	• At least 2 tests per 1,000CY or 3 tests per day
Select Random Fill	Zone of select material 1 foot thick, except in cut areas, to produce subgrade for placement of engineered cover	• Any USCS soil classification except PT, OH, and OL • No debris • Maximum particle size **6 inches**	• USCS Manual visual procedure ASTM D2488	• Continuous inspection
		• At least 90% RC • Uncompacted lift thickness: 6 to 8 inches	• Maximum density and optimum moisture content (ASTM D1557)	• 1 test per week or when soil changes
			• RC per ASTM D6938 (nuke) to at least optimum moisture content	• At least 2 tests per 1,000CY or 3 tests per day
Biotic barrier	Rodent barrier			
Compacted Cover Fill (engineered cover soil)	1.5 feet thick engineered cover material	• Any USCS soil classification except PT, OH, OL, CH, MH, GP, and GW • Maximum particle size **2 inches**	• USCS (ASTM D2487) • Atterberg Limits (ASTM D4318) • Sieve analysis (ASTM D6913)	• 1 test per 8,000 CY
			• USCS Manual visual procedure ASTM D2488	• Continuous inspection
		• At least 90% RC • First layer uncompacted thickness 10 to 12 inches; subsequent layers uncompacted lift thickness 6 to 8 inches	• Maximum density and optimum moisture content (ASTM D1557)	• 1 test per week or when soil changes
			• RC per ASTM D6938 (nuke) to at least optimum moisture content	• 4 tests per 1,000CY or 4 tests per day
Vegetative Layer and	6 inches of material supporting vegetative growth	• Any USCS soil classification except PT, OH, OL, CH, MH, SP, SW, GP and GW • Maximum particle size **1 inch**	• USCS (ASTM D2487) • Atterberg Limits (ASTM D4318) • Sieve analysis (ASTM D6913)	• 1 test per 8,000 CY
			• USCS Manual visual procedure ASTM D2488	• Continuous inspection

		• Compact to 85% RC • Uncompacted lift thickness: 6 to 8 inches	• Maximum density and optimum moisture content (ASTM D1557)	• 1 test per week or when soil changes
			• RC per ASTM D6938 to at least optimum moisture content	• 4 tests per 1,000CY or 4 tests per day
Vegetative Topsoil Layer	Soil placed above the turf reinforcement mat areas	• Any USCS soil classification except PT, OH, OL, CH, MH, SP, SW, GP and GW • Maximum particle size **1 inch** • pH 5.5 to 7	• USCS (ASTM D2487) • Atterberg Limits (ASTM D4318) • Sieve analysis (ASTM D6913) • pH (ASTM D4792)	• 1 test per 8,000 CY
		• No specified compaction required	• No specified compaction required	• No specified compaction required

After the first 5 consecutive passing laboratory tests, soils shall be weekly tested and certified by the borrow source to demonstrate compliance with the Specifications.

TABLE 2
GRAVEL FOR GAS VENT

Property	Frequency	Test Method
Particle Size (1)	1 per source	ASTM D 6913
Reactivity (2)	1 per source	ASTM C 289
Visual	Continuous	ASTM D 2488

(1) A certified sieve analysis shall be submitted. 100 percent shall pass 1/2-inch sieve, 90-100 percent shall pass 3/8-inch sieve, 30-60 percent shall pass a No. 4 sieve, and 0 to 10 percent shall pass a No. 8 sieve.
(2) Certified test results shall indicate non-reactive.

3.11.2 Testing

Perform one of each of the following tests for each material used. Provide additional tests for each source change or change in material.

3.11.2.1 Aggregate Base Testing

Source shall certify aggregate base properties tested for conformance with properties specified in Section 26 of the 2010 Caltrans Standard Specifications (see subparagraph 2.2.4 of this section).

Test aggregate base in accordance with ASTM D 1557 for determination of maximum dry density and optimum moisture at a frequency of every 10,000 cubic yards or change in material type or source. Compact aggregate layer to at least 95 percent relative compaction. The finished surface must not vary more than 0.05 foot from the grade established by the Designer of Record.

3.11.2.2 Density Tests

Test in-place density in accordance with ASTM D 6938.

Perform ASTM D 1557 density test at the start of the job, and continue as specified in Table 1. Test each lift at randomly selected locations at the frequencies shown on Table 1.

3.12 FINISHING

Finish the surface of excavations, embankments, and subgrades to a smooth and compact surface in accordance with the lines, grades, and cross sections or elevations shown. Provide the degree of finish for graded areas within 0.1 foot of the grades and elevations indicated except that the degree of finish for subgrades specified in paragraph DEVELOP GEOSYNTHETIC SUBGRADE LAYER PREPARATION. Finish ditches in a manner that will result in effective drainage. Finish the surface of areas to be turfed from settlement or washing to a smoothness suitable for the application of turfing materials.

Repair graded, topsoiled, or backfilled areas prior to acceptance of the work, and re-establish grades to the required elevations and slopes.

Final surface grades will be track walked in preparation for hydroseeding. Exposed interim surfaces shall be track walked during construction as needed for erosion control.

3.13 PLACING VEGETATIVE TOPSOIL ABOVE EROSION CONTROL BLANKET

Spread topsoil evenly, as described in Specification Section 31 32 11, section 3.3.11.1, on areas covered with turf reinforcement mat as shown on plans. Obtain material required for topsoil from offsite areas. Topsoil shall be spread out using approved placement equipment. On slopes, topsoil shall be placed from the bottom of the slope upward. See Section 31 32 11 SOIL SURFACE EROSION CONTROL for placement in erosion control blanket areas shown on plans as "turf reinforcement mat."

3.13.1 Construction Tolerances

Finished surfaces shall be uniformly graded, meet the minimum and maximum grades, and shall be free from depressions, mounds, or windrows. The top surface of the select fill layer and topsoil layer may be no greater than the lines and grades shown on the Drawings. No minus tolerance will be permitted. Rigid grade stakes shall not be driven into the select fill layer to control placement.

3.13.2 Protection

3.13.2.1 Damage

Erosion rills or other damage that occurs shall be repaired and grades re-established. Repairs to the select fill layer or topsoil layer shall be documented including location and volume of soil affected, corrective action taken, and results of retests.

3.13.2.2 Stockpiles

Storage or stockpiling of material on the completed surface of the select fill or topsoil layers will not be permitted.

3.14 ACCESS ROADS

Access roads shall be constructed above the final cover layer as shown on the Drawings.

3.15 DISPOSITION OF MATERIAL

Dispose of material not suitable for landfill cover system construction resulting from demolition operations with all applicable federal, state, and local regulations as contractually specified in the Waste Management Plan.

3.16 FILLING AND BACKFILLING

Fill and backfill to contours, elevations, and dimensions indicated. Compact each lift before placing overlaying lift. Compact areas not accessible to rollers or compactors with mechanical hand tampers. Aerate material excessively moistened by rain or with naturally high moisture content to a satisfactory moisture content. If moisture content is less than specified, water and thoroughly mix soil to maintain a satisfactory water content capable of obtaining the required compaction. Finish to a smooth surface by blading, rolling with a smooth roller, or both.

3.16.1 Compacted Soil Placement

Provide for general site. Place in lifts and compact as shown on Table 1.

3.16.3 Aggregate Base Placement

Place in one 6 inch lift over access road and compact as specified.

3.16.4 Placement of Gravel for Gas Vent

Gravel for gas vent piping shall be placed to the dimensions and/or quantity indicated on the Drawings. Care shall be exercised so as not to contaminate the gravel during the placement operations.

The gravel shall be placed to a tolerance of minus 0.00 feet to plus 0.20 feet.

3.17 SETTLEMENT MONITORING MONUMENTS

Following completion of the vegetative topsoil cover, and prior to revegetation, settlement monitoring monuments shall be installed as shown on the project Drawings. Following installation of the monuments, the location and elevation shall be surveyed and noted on the as-built Drawings.

3.18 COMPACTION

Compaction shall be as shown on Table 1.

3.18.1 General Site

Compact underneath storm drainage facilities including earthen swales, V-ditches, trapezoidal channels, rip-rap structures, and other improvement areas as required for Compacted Cover Fill in Table 1 .

3.18.2 Compaction for Existing Subgrade

Where the existing surface is the subgrade for the 2-foot thick soil cover, the existing surface shall be compacted to the degree practicable and to the satisfaction of CQA personnel .

3.18.3 Compaction for Subgrade Fill

The subgrade for the 2-foot thick soil cover shall consist of select random fill, unless the existing surface is the subgrade for the soil cover as described above.

Select random fill shall be placed a minimum of 12-inches thick over random fill. Compact select random fill as shown on Table 1.

3.18.4 Cover Soil and Vegetative Layer

Compact cover soil and vegetative layer as shown on Table 1.

3.18.5 Aggregate Base

Compact minimum 6 inch thick aggregate base to 95 percent of the maximum dry density based on ASTM D 1557.

3.19 FINISH OPERATIONS

3.19.1 Grading

All areas, including filled sections and adjacent transition areas, shall be uniformly smooth graded. The completed surface shall be reasonably smooth, and free from irregular surface changes. Finish grades as indicated within one-tenth of one foot of the grades shown on the project Drawings. All areas shall be graded to drain. Maintain areas free of trash and debris. For existing grades that will remain but which were disturbed by Contractor's operations, grade as directed.

Final surface grades will be track walked in preparation for hydroseeding. Exposed interim surfaces shall be track walked during construction as needed for erosion control.

3.19.2 Protection of Surfaces

Protect newly backfilled and graded areas from traffic, erosion, and settlements that may occur. Repair or reestablish damaged grades, elevations, or slopes. Localized changes to site grades from settlement shall be maintained by additional grading, placement of small quantities of fill, and clearing of drainage pathways (Draft Final Geotechnical Investigation Report Installation Restoration Site 2, October 2012).

See Article 3.3 of Section 31 05 20 for filling above geonet.

3.20 DISPOSITION OF SURPLUS MATERIAL

The Contractor shall remove from the project site and dispose, in accordance with the Waste Management Plan and Radiological Protection Plan, surplus or other soil material not required or suitable for filling or backfilling, and brush, refuse, stumps, roots, and timber.

-- End of Section --

SECTION 31 05 20

GEOSYNTHETIC (BIOTIC) LAYER
08/08

PART 1 GENERAL

1.1 SUMMARY

Geosynthetic HDPE geonet material will serve as a biotic layer to prevent small burrowing animals from penetrating the cover.

1.2 REFERENCES

The publications listed below form a part of this Specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM D 1238	(2010) Standard Test Method for Melt Flow Rates of Thermoplastics by Extrusion Plastometer
ASTM D 1505	(2010) Standard Test Method for Density of Plastics by the Density-Gradient Technique
ASTM D 1603	(2006) Standard Test Method for Carbon Black Content in Olefin Plastics
ASTM D 4218	(1996; R 2008) Standard Test Method for Determination of Carbon Black Content in Polyethylene Compounds by the Muffle-Furnace Technique
ASTM D 4716	(2008) Standard Test Method for Determining the (In-Plane) Flow Rate Per Unit Width and Hydraulic Transmissivity of a Geosynthetic Using a Constant Head
ASTM D 5035	(2006; R 2008e1) Standard Test Method for Breaking Force and Elongation of Textile Fabrics (Strip Method)
ASTM D 5199	(2011) Standard Test Method for Measuring Nominal Thickness of Geosynthetics

1.3 SUBMITTALS

Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Sampling and Testing

Manufacturer's quality control manual.

SD-06 Test Reports

Geosynthetic Biotic Layer

Manufacturer's quality control test results.

1.4 QUALITY ASSURANCE

Not used.

1.5 DELIVERY, STORAGE, AND HANDLING

Ensure the biotic layer material has not been damaged during shipping, storage, or handling. Any biotic layer material found to be damaged shall be repaired or replaced. Accept delivery of material only after the required submittals have been approved. Each roll shall be labeled with the manufacturer's name, product identification, lot number, roll number, and roll dimensions.

PART 2 PRODUCTS

2.1 GEOSYNTHETIC BIOTIC LAYER

The biotic layer shall be Skaps Transnet HDPE Geonet TN 220 or approved equal. The polymer used to manufacture the geonet shall be polyethylene which is clean and free of any foreign contaminants. Regrind material which consists of edge trimmings and other scraps may be used to manufacture the geonet; however, post-consumer recycled materials shall not be used. The geosynthetic biotic layer shall conform to the property requirements listed in Table 1. Where applicable, Table 1 property values represent minimum average roll values (MARV). .

TABLE 1 - GEOSYNTHETIC BIOTIC LAYER (GEONET) PROPERTIES

PROPERTY	TEST METHOD	TEST VALUE	MINIMUM MQC TESTING FREQUENCY
Thickness, range	ASTM D 5199	220±20 mil	100,000 SF
Polymer Density, minimum	ASTM D 1505	0.940 g/cc	100,000 SF
Carbon Black Content, range	ASTM D 1603 ASTM D 4218	2-3 percent	100,000 SF
Tensile Strength, minimum, Note 1	ASTM D 5035	45 lbs/in	100,000 SF
Melt Flow, maximum, Note 2	ASTM D 1238	1 g/cm^3	100,000 SF

Note 1: MARV is statistically defined as mean minus two standard deviations and it is the value which is exceeded by 97.5 percent of all the test data.
Note 2: Condition 190/2.16.

2.2 SAMPLING AND TESTING

2.2.1 Manufacturing Quality Control Testing

Manufacturing quality control test methods and frequencies shall be in accordance with Table 1 unless otherwise approved.

2.2.2 Conformance Testing

Not used.

PART 3 EXECUTION

3.1 INSTALLATION

Install under continuous observation of a qualified geosynthetics CQC.

3.1.1 Surface Preparation

Prior to placement of the geosynthetic biotic layer, the subgrade shall be smooth and free of all materials which could damage the biotic layer.

3.1.2 Placement

The geosynthetic biotic layer shall not be damaged during placement. One (1) inch is the maximum rut depth allowed. On side slopes, geotextiles shall be anchored at the top and then unrolled in the direction of maximum slope, keeping the net flat against the subgrade to minimize wrinkles and folds.

After placement, the material shall be examined to ensure that no potentially harmful objects are present.

3.1.3 Seams and Overlaps

3.1.3.1 Geonet Side Seams

Overlap geonet side seams a minimum of 12 inches on surfaces flatter than 5 horizontal to 1 vertical.

On slopes 5 horizontal to 1 vertical or steeper, side seam fastener spacing shall be a maximum of 5 feet with overlapped geonet if required to maintain overlap.

Adjoining rolls across the roll width should be shingled down in the direction of the slope and joined together with cable ties spaced every foot along the roll width if required to maintain overlap.

3.1.3.2 Geonet End Seams

Overlap geonet end seams a minimum of 1 foot. End seam fastener spacing shall be a maximum of 1 foot on slopes 5 horizontal to 1 vertical or steeper if required to maintain overlap.

3.1.3.3 Geonet Fasteners

Tie geonet rolls together with plastic fasteners. The fasteners shall be a contrasting color from the geonet and attached geotextiles. Metallic fasteners will not be allowed.

3.2 REPAIRS

3.2.1 Geonet Damage

Prior to covering the deployed geonet, each roll shall be inspected for damage resulting from construction.

Any rips, tears or damaged areas on the deployed geonet shall be patched. The patch shall be secured to the original geonet by tying every 12 inches with the approved tying devices.

Make repairs by placing a patch of the geosynthetic biotic layer over the damaged area. Extend the patch a minimum of 1 foot beyond the edge of the damage. Use approved fasteners, if necessary, spaced every 6 inches around the patch, to hold the patch in place.

3.3 PROTECTION AND BACKFILLING

The geonet shall be continually inspected by the CQC during soil cover.

Soil cover shall be placed so that it does not shift the geonet from its intended position and underlying materials are not exposed or damaged. Place cover soil from the bottom of the slope upward (for slopes of 5 horizontal to 1 vertical or greater) and shall not be dropped directly onto the biotic layer from a height greater than 3 feet. No equipment shall be operated directly on the top surface of the geosynthetic biotic layer without permission from the PQAE. The initial loose soil lift thickness shall be 12 inches. Use equipment with ground pressures no greater than 7 psi to place the first lift of soil. Cover soil compaction and testing requirements are described in Section 31 00 00 EARTHWORK.

-- End of Section --

SECTION 31 05 22

GEOTEXTILES USED AS FILTERS

08/08

PART 1 GENERAL

1.1 SUMMARY

This Specification is for a 12 ounce per square yard (oz/sy) non-woven geotextile separation layer to line the aggregate base access road and newly installed gas vent trenches.

1.2 REFERENCES

The publications listed below form a part of this Specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM D 4354	(1999; R 2009) Standard Practice for Sampling of Geosynthetics for Testing
ASTM D 4355	(2007) Standard Test Method for Deterioration of Geotextiles by Exposure to Light, Moisture and Heat in a Xenon Arc Type Apparatus
ASTM D 4491	(1999a; R 2009) Standard Test Methods for Water Permeability of Geotextiles by Permittivity
ASTM D 4533	(2004; R 2009) Standard Test Method for Trapezoid Tearing Strength of Geotextiles
ASTM D 4632	(2008) Standard Test Method for Grab Breaking Load and Elongation of Geotextiles
ASTM D 4751	(2004) Standard Test Method for Determining Apparent Opening Size of a Geotextile
ASTM D 4759	(2011) Standard Practice for Determining the Specification Conformance of Geosynthetics
ASTM D 4873	(2002; R 2009) Standard Guide for Identification, Storage, and Handling of Geosynthetic Rolls and Samples
ASTM D 6241	(2004; R2009) Standard Test Method for the Static Puncture Strength of Geotextiles and Geotextile-Related Products Using a 50-mm Probe

1.3 DEFINITIONS

a. Formulation: The mixture of a unique combination of ingredients identified by type, properties and quantity. For geotextiles, a formulation is defined as the exact percentages and types of resin(s), additives and/or carbon black.

b. Manufacturing Quality Control (MQC): A planned system of inspections that is used to directly monitor and control the manufacture of a material which is factory originated. MQC is normally performed by the manufacturer of geosynthetic materials and is necessary to ensure minimum (or maximum) specified values in the manufactured product. MQC refers to measures taken by the manufacturer to determine compliance with the requirements for materials and workmanship as stated in certification documents and Contract Specifications [ref. EPA/600/R-93/182].

c. Minimum Average Roll Value (MARV): For geosynthetics, a manufacturing quality control tool used to allow manufacturers to establish published values such that the user/purchaser will have a 97.7% confidence that the property in question will meet published values. For normally distributed data, "MARV" is calculated as the typical value minus two (2) standard deviations from documented quality control test results for a defined population from one specific test method associated with one specific property.

d. Minimum Value: The lowest sample value from documented manufacturing quality control test results for a defined population from one test method associated with one specific property.

e. Maximum Value: The highest sample value from documented manufacturing quality control test results for a defined population from one test method associated with one specific property.

f. Separation: The placement of a flexible porous geosynthetic between dissimilar materials so the integrity and functioning of both materials can remain intact or be improved. For separation of stone base courses overlying soil subgrades this primary function simultaneously prevents the stone from intruding down into the soil and the soil from pumping up into the stone.

1.4 SUBMITTALS

SD-03 Product Data

Manufacturing Quality Control Sampling and Testing

SD-07 Certificates

Geotextile

Prior to scheduled use, manufacturer's certificate of compliance stating that the geotextile meets the requirements of this section.

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver, store, and handle geotextile in accordance with ASTM D 4873. No hooks, tongs, or other sharp instruments shall be used for handling geotextile.

1.5.1 Delivery

Notify the PQA a minimum of 24 hours prior to delivery and unloading of geotextile rolls packaged in an opaque, waterproof, protective plastic wrapping. The plastic wrapping shall not be removed until deployment. If quality assurance samples are collected, immediately rewrap rolls with the plastic wrapping. Geotextile or plastic wrapping damaged during storage or handling shall be repaired or replaced, as directed. Label each roll with the manufacturer's name, geotextile type, roll number, roll dimensions (length, width, gross weight), and date manufactured.

1.5.2 Storage

Geotextile labeling, shipment, and storage shall follow ASTM D 4873. Product labels shall clearly show the manufacturer or supplier name, style, and roll number. Each shipping document shall include a notation certifying that the material is in accordance with the manufacturer’s certificate.

Each geotextile roll shall be wrapped with a material that will protect the geotextile, including the ends of the roll, from damage due to shipment, water, sunlight and contaminants. The protective wrapping shall be maintained during periods of shipment and storage. Geotextile may be exposed for a maximum period of 15 days.

During storage, geotextile rolls shall be elevated off the ground and adequately covered to protect them from the following: site construction damage, precipitation, extended ultraviolet radiation including sunlight, chemicals that are strong acids or strong bases, flames including welding sparks, temperatures in excess of 160°F (71°C), and any other environmental condition that may damage the property values of the geotextile.

1.5.3 Handling

Handle and unload geotextile rolls with load carrying straps, a fork lift with a stinger bar, or an axial bar assembly. Rolls shall not be dragged along the ground, lifted by one end, or dropped to the ground.

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Geotextile

Provide geotextile that is a non-woven matching or exceeding the minimum average roll values listed in TABLE 1.

TABLE 1
MINIMUM PHYSICAL REQUIREMENTS FOR SEPARATION GEOTEXTILE

PROPERTY (1)	UNITS	ACCEPTABLE VALUES	TEST METHOD
WEIGHT	OZ/SY	12	ASTM D 5261
GRAB STRENGTH	LBS	203	ASTM D 4632
CBR PUNCTURE	LBS	440	ASTM D 6241
TRAPEZOID TEAR	LBS	79	ASTM D 4533
APPARENT OPENING SIZE	INCHES	0.024	ASTM D 4751
PERMITTIVITY	SEC -1	0.02	ASTM D 4491
ULTRAVIOLET STABILITY (2)	PERCENT	50 AT 500 HRS	ASTM D 4355

(1) All values are minimum average roll values (MARV) except AOS which is a maximum average roll value (MaxARV) and UV stability which is a minimum average value.
(2) Evaluation to be on 50 mm strip tensile specimens after 500 hours exposure.

2.1.1.2 Geotextile Fiber

Fibers used in the manufacturing of the geotextile shall consist of a long-chain synthetic polymer composed of at least 85 percent by weight of polyolefins, polyesters, or polamides. Add stabilizers and/or inhibitors to the base polymer, if necessary to make the filaments resistant to deterioration caused by ultraviolet light and heat exposure. Reclaimed or recycled fibers or polymer shall not be added to the formulation. Geotextile shall be formed into a network such that the filaments or yarns retain dimensional stability relative to each other, including the edges. Finish the edges of the geotextile to prevent the outer fiber from pulling away from the geotextile.

2.1.1.3 Workmanship and Appearance

The finished geotextile shall have good appearance qualities. It shall be free from such defects that would affect the specific properties of the geotextile, or its proper functioning. General manufacturing procedures shall be performed in accordance with the manufacturer’s internal quality control guide and/or documents.

2.2 MANUFACTURING QUALITY CONTROL SAMPLING AND TESTING

The Manufacturer is responsible for establishing and maintaining a quality control program to assure compliance with the requirements of the Specification. Documentation describing the quality control program shall be made available upon request. Perform manufacturing quality control sampling and testing in accordance with the manufacturer's approved quality control manual. As a minimum, geotextiles shall be randomly sampled for testing in accordance with ASTM D 4354, Procedure A. Acceptance of geotextile shall be in accordance with ASTM D 4759. Tests not meeting the specified requirements will result in the rejection of applicable rolls.

2.2.1 Certification

The Contractor shall provide to the CQA, a certificate stating the name of the manufacturer, product name, style number, chemical composition of the filaments or yarns, and other pertinent information to fully describe the geotextile.

The manufacturer is responsible for establishing and maintaining a quality control program to assure compliance with the requirements of the Specification.

Documentation describing the quality control program shall be made available upon request.

The manufacturer's certificate shall state that the finished geotextile meets the requirements of the Specification as evaluated under the manufacturer's quality control program. A person having legal authority to bind the manufacturer shall attest to the certificate.

Either mislabeling or misrepresentation of materials shall be reason to reject those geotextile products.

PART 3 EXECUTION

3.1 SURFACE PREPARATION

Subgrade materials and compaction requirements shall be in accordance with Section 31 00 00. Prepare surface, on which the geotextile will be placed, to a relatively smooth surface condition in accordance with the applicable portion of this Specification and shall be free from obstruction, sharp stones, debris, depressions, erosion feature, or vegetation. Remove any irregularities so as to ensure continuous, intimate contact of the geotextile with all the surface. Any loose material, soft or low density pockets of material, shall be removed; erosion features such as rills, gullies, etc., shall be graded out of the surface before geotextile placement.

3.2 INSTALLATION OF THE GEOTEXTILE

3.2.1 General

Geotextile rolls which are damaged or contain imperfections shall be repaired or replaced as directed. The geotextile shall be laid flat and smooth so that it is in direct contact with the subgrade. The geotextile shall also be free of tensile stresses, folds, and wrinkles. On slopes steeper than 10 horizontal on 1 vertical, lay the geotextile with the machine direction of the fabric parallel to the slope direction. Place the geotextile in the manner and at the locations shown. At the time of installation, reject the geotextile if it has defects, rips, holes, flaws, deterioration or damage incurred during manufacture, transportation or storage.

3.2.1.1 Placement

Place the geotextile with the long dimension parallel to the centerline of trench and laid smooth and free of tension, stress, folds, wrinkles, or creases. Place the strips to provide a minimum width of 12 inches of overlap for each joint. Adjust the actual length of the geotextile used based on initial installation experience. Remove the temporary anchoring as the aggregate material (specified in Section 31 00 00) is placed to relieve high tensile stress which may occur during placement of material on the geotextile. Perform trimming in such a manner that the geotextile is not damaged in any way.

3.3 PROTECTION

Protect the geotextile at all times during construction from contamination by surface runoff; remove any geotextile so contaminated and replaced with uncontaminated geotextile. Replace any geotextile damaged during its installation or during placement of aggregate base. Protect the geotextile from damage prior to and during the placement of riprap or other materials. This may be accomplished by limiting the height of drop to less than 1 foot, by placing a cushioning layer of sand or gravel on top of the geotextile before placing the material, or other methods deemed necessary. Care should be taken to ensure that the utilized cushioning materials will not impede the flow of water. Before placement of aggregate base, demonstrate that the placement technique will not cause damage to the geotextile. In no case shall any type of equipment be allowed on the unprotected geotextile.

3.4 REPAIRS

Repair torn or damaged geotextile. Clogged areas of geotextile shall be removed. Perform repairs by placing a patch of the same type of geotextile over the damaged area. The patch shall extend a minimum of 12 inches beyond the edge of the damaged area. Patches shall be continuously fastened using approved methods. The machine direction of the patch shall be aligned with the machine direction of the geotextile being repaired. Remove and replace geotextile rolls which cannot be repaired.

-- End of Section --

SECTION 31 11 00

CLEARING
November 2011

PART 1 GENERAL

1.1 SUMMARY OF WORK

Work includes:
a. Clear site vegetation to ground surface.
b. Remove designated trees to soil line.
c. Produce and stockpile onsite mulch derived from cleared vegetation and trees.

PART 2 PRODUCTS

Not used.

PART 3 EXECUTION

3.1 PROTECTION

3.1.1 Roads and Walks

Keep roads and walks free of dirt and debris at all times.

3.1.2 Trees, Shrubs, and Existing Facilities

Protection shall be in accordance with the Environmental Protection Plan. Trees and vegetation to be left standing shall be protected from damage incidental to clearing, grubbing, and construction operations by the erection of barriers or by such other means as the circumstances require.

3.1.3 Utility Lines

Not used.

3.1.4 Species and Habitat

The Contractor is to implement substantive provisions of California Fish and Game Code 3511 and 2080. "Prior to any site clearing or excavation during the breeding season (March 1 through September 30), a TetraTech biologist will survey the area to determine the presence of migratory birds and to locate any active nests. The survey will be performed within 72 hours of the start of any ground-disturbance activities. If nests are found, the birds will be allowed to fledge before excavation. If this is not possible, the eggs/chicks will be taken to a licensed wildlife rehabilitator for captive rearing. The Navy will consult with the US Fish and Wildlife. Approval from the US Fish and Wildlife is not required before proceeding with CERCLA remedy" (August 2011, KCH, Intermediate Draft Remedial Design Report Installation Restoration Site 2, Page 5-2).

3.2 CLEARING

Clearing shall consist of the felling, trimming, and cutting of trees into sections and the satisfactory disposal of the trees and other vegetation designated for removal, including downed timber, snags, brush, and rubbish occurring within the areas to be cleared. Clearing shall also include the removal and disposal of structures that obtrude, encroach upon, or otherwise obstruct the work. Trees, stumps, roots, brush, and other vegetation in areas to be cleared shall be cut off flush with the original ground surface, except such trees and vegetation as may be indicated or directed to be left standing.

3.3 GRUBBING

Due to radiological concerns, activities that may expose radiological materials are prohibited.

3.4 MULCHING

Cleared vegetation shall be passed through a tub grinder or equivalent process. The resulting debris shall be a mulch that can be placed two feet below the final cover subgrade (See Section 31 00 00).

3.5 DISPOSAL OF MATERIALS

Remove from the project site and dispose, in accordance with the Waste Management Plan, Radiological Work Plan, and Radiological Protection Plan of timber, scrub, vegetation, and debris which cannot be utilized as mulch material. Burning will not be permitted.

1.2 SYSTEM DESCRIPTION

The off-gas piping system shall consist of buried PVC pipe, pipe supports, fittings, equipment and accessories.

1.4 SUBMITTALS

SD-03 Product Data

Material Safety Data Sheet

Material safety data sheet in conformance with ANSI Z400.1/Z129.1 for solvents, solvent cements, or glues used in pipe connections.

1.5 QUALITY ASSURANCE

1.5.1 Contractor Qualifications

Not used.

1.5.2 Single Source Supplier

Not used.

1.6 DELIVERY, STORAGE, AND HANDLING

1.6.1 Packaging

Plastic pipe shall be packed, packaged and marked in accordance with ASTM D 3892.

1.6.3 Storage

Pipe and fittings shall be handled and stored in accordance with the manufacturer's recommendations. Piping bundles shall be stored on a prepared surface and should not be stacked more than two bundles high.

1.7 SEQUENCING AND SCHEDULING

Not used.

1.8 EXTRA MATERIALS

Not used.

1.9 MAINTENANCE SERVICE

Not used.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

Provide materials and equipment that are new and unused.

2.1.1 Standard Products

Provide material and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of the products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Pipe, valves, fittings and appurtenances shall be supported by a service organization.

2.1.2 Identification

Each piece of pipe shall bear the ASTM designation and the ASTM markings required for that designation. Each valve shall be marked in accordance with MSS SP-25 to identify the manufacturer, size, pressure rating, body disc and seat material. Securely attach a tag with the manufacturer's name, catalog number and valve identification.

2.2 DESIGN STRENGTH

Pipe shall have an SDR value of 17.

2.3 STEEL PIPE

Not used.

2.4 COPPER TUBING

Not used.

2.5 POLYVINYL CHLORIDE (PVC) PIPING

Design and fabrication of below grade components of the off-gas piping system shall be in accordance with ASTM D 2513 except as modified herein.

2.5.1 PVC Pipe

Pipe shall be in accordance with ASTM F 442/F 442M, ASTM D 2241, SDR 17. Materials shall conform to ASTM D 3915, ASTM D 1784, Type IV, Grade 1, rigid (23447-B). The maximum eccentricity of the inside and outside circumferences of the pipe walls shall be 12 percent. Pipe shall be provided which does not fail, balloon, burst, or weep as defined in ASTM D 1598.

2.5.2 PVC Joints

Joints shall be pressure rated solvent cemented bell joints in accordance with ASTM D 2672 except where flanged or threaded fittings are required at expansion joints, valves, flowmeter, equipment connections or otherwise shown. Flanges shall be joined to pipe by solvent cementing. Primer shall conform to ASTM F 656. Solvent cement shall conform to ASTM D 2564.

2.5.3 PVC Fittings

Fittings shall be in accordance with ASTM D 2467.

2.6 HIGH DENSITY POLYETHYLENE (HDPE) PIPING

Not used.

2.7 REINFORCED EPOXY RESIN PIPING

Not used.

2.8 DUCT SYSTEMS

Not used.

2.9 FLANGED CONNECTIONS

Not used.

2.10 EQUIPMENT AND APPURTENANCES

Not used.

2.11 FACTORY TESTS

Not used.

PART 3 EXECUTION

3.1 EXAMINATION

Not used.

3.2 MANUFACTURER'S REPRESENTATIVE

Not used.

3.3 CONDENSATE CONTROL

Not Used

3.4 PRESSURE REGULATOR AND METER INSTALLATION

3.4.1 Vents

Locate discharge stacks, vents, or outlet ports as shown on Drawings.

3.5 INSTALLING PIPE UNDERGROUND

Installation shall conform to the lines, grades, details, and notes shown on the Drawings, and as referenced in these Specifications.

3.5.1 Excavation

Excavation of the existing subgrade for the gas vent shall be performed prior to placement of the gravel. The Contractor shall survey the location of the gas vent to ensure that the gravel bedding is as reflected on the Drawings.

Placement of the gravel material will not be allowed until the survey information has been submitted to the CQC.

3.5.2 Pipe Installation

Pipe shall be placed on a 2-inch thick bedding layer composed of approved gravel with the slots positioned as indicated on the Drawings.

All pipe shall be installed in a manner so as to provide for expansion and contraction as recommended by the manufacturer. The pipe shall lay free on the base with no induced strain. Where there is evidence of induced pipe strain, the Contractor shall be required to eliminate the strain. The Contractor shall also remove and replace any fitting which induces a torque or strain to the pipe.

All pipe shall be cut, in a manner so as to ensure square ends. Burrs at cut ends shall be removed prior to installation so that a smooth unobstructed flow will be obtained.

Installation of fittings and joints shall conform to manufacturer's recommendations.

Slotted pipe may be joined with compatible couplings secured with round head self-tapping screws, flexible band seal couplings. Joints for solid riser pipe shall be joined as recommended by the manufacturer. All caps shall be solvent welded unless otherwise indicated on the Drawings.

The pipe shall not be concealed until a final record survey has been completed and the CQC has approved the pipe installation.

Pipe and fittings shall be held firmly in position and protected from damage while drainage gravel or backfill is being placed. All pipe and fittings shall be clean upon installation and kept so during the progress of the work.

Any pipe that becomes either partially or fully clogged and/or damaged before final acceptance shall be cleaned/repaired to the satisfaction of the PQA and/or replaced.

3.5.3 Magnetic Tape

Not used.

3.5.4 Pipe Coatings

Not used.

3.6 INSTALLING PIPE ABOVEGROUND

Existing above-ground vent risers will be left in place, if possible; otherwise they will be replaced using same alignment following cover construction. Anti-perch devices will be installed on all risers.

3.7 JOINTING PIPE

Not used.

3.8 CONNECTIONS

Not used.

3.9 PRESSURE AND LEAKAGE TESTS

Not used.

1.3 SYSTEM DESCRIPTION

The work consists of furnishing and installing soil surface erosion control materials, including fine grading, blanketing, stapling, mulching and miscellaneous related work, within project limits and in areas outside the project limits where the soil surface is disturbed from work under this Contract at the designated locations. This work includes all necessary materials, labor, supervision and equipment for installation of a complete system. Coordinate this section with the requirements of Section 31 00 00 EARTHWORK.

1.3.1 Definitions

a. Minimum Average Roll Value (MARV): Property value calculated as typical minus two standard deviations. Statistically, it yields a 97.7 percent degree of confidence that any sample taken during quality assurance testing will exceed value reported.

b. Typical Roll Value: Property value calculated from average or mean obtained from test data.

c. Rolled Erosion Control Product (RECP) - A temporary degradable or long-term non-degradable material manufactured or fabricated into rolls designed to reduce soil erosion and assist in the growth, establishment and protection of vegetation.

d. Turf Reinforcement Mat (TRM) - A long-term, non-degradable RECP composed of UV-stabilized, non-degradable, synthetic fibers, nettings and/or filaments processed into three-dimensional reinforcement matrices designed for permanent and critical hydraulic applications where design discharges exert velocities and shear stresses that exceed the limits of mature natural vegetation. TRMs provide sufficient thickness, strength and void space to permit soil filling and/or retention and the development of vegetation within the matrix.

1.4 SUBMITTALS

Approval is required for all submittals. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Erosion Control Blanket

Hydroseed

Hydromulch

Fiber Rolls

Silt Fence

SD-07 Certificates

Seed Mixes
State certification and approval for seed.

Erosion Control Blanket Certification

Prior to delivery of materials, certificates of compliance attesting that materials meet the specified requirements. Certified copies of the material certificates shall include the following.

For items listed in this section:

a. Certification of origin including the name, address and telephone number of manufacturer.

1.5 REGULATORY REQUIREMENTS

According to page 21 of the Record of Decision (ROD), "CERCLA §121(d)(1) and NCP §300.430(f)(1)(ii)(B) require that remedial actions at CERCLA sites at least attain legally applicable or relevant and appropriate federal and state requirements, standards, criteria, and limitations with are collectively referred to as ARARs, unless such ARARs are waiver under 121(d)(4) of §CERCLA."

1.5.1 State ARARs for State and Regional Water Quality Control Boards

Water Quality Control Plan for the San Francisco Bay Basin Chapters 2 and 3 (California Water Code 13240), except for municipal beneficial use designation, describes water quality objectives including narrative and numerical standards, and incorporates statewide water quality control plans and policies. The beneficial uses for the East Bay subbasin are agricultural supply, industrial service supply and industrial process supply. These also apply to the shallow groundwater system at Alameda Point. The narrative standard requiring that all waters be maintained free of toxic substances in concentrations that are lethal to or that produce other harmful responses in aquatic organisms, and that there shall be no acute toxicity or chronic toxicity in ambient waters is an ARAR for groundwater.

The Navy accepts the substantive provisions of 13241, 13243, 13262(a), 13269, and 13360 of the Porter-Cologne Act enabling legislation, as implemented through the beneficial uses, Water Quality Orders, waste discharge requirements, and promulgated policies of the Basin Plan for the San Francisco Bay Region.

SWRCB Resolution 88-63 (Sources of Drinking Water Policy) designates all groundwater and surface waters of the state as drinking water except where the total dissolved solids exceed 3,000 milligrams per liter, and it is not reasonably expected by the Water Board to supply a public water system.

The project has been designed to minimize/eliminate any potential impact on local wetlands areas. The substantive provisions of the following are accepted as ARARs for implementing California Toxics Rule and National Toxics Rule and for point source discharge of groundwater to surface water that may be necessary: Policy for Implementation of Toxic Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (Inland Surface Waters Plan) (SWRCB 2000a), Sections 1.3 and 1.4.

1.5.2 Federal ARARs for Clean Water Act

The substantive numeric standards in the California Toxics Rule (40 CFR 131.38) and National Toxics Rule (40 CFR 131.36(b)) are ARARs for surface water and will be met in the surface water offshore of IR Site 2R, at the interface of the groundwater and the Bay.

1.5.3 State ARARs for California Endangered Species Act, California Fish and Game Code

Substantive provisions of California Fish and Game Code 5650(a), (b), and (f) are relevant and appropriate. Any removal action taking place in an area that may impact waters of the state will be conducted in such a way as to ensure that materials dug up will not be released into the waters of the state. Action must be taken if toxic materials are placed where they can enter waters of the state.

Within the San Francisco Bay Coastal Zone (activities affecting the San Francisco Bay and 100 feet landward of the shoreline) construction will be conducted to reduce fill and disposal of dredged material in the San Francisco Bay, maintain marches and mudflats to the fullest extent possible to conserve wildlife, abate pollution, and protect the beneficial uses of the bay. Construction shall be conducted in accordance with the substantive provisions of the Coastal Zone Management Act and San Francisco Bay Plan (an approved state management program).

1.5.4 Dewatering

Substantive provisions of Title 33 of the United States Code, Chapter 26, Section 1311(b)(2) and Clean Water Act 301(b) are applicable for point source discharges of groundwater to surface water in San Francisco Bay associated with any dewatering activities. Effluent limitations are to meet Best Conventional Pollution Control Technology and Best Available Technology standards to the extent economically feasible.

1.6 INTERIM EROSION AND STORM WATER CONTROL

The Contractor will be responsible for selecting and implementing temporary erosion and stormwater controls during construction in compliance with the State Water Resources Control Board adopted Order No. 2009-0009-DWQ (Waste

Discharge Requirements for Discharges of Storm Water Runoff Associated with Construction Activities and Land Disturbance Activities) and the project Storm Water Pollution Control Plan .

These Specifications address permanent erosion and stormwater controls to be left in place upon completion. It is the intent of these Specifications that at the conclusion of the Contract, the site will be protected with newly installed erosion control improvements. However, interim erosion control features installed during the latter phases of the project may be considered and compensated as final, at the discretion of the Engineer, if the components are deemed to be in suitable and undamaged condition.

1.6.1 Federal ARARs for Erosion Control

The final cover shall be constructed to promote drainage and minimize erosion or abrasion of the cover (22 CCR 66264.310(a)(3)).

Collection and holding facilities associated with precipitation and drainage control systems shall be emptied immediately or otherwise managed to maintain system design capacity (27 CCR 20365(c) and (d), 21090(c)(4) and 21150).

1.6.2 Federal ARARs for Storm Water

The Contractor is to meet general requirements for a storm water management plan and implementation of best management practices per 40 CFR 122.44(k)(2) and (4). Substantive provisions are applicable for the excavation of waste during removal of radiological hot spots prior to placing the multilayer soil cover and for ground-disturbing activities.

1.6.3 Federal ARARs for Dredged Material

Discharge of dredged or fill material into wetlands is prohibited without a permit (33 United States Code 1344). In the event that dredged material needs to be discharged to waters of the United States, discharges of dredged material to waters of the United States including adjacent wetlands shall be done in compliance with substantive provisions of the following: 33 CFR 320.4, 40 CFR 230.10, 230.11, 230.20-230.25, 230.31, 230.32, 230.41, 230.42 and 230.53.

1.6.4 ARARs for Storage

The Contractor may need to temporarily store waste. Storage shall be done in compliance with ARARs.

Keep incompatible materials separate for storage of RCRA hazardous waste not meeting small-quantity generator criteria before treatment, disposal, or storage elsewhere. Separate incompatible materials stored near each other by a dike or other barrier (22 CCR 66264.177). At closure, remove all hazardous waste and residues from the containment system and decontaminate or removal all containers and liners (22 CCR 666264.178). The substantive provisions are ARARs for handling small amounts of waste generated during construction (for example, the construction of new groundwater monitoring wells or other investigation derived waste). The requirements are applicable if waste is determined to be RCRA hazardous or non-RCRA, state-regulated hazardous waste. These requirements are relevant and appropriate for solid waste that is designated or nonhazardous solid waste.

Inspect container storage weekly for deterioration (22 CCR 66264.174).

Place containers on a sloped, crack-free base, and protect from contact with accumulated liquid. Provide containment system with a capacity of 10 percent of the volume of containers of free liquids. Remove spilled or leaked waste in a timely manner to prevent overflow of the containment system (22 CCR 66264.175(a) and (b)).

On-site hazardous waste accumulation is allowed for up to 90 days as long as the waste is stored in containers in accordance with 22 CCR 262.171-178 or in tanks, on drip pads, inside building, and is labeled and dated.

Containers of RCRA hazardous waste must be maintained in good condition, compatible with hazardous waste to be stored, and closed during storage, except to add or remove waste (22 CCR 66264.171, 66264.172, 66264.173).

1.7 QUALITY ASSURANCE

1.7.1 Installer's Qualification

Not Used

1.7.2 Substitutions

Not Used

1.7.3 Sustainable Design Requirements

NOT USED.

1.7.4 Erosion Control Blanket Turf Reinforcement Mat

a. Acceptance shall be based on manufacturer's certifications and testing of quality control samples obtained using Procedure B of ASTM D 4354.

b. Quality Assurance Sampling and Testing will be waived for ISO 9001:2000 Certified Manufacturing Facilities. Documentation of ISO 9001:2000 Certification shall be provided upon request.

1.8 DELIVERY, STORAGE, AND HANDLING

Store materials in designated areas and as recommended by the manufacturer for protection from the elements, direct exposure, and damage. Do not drop containers from trucks. Material shall be free of defects that would void required performance or warranty. Deliver geosynthetic binders and synthetic soil binders in the manufacturer's original sealed containers and store in a secure area.

a. Furnish erosion control blankets in rolls with suitable wrapping to protect against moisture and extended ultraviolet exposure prior to placement. Label erosion control blanket and geotextile fabric rolls to provide identification sufficient for inventory and quality control purposes.

1.8.1 Rolled Erosion Control Product (RECP)

a. RECP labeling, shipment and storage shall follow ASTM D 4873.

b. Product labels shall clearly show the manufacturer or supplier name, style name, and roll number.

c. Each shipping document shall include a notation certifying that the material is in accordance with the manufacturer's certificate.

d. Each RECP roll shall be wrapped with a material that will protect the geotextile from damage due to shipment, water, sunlight, and contaminants.

e. The protective wrapping shall be maintained during periods of shipment and storage.

f. During storage, RECP rolls shall be elevated off the ground and adequately covered to protect them from the following: Site construction damage, extended exposure to ultraviolet (UV) radiation, precipitation, chemicals that are strong acids or strong bases, flames, sparks, temperatures in excess of 71 deg C (160 deg F) and any other environmental condition that might damage the RECP.

PART 2 PRODUCTS

2.1 RECYCLED PLASTIC

NOT USED.

2.2 BINDERS

2.2.1 Synthetic Soil Binders

Calcium chloride, or other standard manufacturer's spray on adhesives designed for dust suppression.

2.2.2 Geosynthetic Binders

NOT USED.

2.3 MULCH

Mulch shall be free from weeds, mold, and other deleterious materials. Mulch materials shall be native to the region.

2.3.1 Straw

Not Used

2.3.2 Hay

NOT USED.

2.3.3 Wood Cellulose Fiber

Wood cellulose fiber shall be 100 percent recycled material and shall not contain any growth or germination-inhibiting factors and shall be dyed with non-toxic, biodegradable dye of an appropriate color to facilitate placement during application. Composition on air-dry weight basis: a minimum 9 to a maximum 15 percent moisture, and between a minimum 4.5 to a maximum 6.0 pH. Wood cellulose fiber shall not contain environmentally hazardous levels of heavy metals.

2.3.4 Paper Fiber

Paper fiber shall comply with 2010 Caltrans Standard Specifications Section 21-1.02E.

2.3.5 Shredded Bark

Not used.

2.3.6 Wood By-Products

Not used.

2.3.7 Coir

Not used.

2.3.8 Asphalt Adhesive

Not used.

2.3.9 Mulch Control Netting and Filter Fabric

Not used.

2.3.10 Hydraulic Mulch

Hydraulic mulch shall have the following mixture characteristics:

CHARACTERISTIC (typical)	VALUE
Conwed 1000 Wood Fiber	2,000 lbs/acre
Ecology Controls M-Binder/Tack	100 lbs/acre
Biosol Forte 7-2-1 Organic fertilizer	800 lbs/acre
AM-120 Mycorrhizal inoculum	60 lbs/acre
Tri-C Soluble Humate	1/lb/acre

2.3.11 Tackifier

Ecology Controls M-Binder/Tack

2.3.12 Dye

Dye shall be a water-activated, green color. Pre-package dye in water dissolvable packets in the hydraulic mulch.

2.4 GEOTEXTILE FABRICS

Not used.

2.5 EROSION CONTROL BLANKETS

2.5.1 Erosion Control Blankets Type I

Not used.

2.5.2 Erosion Control Blankets Type II

Not used.

2.5.3 Erosion Control Blankets Type III

Not used.

2.5.4 Erosion Control Blankets Type IV

Not used.

2.5.5 Erosion Control Blankets Type V

Not used.

2.5.6 Erosion Control Blankets Type VI

Not used.

2.5.7 Erosion Control Blankets Type VII

Not used.

2.5.8 Erosion Control Blankets Type VIII

Not used.

2.5.9 Erosion Control Blankets Type IX

Not used.

2.5.10 Erosion Control Blankets - Turf Reinforcement Mat (TRM)

1. Three-dimensional, lofty woven polypropylene geosynthetic specially designed for erosion control applications on steep slopes and vegetated waterways.

2. Matrix composed of monofilament yarns woven into uniform configuration of resilient pyramid-like projections.

3. Material to exhibit very high interlock and reinforcement capacity with both soil and root systems and demonstrate high tensile modulus.

4. Minimum Average Roll Values:

Property	Test Method	Value	Units
Thickness	ASTM D 6525	0.25	in
Resiliency	ASTM D 6524	70	percent
Mass Per Unit Area	ASTM D 6566	7.5	oz/sq yd
Tensile Strength	ASTM D 6818	2000 x 1800	lb/ft
Tensile Elongation	ASTM D 6818	50	max percent
Tensile Strength	ASTM D 4595	259.2	lbs/ft
Light Penetration (% Passing)	ASTM D 6567	50 (max)	percent
Moisture Absorption	ASTM D 570	0.01 (max)	percent
UV Resistance(1)	ASTM D 4355	90 at 3,000 hours	percent

NOTE 1: Photodegradable life a minimum of 36 months with a minimum 90 percent light penetration. Apply to slopes up to a maximum 1:1 gradient.

5. Manufacturing Quality Control: Testing shall be performed at a laboratory accredited by GAI-LAP for tests required for the geosynthetic, at frequency exceeding ASTM D 4354, with following minimum acceptable testing frequency:

Property	Test Frequency (sq yd)
Mass Per Unit Area	1/24,000
Tensile Strength	1/24,000
Tensile Elongation	1/24,000
Light Penetration (% Passing)	1/24,000

2.5.11 Erosion Control Blankets Type XI (Re-vegetation Mat)

Not used.

2.5.12 Seed

2.5.12.1 Classification

Provide State-certified seed of the latest season's crop delivered in original sealed packages, bearing producer's guaranteed analysis for percentages of mixtures, purity, germination, weed seed content, and inert material. Label in conformance with AMS Seed Act and applicable state seed laws. Wet, moldy, or otherwise damaged seed will be rejected. Field mixes will be acceptable when field mix is performed on site in the presence of PQA.

2.5.12.2 Planting Dates

Apply seed between September 1 to March 1.

2.5.12.2.1 Seed Purity

Not used.

2.5.12.2.2 Seed Mixture by Weight

Botanical Name	Common Name	Seeding Rate (PLS lbs/ac)	Source
Bromus carinatus	California “Bay Area” Brome	8	Alameda County
Elymus glaucus "Bay Area"	”Bay Area” Blue Wildrye	6	Alameda County
Hordeum brachyantherum-	Meadow Barley	6	Contra Costa County
Eschscholzia californica-	California Poppy	1.5	Monterey County
Clarkia purpurea-	Wine Cup Clarkia	0.75	Northern Cal Native
Achillea millefolium-	White Yarrow	0.5	Santa Clara County
Eriogonum parvifolium	Sea Cliff Buckwheat	0.75	San Mateo County
Artemisia douglasiana	Mugwort	0.50	Santa Clara County
Euthamia occidentalis	Western Golden Rod	0.10	Santa Clara County
Acmispon glaber-	Lotus/Deerweed	4.0	Santa Clara County
Mimulus aurantiacus	Sticky Monkey Flower	0.15	Santa Clara County
Mimulus guttatus	Seepspring Monkey Flower	0.05	Cental California Coast
Grindelia stricta	Coastal Gumweed	1.0	Alameda County
Sisyrinchium bellum	Blue Eyed Grass	1.5	San Mateo County

2.5.13 Staking

Not used.

2.5.14 Staples

Not used.

2.5.15 Erosion Control Blanket Metal Pin Ground Anchors

Metal pins shall be steel, with a minimum diameter of 0.2 inches and 12 inches in length. Metal pins installed in the anchor trenches in the creek shall be 36 inches in length. Pins shall be installed with a 1.5 inch steel washer as shown on plans.

2.6 SYNTHETIC GRID AND SHEET SYSTEMS

Not used.

2.7 ARTICULATING CELLULAR CONCRETE BLOCK SYSTEMS

Not used.

2.8 FERTILIZER

2.9.1 Hydroseeding Fertilizer

Hydroseeding fertilizer shall be Biosol Forte 7-2-1 (slow-release) per subparagraph 2.3.10 in Section 31 32 11.

2.9 WATER

Unless otherwise directed, water is the responsibility of the Contractor per subparagraph 01 11 00(b) of Section 01 11 00. . The source of water shall be approved by PQA.

2.10 FIBER ROLLS

Fiber rolls material shall meet Caltrans Standard Specification Section 21-1.02P – Fiber Rolls.

2.11 SILT FENCE

Silt fence fabric shall meet standards in ASTM D 6461.

2.12 GRAVEL BAGS

Gravel bags shall meet Caltrans Standard Specification Section 13-5.02G – Gravel Filled Bags.

PART 3 EXECUTION

3.1 WEATHER CONDITIONS

Perform erosion control operations under favorable weather conditions; when excessive moisture, frozen ground or other unsatisfactory conditions prevail, the work shall be stopped as directed. When special conditions warrant a variance to earthwork operations, submit a revised construction schedule for approval. Do not apply erosion control materials in adverse weather conditions which could affect their performance.

3.1.1 Finished Grade

Verify that finished grades are as indicated on the Drawings; complete finish grading and compaction in accordance with Section 31 00 00 EARTHWORK, prior to the commencement of the work. Verify and mark the location of underground utilities and facilities in the area of the work. Repair damage to underground utilities and facilities.

3.1.2 Placement of Erosion Control Blankets

Before placing the erosion control blankets, ensure the subgrade has been graded smooth; has no depressed, void areas; is free from obstructions, such as tree roots, projecting stones or other foreign matter. Vehicles will not be permitted directly on the blankets.

a. Grade and compact areas to be treated with RECP and compacted as indicated or as directed by Engineer.

b. Remove large rocks, soil clods, vegetation, and other sharp objects that could keep RECP from intimate contact with subgrade.

c. Prepare seedbed by loosening 50 to 75 mm (2 to 3 in) of soil above final grade.

d. Select and apply seed, topsoil, and hydromulch in accordance with to scarified surface prior to installation of RECP. The topsoil Specification is in Section 31 00 00 Earthwork.

e. Construct an anchor trench as shown on Drawing sheet D-2.

f. Anchor trenches will be 24 inches deep along creeks with 36-inch length metal pin anchors inside the trench. Anchor trenches at the toe of the slope outside of creek areas shall be 12 inches deep with 12-inch length metal pins as shown on plans.

3.1.3 Synthetic Grid

Not used.

3.1.4 Concrete Cellular Block

Not used.

3.1.5 Soil Conditioner Application Rates

Apply soil conditioners at rates as determined by laboratory soil analysis of the soils at the job site.

3.1.6 Fertilizer Application Rates

Hydroseeding fertilizer shall be applied at rates stated in subparagraph 2.3.10 in Section 31 32 11.

3.2 SITE PREPARATION

Provide soil preparation (including soil conditioners as required), fertilizing, seeding, and surface topdressing of all newly graded finished earth surfaces, unless indicated otherwise, and at all areas inside or outside the limits of construction that are disturbed by the Contractor's operations.

3.2.1 Soil Test

See Section 31 00 00 Earthwork.

3.2.2 Layout

Erosion control material locations may be adjusted to meet field conditions. When soil tests result in unacceptable particle sizes, a shop Drawing shall be submitted indicating the corrective measures.

3.2.3 Protecting Existing Vegetation

Not used.

3.2.4 Obstructions Below Ground

When obstructions below ground affect the work, submit shop Drawings showing proposed adjustments to placement of erosion control material for approval.

3.3 INSTALLATION

3.3.1 Synthetic Binders

Not used.

3.3.2 Seeding

3.3.2.1 Seed Application Seasons and Conditions

Immediately before seeding, restore soil to proper grade. Do not seed when ground is muddy frozen, snow covered, or in an unsatisfactory condition for seeding. If special conditions exist that may warrant a variance in the above seeding dates or conditions, submit a written request to PQA stating the special conditions and proposed variance.

3.3.2.2 Seed Application Method

Seeding method shall be hydroseeding or broadcasting, as shown on plans. The application rate shall be single step

3.3.2.2.1 Hydroseeding

First, mix water and fiber. Wood cellulose fiber, paper fiber, or recycled paper shall be applied as part of the hydroseeding operation. Fiber shall be added at 2,000 pounds, dry weight, per acre. Then add and mix seed, binder, inoculants, fertilizer, and remainder of mulch to produce a homogeneous slurry. Seed shall be mixed to ensure broadcasting at the rate shown in Section 2.5.12.2.2. When hydraulically sprayed on the ground, material shall form a blotter like cover impregnated uniformly with grass seed. Spread with one application with no second application of mulch.

3.3.2.2.2 Broadcast Seed and Mulch Application

Not Used

3.3.2.2.3 Broadcast and Drop Seeding

Not Used

3.3.3 Mulch Installation

Not Used

3.3.4 Mulch Control Netting

NOT USED.

3.3.5 Mechanical Anchor

NOT USED.

3.3.6 Asphalt Adhesive Tackifier

NOT USED.

3.3.7 Non-Asphaltic Tackifier

NOT USED.

3.3.8 Asphalt Adhesive Coated Mulch

NOT USED.

3.3.9 Wood Cellulose Fiber, Paper Fiber, and Recycled Paper

Apply wood cellulose fiber, paper fiber, or recycled paper as part of the hydraulic mulch operation.

3.3.10 Hydraulic Mulch Application

3.3.10.1 Unseeded Area

NOT USED.

3.3.10.2 Seeded Area

For hydraulic seeded areas, apply mulch at the rate per manufacturer recommendation with the seed and fertilizer, and at the rate per manufacturer recommendation in a second application of mulch only.

3.3.11 Erosion Control Blankets

3.3.11.1 In Areas of Concentrated Surface Water Flow Labeled as Turf Reinforcement Mat on Plans.

a. Install RECP at elevation and alignment indicated on plans.

b. Secure into trench with anchoring devices, backfill, and compact with specified soil or as directed by Engineer.

c. Unroll RECPs downslope, overlapping adjacent rolls minimum 75 mm (3 in). Lay material loosely, maintaining direct contact with soil.

d. Secure RECP to slope with one ground anchoring device (metal pin) per square yard.

e. Alternate installation methods must be approved by Engineer prior to execution.

f. Where applicable soil fill and seed the RECP:

1. Spread and lightly rake 12 to 20 mm (0.5 to 0.8 in) of protective layer soil into RECP to completely fill its thickness. See Section 31 00 00 Earthwork for protective layer soil Specification.

2. When using lightweight power equipment to fill RECP, avoid sharp turns. Do not drive tracked or heavy equipment over RECP.

3. Smooth out soil by barely exposing top portion of RECP. Do not place excessive soil above material.

4. Broadcast additional seed or mulch above soil-filled mat and water.

3.3.12 Synthetic Sheet System

NOT USED

3.3.12.1 Sheet System Revegetation

NOT USED.

3.3.12.2 Sheet System Grids

NOT USED.

3.3.12.3 Sheet System Seeding

NOT USED.

3.3.12.4 Grid System Grids

NOT USED.

3.3.13 Grids

3.3.13.1 Grid System Revegetation

NOT USED.

3.3.13.2 Synthetic Grids

NOT USED.

3.3.13.3 Grid System Seeding

NOT USED.

3.3.14 Articulating Cellular Concrete Block System Installation

NOT USED.

3.3.14.1 Concrete Grout

NOT USED.

3.3.14.2 Toe Protection

NOT USED.

3.3.14.3 Backfilling Cellular Block System

NOT USED.

3.3.14.4 Block System Revegetation

NOT USED.

3.3.14.5 Seeding, Fertilizing, Mulching

Install seed, topsoil, and hydromulch above erosion control blanket areas.

3.3.14.5.1 Sediment Fencing

Install posts at the spacing indicated on Drawings and at an angle between 2 degrees and 20 degrees towards the potential silt load area. Sediment fence height shall be approximately 16 inches. Do not attach filter fabric to existing trees. Secure filter fabric to the post and wire fabric using staples, tie wire, or hog rings. Imbed the filter fabric into the ground as indicated on Drawings. Splice filter fabric at support pole using a 6 inches overlap and securely seal.

3.4 FIBER ROLLS

Fiber rolls material shall be installed to meet the 2010 Caltrans Standard Specification Section 21-1.02P – Fiber Rolls.

3.5 SILT FENCE

Silt fence shall be installed to meet ASTM D 6462.

3.6 GRAVEL BAGS

Gravel bags shall be installed as shown on the plans and to meet the 2010 Caltrans Standard Specification Section 13-10.03C – Temporary Gravel Bag Berms.

3.7 CLEAN-UP

Dispose of excess material, debris, and waste materials offsite at an approved landfill or recycling center. Clear adjacent paved areas.

Immediately upon completion of the installation in an area, protect the area against traffic or other use by erecting barricades and providing signage as required, or as directed.

3.8 WATERING SEED

Start watering immediately after installing erosion control blanket type XI (revegetation mat). Apply water to supplement rainfall at a sufficient rate to ensure moist soil conditions to a minimum 1 inch depth. Prevent run-off and puddling. Do no drive watering trucks over turf areas, unless otherwise directed. Prevent watering of other adjacent areas or plant material.

-- End of Section --

SECTION 32 31 13

CHAIN LINK FENCES AND GATES
08/10

PART 1 GENERAL

1.1 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Fence Assembly

Location of Gate, Corner, End, and Pull Posts

Gate Assembly

Gate Hardware and Accessories

SD-03 Product Data

Zinc Coating

Fabric

Stretcher Bars

Concrete

1.3 ASSEMBLY AND INSTALLATION INSTRUCTIONS

Submit manufacturer's erection/installation Drawings and instructions that detail proper assembly and materials in the design for fence, gate, hardware and accessories.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver materials to site in an undamaged condition. Store materials off the ground to provide protection against oxidation caused by ground contact.

1.5 QUALITY ASSURANCE

1.5.1 Required Report Data

Submit reports listing chain-link fencing and accessories regarding weight in ounces for zinc coating and chemical composition and thickness of aluminum alloy coating.

1.5.2 Certificates of Compliance

Not Used

PART 2 PRODUCTS

2.1 GENERAL

Provide fencing materials conforming to the requirements of Section 80-3.02 of the 2010 Caltrans Standard Specifications.

Submit manufacturer's data indicating percentage of recycled material content in protective fence materials, including chain link fence, fabric, and gates to verify affirmative procurement compliance.

PART 3 EXECUTION

3.1 GENERAL

Ensure final grading and established elevations are complete prior to commencing fence installation.

Install chain link fence in conformance with Section 80-3.03 of the 2010 Caltrans Standard Specifications.

3.15 TOLERANCES

Provide posts that are straight and plumb within a vertical tolerance of 1/4 inch after the fabric has been stretched. Provide fencing and gates that are true to line with no more than 1/2 inch deviation from the established centerline between line posts. Repair defects as directed.

3.16 SITE PREPARATION

3.16.1 Clearing and Grading

Clear fence line of trees, brush, and other obstacles to install fencing. Establish a graded, compacted fence line prior to fencing installation.

3.17 FENCE INSTALLATION

Install fence on prepared surfaces to line and grade indicated. [Secure fastening and hinge hardware in place to fence framework by peening or welding. Allow for proper operation of components. Coat peened or welded areas with a repair coating matching original coating.] Install fence in accordance with fence manufacturer's written installation instructions except as modified herein.

3.18 ACCESSORIES INSTALLATION

3.18.2 Padlocks

Provide padlocks for gate openings and provide chains that are securely attached to gate or gate posts. Provide padlocks keyed alike, and provide two keys for each padlock.

3.19 GROUNDING

Not Used - if site conditions warrant grounding of fence consult engineer.

3.20 SECURITY

Install new security fencing, remove existing security fencing, and perform related work to provide continuous security for facility. Schedule and fully coordinate work with Contracting Officer and cognizant Security Officer.

3.21 CLEANUP

Remove waste fencing materials and other debris from the work site.

-- End of Section --

SECTION 33 24 13

MONITORING PROBES
08/08

PART 1 GENERAL

1.1 DESCRIPTION OF WORK

Provide groundwater monitoring wells and landfill gas monitoring probes, including drilling, casing, screen, gravel packing, grouting, development, monitoring device, and incidental-related work complete and ready for operation.

1.2 REFERENCES

The publications listed below form a part of this Specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM C 150	(2009) Standard Specification for Portland Cement

EPA 600-4-89-034	(1990) Handbook of Suggested Practices for the Design and Installation of Groundwater Monitoring Wells

1.3 SYSTEM DESCRIPTION

1.3.1 Groundwater Monitoring Wells

Not used.

1.3.2 Landfill Gas Monitoring Probes

Construct each monitoring probe to yield chemically representative landfill gas samples of the screened interval for chemical analysis. The screened interval is that portion of a monitoring probe which is directly open to the landfill waste by way of openings in the probe screen and indirectly open to the landfill waste by way of the gravel pack (or other permeable material) extending continuously below and/or above the screen.

1.4 INSTALLATION PLAN

1.5 SUBMITTALS

Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Proposed method of drilling

SD-02 Shop Drawings

Installation Diagrams

As-built installation diagram for each monitoring well and probe installed, prepared by the geologist/engineer present during well/probe installation operations, within 10 working days of the completion of the well installation procedure.

Survey Maps and Notes

Survey maps and notes, including a tabulated list of all monitoring wells, probes, and monuments, copies of all field books, maps showing the locations, and elevations of all monitoring wells and probes, and all computation sheets within 10 working days after completion of the survey.

SD-03 Product Data

Well seal materials

Borehole Logs

Original borehole logs, within 10 working days after completion of the boring and well installation procedures.

Installation Diagrams

Installation diagram for each monitoring well and probe within 10 working days of the completion of the installation.

Project Photographs

Photographs taken before, during, and after completion of the work, of each well/probe installation.

Monitoring Wells and Probes

Catalog data for monitoring well/probe screens (to include the screen slot size), casing, riser pipe, filter pack material, bentonite, cement, centralizers, surface protective covers, locking caps, airline oil filters for pneumatic drilling, dedicated sampling equipment, and chemical specifications on drill lubricants and tracers, if used. Include any information, written or otherwise, supplied by the manufacturers or suppliers of the above listed items.

Qualifications

Personnel qualification documentation. Probe driller qualifications, including the driller’s license number and health and safety certifications.

Permits

A copy of all permits, licenses, or other requirements necessary for execution of the work.

Documentation and Quality Control Reports

Reports for well/probe construction and development.

SD-06 Test Reports

Decontamination and drilling water analytical test results.

Filter Pack

Filter pack material test results; sieve and Chemical Analysis.

Drilling Fluid Additive

Manufacturer's data, if available, including analytical test results of the additive, if not a part of the manufacturer's data.

SD-11 Closeout Submittals

Disposal certificates

1.6 PERFORMANCE REQUIREMENTS

Perform work in conformance with the approved EM 385-1-1 and OSHA requirements. Each system, including equipment, materials, installation, and performance, shall be in accordance with local, State, and Federal regulations, ASTM D 5092, and EPA 600-4-89-034 except as modified herein. Requirements shall be ASTM C 150, Type I or II for all cement. Identify and secure monitoring wells and probes to avoid unauthorized access and tampering.

1.7 QUALITY ASSURANCE

1.7.1 Notification

Notify the RPM/ROICC 15 days prior to drilling.

1.7.2 Qualifications

Provide an onsite geologist/engineer with at least 3 years experience in hazardous waste projects, soil and rock logging, and monitoring well/probe installation, registered in the state of California, responsible for all geophysical and borehole logging, drilling, well/probe installation, developing and testing activities. Provide a driller licensed in the state of California, according to the state requirements. Perform and provide geophysical log interpretation done by a qualified log analyst, demonstrating competence through background, training, and experience when so called upon.

1.8 DELIVERY, STORAGE, AND HANDLING

Deliver materials in an undamaged condition. Unload and store with minimal handling. Store materials in onsite enclosures or under protective coverings. Store plastic piping, jointing materials, and rubber gaskets under cover, out of direct sunlight. Store materials off the ground. Keep insides of pipes and fittings free of dirt and debris by taping or sealing off open pipe ends. Replace defective or damaged materials with new materials.

PART 2 PRODUCTS

2.1 PROBE ASSEMBLY

Landfill gas monitoring probes shall consist of the following:

a. Solid Pipe, Couplings, End Caps, and Fittings: PVC schedule 80 (ASTM D 1785), square flush-threaded ½-inch diameter, 8 threads per inch (TPI).

b. Screen Pipe: PVC schedule 80 (ASTM D 1785), square flush-threaded, ½-inch diameter, 8 TPI machine-slotted, 0.020-inch slots.

c. Labcock Valves: 1/4-inch PVC (mpt x hose barb), screw-on with tapered hose barbs. Hose Barb Cap: a snugly fitted cap; to keep dirt out.

d. Probe Identification Tags: 1-1/4-inch diameter by 1/16-inch thick brass tags, stamped with the 1/2-inch high letters/numbers indicating probe’s name and depth of the probe.

2.1.1 Gravel Pack and Sealing Materials

a. Sand: Screen sand shall consist of commercially produced, clean, graded, #3 Monterey Sand, or equivalent, as approved by the Engineer/Geologist.

b. Bentonite Seal: Bentonite seals shall be Enviroplug #16 and hydrated in the field in accordance with manufacturer Specifications or requirements, or equivalent, as approved by the Engineer/Geologist.

2.1.2 Surface Completion Assembly

a. Probe Apron: Probe Apron shall be 3-foot square by 6-inch thick, slope-to-drain. Concrete for the well apron shall be commercially available pre-mixed bagged concrete, or may be hand mixed. Hand mixing shall conform to 90-1.02(G) of the 2010 Caltrans Standard Specifications.

b. Cover: Probe covers shall be 8 inches in diameter and schedule 40 steel pipe and shall have a steel lid fabricated with a locking devise in accordance with the details on the Drawings.

c. Guard Posts: Each probe shall be protected by four (4) guard posts, and shall be schedule 40 steel pipe with a welded on threaded pipe cap. Concrete for the bollards shall be commercially available pre-mixed bagged concrete, or may be hand mixed as described in subparagraph 2.1.2(a) of this Section. The guard posts shall be primed and painted protective standard golden yellow after installation.

d. Lock to match key for existing system (i.e. one key for all probes).

2.9 PROTECTIVE POSTS

Provide and place four 3-inch diameter, schedule 40 carbon steel, protective bollards around each monitoring well/probe, and as indicated.

PART 3 EXECUTION

3.1 PROTECTION OF EXISTING CONDITIONS

Maintain all existing survey monuments and monitoring wells/probes, and protect them from damage from equipment and vehicular traffic. Immediately report and repair any items damaged by the Contractor. Re-install monitoring wells/probes requiring replacement due to Contractor negligence according to these Specifications. Protect wells/probes scheduled for destruction from damage so that destruction may be performed according to these Specifications.

3.2 PREPARATION

3.2.1 Decontamination

a. Prior to drilling, steam-clean drilling equipment with clean water to prevent potential cross contamination.

3.3 PROBE INSTALLATION

Install in accordance with applicable standards and recommendations. In general, the procedure shall be as follows:

3.3.1 Drilling

a. Actual boring depths will depend on conditions encountered during drilling.

c. Containerize and dispose of cuttings off-site at a designated location as specifically directed by the Engineer/Geologist. The Contractor shall pay for all costs associated with transporting and disposal of waste generated during the project.

If obstructions are encountered during borehole advancement, continue drilling until obvious that further efforts to advance the borehole are impractical. The Engineer/Geologist will then determine which of the following courses of action should be followed:

a. If, during the drilling of a borehole, contact with an obstruction is made such that the probe cannot be completed to the full depth as called for on the Drawings, the Engineer/Geologist shall be consulted as to whether the borehole has advanced to a sufficient depth. If, in the opinion of the Engineer/Geologist, the borehole has reached a sufficient depth, the Contractor shall be required to complete the probe, and the Contractor shall be compensated based on the depth (lineal feet) actually reached.

b. If, during the drilling of a borehole, the probe cannot be completed to the full depth as called for on the Drawings, the Engineer/Geologist shall be consulted as to whether the borehole has advanced to a sufficient depth. If, in the opinion of the Engineer/Geologist, the borehole has not reached a sufficient depth to function as an effective probe due to the fault of the driller, the Contractor shall destruct this borehole by backfilling it with soil. The backfill material shall be placed in the borehole in three-foot lifts and tamped by the drill rig auger bucket. The Contractor shall not be compensated for this work.

3.3.2 Probe Installation

In general, the probe installation procedures shall be as follows:

a. Drill borehole so as to install the nested probes in a plumb and true line.

b. Install probes beginning with the deepest probe assembly first, followed by the next deepest probe assembly, until all probes have been properly installed.

c. Attach brass identification tag to each probe with Stainless Steel wire. Tags shall indicate probe name, and depth to ground surface to the bottom of the probe screen.

d. Pour #3 Monterey sand gradually and carefully into annular space to prevent bridging. Pour to the level above the top of the screened pipe, as determined by volume measurements and sounding with a weighted tape. Casing or tremmie shall be used to place the #3 sand. Casing or tremmie shall be withdrawn at the same rate that the #3 sand is placed. Sound frequently so that placement is accurate to within 0.2 foot.

e. Pour bentonite (Enviroplug #16, or approved equal), gradually to the appropriate level above the top of the #3 sand, as determined by volume measurements and sounding with a weighted tape. Casing or a tremmie shall be used, and shall be withdrawn slowly at the same rate the bentonite seal is placed. Add sufficient water for the bentonite seal to hydrate, in accordance with the manufacturer's recommendations, prior to placement of the remaining materials.

f. Attach probe top to top of solid pipe and seal with Labcock.

g. Install protective well monument and lid, in accordance with the details on the Drawings.

3.4 SURVEYS

Establish coordinates and elevations for each monitoring well/probe/test hole. Determine horizontal coordinates to the closest 0.1 foot and referenced to the State Plane Coordinate System. Obtain a ground elevation to the closest 0.01 foot at each well/probe. The highest point on the top of the riser pipe serves as a measurement point; reference this elevation and survey to the nearest 0.01 foot using the National Geodetic Vertical Datum of 1988. Plot the location, identification, coordinates, and elevations of the wells, probes, and monuments on maps with a scale large enough to show their location with reference to other structures.

3.5 WELL/PROBE DECOMMISSIONING/DESTRUCTION

Due to the radiological contamination at the site the well/probe destruction shall only be accomplished by a pressure grouting method Maintain a well/probe decommissioning/destruction record as specified in paragraph Well/Probe Decommissioning/Destruction Records. Measure groundwater levels, if encountered before the decision is made for decommissioning/destruction, in all borings prior to backfilling. Include these water levels in the well/probe decommissioning/destruction records. No well/probe may be decommissioned/destructed without the final approval of the RAWP.

3.6 ACCEPTANCE

It is the responsibility of the Landfill Engineer to ensure that the well/probes are properly designed and installed. It is the responsibility of TtEC, to construct, install, develop, and test all monitoring wells and probes according to the requirements of this Specification so that they are suitable for the intended purpose.

3.7 SITE CLEANUP

After completion of the work, remove tools, appliances, surplus materials, temporary drainage, rubbish, and debris incidental to work. Backfill excavation and vehicular ruts and dress to conform with the existing landscape or terrain. Utilities, structures, roads, fences, or any other pre-existing item which must be repaired or replaced due to the Contractor's negligence are the Contractor's responsibility; accomplish repair or replacement prior to completion of this Contract.

3.8 DOCUMENTATION AND QUALITY CONTROL REPORTS

Monitoring well construction, alteration, and destruction reports shall be completed on forms provided by the California Department of Water Resources. Other types of forms may be used for submission to the Department with the prior approval of the Department. The completed forms shall be submitted to the Department in accordance with relevant provisions of Sections 13750 through 13754 (Division 7, Chapter 10, Article 3) of the California Water Code.

Establish and maintain documentation and quality control reports for well/probe construction and development to record the desired information and to assure compliance with Contract requirements, including, but not limited to, the following:

3.8.1 Borehole Logs

Prepare and complete a borehole log for each boring drilled, prepared by the geologist present onsite during all drilling and installation activities. Provide the log at an appropriate scale. Keep copies current and complete of all logs in the field and make available at all times for inspection by the RPM/ROICC. Include, as a minimum, the following:

a. Name of the project and site.

b. Boring/well/probe identification number.

c. Location of boring (coordinates, if available).

d. Make and manufacturer's model designation of drilling equipment and name of drilling firm.

e. Date boring was drilled.

f. Reference data for all depth measurements.

g. Name of driller and name and signature of geologist/engineer preparing log.

h. Nominal hole diameter and depth at which hole diameter changes.

i. Total depth of boring.

j. Method of drilling, including sampling methods and sample depths, including those attempted with no recovery. Indication of penetration resistance such as drive hammer blows given in blows per 6 inches of driven sample tubes. Include in information hammer weight and drop distance. Record information such as rod size, bit type, pump type, etc. Also include a description of any temporary casing used, drill fluids and fluid additives used, if any, including brand name and amount used, along with the reason for and start (by depth) of its use, and, if measured, mud viscosities and weight.

k. Depth of each change of stratum. If location of strata change is approximate, it shall be so stated.

l. Description of the material of which each stratum is composed, in accordance with ASTM D 2488, and/or standard rock nomenclature, as necessary. Include in soil parameters for logging , but do not limit to, classification, depositional environment and formation, if known, Unified Soil Classification Symbol, secondary components and estimated percentages, color (using FSUP 77341 or GSA RCC00100R), plasticity, consistency (cohesive soil), density (non-cohesive soil), moisture content, structure and orientation, and grain angularity.

m. Include in rock core parameters for logging , but do not be limit to, rock type, formation, modifier denoting variety (shaly, calcareous, siliceous, etc.), color (using GSA RCC00100R), hardness, degree of cementation, texture, crystalline structure and orientation, degree of weathering, solution or void conditions, primary and secondary permeability, and lost core.

n. . Duly note and record the results of visual observation of the material encountered, and any unusual odor detected.

o. Depth of any observed fractures, weathered zones, or any abnormalities encountered.

p. Depth and estimated percent of drill fluid loss or lost circulation. Measures taken to regain drill water circulation. Significant color changes in the drilling fluid return.

q. Depth to water and date measured before, during, and after each drilling shift, and prior to well/probe installation. Provide and maintain at each well/probe under construction a portable water level measuring device of sufficient length to measure the water level to 165 foot depth. Make the device onsite at all times and provide graduated measuring wire in 0.01 foot. Take water level measurements to the nearest 0.01 foot.

3.8.2 Well/Probe Decommissioning/Destruction Records

Include in decommissioning/destruction records, as a minimum, the following:

a. Project name.

b. Well/probe or test hole number.

c. Well/probe/boring location, depth and diameter.

d. Date of decommissioning/destruction.

e. Method of decommissioning/destruction.

f. All materials used in the decommissioning/destruction procedure and the interval in which test materials were placed.

g. Casing, and or other items left in hole by depth, description, and composition.

h. Description and total quantity of grout used initially.

i. Description and daily quantities of grout used to compensate for settlement.

j. Water or mud level (specify) prior to grouting and date measured.

k. The reason for decommissioning/destruction of the monitoring well/probe/test hole.

3.8.3 Project Photographs

Before, during, and after completion of work, take a minimum of one view of each well/probe installation. Provide color prints with an information box, showing (typewritten) the following information:

Project No.	Contract No.
Contractor/Photographer:	
Photograph No.	Date/Time:
Description:	
Direction of View:	

3.8.4 Survey Maps and Notes

Prepare and submit a tabulated list of all monitoring wells, probes, and monuments, copies of all field books, maps showing the locations and elevations of all monitoring wells and probes, and all computation sheets, consisting of the designated number of the well, probe, or monument, the X and Y coordinates, and all the required elevations.

-- End of Section --

SECTION 33 40 00

STORM DRAINAGE UTILITIES
02/10

PART 1 GENERAL

1.1 SUMMARY

This section sets forth the requirements for permanent drainage improvements indicated on the Drawings including the drainage channel transition.

The Contractor shall refer to Section 31 00 00 EARTHWORK, regarding design intent for development of final cover grades and gradients, and the potential for modification of grades and alignment of civil and drainage improvements.

In general drainage improvements shall include construction of Portland Cement Concrete (PCC), conversion of manholes to storm drain inlets and installing turf reinforcement mat lined channels (See Section 31 32 11).

1.2 REFERENCES

The publications listed below form a part of this Specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM A 615/615M	(2009b) Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement
ASTM C 39	(2011a) Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens
ASTM C 94	(2012) Standard Specification for Ready Mixed Concrete

1.3 SUBMITTALS

Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Joint sealants

Submit manufacturer's product data, indicating VOC content. Manufacturer's catalog data for the following items must include printed instructions for admixtures, bonding agents, epoxy-resin adhesive binders, waterstops, and liquid chemical floor hardeners.

SD-06 Test Reports

Compressive Strength Testing per mix design

SD-07 Certificates

Curing Compound

Provide certificates for concrete that are in accordance with the paragraph entitled, "Classification and Quality of Concrete," of this section. Provide certificates that contain project name and number, date, name of Contractor, name of concrete testing service, source of concrete aggregates, material manufacturer, brand name of manufactured materials, material name, values as specified for each material, and test results.

1.4 DELIVERY, STORAGE, AND HANDLING

1.4.1 Delivery and Storage

Materials delivered to site shall be inspected for damage, unloaded, and stored with a minimum of handling. Materials shall not be stored directly on the ground. The inside of pipes and fittings shall be kept free of dirt and debris. Before, during, and after installation, plastic pipe and fittings shall be protected from any environment that would result in damage or deterioration to the material. Keep a copy of the manufacturer's instructions available at the construction site at all times and follow these instructions unless directed otherwise by the PQAE. Solvents, solvent compounds, lubricants, elastomeric gaskets, and any similar materials required to install plastic pipe shall be stored in accordance with the manufacturer's recommendations and shall be discarded if the storage period exceeds the recommended shelf life. Solvents in use shall be discarded when the recommended pot life is exceeded.

1.4.2 Handling

Materials shall be handled in a manner that ensures delivery to the trench in sound, undamaged condition. Pipe shall be carried to the trench, not dragged.

PART 2 PRODUCTS

2.1 PORTLAND CEMENT CONCRETE

A. PCC shall conform to the requirements of Section 90 of the 2010 Caltrans Standard Specifications. Contractor shall submit PCC mix design.

2.1.1 Drainage Channel Transition

Not used.

2.1.2 Trapezoidal Channels

Not used.

2.1.3 Portland Cement Material

All cement to be used or furnished shall be:

a) Type II portland cement, or Type V portland cement.
The Contractor shall furnish a Certificate of Compliance signed by the manufacturer identifying the cement and confirming compliance.

Whenever suitable facilities are available for handling and weighing bulk cement, they shall be used.

Otherwise, cement shall be delivered in original unopened sacks marked with brand, type, and weight.

Cement shall be stored in such a manner as to permit ready access for inspection and sampling and suitably protected against contamination and moisture. Should any cement show evidence of contamination or be otherwise unsuitable, the Engineer may reject it and require that it be removed from the site.

All portland cement used in concrete for any individual structure shall be of the same brand and type unless otherwise approved by the Engineer.

2.1.4 Aggregate

Aggregate shall be of such character that it will be possible to produce workable concrete within the limits of slump and water content.
Methods of handling materials resulting in segregation, degradation, or the combining of materials which results in failure to meet Specifications shall not be permitted. The free moisture content of sand shall not exceed 8 percent at the time of batching.

Aggregates shall be nonreactive when tested in accordance with ASTM C 289 and evaluated in accordance with Appendix X-1 of ASTM C 33. Aggregates found to be potentially reactive may be used only upon written approval.

2.1.4.1 Combined Aggregate Grading

Combined aggregate grading shall conform to Section 90-1.02(C)(4)(d) of the 2010 Caltrans Standard Specifications for 1/2-inch max.

2.1.5 Admixtures

Admixtures shall conform to Section 90-1.02(E) of the 2010 Caltrans Standard Specifications.

2.1.6 Water

Water shall conform to Section 90-1.02(D) of the 2010 Caltrans Standard Specifications.

2.1.7 Concrete Consistency

Concrete shall conform to Section 90-.02(G) of the 2010 Caltrans Standard Specifications.

2.2 REINFORCING STEEL

Not used.

2.3 STEEL GRATE

The steel grate above the drainage inlets shall be Steel Grate Type 36R. Steel grate material shall conform to requirements in Section 75-1.02(B) of the 2010 Caltrans Standard Specifications.

2.4 CURING COMPOUND

2.4.1 Membrane Curing Compound

Curing compounds for concrete improvements shall conform to the requirements of 90-1.03 of the 2010 Caltrans Standard Specifications and shall be clear or translucent with fugitive dye, or white pigmented.

The Contractor shall submit a Certificate of Compliance for the proposed curing compound to be used.

2.5 SHOTCRETE

Shotcrete can be used for small quantities (less than 2 cubic yards) and shall conform to Section 53-1 of the 2010 Caltrans Standard Specifications.

PART 3 EXECUTION

3.1 PORTLAND CEMENT CONCRETE (PCC)

The Contractor shall place and finish concrete to the lines and grades indicated on the Drawings. Reinforcement and PCC shall be placed in accordance with the applicable portions of Sections 52, and 51, and 90 of the 2010 Caltrans Standard Specifications, as indicated on the Drawings.

All Concrete shall be cured in accordance with the applicable portions of Section 90 of the 2010 Caltrans Standard Specifications.

3.1.1 Test for Portland Cement Concrete

Each Portland cement concrete mix design used shall be tested in accordance with ASTM C 39 for Compressive Strength. If prior testing is available, it may be submitted with the mix design.

3.2 JOINT SEALANTS

Joints sealants shall be constructed in accordance with the requirements of Section 40-1.02(I) of the 2010 Caltrans Standard Specifications.

3.3 SHOTCRETE

Shotcrete shall be constructed in conformance with Section 53-1.03 of the 2010 Caltrans Standard Specifications.

Mr. Jacques Lord
U.S. Department of the Navy
Base Realignment and Closure
Program Management Office West

Subject: **GEOTECHNICAL RECOMMENDATIONS
INSTALLATION RESTORATION SITE 2
Alameda Point
Alameda, California**

Dear Mr. Lord,

Presented herein is Tetra Tech's geotechnical recommendations for the remediation of Installation Restoration (IR) Site 2 at the former Naval Air Station Alameda, currently referred to as Alameda Point. The Department of Navy prepared a Record of Decision (ROD) in August 2010 documenting the selected remedy for the site which includes installing a multilayer soil cover over the former landfill to isolate buried refuse and prevent animal burrowing.

Previous geotechnical investigations of the site have reported the following geotechnical hazards for the IR Site 2:

- Strong earthquake ground shaking;
- Stability of perimeter slopes;
- Liquefaction and lateral spreading of loose hydraulic fills; and
- Settlement resulting from surcharging of soft Young Bay Mud.

The purpose of this report is to provide geotechnical recommendations for the remediation of the IR Site 2. Although the information about the subsurface conditions is taken from previous investigations of the site, this report is intended to be a stand-alone document to serve as a sole geotechnical engineering document submitted in support of the 100% Remedial Design (RD). This report replaces the previously submitted draft report dated May 4, 2012 as it includes additional analyses of seismically induced deformations of the perimeter slopes to evaluate the potential for the loss of refuse confinement integrity and displacement of refuse into the San Francisco Bay and/or breach of bay waters into the site during a seismic event.

We appreciate the opportunity to provide our professional services on this project. If you have any questions regarding this report or if we can be of further service, please do not hesitate to contact the undersigned.

Respectfully submitted,
Tetra Tech, Inc.

TABLE OF CONTENTS

Plates (on CD only)

Appendices (on CD only)

1. INTRODUCTION

Presented herein is a geotechnical evaluation and recommendations provided as part of the remediation of the Installation Restoration (IR) Site 2. The selected remedy will consist of a multilayer soil cover placed to isolate the refuse and prevent animal burrowing. The multilayer soil cover will consist of a biotic geonet barrier followed by a minimum 2-foot layer of general soil, including a 6-inch minimum vegetative layer, to provide a cover for the former landfill area. Site grades are proposed to be no greater than 1.5 percent.

The following geotechnical evaluations previously performed for the subject site were reviewed for the development of the presented design recommendations:

- "Draft Geotechnical Investigation Report, Installation Restoration Site 2, Alameda Point, Alameda, California", CH2M Hill Kleinfelder (KCH), A Joint Venture, August 2011, hereafter referred as the "**KCH report**".

- "Final Ordinance and Explosive Waste/Geotechnical Characterization Report", Tetra Tech Foster Wheeler, Inc. (Tetra Tech FW), January 2004, hereafter referred as the "**Tetra Tech FW report**".

Relevant field exploration and laboratory testing data from the above referenced reports are included in Appendices A and B of this report, respectively.

Previous investigations of the site have identified potential seismic-related instability of the perimeter of the site due to liquefaction, lateral spreading, liquefaction flow failure and/or large seismically induced permanent deformations. The perimeter containment of the refuse consists of a seawall retaining hydraulic fill, a coastal margin clean of refuse, and a perimeter berm. The critical areas where the refuse approaches the waters of the San Francisco Bay are located at the northwest and southeast corners of IR Site 2. These perimeter containment areas are hereafter referred to as the western and southern coastal margins.

The Geotechnical Report included in Attachment 1 of the 90% Remedial Design (May 4, 2012) indicated that a wide range of permanent seismic deformations and liquefaction-induced flow failures were predicted for a potential MCE event at IR Site 2. That report recommended ground improvement including cement deep soil mixing to mitigate the predicted seismic deformation and flow failure. In order to confirm that those ground improvements provided best value for this project, the Navy performed additional analyses and focused modeling of permanent seismic deformations and flow run-outs to better and more accurately quantify the impact of an MCE event. This revised Draft Final version presents the additional analyses, and indicates that ground improvements are not required because:

- Solid refuse is not anticipated to be released into the San Francisco Bay by the predicted permanent seismic deformations and /or flow run-outs; and

- The site will remain isolated from and will not be flooded by waters of the San Francisco Bay.

The predicted nature and magnitude of the seismic displacements and deformations are quantified in this revised report, and summarized in Section 12. Since the waste will still be isolated from the San Francisco Bay following an MCE event and therefore the cover integrity to act as a pathway interruption between the landfill waste and human and environmental receptors is expected to remain effective; the MCE would not compromise the CERCLA remedy and ground improvements such as cement cement deep soil mixing are not warranted. However, some level of damage to the cover and seawall should be anticipated after an MCE event, and will require repair.

2. BASIS OF DESIGN

Permanent seismic deformations and liquefaction-induced flow failures have been modeled for the IR Site 2 in the above referenced geotechnical evaluations. The purpose of this report is to further evaluate the findings of the previous investigations, with a focus on evaluating the magnitudes of the predicted permanent deformations and flow run-outs in relation to the width of the coastal margin and waters of the San Francisco Bay. Also included in this report is the further evaluation of long term settlement potential of the proposed cover grades. This report was prepared in support of the 100% Remedial Design (100% RD), utilizing the results of the previous investigations.

In accordance with the Applicable or Relevant and Appropriate Requirements (ARARs) presented in the Record of Decision (ROD) (United States Department of Navy and Unites States Environmental Protection Agency, 2010), the cover should accommodate the forces generated by the maximum credible earthquake (MCE) so that the integrity of the cover is maintained as required by article §66264.310 of Title 22, Chapter 14 – Standards for Owners and Operators of Hazardous Waste Transfer, Treatment, Storage, and Disposal Facilities. For the purposes of this investigation, the integrity of the cover is considered to be maintained if the following conditions are satisfied:

- There is no release of solid refuse to the San Francisco Bay beyond the perimeter seawall;
- The site will remain isolated from and will not be flooded by the San Francisco Bay waters; and
- The function of the cover to act as a pathway interruption between landfill content and human and environmental receptors will not be rendered ineffective, provided remedial grading is planned for after the MCE.

The existing slurry wall along the western coastal margin will be disturbed commensurately with the predicted deformations. However, according to the ROD, there are no engineering controls associated with the selected groundwater remedy, and the capacity of the existing slurry wall to impede groundwater before or after the MCE is not considered as part of the basis of design.

Consequently, the focus of this report is to predict and quantify seismic deformations and flows and evaluate the impact of the predicted permanent deformations and flow run-outs on cover integrity. In the event of the MCE, it should be understood given the magnitude of predicted deformations presented herein that the planned recreational areas at IR Site 2 will have to be closed to unauthorized personnel and remedial grading performed to disrupt any potential exposure pathways.

3. SCOPE OF WORK

The following geotechnical issues were evaluated and addressed in this report to support the 100% RD:

- Review of the previous investigations of the site and preparation of design cross-sections;
- Evaluation of the site seismic demand using the latest generation ground motion prediction equations and site specific ground response analyses;
- Analyses of slope stability;
- Estimation of permanent seismic deformations;
- Estimation of run-out distances of liquefaction- and seismically- induced flows; and
- Evaluation of long term settlement potential.

Based on the previous reports and as confirmed by evaluations and analyses presented herein, the western and southern coastal margins are susceptible to seismically induced displacements or flow failures.

4. SITE DESCRIPTION AND HISTORY

The IR Site 2 is located on the coastline of Alameda Point, in Alameda, California, and includes:

- West Beach Landfill (70 acres);
- Wetlands (33 acres); and
- Coastal margins (17 acres).

Alameda Point is located on the western point of Alameda Island near Oakland, on the eastern side of the San Francisco Bay. The location of the site within the San Francisco Bay area is shown on Plate 1, Project Location Map, attached to this report.

The IR Site 2 was reclaimed from the San Francisco Bay by constructing a rockfill seawall in 1956 along the western margin of the site and filling the interior with hydraulic fill dredged from the ship channel south of the site. In 1958, an extension of the seawall and additional hydraulic fill completed the southern margin of the IR Site 2. The site was used as a refuse disposal site shortly after the completion of the seawall until 1978 and contains an estimated 1.6 million tons of waste. The Tetra Tech FW report (2004) describes the waste as generally consisting of municipal solid waste, chemical waste drums, solvents, oily waste and sludge, paint, industrial strippers and cleaners, acids, mercury, polychlorinated biphenyl (PCB) containing liquids, batteries, scrap metal, inert ordinance, asbestos, pesticides, biological waste, tear gas agents, and low-level radiological waste.

In 1982 as a part of earlier remediation, a perimeter berm was constructed around the landfill. Recent borings provided in the KCH report (2011) indicate that some debris is present beneath the perimeter berm, at least along the western and southern coastal margins. Based on the KCH and Tetra Tech FW reports, between 1983 and 1985, a partial soil cover was constructed over the site, a slurry seepage cut-off wall was constructed along the western coastal margin adjacent to the seawall, and unspecified repairs were performed to the seawall. The slurry wall is about 820 feet long, 2 feet wide and 20 to 30 feet deep and intended to restrict contaminant migration from the landfill into the San Francisco Bay. In 1986, approximately 20,000 cubic yards of imported soil was graded over portions of the landfill to backfill depressions that were causing water ponding. At that time, an estimated 55,000 cubic yards of fill were still planned to complete the uniform cover of the landfill. In 1999, the IR Site 2 was official added to the National Priorities List of Superfund sites.

5. SUBSURFACE CONDITIONS

5.1. Subsurface Conditions

Subsurface conditions were evaluated by reviewing relevant logs of soil borings, test pits, and Cone Penetration Test (CPT) soundings presented in the Tetra Tech FW and KCH reports. The locations of considered explorations are shown on Plate 2, Site and Exploration Location Map, attached to this report. Applicable exploration logs are reproduced in Appendix A of this report. The related representative Geologic Sections cross sections A-A', B-B', C-C', and D-D' are shown on Plates 3 through 6.

The IR Site 2 is generally underlain by loose man-made hydraulic fill over soft Young Bay Mud. Geologic stratigraphic units underlying the refuse at the site are taken from Seismic Hazard Zone Report 081, Oakland West 7.5-Minute Quadrangle (California Geologic Survey, 2003), and summarized as follows. The lithographic descriptions are based on borehole and CPT logs performed during previous investigations. The material descriptions which follow generally comply with the Unified Soil Classification System as presented in ASTM D2487.

5.1.1. Artificial Fill over Bay Mud (afbm)

At the IR Site 2, this material is present over the entire area and is primarily hydraulic fill consisting of loose sand dredged from the ship channel south of the site where the source material is likely Merritt Sand (Qds) or coarse Young Bay Mud (Qhbm) described subsequently, but also includes more recent refuse where waste has been buried, perimeter berm fill and landfill cover. This material is a thickness of approximately 20 to 30 feet. This material generally consists of *poorly graded sand*, *poorly graded sand with silt*, and *silty sand*, is loose in compactness, and has high liquefaction susceptibility.

5.1.2. Holocene San Francisco Bay Mud (Qhbm) – Young Bay Mud

Qhbm is commonly referred to as Young Bay Mud. Both fine-grained and coarse-grained members of this stratigraphic unit are present underlying the hydraulic fill at the site, with thick deposits of fine-grained mud beneath the landfill perimeter along the western coastal margin and north portion of the site, and relatively thin deposits of coarse-grained sediments beneath the southern coastal margin.

The fine-grained member generally consists of *lean clay* and *fat clay* whereas the course-grained member consists of *poorly graded sand with silt* and *silty sand*. This material is of variable thickness ranging from approximately 60 feet at the northwest corner to as little as 10 feet at the southeast corner of the IR Site 2. The coarse-grained member of the Young Bay Mud unit possesses high liquefaction susceptibility. The fine-grained member is soft to firm in consistency and prone to consolidation under static loads and softening during cyclic loading.

5.1.3. Latest Pleistocene to Holocene Dune Sand (Qds) – Merritt Sand

Qds is commonly referred to as Merritt Sand. This relatively extensive unit makes up the core of Alameda Island and underlies much of downtown Oakland. This material underlies the Young Bay Mud and generally consists of *poorly graded sand*, *poorly graded sand with silt*, and *silty sand*, is medium dense to dense in consistency, and has low liquefaction susceptibility. The thickness of this material is uncertain over most of the site due to most of the borings terminating within this stratigraphic unit. However, this material appears to have a thickness on the order of 40 feet at the southeast corner and thinning towards the northwest corner of the IR Site 2.

5.1.4. Latest Pleistocene San Francisco Bay Mud (Qpbm) – Old Bay Mud

Qpbm is commonly referred to as the Old Bay Mud, but also the Yerba Buena Mud in the Tetra Tech FW report. This material underlies the Merritt Sand and generally consists of *lean clay* and *fat clay*, is stiff to very stiff in consistency and prone to softening during cyclic loading. The thickness of this unit was found to be on the order of 100 feet in borings performed between IR Sites 1 and 2.

5.1.5. Early to Late Pleistocene Alluvial Fan Deposits (Qof)

Qof is referred to as the Alameda Formation in the Tetra Tech FW report and in this investigation. This material underlies the Old Bay Mud and primarily consists of a relatively thin stiff *lean clay* cap over relatively thick very dense *silty sand* which was deposited on bedrock and has low liquefaction susceptibility. The thickness of this unit is likely to be on the order of 200 feet.

5.1.6. Bedrock – Franciscan Complex (KJc)

Bedrock at Alameda Point consists of the Franciscan Complex, a mélange of greywacke-type coarse-grained and poorly sorted sandstone (deposited as marine debris flows), shallow marine siltstone and claystone, and serpentine derived from basaltic crust formed as the oceanic crust accreted onto the North American continent during the early Jurassic to late Cretaceous period some 145 million years ago. Bedrock was not reached in the borings but is inferred based on geological mapping to be at a depth of approximately 400 feet at the IR Site 2 as reported in the Tetra Tech FW report.

5.2. Groundwater

Groundwater is relatively shallow at the IR Site 2 as documented most recently in the KCH report at elevations ranging from approximately 0 to 4 feet above mean sea level, or depths ranging from about 3 to 5 feet below ground surface at the interior of the landfill. Groundwater levels at the IR Site 2 fluctuate with tidal and seasonal influences as described in the 2004 tidal study (Shaw, 2005).

6. SEISMIC DEMAND

Based on the Record of Decision (ROD) findings, the integrity of the cover shall be maintained following the effect of the lateral and vertical forces and displacements induced by the Maximum Credible Earthquake (MCE). This seismic design demand is consistent with the requirements set forth by the California Code of Regulations (CCR) Title 22 – Environmental Health Standards for the Management of Hazardous Waste. The MCE is herein considered as the maximum earthquake that appears capable of occurring under the presently known geologic framework. The seismic demand was determined by the following procedure:

- Deterministic evaluation of causative faults near IR Site 2 known to be capable of large earthquakes and representative of the MCE event;
- Deterministic analyses using a fault model based on the Next Generation Attenuation (NGA) ground motion prediction equations to determine a target bedrock acceleration response spectrum;
- Selection of 7 bedrock outcropping acceleration time histories scaled individually such that the average of all records matches the target acceleration response spectrum as closely as possible; and
- One-dimensional wave propagation analyses to evaluate the site specific ground response to be used in stability analyses.

The above analytical steps are described in more detail as follows.

6.1. Causative Faults

Using a web-based tool provided by Caltrans, ARS Online v.1.0.4, the selected causative faults for the deterministic MCE event include the Hayward-Rogers Creek Fault and San Andreas Fault located 6.8 miles northeast and 11.8 miles southwest of the IR Site 2, respectively, at the closest point to the fault. These faults are utilized for development of the deterministic MCE. Causative fault parameters are summarized in Table 1.

Table 1
Causative Fault Parameters

Fault	Moment Magnitude	Closest Distance (miles)	Fault Type
Hayward-Rogers Creek	7.3	6.8	Strike slip
San Andreas	7.9	11.8	Strike slip

6.2. Target Bedrock Acceleration Response Spectrum

A fault model provided by Atik (2009) and based on the NGA relationships was used to determine the target MCE bedrock response spectrum to aid in selecting acceleration time histories for subsequent ground response analyses. A response spectrum was determined for both causative faults based on magnitude, distance, fault type and a presence of soft bedrock representative of the Franciscan Complex underlying the IR Site 2. Soft bedrock refers to rock having a shear wave velocity in the range of 2,500 to 5,000 feet per second (fps). The target response spectrum was conservatively taken as a composite of the Hayward-Rogers Creek Fault spectrum for periods less than 1 second and the San Andreas Fault spectrum for periods greater than 1 second as shown in Figure 1.

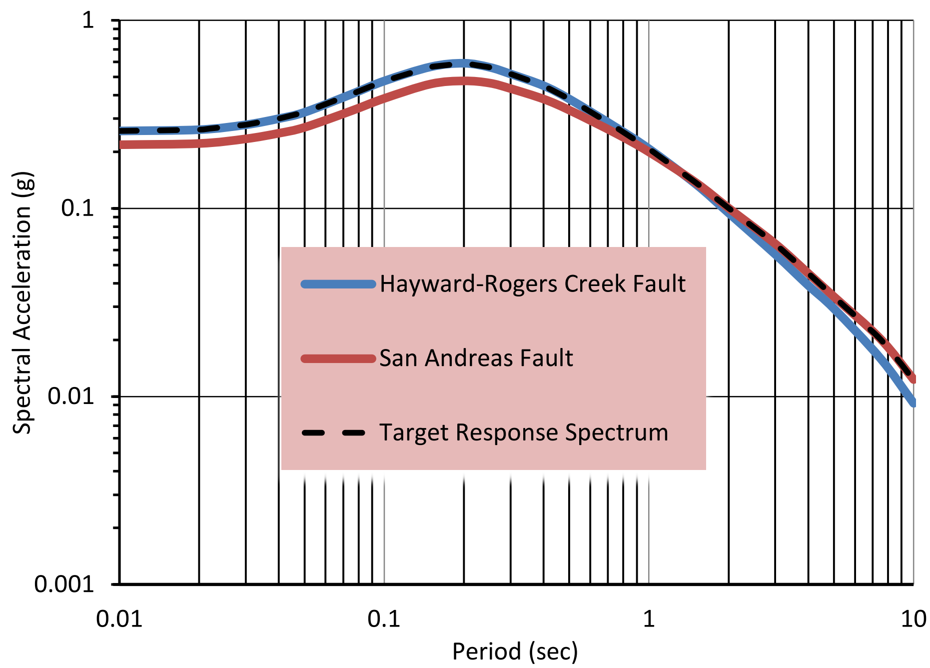

Figure 1 – Target MCE Bedrock Response Spectrum

6.3. Acceleration Time Histories

A set of 7 acceleration time histories were chosen using the 2010 Ground Motion Database provided by the Pacific Earthquake Engineering Research (PEER) Center which contains over 3,000 acceleration time histories obtained from about 100 shallow crustal earthquakes recorded at over 1,000 stations.

Acceleration time histories where chosen to match to the degree practicable the magnitude, distance, and fault type of the causative faults and to reflect the soft bedrock condition. Individual acceleration time histories were then linearly scaled such that the geometric mean of all 7 acceleration time histories matches the target bedrock response spectrum as closely as possible. The 7 acceleration time histories chosen from the database are summarized in Table 2.

Table 2
Selected Acceleration Time Histories

Record No.	Event	Year	Station	Magnitude	Fault Type	Closest Distance (mi)	Site Shear Wave Velocity (fps)	Duration (sec)	Scale Factor
164	Imperial Valley - 06	1979	Cerro Prieto	6.53	Strike slip	9.4	2,160	36	1.2486
2739	Chi Chi Taiwan - 04	1999	CHY080	6.2	Strike slip	7.8	2,230	11	1.7156
1787	Hector Mine	1999	Hector	7.13	Strike slip	7.3	2,250	10	0.7601
265	Victoria - Mexico	1980	Cerro Prieto	6.33	Strike slip	9.0	2,160	9	0.7981
1148	Kocaeli - Turkey	1999	Arcelik	7.51	Strike slip	8.4	1,720	11	1.2636
1111	Kobe - Japan	1995	Nishi-Akashi	6.9	Strike slip	4.4	2,000	10	0.6437
864	Landers	1992	Joshua Tree	7.28	Strike slip	6.8	1,240	26	0.8838
Target parameters				7.3 – 7.9	Strike slip	6.8 – 11.8	2,500 – 5,000		

The scaled acceleration time histories and geometric mean are shown in relation to the target bedrock response spectrum in the following Figure 2.

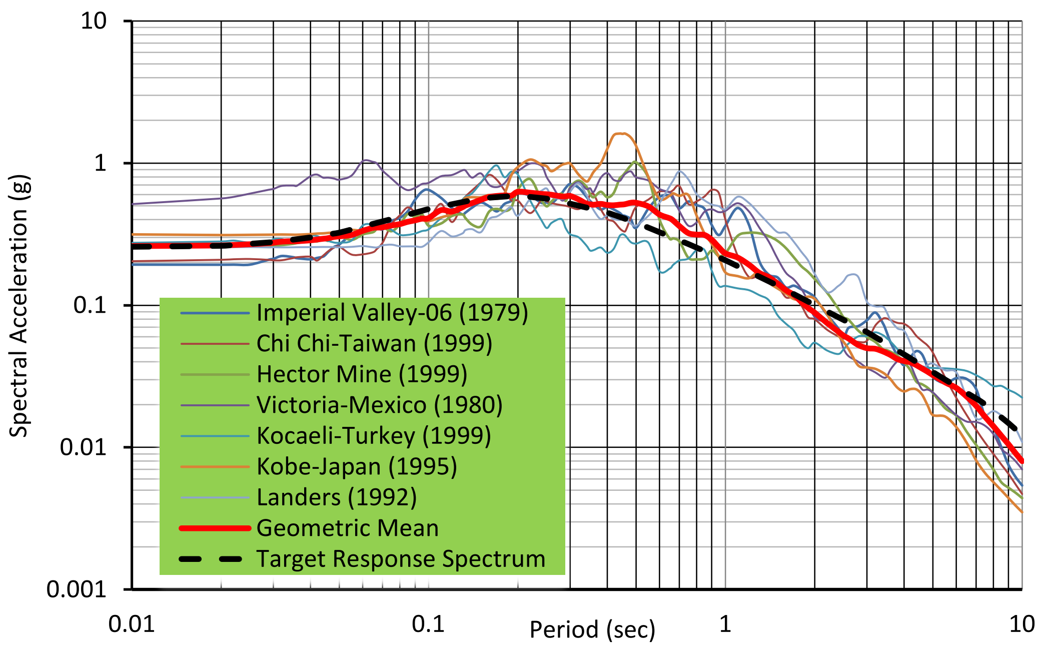

Figure 2 – Bedrock Acceleration Response Spectrum Matching

TETRA TECH

6.4. Site Specific Ground Response Analyses

The site response at the ground surface was determined by one-dimensional wave propagation analyses using the program SHAKE2000. SHAKE2000 models wave propagation through a one-dimensional column of soil. Two soil profiles were evaluated: one for the western coastal margin and one for the southern coastal margin.

SHAKE2000 models the subsurface as a layered linear viscoelastic system using the following input parameters: layer thickness, mass density, shear modulus, and material damping. The nonlinearity of actual soil is taken into consideration by an iterative sequentially linear approach where the shear modulus is modified following each iteration until the calculated strain and shear modulus fall on the pre-determined shear modulus degradation curve. The shear modulus degradation curve has been determined by others for various soil types in the laboratory. Changes in material damping with strain are accounted for by a similar damping curve.

The small strain or maximum shear modulus of soils within the upper 100 feet was determined from shear wave velocity measurements made during CPT soundings at the IR Site 2 and documented in the Tetra Tech FW report. For deeper layers, the material shear wave velocity was assumed based on published values for known geologic stratigraphic units and studies performed for the replacement of the east span of the San Francisco-Oakland Bay Bridge (Fugro-EMI, 1999) and summarized in the Tetra Tech FW report. The only exception was the selection of the properties for the Franciscan Complex, which was taken as a soft rock to rock material based on the Bulletin of the Seismological Society of America (Wills, 2000) with a shear wave velocity of 2,550 fps, which is compatible with the target MCE bedrock response spectrum.

The material parameters utilized in SHAKE2000 for IR Site 2 subsurface materials are summarized in Table 3 and shown graphically in the following Figures 3 and 4 for the western and southern coastal margin profiles, respectively.

Table 3
SHAKE 2000 Material Input Parameters

Material	Mass Density (pcf)	Shear Wave Velocity (fps)	Maximum Shear Modulus (ksf)	Material Damping (%)
Artificial Fill	110	656	1,470	5
Young Bay Mud	105	656	1,403	5
Merritt Sand	125	1,353	7,106	5
Old Bay Mud	110	825-995	1,570-3,382	5
Alameda Clay	125	950	3,503	5
Alameda Sand	125	1,500	8,734	5

6.5. Design Peak Ground Acceleration

All 7 selected and scaled acceleration time histories were input into the SHAKE2000 model for the western and southern coastal margin profiles. Representative input and output of the SHAKE2000 model is included in Appendix C of this report. The results of the SHAKE2000 analyses are summarized in terms of peak ground acceleration (PGA) in Table 5 and shown graphically as site response spectra in the following Figures 7 and 8 for the western and southern coastal margins, respectively.

Table 5
SHAKE 2000 Results Summary

Acceleration Time History Record No.	Peak Bedrock Acceleration (g)	Peak Ground Acceleration (g)	
		Western Coastal Margin	Southern Coastal Margin
164	0.193	0.213	0.176
2739	0.204	0.228	0.141
1787	0.260	0.312	0.263
265	0.515	0.410	0.355
1148	0.275	0.212	0.159
1111	0.315	0.345	0.366
864	0.255	0.411	0.385
	Average	**0.31**	**0.26**

The design PGA is taken as the average result for the 7 input acceleration time histories to be 0.31 for the western coastal margin and 0.26 for the southern coastal margin.

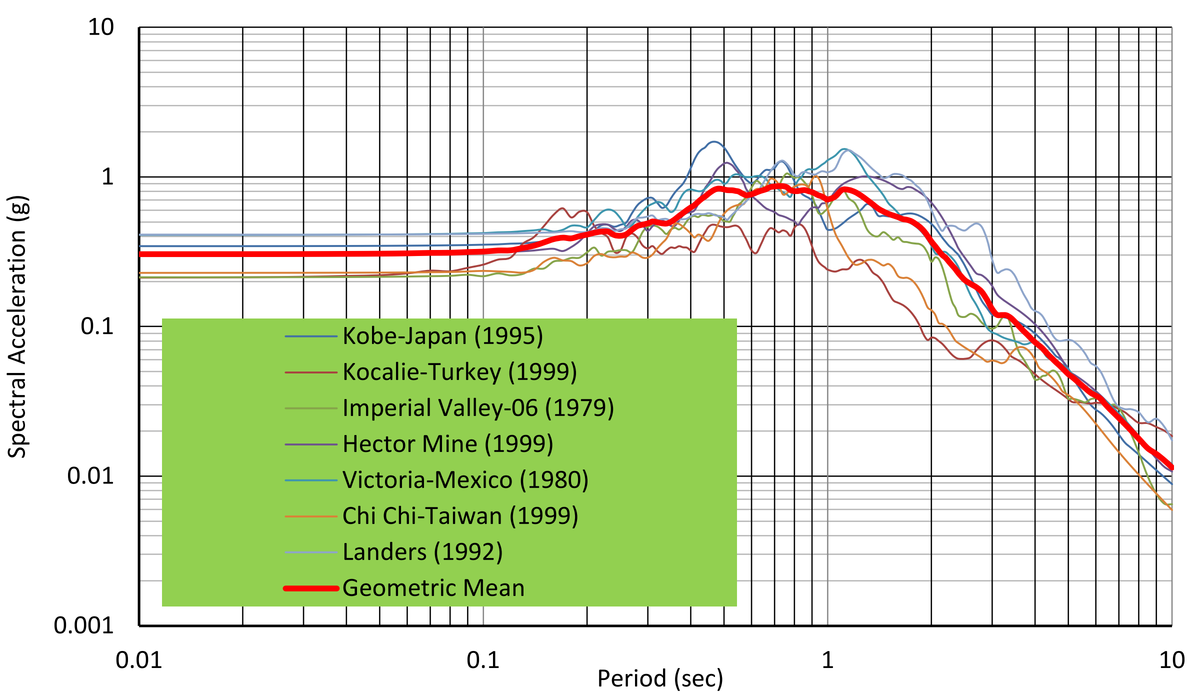

Figure 7 – Ground Response Spectrum for Western Coastal Margin

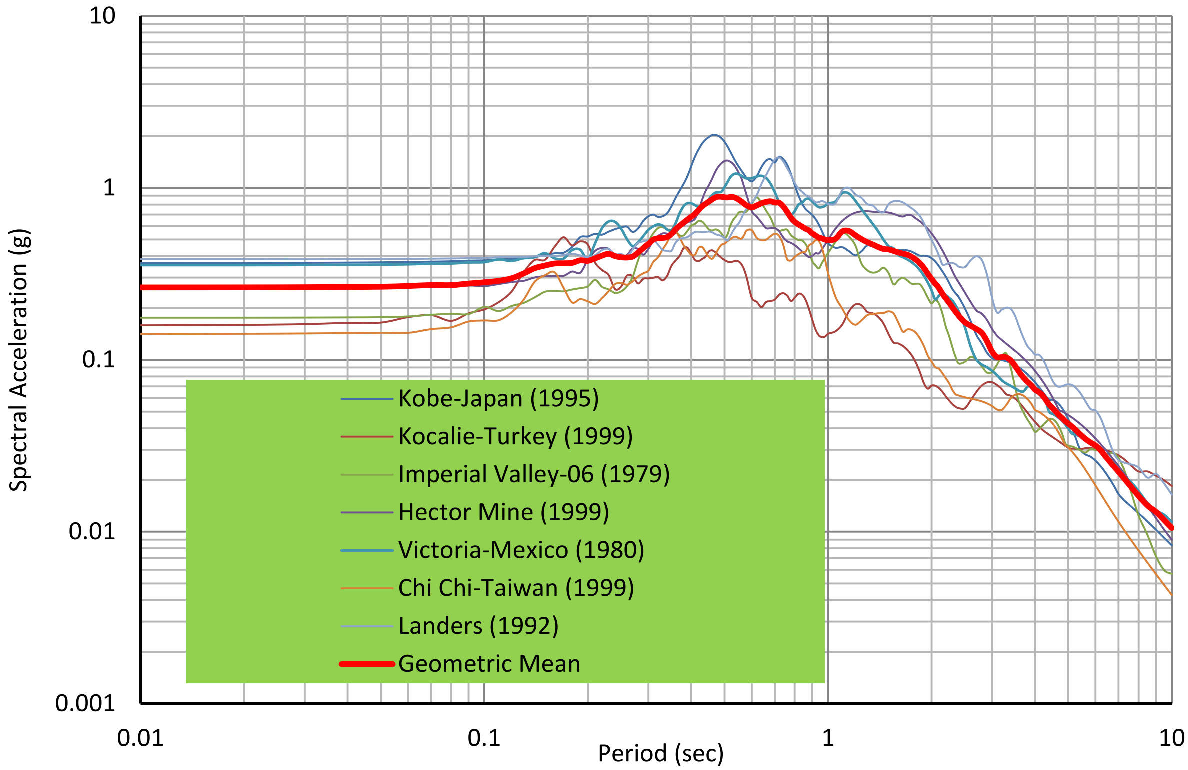

Figure 8 – Ground Response Spectrum for <u>Southern Coastal Margin</u>

7. SLOPE STABILITY AND NEWMARK-TYPE SEISMIC DEFORMATIONS

As previously stated, based on the prior reports and as confirmed by evaluations and analyses presented herein for the modeled maximum credible earthquake, the western and southern coastal margins are susceptible to seismically induced displacements or flow failure for the modeled maximum credible earthquake. The sections below provide a detailed summary of analyses performed to quantify the potential for failure and displacements.

7.1. Slope Stability and Newmark-Type Deformation Evaluation Methodology

The seawalls along the western and southern coastal margins of the landfill are considered to provide the confinement of the landfill refuse. However, the perimeter slopes, including the seawalls, were identified to be potentially unstable during a maximum credible earthquake and susceptible to permanent seismic deformation or flow failures as documented in both the Tetra Tech FW and KCH reports. Consequently, two critical sections representative of the western and southern coastal margins were developed for slope stability analyses utilizing the updated seismic demand presented in this report. For the purposes of this investigation, critical sections are defined as the steepest section at its maximum height providing the greatest potential for instability. The locations of the sections are shown on Plate 2, Site and Exploration Location Map, attached to this report. The sections are shown graphically as Geologic Sections A-A' and B-B', Plates 3 and 4, attached to this report, for the southern and western coastal margins, respectively.

A third section crossing the landfill boundary and the wetlands was considered. A similar section was also considered in the KCH report. This third section is shown graphically as Geologic Section C-C', Plate 5 attached to this report, and is considered the critical section for the wetlands margin.

To provide drainage above the steeper slopes described above, site grades have been revised since performing the slope stability evaluations presented herein. However, the analyzed design sections remain critical as defined above, and the conclusions regarding slope stability and permanent seismic deformations remain valid.

A fourth Geological Section D-D' is provided, but not for stability analysis. Section D-D' is oblique to the coastal margins and does not represent a critical section. The purpose of Geologic Section D-D' is to show the variability of the thickness of Young Bay Mud. As described in more detail in Section 11 of this report, the static long term settlement is largely controlled by the thickness of Young Bay Mud. To provide detail on such a lengthy section, a vertical exaggeration is used to make the layers legible. The vertical exaggeration results in artificially steep slopes, making the section inappropriate for stability analysis.

The purpose of the slope stability evaluation is to update the results presented in the Tetra Tech FW and KCH reports, with new consideration given to movements of the failure mass during the design earthquake event to help evaluate the potential and reach of post-earthquake flows. Slope stability evaluations were performed using the computer program SlopeW (Geo-Slope Office, 2007) using Spencer's rigorous limit equilibrium method, satisfying all three conditions of equilibrium: force equilibrium in the horizontal and vertical directions and moment equilibrium. A minimum Factor of Safety of 1 was considered acceptable for post-earthquake stability conditions as prescribed in United States Army Corps of Engineers (USACE) Manual EM 1110-2-1913 (USACE, 2000). Conversely, post-earthquake flow failure was considered eminent for a Factor of Safety less than 1.

Permanent deformations are anticipated to occur during the earthquake when inertial forces resulting from the earthquake destabilize the slope. After the earthquake, when soil strengths are fully reduced by liquefaction or softening, additional deformations may occur if the slope geometry remains unstable after the generally stabilizing deformations which occurred during the earthquake. Additional deformations after the earthquake may consist of rigid sliding mass displacements similar to the displacements predicted during the earthquake and described below until a stable configuration is achieved, or may consist of flow deformation. Flow deformation analyses based on fluid mechanics were performed to bracket the range of seismically induced permanent displacements as described in Section 8 of this report.

Deformation predictions during the earthquake were performed by pseudostatic slope stability analyses to determine the yield accelerations and double-integrating the acceleration time history for periods where the accelerations exceed the yield acceleration to compute cumulative permanent seismic displacements (Newmark, 1965).

Slope stability and Newmark-type permanent seismic deformation analyses were performed for the following cases and purposes:

- Before earthquake, static analyses mobilizing the soil's full strength were performed to evaluate the baseline stability using conventional slope stability analyses using SlopeW.

- During earthquake, pseudostatic analyses mobilizing strengths between before and after the earthquake were performed to determine the yield acceleration using SlopeW for calculating permanent seismic displacement taking place during the earthquake based on Newmark's method.

  For the coastal margin areas (Sections A-A' and B-B'), the SHAKE2000 computer program was used to perform the deformation analyses. The program uses double integration of the horizontal equivalent acceleration (HEA) time histories based on weighted-average motions within the sliding mass. The HEA is the acceleration applied to an ideal rigid sliding mass considered to be equivalent of accelerations within a flexible sliding mass where accelerations vary with depth. The deformations were calculated for all 7 scaled time histories and the average of all 7 computed deformations was taken as the prediction of permanent seismic rigid deformation during the earthquake.

  For the interior slope between the landfill and wetlands (Section C-C') where deformations are not as critical because of the width of the buffer zone between the landfill boundary and the seawall, a simplified method (Bray and Travasarou, 2007) based on a database of similar simulations as described above was used to predict permanent seismic deformations. This method is considered to yield adequate results compared to the more rigorous Newmark method. The simplified method also quantifies the probability of exceedance of a given seismic deformation, whereas the rigorous method provides a deterministic value calculated based on a given acceleration time history. The simplified method result presented for Section C-C' on Table 7 is a conservative value, i.e., probability of exceedance of only 16 percent. Results for other risk levels (probability of exceedance of 50 and 84 percent) are provided in Appendix E. The ground response spectrum shown in Figure 8 for the southern coastal margin was used for the simplified method because the subsurface conditions are similar to the interior wetlands margin slope, in particular relatively thin Young Bay Mud and thick Merritt Sand layers. The mean predicted deformation was taken as representative of anticipated permanent deformation during the earthquake.

- After earthquake, static slope stability analyses were performed to determine the stability of the sections when subgrade materials are fully weakened due to seismic loading either due to the liquefaction of sandy soils or strain softening of Young Bay Mud. When the Factor of Safety indicates instability, i.e., less than 1, additional analyses are performed to evaluate if the Newmark-type displacements during the earthquake have shifted the slope into a more stable configuration that is capable of withstanding the fully weakened strength of the subgrade materials. This analysis was accomplished by performing conventional slope stability analyses on a rotated/displaced slope geometry. The amount of rotation/displacement was chosen to roughly match the magnitude of the displacement during the earthquake calculated in the previous step. If such a configuration was stable, no post-earthquake displacements are anticipated and the magnitude of permanent seismic deformation is the Newmark-type displacement calculated in the previous step. This condition was determined applicable for the western coastal margin, Section B-B', and the wetlands margin, Section C-C'.

  However, if the displacement *during* the earthquake did not result in a stable configuration *after* the earthquake, post-earthquake movement was anticipated and in the case of the liquefied material the resulting reach of the post-earthquake flow was calculated using flow run-out analyses described in Section 8. This condition was determined applicable for the southern coastal margin, Section A-A'. This flow run-out analysis was also used in the conclusions of this report as the conservative upper-bound of the possible seismically induced permanent displacements.

7.2. Shear Strengths of On-Site Materials

Shear strength parameters were taken from applicable laboratory test results, CPT soundings, and Standard Penetration Test (SPT) results presented in the Tetra Tech FW and KCH reports. The relevant borehole logs and laboratory test results are included herein in Appendices A and B.

Shear strength parameters for the various materials comprising the perimeter slopes are summarized in Table 6 for the before and after earthquake cases. For the during earthquake case, before and after earthquake strengths were averaged and used to determine the yield acceleration for subsequent permanent deformation analyses.

The existing slurry wall is considered to be a typical bentonite-soil cut-off wall to impede gourndwater connection between the landfill and the Bay. Due to its size on the order of 2 feet wide, the existing slurry wall does not have any engineering impact on the deformation and stability analyses and was not rigorously considered.

Table 6
Shear Strength Parameters

Material	Before Earthquake			After Earthquake		
	Friction Angle (deg)	Cohesion (psf)	S_u/σ'_v (1)	Friction Angle (deg)	Cohesion (psf)	S_u/σ'_v (1)
Landfill Cover	32	150	-	32	150	-
Perimeter Berm Fill	32	150	-	32	150	-
Refuse	32	0	-	0	600	-
Hydraulic Fill	30	0	-	0	300	-
Young Bay Mud (fine-texture)	-	-	0.25	-	N/A	0.20
Young Bay Mud (coarse texture)	30	0	-	0	300	-
Merritt Sand	36	0	-	36	0	-
Old Bay Mud	-	-	0.30	-	-	0.24
Improvement Zone (western coastal margin)	0	4,750	-	0	4,750	-
Improvement Zone (southern coastal margin)	0	9,500	-	0	9,500	-

(1) Based on Stress History and Normalized Soil Engineering Properties (SHANSEP) model which relates undrained shear strength, S_u, to effective overburden stress, σ'_v, or preconsolidation pressure.

The determination of shear strength parameters are described in more detail in the following sections.

7.2.1. Landfill Cover and Perimeter Berm Fill

Strength parameters for the landfill cover and the berm fill were based on typical values for compacted fill consisting of primarily sand with some fines (NAVFAC DM 7.02, Table 1, pg. 7.2-39). No reduction in strength was used in stability analyses for these compacted fill materials above groundwater while evaluating post-earthquake stability.

7.2.2. Refuse

Strength parameters for refuse mixed with hydraulic sandy fill were estimated based on SPT results which indicate a slightly higher strength than the underlying fill, presumably due to compaction resulting from the mechanical mixing of refuse with pre-existing hydraulic fill. SPT results generally indicate a friction angle consistent with medium dense sandy material (Lambe and Whitman, 1969). This material is considered liquefiable and the residual liquefied post-earthquake strength was correlated from SPT results and taken as the lower third of the correlation (Seed and Harder, 1990).

7.2.3. Hydraulic Fill

Strength parameters for hydraulic fill were estimated based on SPT results similar to the approach described for refuse. SPT results generally indicate a friction angle consistent with loose sandy material (Lambe and Whitman, 1969). This material is considered liquefiable and the residual liquefied post-earthquake strength was correlated from SPT results and taken as the lower third of the correlation (Seed and Harder, 1990).

7.2.4. Young Bay Mud

Strength parameters for *fine-grained* Young Bay Mud were estimated based on the Stress History and Normalized Soil Engineering Properties (SHANSEP) model (Ladd and Foott, 1974) which relates the undrained shear strength to the effective overburden stress (or preconsolidation pressure) as a constant factor characteristic for the material. The Tetra Tech FW report references this factor to be 0.2 to 0.3 for the Young Bay Mud at the IR Site 2 based on strength testing and correlations with plasticity, as well as data from the nearby San Francisco-Oakland Bay Bridge east span replacement (FUGRO-EMI, 2001). Based on CPT soundings, a SHANSEP factor of 0.25 was utilized for stability analyses. Although this material is not considered liquefiable it is susceptible to weakening during a seismic event and the post-earthquake strength was estimated as 80 percent of the static strength based on testing at the San Francisco Marina District and typical for Young Bay Mud having a plasticity index of about 25 (Sitar and Rau, 1998) resulting in a SHANSEP factor of 0.20.

Strength parameters for *coarse-grained* Young Bay Mud were based on SPT results which generally indicate a friction angle consistent with loose sandy material (Lambe and Whitman, 1969). This material is considered liquefiable and the residual post-earthquake strength was correlated from SPT results and taken as the lower third of the correlation (Seed and Harder, 1990).

7.2.5. Merritt Sand

Strength parameters for the Merritt Sand were estimated based on SPT results which generally indicate a friction angle consistent with dense sandy material (Lambe and Whitman, 1969). This material is not prone to liquefaction, and no reduction in strength was considered for post-earthquake stability.

7.2.6. Old Bay Mud

Strength parameters for the Old Bay Mud were estimated based on the SHANSEP model using a constant ratio of 0.3, accounting for slightly overconsolidated stiff to very stiff clay. Although this material is not considered liquefiable it is susceptible to weakening during a seismic event and the post-earthquake strength was estimated as 80 percent of the static strength, resulting in a SHANSEP factor of 0.24. Because of the depth of the Old Bay Mud, the strength of this material has no influence on the results of stability analyses.

7.3. Results of Slope Stability Analyses

The results of the slope stability analyses are discussed in Section 9 and summarized in Table 7, including associated permanent seismic rigid deformation, and where applicable, flow run-out analyses. The graphical outputs of the slope stability analyses are presented in Appendix D of this report.

8. FLOW RUN-OUT ANALYSES

Liquefaction-induced slides of saturated sand or fully-softened, sensitive mud may be flow-like in character. Flow slides exhibit varied velocity profiles along the depth of the slide resembling the flow of fluids, whereas the rigid body displacements analyzed using conventional slope stability methods described in the previous section of this report imply a constant velocity "single-piece" movement of the slide during the analysis. Rigid materials deform by movement along discrete failure surfaces. Fluids, by contrast, deform as a whole and within the moving mass in what is termed flow. Flows exhibit deformations significantly greater than rigid body displacements.

Although most slides behave largely like rigid bodies, as the involved materials soften the deformation character transitions more towards the flow-type movement. An actual flow slide is likely to be somewhere between the two idealized end members: (1) rigid body movement previously discussed and (2) fluidized flow. The rigid body movement is conventionally and herein analyzed using limit equilibrium methods. The fluidized flow deformation analyses described below are intended to constraint the other extreme of possible deformations.

The flow-type analysis described below was used for the southern coastal margin because at this location the slope is predicted to be unstable after strong ground shaking due to the MCE has subsided. That is, the deformation occurring during the earthquake is not predicted to result in a stable configuration after the earthquake, and the slope flows until reaching a stable run-out distance predicted as follows.

8.1. Flow Rheological Model

The flow resistance depends on the rheology of the fluid. A plastic flow rheological model was chosen for the simplified flow analyses described below. Plastic flow is characterized by flow initiated only after exceeding some threshold shear strength with little viscous resistance once flow begins. Viscous resistance refers to resistance which is a function of velocity and consequently varies within the flow depth and changes with time as the flow decelerates. In contrast, flow resistance in a plastic flow is provided by a uniform, steady-state shear strength. Because plastic flow may be defined by a single shear strength parameter, the closed-form solution described below may be readily used to estimate the flow run-out distance. In this regard, the choice of a plastic flow rheological model is a matter of convenience because it lends itself to a numerically simple solution. Given that the confining contribution of the seawall is completely ignored in the method described below, the predicted run-out distance is deemed to be conservative.. For liquefied sand, the shear strength parameter used to define plastic flow is the residual, post-earthquake shear strength taken as 300 psf for hydraulic fill presented in Table 6. Plastic flows generally exhibit changes in shape with little change in volume.

8.2. Approximate Energy Method

A flow model for simplified geometries applicable to the southern coastal margin utilized herein may be developed by applying two fundamental principles of physics: (1) conservation of energy and (2) conservation of mass. The initial geometry consists of a vertical face 25 feet in height representing the seawall behind which is a uniform height/thickness of liquefied dredged sand. The final geometry is taken as a parabolic profile representing the run-out, based on the theory of roll waves in plastic medium (Lucia, 1981).

The simplified model geometry described above may also be applied to all geometries subject to plastic flow. However, this method was used only for the southern coastal margin because only at this location is the coastal margin predicted to be unstable after strong ground shaking due to the MCE has subsided and therefore subject to further flow run-out analysis.

The initial and final model geometries are shown in Figure 9.

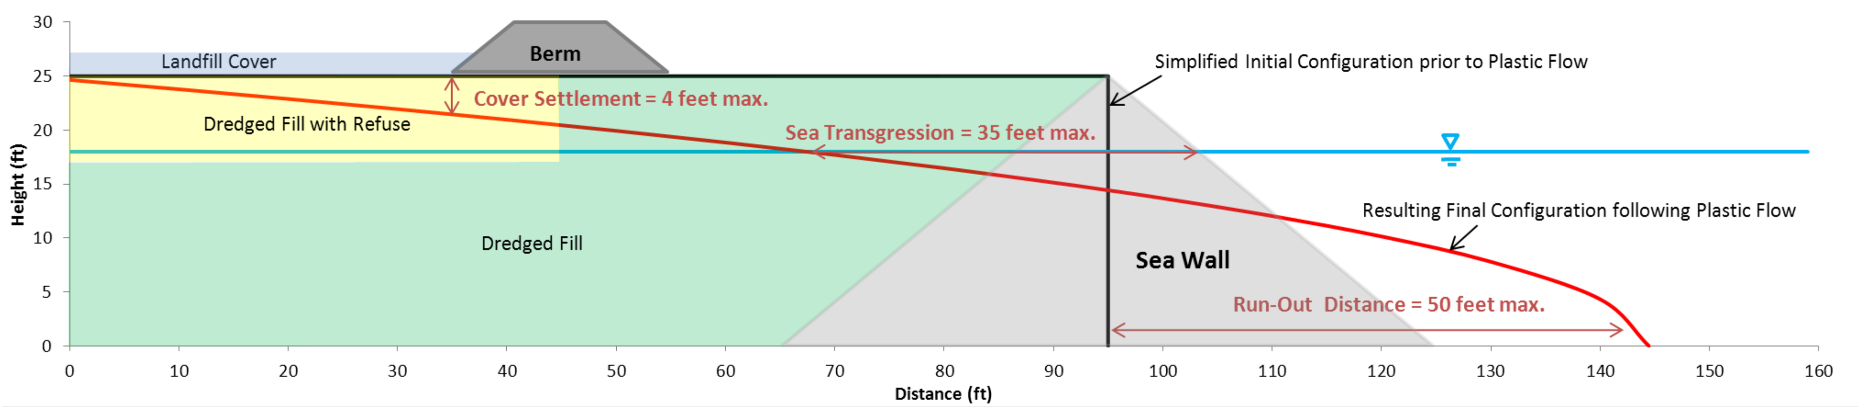

Figure 9.1 – Flow Run-Out Model, Simplified Initial and Final Geometries

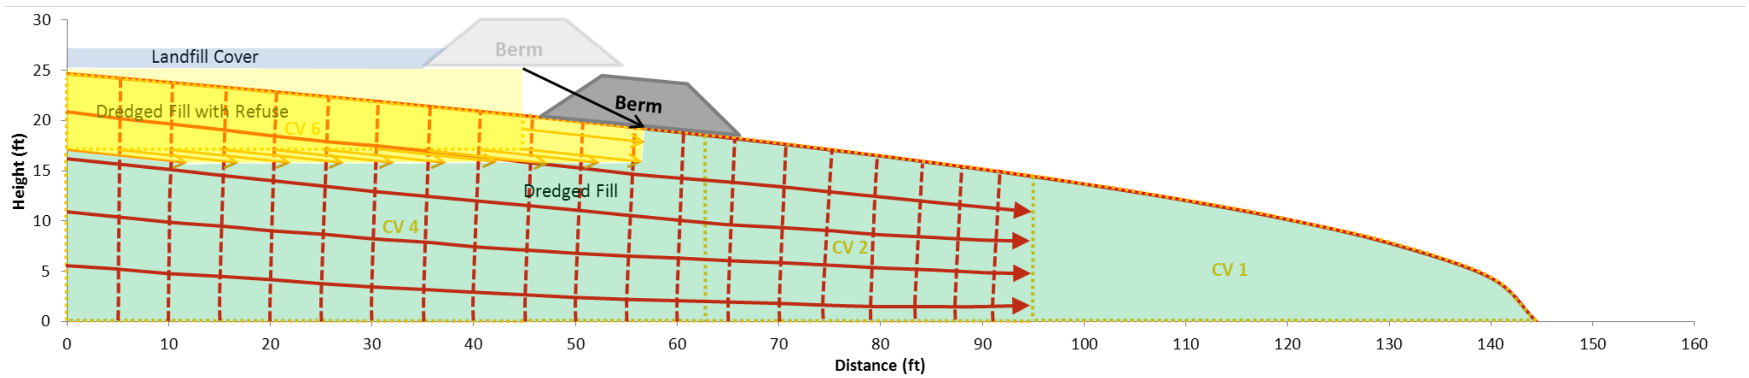

Figure 9.2 – Flow Run-Out Model, Interpreted Plastic Flow of Dredged Fill and Refuse

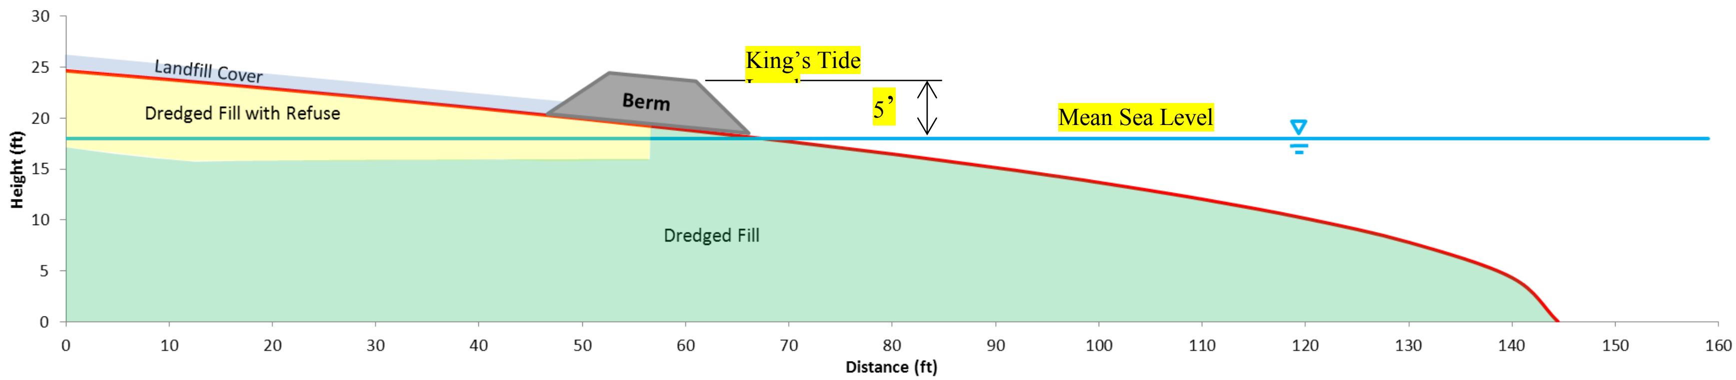

Figure 9.3 – Flow Run-Out Model, Interpreted Rigid Translation of Berm and Final Configuration

Conservation of energy is accomplished by equating the change in potential energy from the initial geometry to the final run-out geometry to the work done by the shear stress acting on the base of the flow, formulated as Equation 1; and conversation of mass is accomplished by equating the volume of the initial geometry to the volume of the final run-out geometry, formulated as Equation 2 (Hungr, 1995):

9. RESULTS OF SLOPE STABILITY AND PERMANENT SEISMIC DEFORMATION ANALYSES

The results of the slope stability and permanent deformation analyses are summarized in Table 7. The graphical outputs of the slope stability analyses are presented in Appendix D of this report. Graphical output of the SHAKE2000 deformation computations showing equivalent acceleration time histories, velocity time histories by integration, and cumulative deformation by double integration are included in Appendix E of this report. The simplified method computations for the interior wetlands margin slope are also included in Appendix E.

9.1. Slope Stability and Newmark-Type Displacement Interpretation and Conclusions

The results presented in Table 7 offer the following observations and conclusions:

- The perimeter slope at the southern coastal margin is susceptible to liquefaction and may flow as evidenced by a Factor of Safety less than 1 after the earthquake. The rigid body rotation model is not applicable to where liquefaction and/or softening reduce appreciably the soil strength. Therefore, the predicted rigid body displacements summarized above should be considered a reasonable lower bound, whereas the flow run-out displacement of 50 feet modeled after the earthquake and discussed in the following section should be considered a conservative upper bound.

- The perimeter slope at the western coastal margin stabilizes after rotation of the sliding mass during the earthquake as evidenced by a Factor of Safety greater than 1 after the earthquake;

- Based on rigid body rotation, solid refuse at the western coastal margin is not predicted to be released into the San Francisco Bay, and nor is it predicted to be inundated with water overtopping the seawall;

- The headscarp at the western coastal margin after rigid rotation is predicted to be on the order of 12 feet in height, and may expose some incidental debris beneath the perimeter berm but will generally leave the refuse prism behind the berm intact;

- The wetlands margin is stable after the earthquake even without considering potentially stabilizing deformations during the earthquake; and

- Deformations accumulating during the earthquake at the wetlands margin are not predicted to exceed 2 feet.

9.2. Flow Model Interpretation and Conclusions

The flow model makes a key simplifying, conservative but unrealistic assumption by assuming that the seawall is instantaneously whisked out of existence leaving a vertical height of liquefied sand to flow out into the San Francisco Bay. By inspection of the volume of the seawall relative to the flow mass as shown in Figure 9, it is apparent that the seawall would provide a considerable rigid shell restricting outward flow. In other words, the actual flow is a composite flow with both rigid inclusions and liquefied zones. At the southern coastal margin, where the seawall rests on liquefiable dredged sand, the seawall may drift seaward on the underlying liquefied flow. At the western coastal margin, where the seawall rests on soft bay mud, the seawall may rotate out or sink as a result of plastic flow. The above descriptions of possible seawall distortions are nowhere near as unfavorable as assumed in the model.

The berm consists of compacted fill. The materials comprising the berm are not below groundwater and consequently are not prone liquefaction. For the purposes of the model, the berm is considered to be a rigid body rafting on top of a subgrade subject to plastic flow as shown of Figure 9.2.

The following conclusions (also shown graphically on Figure 9) may be drawn:

- The conservative maximum predicted run-out of a flow slide is 50 feet past the crest of the perimeter seawall and the solid refuse is not predicted to be released into the San Francisco Bay;

- The freeboard provided by the seawall is predicted to be lost with inundation of the coastal margin;

- The cover is predicted to settle a maximum of 4 feet adjacent to the perimeter berm;

- Based on an existing top of berm elevation of 16 to 17 feet above sea level, the top of the berm after flow run-out is predicted to be at elevation 11 to 12 feet; and

- Based on a high King's tide elevation of 11.7 feet (Shaw, 2005), the berm may be crested and overtopped if a King's tide were to coincide with or occur immediately after the MCE (see Figure 9.3).

Following any significant earthquake event and in order to maintain an adequate freeboard during the King's tide and to protect against the wave lap erosion of a submerged toe of the perimeter berm, the berm should be inspected, assessed, and raised and/or armored as necessary as a part of remedial grading immediately.

Rising sea level on the order of 0.1 foot over a period of time measured in decades has been recorded at the site (Shaw, 2005). Rising sea level is considered relevant to long term maintenance of the coastal margin, not to remedial grading after an MCE or a significant earthquake event . If sea level rise is appreciable in the coming decades, the berm should be raised to keep pace with rising mean sea level as part of long term maintenance of the coastal margin.

10. LIQUEFACTION

Alameda Point including the IR Site 2 is susceptible to the hazard of liquefaction as evidenced during the 1989 Loma Prieta earthquake which resulted in sand boils, lateral spreads and ground settlement, damaging two runways at the Alameda Naval Air Station (Tinsley, 1998). The observed liquefaction hazard at the IR Site 2 is a result of loose, saturated sandy hydraulic fills placed behind the seawalls. The Tetra Tech FW report describes reported transverse cracks up to 4 inches wide and 3 to 4.5 feet deep as a result of liquefaction during the Loma Prieta earthquake. The 1989 Loma Prieta earthquake had a magnitude of 7.1 and occurred about 60 miles south of Alameda Point with a PGA of approximately 0.21g recorded at Hanger 23 of the Alameda Naval Air Station, less than 1 mile from IR Site 2. Strong shaking was observed for approximately 20 seconds.

10.1. Liquefaction Induced Settlements

The KCH report modeled liquefaction induced settlements of generally less than 4 inches, with the exception of the southern coastal margin and the center of the landfill where 10 and 12 inches of liquefaction induced settlements are modeled, respectively. The Tetra Tech FW report presents liquefaction induced settlement predictions only for the coastal margins, not the interior of the landfill, but provided similar results modeling 8 to 10 inches for the southern coastal margin and 2 to 9 inches for the western coastal margin.

The seismic demand presented in this report based on the latest generation ground motion prediction equations is less than that provided in the KCH and Tetra Tech FW reports. However, the cyclic stress ratio causing liquefaction still generally exceeds the cyclic resistance ratio of the hydraulic fill, and therefore the predictions provided in the KCH and Tetra Tech FW reports remain applicable. Predictions of liquefaction induced settlements at the IR Site 2 are included in Appendix F of this report.

10.2. Liquefaction Induced Lateral Spreading

Using empirical predictions of lateral spreads (Youd, 2002), the Tetra Tech FW and KCH reports model a broad range of liquefaction induced lateral spreads from a few inches to flows of many tens of feet. It should be understood that the method used is based on case histories of liquefaction for similar site conditions and the higher estimates for the IR Site 2 are well beyond documented case histories. As a result, estimates of lateral spreads for the MCE event at the IR Site 2 are poorly constrained and uncertain, but are generally conservative estimates.

Due to the confinement provided by the seawalls, it is our opinion that lateral spreads will be localized similarly to the experience of the 1989 Loma Prieta earthquake described in the subsequent California Geological Survey Report:

"In Alameda, Youd and Hoose (1978) identified two 1906 newspaper reports of ground settlement that caused railroad tracks in Alameda to sink about 4 feet (sites 173 and 174, Plate 1.2). Tinsley and others (1998) recorded four liquefaction sites in Alameda. Liquefaction at site 39 (Plate 1.2) made the two runways and taxiways at the Alameda Naval Air Station inoperable following the 1989 earthquake (site 39, Plate 1.2). Pipelines broke at Mariner Square (site 42), sand boils were observed at the southwestern shoreline of Alameda, at Robert W. Crown Memorial State Beach (site 44), and various effects, including approximately two dozen residential pipeline breaks, were evident at site 45, in neighborhoods near the state beach " (California Geological Survey 2003).

However, with the MCE event, lateral spreads in some areas may be on the order of several feet. Localized soil movements during the MCE event should be anticipated to distort the cover and may result in localized depressions, drainage reversals or similar effects which might require remedial grading.

It should be noted that based on the presented analyses the seawall along the southern coastal margin which is founded on liquefiable hydraulic fill and coarse-grained Young Bay Mud is susceptible to edge failure and lateral spreading.

11. STATIC LONG-TERM SETTLEMENTS

The fine-grained Young Bay Mud underlying the IR Site 2 is soft and compressible. As a result, the IR Site 2 is susceptible to consolidation settlements when surcharged with new fills. Magnitudes of consolidation settlements are anticipated to be governed by the following key factors.

- Thickness of surcharge fills; and
- Thickness of compressible fine-grained Young Bay Mud.

The KCH report predicts settlements for two conditions: thick Young Bay Mud and thin Young Bay Mud. A settlement contour map and two settlement query profiles for each condition above are reproduced in Appendix F of this report. It should be understood that the predicted settlements provided in Appendix F are based on the 60% RD grading plans. Plans currently under development propose significantly thinner fills and commensurately lower settlements should be anticipated.

For the 90% RD grading plan, based on the settlement models provided in the KCH report, settlements of up to 18 inches maybe anticipated at the northern portion of the IR Site 2 where thick deposits of fine-grained Young Bay Mud prevail and the greatest fills are planned. At the southern portion of the IR Site 2, settlements up to 3 inches maybe anticipated where the thin deposits of fine-grained Young Bay Mud prevail and the least fills are planned.

12. SUMMARY OF ANALYSES

Based on the review of the referenced geotechnical reports prepared for the IR Site 2 and additional evaluations of the seismic demand, slopes stability, predicted permanent deformations, and flow run-out analyses, the following conclusions are presented.

Permanent seismic deformations and liquefaction-induced flow failures have been modeled for the MCE event at IR Site 2. These predictions are corroborated by the analyses presented in this report. However, further analyses of permanent seismic deformations and flow run-outs presented in this report predict that the integrity of the cover will be maintained after the MCE event, based on meeting the following performance goals:

- Solid refuse is not anticipated to be released into the San Francisco Bay by the predicted permanent seismic deformations and/or flow run-outs; and
- The site will remain isolated from and will not be flooded by waters of the San Francisco Bay.

In the event that the modeled seismic deformations and liquefaction-induced flow failures occur after the MCE event, substantial remedial grading of the cover and repairs to the seawalls should be anticipated. Contingency provisions to facilitate such repairs should be developed and would need to be implemented. The function of the cover to act as a pathway interruption between landfill content and human and environmental receptors is expected to remain effective, however if left unrepaired further damage, may in time render the cover ineffective. Immediately after the MCE, cracks or openings in the cover resulting from lateral spreads should be filled by pushing in adjacent cover soil, or if needed by placing imported soil, to provide a continuous cover. Thereafter, the minimum cover thickness and grades should be re-established by remedial grading. A revised grading design may be necessary. The impact of the MCE event is summarized as follows:

- Maximum lateral displacement of seawall on the order of 10 to 50 feet;
- Maximum settlement of the cover adjacent to the coastal margin area of 4 feet;
- Lowest subsided top of berm elevation of 11 feet above sea level;
- Maximum vertical head scarp within the coastal margin and perimeter berm areas of 12 feet;
- Maximum settlement of the cover throughout the interior of the landfill of 12 inches; and
- Lateral spreads of the cover throughout the interior of the landfill of intensity capable of breaking pipelines and rendering pavements unusable where present, estimated to be on the order of several feet.

13. COVER CONSTRUCTION RECOMMENDATIONS

Prior to any grading activities, the surface should be cleared of vegetation and surface trash or debris to the degree practicable. After clearing, the exposed subgrade should be moisture conditioned to at least the optimum moisture content and compacted to at least 85 percent of the maximum dry density as determined by ASTM D1557. Prior to placing any fill materials, a representative of the Geotechnical Engineer should observe the subgrade to verify all necessary removals have been made and fill will be placed on suitable materials.

Imported fill materials necessary to achieve final grades and provide the cover should be clean and predominantly granular. Imported soils should be approved by the Geotechnical Engineer prior to arrival on site.

Fill materials should be placed in horizontal lifts of no more than 8 inches in loose thickness, moisture conditioned to at least the optimum moisture content, and compacted to at least 90 percent of the maximum dry density as determined by ASTM D1557.

14. LIMITATIONS

The recommendations and opinions expressed in this report are based on Tetra Tech's review of background documents and on information obtained from field explorations and the associated laboratory testing performed by others. It should be noted that this seismic study did not evaluate the possible presence of hazardous materials on any portion of the site which was evaluated elsewhere.

Conditions not observed and described in this report may be present on the site. It should be understood that conditions different from those anticipated in this report may be encountered during grading operations.

Changes to the applicable laws, regulations, codes, and standards of practice may occur as a result of government action or the broadening of knowledge. The findings of this document may, therefore, be invalidated over time, in part or in whole, by changes over which Tetra Tech has no control.

Tetra Tech's recommendations for this site are dependent upon appropriate quality control. Accordingly, the recommendations are made contingent upon the opportunity for Tetra Tech to observe grading operations. If parties other than Tetra Tech are engaged to provide such services, such parties must be notified that they will be required to assume complete responsibility as the Geotechnical Engineer of Record for the geotechnical phase of the project by concurring with the recommendations in this report and/or by providing alternative recommendations.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Tetra Tech should be contacted if the reader requires additional information or has questions regarding the content, interpretations presented, or completeness of this document.

Tetra Tech has endeavored to perform its evaluation using the degree of care and skill ordinarily exercised under similar circumstances by reputable geotechnical professionals with experience in this area in similar soil conditions. No other warranty, either expressed or implied, is made as to the conclusions and recommendations contained in this report.

GENERAL NOTES

Boring log data represents a data snapshot.

This data represents subsurface characteristics only to the extent encountered at the location of the boring.

The data inherently cannot accurately predict the entire subsurface conditions to be encountered at the project site relative to construction or other subsurface activities.

Lines between soil layers and/or rock units are approximate and may be gradual transitions.

The information provided should be used only for the purposes intended as described in the accompanying documents.

In general, Unified Soil Classification System designations presented on the logs were evaluated by visual methods.

Where laboratory tests were performed, the designations reflect the laboratory test results.

SOIL BORING KEY

MOISTURE CONTENT

FIELD TEST	ABBR	DESCRIPTION
Dry	D	Absence of moisture, dusty, dry to the touch
Moist	M	Damp but no visible water
Wet	W	Visible free water, usually soil is below water table

CEMENTATION

DESCRIPTION	ABBR	FIELD TEST
Weakly	WC	Crumbles or breaks with handling or slight finger pressure
Moderately	MC	Crumbles or breaks with considerable finger pressure
Strongly	SC	Will not crumble or break with finger pressure

PLASTICITY

DESCRIPTION	ABBR	CRITERIA
Nonplastic	NP	A 1/8-in (3-mm) thread cannot be rolled at any water content
Low (L)	LP	The thread can barely be rolled and the lump cannot be formed when drier than the plastic limit
Medium (M)	MP	The thread is easy to roll and not much time is required to reach the plastic limit. The thread cannot be rerolled after reaching the plastic limit. The lump crumbles when drier than the plastic limit
High (H)	HP	It takes considerable time rolling and kneeding to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump can be formed without crumbling when drier than the plastic limit

STRUCTURE

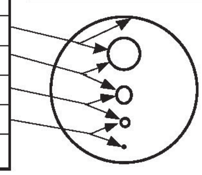
DESCRIPTION	CRITERIA
Stratified	Alternating layers of varying material or color with layers at least 1/4 in thick; note thickness
Laminated	Alternating layers of varying material or color with the layers less than 1/4 in thick; note thickness
Fissured	Breaks along definite planes of fracture with little resistance to fracturing
Slickensided	Fracture Planes appear polished or glossy, sometimes striated
Blocky	Cohesive soil that can be broken down into small angular lumps which resist further breakdown
Lensed	Inclusion of small pockets of different soils, such as small lenses of sand scattered through a mass of clay; note thickness
Homogeneous	Same color and appearance throughout

CONSISTENCY -FINE-GRAINED SOIL

CONSISTENCY	FIELD TEST
Very Soft	Thumb will penetrate soil more than 1 in. (25 mm)
Soft	Thumb will penetrate soil about 1 in. (25 mm)
Firm	Thumb will indent soil about 1/4 in. (6 mm)
Hard	Thumb will not indent soil but readily indented with thumbnail
Very Hard	Thumbnail will not indent soil

GRAIN SIZE

DESCRIPTION		SIEVE SIZE	GRAIN SIZE	APPROXIMATE SIZE
Boulders		>12"	>12"	Larger than basketball-sized
Cobbles		3 - 12"	3 - 12"	Fist-sized to basketball-sized
Gravel	coarse	3/4 - 3"	3/4 - 3"	Thumb-sized to fist-sized
	fine	#4 - 3/4"	0.19 - 0.75"	Pea-sized to thumb-sized
Sand	coarse	#10 - #4	0.079 - 0.19"	Rock salt-sized to pea-sized
	medium	#40 - #10	0.017 - 0.079"	Sugar-sized to rock salt-sized
	fine	#200 - #40	0.0029 - 0.017"	Flour-sized to sugar-sized
Fines		Passing #200	<0.0029"	Flour-sized and smaller

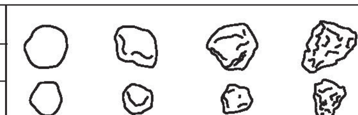


REACTION WITH HCL

DESCRIPTION	CRITERIA
None	No visible reaction
Weak	Some reaction, with bubbles forming slowly
Strong	Violent reaction, with bubbles forming immediately

ANGULARITY

DESCRIPTION	ABBR	CRITERIA
Angular	A	Particles have sharp edges and relatively plane sides with unpolished surfaces
Subangular	SA	Particles are similar to angular description but have rounded edges
Subrounded	SR	Particles have nearly plane sides but have well-rounded corners and edges
Rounded	R	Particles have smoothly curved sides and no edges



APPARENT / RELATIVE DENSITY - COARSE-GRAINED SOIL

APPARENT DENSITY	ABBR	SPT (# blows/ft)	MODIFIED CA. SAMPLER (# blows/ft)	CALIFORNIA SAMPLER (# blows/ft)	RELATIVE DENSITY (%)	FIELD TEST
Very loose	VL	<4	<4	<5	0 - 15	Easily penetrated with 1/2-inch reinforcing rod pushed by hand.
Loose	L	4 - 10	5 - 12	5 - 15	15 - 35	Difficult to penetrate with 1/2-inch reinforcing rod pushed by hand.
Medium dense	ML	10 - 30	12 - 35	15 - 40	35 - 65	Easily penetrated a foot with 1/2-inch reinforcing rod driven with 5-lb hammer.
Dense	D	30 - 50	35 - 60	40 - 70	65 - 85	Difficult to penetrate a foot with 1/2-inch reinforcing rod driven with 5-lb hammer.
Very dense	VD	>50	>60	>70	85 - 100	Penetrated only a few inches with 1/2-inch reinforcing rod driven with 5-lb hammer.

FOSTER WHEELER ENVIRONMENTAL CORPORATION

LOG OF UXO BORING B-2-12

(Sheet 1 of 1)

Client: SWDIV	Drilling Company: Western Strata Exploration
Project: CTO054 Alameda Point	Drilling Method: Hollow-Stem Auger
Project Number: 1990.054D	Sampling Method: Not applicable (see log)
Location: Installation Restoration Site 2	Borehole Diameter: 4 in.
Geologist/Engineer: V. Richards	Northing: 473,453.12 Feet (CCS27 Zone 3)
Date Started: February 13, 2002	Easting: 1,471,403.97 Feet (CCS27 Zone 3)
Date Completed: February 13, 2002	Ground Surface Elevation: 4.57 Feet MSL, NGVD 29
Total Depth: 24.0 Feet bgs	Top of Casing Elevation: NA

Depth (ft.)	Time	Comments	Water Level	USCS	LITHOLOGIC DESCRIPTION	Elevation (ft.)
0		Hand Auger 0feet to 4 feet bgs, UXO clear		SM	ARTIFICIAL FILL AND REFUSE 0 to 16 feet	4
1–3			▼ (3 ft)		REFUSE: Wood, concrete, wire and other construction debris in matrix of silty sand, soil dark blueish grey (5B 4/1), saturated at 3 feet bgs.	2
4	0814	Installed PVC at 4 feet - UXO cleared to 8 feet				0
7					REFUSE: Wood, concrete, wire and other construction debris in matrix of silty sand, soil dark blueish grey (5B 4/1)	-2
8	0821	Installed PVC at 8 feet - UXO cleared to 12 feet				-4
11					REFUSE: Wood, concrete, wire and other construction debris in matrix of silty sand, soil dark blueish grey (5B 4/1)	-6
12	0854	Installed PVC at 12 feet - UXO cleared to 16 feet				-8
16	0919	Installed PVC at 16 feet - UXO cleared to 20 feet				-12
17–18				SM	SILTY SAND: Fine sand with high plastic fines, dark blueish grey (5B 4/1)	-14
20	0957	Installed PVC at 20 feet - UXO cleared to 24 feet				-16
24		This UXO boring also utilized for the clearance of C-2-14				-20
26–28					Boring terminated by field geologist at 24 feet No refuse encountered at total depth Groundwater encountered at approximately 3 feet Boring backfilled with bentonite grout	-22

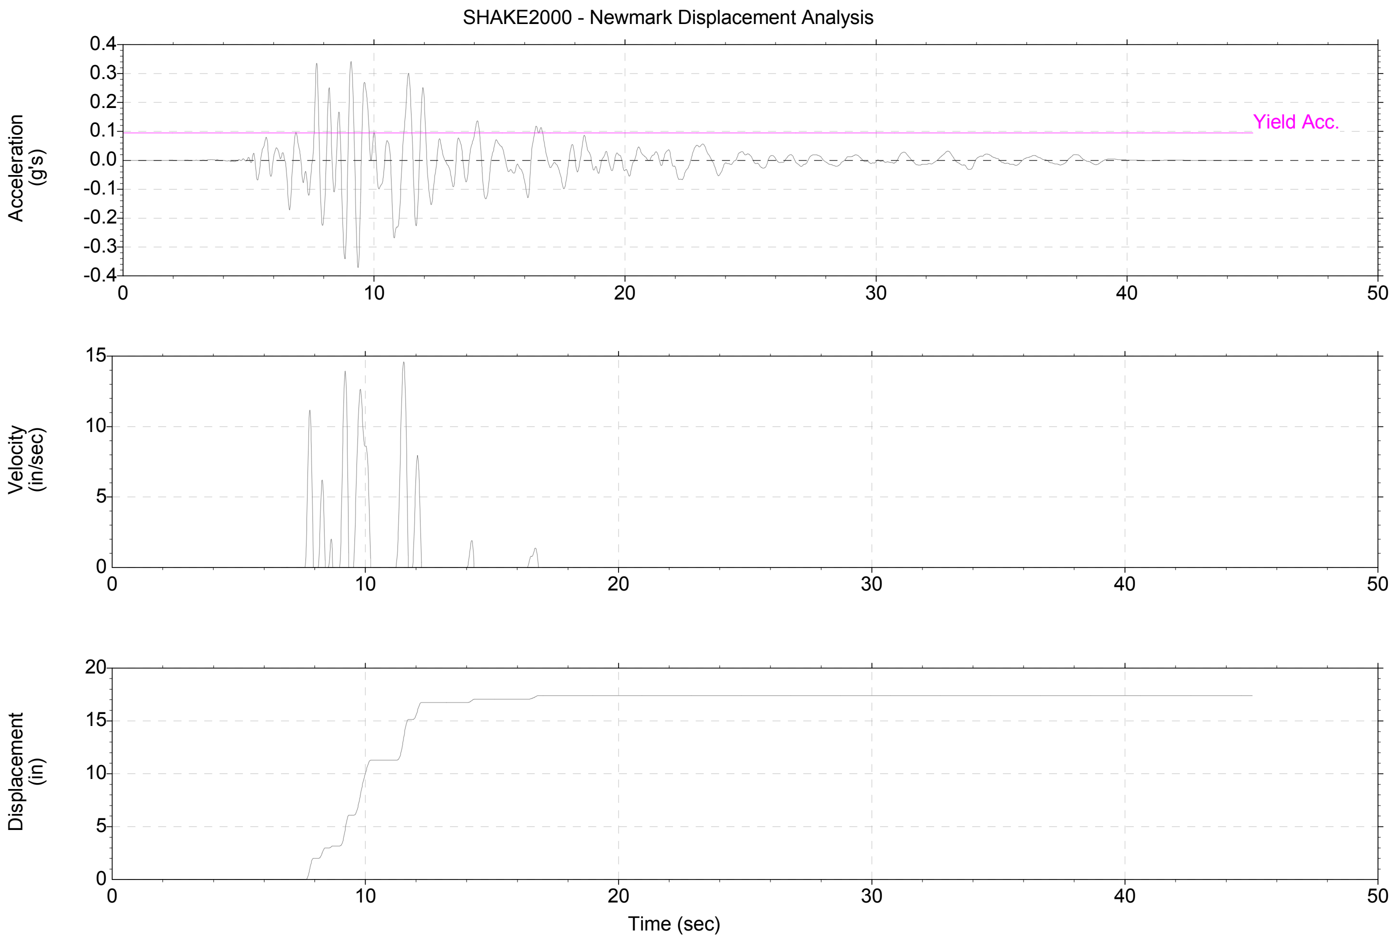
Rigorous Newmark-Type Seismic Deformations



Notes:

Displacement Analysis - Newmark Method
Project: SHAKE2000 - Newmark Displacement Analysis

Newmark Method by Franklin & Chang (1977)
Constant Yield Acceleration: .095 (g)
Acceleration Time History: Stress History Layer No. 2 - HEA - Layer: 2
- Analysis: 1 - Soil Deposit: 2
Acceleration Time History File: c:\IR2 rerun\South\South-L2A1D2-8-Soil Pro-E.NIS_FN.hea
Peak Acceleration Value: .3708882 (g)
Upslope Movement not Included in Analysis
Acceleration due to gravity: 386.4 (in/sec^2)

Displacement computed: 17.38686 in

Simplified Newmark-Type Seismic Deformations

Simplified Procedure for Estimating Earthquake Induced Deviatoric Slope Displacements
by Jonathan D. Bray and Thaleia Travasarou
Journal of Geotechnical and Geonvironmental Engineering, ASCE, V. 133(4), pp. 381-392, April 2007

SEE NOTES BELOW FOR GUIDANCE IN THE USE OF SPREADSHEET

Input Parameters			
Yield Coefficient (ky)	0.06		Based on pseudostatic analysis
Initial Fundamental Period (Ts)	0.20	seconds	1D: Ts=4H/Vs 2D: Ts=2.6H/Vs
Degraded Period (1.5Ts)	0.30	seconds	
Moment Magnitude (M_w)	7.3		
Spectral Acceleration (Sa(1.5Ts))	0.47	g	

Additional Input Parameters		
Probability of Exceedance #1 (P1)	50	%
Probability of Exceedance #2 (P2)	84	%
Probability of Exceedance #3 (P3)	16	%
Displacement Threshold (d_threshold)	15	cm

Intermediate Calculated Parameters			
Non-Zero Seismic Displacement Est (D)	29.44	cm	eq. (5) or (6)
Standard Deviation of Non-Zero Seismic D	0.66		

Results			
Probability of Negligible Displ. (P(D=0))	0.000		eq. (3)
D1	29.44	cm	calc. using eq. (7)
D2	15.27	cm	calc. using eq. (7)
D3	56.75	cm	calc. using eq. (7)
P(D>d_threshold)	0.847		eq. (7)

Notes

1. Values highlighted in blue are input parameters
2. Probability of Exceedance is the desired probability of exceeding a particular displacement value.
3. Displacements D1, D2, and D3 correspond to P1, P2, and P3, respectively.
   (e.g., the probability of exceeding displacement D1 is P1)
4. Calculated seismic displacements are due to deviatoric deformation only (add in volumetrically induced movement).
5. ky may range between 0.01 and 0.5, Ts between 0 and 2 s, Sa between 0.002 and 2.7 g, M between 4.5 and 9
6. Rigid slope is assumed for Ts < 0.05 s
7. When a value for D is not calculated, D is < 1cm
8. ky may be estimated using the simplified equations shown below.
9. Examples of how Ts is estimated are shown below.
10. Vs = weighted avg. shear wave velocity for the sliding mass, e.g., for 2 layers, Vs = [(h1)(Vs1) + (h2)(Vs2)]/(h1 + h2)

Simplified Procedure for Estimating Earthquake Induced Deviatoric Slope Displacements

Flow Run-Out Analyses

FLOW RUN-OUT ANALYSIS OF PLASTIC FLUID

Cardano's Cubic Formula Reduction

SECTION A-A' (B-B')

PROBLEM DEFINITION

95	Initial length, ft (x_0)
25	Initial height, ft (H_0)
115	Unit weight, pcf (γ)
300	Cohesion, psf (c)

CARDANO'S PARAMETERS

75	a
0	b
-4090937.5	c
364877929.7	d
-18181.9	Q
-2432519.531	R
-93492357303	D<0
2451661	SQRT (-Q3)
-0.99	R/SQRT (-Q3)
172.84	theta
57.61	theta divided by 3, degrees
1.01	converted to radian
5.19	theta+4Pi/3
0.46	cos (theta+4Pi/3)

CUBIC ROOTS

144.5	X1 - Final length (x_f)
125.0	X2, X3
24.7	Final height (H_f)

APPROXIMATE ENERGY METHOD (SIMULTANEOUS EQUATIONS)

$$\frac{c}{4}x_f^3 - \left(\frac{c}{4}x_0^2 + \gamma H_0^2 \frac{x_0}{2}\right)x_f + \frac{9}{16}\gamma H_0^2 x_0^2 = 0$$

$$H_0 x_0 = \frac{2}{3}H_f x_f$$

Alameda Installation Restoration Site 2, Former Naval Air Station Alameda, Alameda County, California

Project Settings

Document Name: Alameda_Point_ThickYBM
Project Title: Alameda Installation Restoration Site 2, Former Naval Air Station Alameda, Alameda County, California
Analysis: Consolidation settlement calculation
Author: John Liao
Company: Kleinfelder
Date Created: 6/9/2011, 1:46:30 PM
Stress Computation Method: Westergaard
Time-dependent Consolidation Analysis
Time Units: months
Permeability Units: feet/day
Include buoyancy effect when material settles below water table
Include vertical stress reduction due to settlement above a point
Use average properties to calculate layered stresses
Groundwater method: Water Table
Water Unit Weight: 0.0624 kips/ft^3
Depth to water table: 5 [ft]

Stage Settings

Stage #	Name	Time [months]

Settle3D Analysis Information

Alameda Installation Restoration Site 2, Former Naval Air Station Alameda, Alameda County, California

Project Settings

Document Name: Alameda_Point_ThinYBM
Project Title: Alameda Installation Restoration Site 2, Former Naval Air Station Alameda, Alameda County, California
Analysis: Consolidation settlement calculation
Author: John Liao
Company: Kleinfelder
Date Created: 6/9/2011, 1:46:30 PM
Stress Computation Method: Westergaard
Time-dependent Consolidation Analysis
Time Units: months
Permeability Units: feet/day
Include buoyancy effect when material settles below water table
Include vertical stress reduction due to settlement above a point
Use average properties to calculate layered stresses
Groundwater method: Water Table
Water Unit Weight: 0.0624 kips/ft^3
Depth to water table: 5 [ft]

Stage Settings

1.0 INTRODUCTION

This Radiological Work Plan for IR Site 2 (Rad Work Plan) describes survey, decontamination procedures, and methodologies to support implementation of the remedial action for soil at Installation Restoration Program (IR) Site 2, Alameda Point, Alameda, California. Tetra Tech EC, Inc. (TtEC) was contracted by the Department of the Navy (DON) to prepare the Remedial Action Work Plan (RAWP), to which this Radiological Work Plan is attached, under Contract Task Order 0009, Contract No. N62473-10-D-0809 for the Base Realignment and Closure (BRAC) Program Management Office (PMO) West under Naval Facilities Engineering Command Southwest.

The selected remedy for soil, as outlined in the Record of Decision (ROD) for IR Site 2, is the installation of a multilayer soil cover (cover), engineering and institutional controls (ICs), and monitoring (DON 2010). The RAWP in conjunction with the 100% Remedial Design (Attachment 1) provides details, specifications, and design drawings for the construction of the cover. The methodologies and processes described in this Rad Work Plan apply to operational radiological activities performed by TtEC in relation to this project. A basic concept in radiation protection specifies that exposures to ionizing radiation and releases of radioactive material should be managed to reduce collective doses to workers and the public and ensure that exposure is as low as reasonably achievable (ALARA). The ALARA principle will be considered during the course of the radiological work carried out under the Rad Work Plan for survey activities.

The objective of this Rad Work Plan is to provide the radiological procedures and methodologies for:

- Clearance of vegetation and subgrading IR Site 2
- Performing an initial survey of the subgrade prior to installing the cover to establish baseline risk and dose estimates
- Removing identified radioactive contamination at twice background radiation levels based on the initial survey
- Disposing of soil exceeding the release criteria for the radionuclides of concern (ROCs) from the ROD (Navy 2010) as low-level radioactive waste (LLRW)
- Performing a final survey of the 2-foot cover to establish final risk and dose estimates
- Providing modeling to demonstrate that, with the 2-foot cover installed, the maximum annual dose to an individual of 15 mrem, and the excess lifetime cancer risk (ELCR) at 3×10^{-4} for the critical group, are not exceeded.

The radiological activities that support the objective of the Rad Work Plan include:

- Reference (background) surveys

- Scoping surveys
- Remedial action support surveys
- Final Status Surveys (FSSs)
- Personnel surveys
- Equipment and material surveys
- Truck surveys
- Decontamination

Where applicable, radiological survey activities will be conducted in accordance with the guidelines in the Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM), Nuclear Regulatory Commission (NRC) NUREG-1575 (DoD et al. 2000), as incorporated into this Rad Work Plan. Other survey activities as well as activities not addressed by MARSSIM will be performed in accordance with this Rad Work Plan and the Standard Operating Procedures (SOPs) and the Radiation Protection Plan (Attachment 3 to the RAWP). Table 1-1 lists each of the TtEC field SOPs developed for performing radiological work at Alameda Point.

This Rad Work Plan is organized as follows:

Section 1.0 Introduction – Section 1.0 provides an overview of the project scope, work objectives, and organization of the Rad Work Plan.

Section 2.0 Background – Section 2.0 describes Alameda Point, provides a historical summary of IR Site 2, and includes an overview of the radiological history of IR Site 2.

Section 3.0 Key Radiological Personnel and Work Control Procedures – Section 3.0 discusses the project organization, roles and responsibilities of key project personnel, personnel qualifications, and work control activities.

Section 4.0 ALARA – Section 4.0 discusses ALARA quantitative and qualitative analysis.

Section 5.0 Radiological Controls – Section 5.0 includes a summary of field implementation procedures and practices for the radiological control elements of the project.

Section 6.0 Project-Specific Radiological Control Practices – Section 6.0 describes the overall project in terms of radiological impacts and project-specific radiological control practices.

Section 7.0 Radiological Survey Types, Area Classification, and Selection – Section 7.0 identifies the types of surveys that will be conducted, and discusses survey area classification and survey type selection.

Section 8.0 Survey Overview – Section 8.0 presents an overview of survey planning, survey implementation, and data assessment.

Section 9.0 Release Criteria and Investigation Levels – Section 9.0 identifies the criteria for radiological release for unrestricted use.

Section 10.0 Instrumentation – Section 10.0 identifies field instrumentation that will be used to perform surveys.

Section 11.0 Survey Implementation – Section 11.0 presents the approach to implementing surveys that will be conducted as well as associated sampling activities.

Section 12.0 Decontamination and Disposition – Section 12.0 discusses the survey and construction activities that will be implemented to perform remedial action at sites contaminated by radiation above release limits.

Section 13.0 Radioactive Materials Management – Section 13.0 describes how radioactive materials will be managed, including control of samples, work areas, and wastes.

Section 14.0 Documentation and Records Management – Section 14.0 presents procedures that will be used to manage records/documentation, as well as to assess, interpret, and report data.

Section 15.0 References – Section 15.0 presents references cited in this Rad Work Plan.

This page intentionally left blank.

2.0 BACKGROUND

The following section provides a brief radiological history of IR Site 2. The location, description, general site history, and a summary of previous investigations including radiologic surveys and removal actions can be found in Section 2.0 of the RAWP. A figure showing site features is included as Figure 2-2 in the RAWP.

2.1 RADIOLOGICAL HISTORY

IR Site 2 consists of a former landfill, wetlands area, the interior margin (location of the RadShack Area discussed below), and the coastal margin. The landfill covers approximately 60 acres and is bounded to the north by the interior margin and the east by runways and tarmacs. The former landfill was reportedly used for disposal of wastes generated by Former Naval Air Station (NAS) Alameda activities from 1956 through early 1978 (DON 2010). Radioactive items potentially disposed of in the IR Site 2 (West Beach) landfill could have included but are not limited to wastes from radium painting operations, damaged instruments, and other radioluminescent devices including both radium and strontium deck or bridge markers, thoriated glass optical devices, depleted uranium counterweights, and residue from washdown of aircraft participating in observations of nuclear weapons testing and the aftermath. The Historical Radiological Assessment (HRA) and the ROD list cesium-137 (^{137}Cs), cobalt-60 (^{60}Co), radium-226 (^{226}Ra), strontium-90 (^{90}Sr), thorium-232 (^{232}Th), and uranium-238 (^{238}U) as ROCs. The ROCs and their respective release criteria can be found in Table 2-1.

As part of the environmental investigations being performed to facilitate transfer of Alameda Point, an HRA that documents the history of radiological materials at Alameda Point was generated (Weston 2007). As early as 1973, the radioactive wastes generated by NAS, Naval Air Rework Facility, and Naval Air Depot were being disposed of by licensed radioactive waste disposal firms at approved disposal facilities. In 1983, a DON Initial Assessment Study (E&E 1983) reported the use of radioactive materials at Alameda Point starting in the 1940s, particularly at the dial painting section of the instrument shop at Building 5. Dial painting consisted of a two-step process. First, refurbished old aircraft dials were scraped and cleaned in solvent. Then the dials were repainted with radioluminescent paint containing ^{226}Ra. Radium-impacted waste (scraping solids, rags, used paint brushes, and so forth from refurbishing dials and gauges) was collected from the shop and discarded at IR Sites 1 and 2. The radium painting shop was closed in the early 1960s (exact date unknown), and a contractor decontaminated the facility.

Disposal of radioluminescent devices containing radium was not controlled by specific procedures until the late 1960s. Before that time, it was common practice throughout private industry and the military to dispose of radioluminescent instruments and articles by burial in landfills. Other radionuclides were used in radioluminescent devices, but ^{226}Ra is the primary ROC. This survey and previous radiation surveys by PRC Environmental Management, Inc.

(1997) and Supervisor of Shipbuilding, Conversion and Repair, Portsmouth (1999) substantiated these conclusions.

Preliminary radiological surveys were completed at IR Site 2 in September 1995. One anomaly was recovered from the landfill based on this survey. In 1998/1999, a gamma radiation survey using 2-inch by 2-inch sodium-iodide (NaI) scintillation detectors was conducted at the landfill. Fifty locations with the highest readings were excavated and discrete anomalies removed. In 2004, Tetra Tech FW, Inc. conducted radiological characterization surveys at IR Site 2 (TtFW 2005). Soil samples collected indicated ^{226}Ra at levels above background concentrations.

In 2006, TtEC performed additional radiological surveys of the shoreline and the former RadShack Area. The results of these surveys were used to determine the location of radiological anomalies. These anomalies were subsequently removed under a time-critical removal action (TCRA) scope of work (TtEC 2009). The primary objective of the TCRA was to mitigate the potential risk posed by material potentially presenting an explosive hazard and radiological contamination at IR Sites 1, 2, and 32 and the threatened release of hazardous substances to the environment. The radiological removal action objectives were: 1) To prevent ingestion, dermal contact, or inhalation of radiological anomalies with concentrations that significantly exceed background concentrations (6,000 counts per minute [cpm]) and 2) To ensure that the total effective dose equivalent received through all potential pathways from the radium-impacted waste in the surface and subsurface to any member of the public does not exceed 15 millirems per year. During the TCRA, items and soils contaminated with ^{226}Ra were identified and removed from IR Site 2. However, the horizontal and vertical extent of contamination was greater than expected and complete removal was not feasible. Field conditions indicated that ^{226}Ra contamination is still present throughout IR Site 2.

2.1.1 RadShack Area

The RadShack Area is an approximately 32-foot by 42-foot area formerly the site of a small structure (RadShack) used to store radioactive material while awaiting disposal. The RadShack Area was originally a small wood frame structure surrounded by a locked security fence north of the former landfill and west of the ammunition bunkers. At various points throughout its operation from approximately 1973 to 1980, the RadShack was used as a turn-in point for radioactive items to be disposed of either within IR Site 2 or at an off-site location. A number of remedial actions to remove ^{226}Ra devices were conducted. Soil samples in the area of the RadShack indicate that ^{226}Ra levels are still above background concentrations.

3.0 KEY RADIOLOGICAL PERSONNEL AND WORK CONTROL PROCEDURES

This section describes the responsibilities of key personnel necessary for management of radiological activities at Alameda Point. In addition, this section identifies the minimum training requirements for workers at Alameda Point and work control procedures including Radiation Work Permits (RWPs) and radiological notifications.

3.1 KEY RADIOLOGICAL PERSONNEL

Specific personnel are essential in performing radiological activities at Alameda Point. Qualified and experienced personnel will fulfill the necessary functions to ensure the consistent and successful implementation of radiological work activities at Alameda Point. All key radiological personnel are expected to have the requisite skills necessary to perform these functions. The key radiological personnel include the following:

3.1.1 Radiation Safety Officer

The Radiation Safety Officer (RSO) is responsible for implementing, directing, and supervising all radiological project-related activities. The RSO or designee has the responsibility and authority to perform the following:

- Providing oversight of implementation and ensuring compliance with the applicable NRC (or Agreement State, if applicable) Service Provider Radioactive Materials License (RML)
- Serving as contact for NRC site inspections
- Assisting DON representatives during site audits
- Controlling exposure conditions for site workers
- Implementing a dosimetry program for all site workers entering radiologically controlled areas
- Enforcing radiological controls
- Coordinating radiological activities with other NRC or Agreement State licensed contractors
- Ensuring all radiological work activities comply with RML requirements
- Identifying radiological analysis needs
- Providing health physics guidance on an as-needed basis
- Providing radiological control protection services, if required
- Directing and assisting radiological personnel in proper completion of radiological records

- Assisting the Radiation Safety Officer Representative (RSOR) to determine if an external dose is to be assigned to an individual who reported lost or damaged dosimetry devices
- Reviewing all changes to the Sampling and Analysis Plan (SAP) to ensure radiological requirements are met
- Ensuring that the required radiological safety training is provided
- Reviewing and approving project field procedures associated with the handling of radioactive materials or access to radiological areas
- Ensuring timely and thorough review of records, in accordance with the NLP-07 Radiological Records corporate SOP, prior to approval
- Approving records with verifiable signature and date once records meet the quality standards as described in the NLP-07 Radiological Records corporate SOP
- Conducting radiation incident investigations
- Conducting radiological inspections
- Conducting data assessments and evaluations

3.1.2 Radiation Safety Officer Representative

The RSOR will report directly to the RSO and will perform on-site duties as designated by the RSO. In accordance with DON requirements, the RSO or a qualified designee will be on-site during radiological work activities conducted under this Rad Work Plan. The RSOR has the responsibility and authority to perform and/or delegate the following:

- Implementing, directing, and supervising on-site radiological activities
- Assisting in identifying radiological analysis needs
- Providing health physics guidance
- Assisting in establishment of radiological controls
- Overseeing preparation and approval of radiological documents and field procedures
- Establishing personnel monitoring requirements
- Establishing, implementing, and monitoring on-site radiological training programs
- Conducting assessments of field practices and procedures
- Reviewing and approving data from radiological investigations, surveys, and remediations
- Assisting the RSO in ensuring adequate radiological controls are in place at the work site
- Assuring that specified radiological safety procedures are followed and that the radiological safety tests and inspections are complete and acceptable

- Conducting daily oversight and field safety inspections and tests required by the project technical specifications and applicable professional standards
- Attending required meetings, including the pre-construction conference, weekly quality control (QC) meetings, pre- and post-construction site inspections, and other scheduled and unscheduled meetings
- Administering the on-site dosimetry program
- Verifying compliance with on-site RWPs and SOPs (including laboratory SOPs)
- Assisting the RSO in reviewing changes to the SAP to ensure radiological requirements are met
- Approving issuance of any work document pertaining to radiological safety issues
- Providing surveillance of radiological-related activities
- Assisting the RSO in directing the production of radiological work documents and reports
- Conferring with radiological personnel to provide technical advice and to resolve problems
- Preparing daily project status reports
- Notifying the RSO regarding radioactive anomalies
- Managing the storage of radioactive waste in accordance with the RML
- Overseeing task-specific radiological field activities for compliance with the RML and approved plans, work instructions, SOPs, instrument specifications, and state-of-the-art health physics practices
- Preparing RWPs to outline field conditions, radiological control requirements, and personal protective equipment requirements in the field for RSO approval
- Ensuring all field staff are properly trained and comply with the RWP
- Supervising field staff during survey, site remediation, and decontamination activities, use of survey equipment and instrumentation, and support of other radiological activities
- Ensuring compliance with the applicable SOPs for safety program, survey, and/or remediation activities
- Interpreting and verifying task-specific data accumulated during surveys and monitoring activities

3.1.3 Radiological Control Technicians

Radiological Control Technicians (RCTs) will support projects in the field and have the responsibility and authority to perform the following:

- Performing radiological field activities under the direction of the RSOR or designee in accordance with approved work documents and RML requirements

- Documenting field survey activities in accordance with the Rad Work Plan and SOPs
- Interpreting and verifying field data gathered during survey and monitoring activities
- Supporting dose assessments, and ensuring compliance with emergency plans and procedures
- Performing effluent monitoring and radioactive material inventories
- Performing survey equipment response checks and daily checks of the survey instruments
- Conducting safety evaluations of health physics field and laboratory equipment
- Implementing use of RWPs, including being present at active work areas to ensure compliance

3.2 MINIMUM TRAINING REQUIREMENTS

The minimum training requirements for personnel working in the field at NAS include the following:

- Occupational Safety and Health Administration 40-Hour and Annual 8-Hour Refresher
- Radiation awareness and RWP training
- Activity Hazard Analysis training for the specific task
- Training as required by the implemented Accident Prevention Plan (APP)/Site Safety and Health Plan (SSHP)

3.3 WORK CONTROL PROCEDURES

Prerequisites for the initiation of survey activities include review of the Rad Work Plan, radiological evaluation of the designated work areas, and identification of any potential safety concerns. Work control procedures include the preparation and review of RWPs, work instructions, and appropriate notifications of anomalies or significant radiological events.

3.3.1 Radiological Health and Safety

SOPs and work instructions will be used to address controls necessary for radiologically safe operations. Table 1-1 lists each of the TtEC field SOPs developed for performing radiological work at Alameda Point.

Dose rate, contamination, and air monitoring, including initial baseline sampling to determine radiological background conditions, will be performed as necessary and in accordance with the APP/SSHP. Field activities will be performed in accordance with the approved RWP and APP/SSHP. RWPs will be prepared in accordance with the Radiation Protection Plan (RPP) (Attachment 3 to the RAWP) and SOP 10, Issue and Use of Radiation Work Permits. Personnel protective equipment (PPE) levels, dictated by radiological considerations and physical and chemical safety issues identified at each work location, will be assigned or modified, according to the approved RWP and APP/SSHP and SOP 5, Radiological Protective Clothing Selection, Monitoring, and Decontamination.

3.3.2 Task-specific Work Instructions

In limited situations involving ancillary radiological activities (e.g., monitoring well destruction in radiologically impacted areas), or to further augment SOPs, radiological work instructions may be prepared to facilitate a specific activity. These radiological work instructions, when used, will be provided to the BRAC PMO and the Radiological Affairs Support Office (RASO) for review and approval.

3.3.3 Notifications

During survey activities, radioactive anomalies may be identified and significant radiological events could occur. For the purposes of the Rad Work Plan, an anomaly is described as a reading or result that appears to be an outlier in the professional judgment of the RSOR. When an anomaly is identified, the RSOR will notify the RSO and Supervising Project Manager who will notify the BRAC PMO Remediation Project Manager (RPM) and the RASO. If neither the RSO nor the Supervising Project Manager is available, the RSOR will leave a voice mail and confirmatory e-mail describing the anomaly and follow up with a call to the appointed designee, if any.

Significant events include regulatory visits (such as by the NRC or other regulatory agencies), radiological issues, injuries, and breaches in security. All significant events will be disclosed to the RPM and RASO as described above. Any radiological issues will also be reported to the RSO.

This page intentionally left blank.

4.0 ALARA

ALARA is a philosophy of striving for excellence in the practice of health physics and is an important aspect of radiation-safety regulations. The National Council on Radiation Protection and Measurements has stated "ALARA is simply the continuation of good radiation-protection programs and practices which traditionally have been effective in keeping the average and individual exposures for monitored workers well below the limits." The application of ALARA clearly includes the consideration of economic and social factors, and thus will inherently be different for different sources or facilities.

The ALARA concept is founded in the professional judgment of radiation-safety managers and personnel and, therefore, cannot be used as a measure for whether or not a particular radiation-safety program is adequate in comparison with other programs. Additionally, the ALARA concept does not provide a numerical limit below which the ALARA concept is achieved.

Steps to be taken to implement the environmental ALARA policy are:

- Identification of Potential Radiological Impacts
- Review of Radiological Impacts
- Performance of Qualitative ALARA Analyses
- Performance of Quantitative ALARA Analyses

4.1 IDENTIFICATION OF POTENTIAL RADIOLOGICAL IMPACTS

Each new radiological operation is subjected to ALARA reviews before work begins to ensure that radiation exposures to workers, the public, and the environment meet ALARA principles. ALARA reviews are conducted for all operations, practices, and procedures that have potential for individual or collective doses to workers. Reviews culminate in changes or additions to work planning documents, SOPs, and radiological work permits.

These documents are used to identify activities that have potential for radiological environmental impacts and could require environmental ALARA analysis. If a radiological impact that could significantly affect the environment is identified, the RSO communicates the impact to the work staff and the RASO.

4.2 REVIEW OF RADIOLOGICAL IMPACTS

Radiological impacts to the environment, workers, and the public from field operations are assessed for compliance with ALARA principles. Results from radiological survey activities, and air, soil, sediment, and water samples are used to assess the radiological impacts of removal activities.

Determination of environmental radiological impacts from radiological activities is performed using nine methods: 1) air monitoring stations located around intrusive work site perimeters to track radiological impacts; 2) field monitoring and sampling to identify areas requiring additional remediation; 3) remediation of contaminated areas at or above the release criteria; 4) control of radiologically impacted areas and work sites; 5) frisking of personnel and examining equipment leaving a radiologically controlled area; 6) use of release criteria that equate to dose and risk; 7) review of historical radiological operations to allow complete investigation of all areas of radiological concern; 8) complete characterization of radiologically impacted sites to ensure complete removal of radioactive material above the release criteria; and 9) dosimetry worn by personnel to measure time-averaged doses from gamma radiation.

4.3 PERFORMANCE OF QUALITATIVE ALARA ANALYSES

For FSSs, laboratory analyses of soil samples are performed for all ROCs to ensure that any possible radioactive contamination is identified. An assessment of the qualitative radiological impacts is conducted by performing a dose and risk assessment. The results of analyses and assessments are provided to the RASO and regulatory agencies for review.

4.4 PERFORMANCE OF QUANTITATIVE ALARA ANALYSES

Based on qualitative ALARA analyses, excavation projects that could cause a potential dose to the public are subjected to quantitative ALARA analyses using the steps described below.

Quantitative ALARA analyses include societal, technological, economic, and public policy considerations. In addition, these ALARA analyses consider NRC guidance for performing the following environmental ALARA assessments:

- Identification of possible radiation protection systems, such as alternative operating methods or controls, that are reasonably achievable. The options should range from the most rudimentary (base case) to the most technologically sophisticated systems.
- Quantification of exposures and doses to workers and the public in the vicinity of the work through air monitoring and dosimetry.
- Quantification of the economic factors, including the costs of purchasing, installing, operating, and maintaining the radiological equipment, and the potential health effects associated with the exposure of people and any other direct or indirect cost resulting from exposures to radiation during investigations and/or remediations.
- Identification and estimation of other health and nonhealth detriments and benefits, such as equipment loss and accidents.
- Evaluation of process alternatives using a quantitative cost-benefit analysis, when possible. When evaluations included assumptions, judgments, and limitations that could be quantified, and potential doses were well below the dose limit, qualitative analyses are used with full documentation.
- Implementation of the ALARA principles and monitoring of the results.

The following specific factors are used when performing a quantitative ALARA analysis:

- Dose to workers, the public, and the environment before and during work processes
- Residual dose to the local population
- Applicable alternative processes (treatments, operating methods, or controls) for site investigations or remediations
- Costs for each alternative evaluated
- Societal and environmental (positive and negative) impacts associated with alternatives

Based on recent estimates of dose to the public from removal action activities at former NAS Alameda, only qualitative ALARA analyses are required. Much of the data and analysis used for environmental ALARA evaluations is developed as part of the routine work processes.

To ensure that ALARA levels are met, project actions are designed to 1) reduce ionizing radiation to a level below risk based goals for institutional controls and 2) eliminate identified pathways of exposure to ionizing radiation via cover installation.

This page intentionally left blank.

5.0 RADIOLOGICAL CONTROLS

This section details activities and procedures or references the applicable SOPs that are necessary to provide for overall radiological control during the project. This section includes a summary of field implementation procedures and practices for the radiological control elements of the project.

The following sections describe the components of the overall radiological control plan for the project.

5.1 RADIOLOGICAL ACCESS CONTROL

Radiologically Controlled Areas (RCAs) are areas to which access is controlled in order to protect individuals from exposure to radiation or radioactive materials, and/or prevent the inadvertent release of radioactive materials to uncontrolled areas. RCAs can also serve as a buffer zone between areas. RCA is also a generic term used to describe any area posted for radiological purposes including, but not limited to, Radioactive Materials Areas, Airborne Radioactivity Areas, Contaminated Areas, and Radiation Areas. All work performed during the project that involves potential exposure to radiologically impacted material will be performed within an appropriate RCA. RCAs will be posted and controlled in accordance with TtEC's NRC RML and SOP 12, Radiologically Controlled Areas Posting and Access Control. Only properly trained personnel will be allowed entrance to RCAs. RCAs will be closed and locked if unattended.

Control points will be staffed by a trained RCT to ensure personnel entering the RCA have the required dosimetry and have signed the appropriate RWP. All workers entering an RCA will sign in and out on an RWP access log. In addition, all personnel exiting the RCA will be subject to a personnel survey by an RCT in accordance with TtEC's SOP 5, Radiological Protective Clothing Selection, Monitoring, and Decontamination.

Equipment and materials brought to the site to be used in an RCA will be subject to an incoming survey prior to entering an RCA. Equipment used in an RCA will remain in an RCA until surveyed for free release. Equipment incoming surveys will be performed in accordance with TtEC's SOP 1, Radiation and Contamination Surveys. Free Release Surveys will be performed in accordance with TtEC's SOP 3, Release of Materials and Equipment from Radiologically Controlled Areas.

5.2 RADIOLOGICAL HEALTH AND SAFETY CONTROL

TtEC will provide radiation awareness training to all personnel involved in radiological work during the project. The type and amount of instruction will be based on regulatory requirements (as found in Part 10 of the *Code of Federal Regulations* [CFR] Sections 19.12[a] and 19.12[b]), the TtEC NRC license requirements, and past documented experience, and will be commensurate with potential radiological health protection in the areas in which the employees are expected to work.

In accordance with 10 CFR 19.12, workers will receive general and site-specific radiation awareness instruction prior to beginning work with licensed materials. Successful completion of this training will be demonstrated by a worker attaining a minimum score of 80 percent on a written exam. The elements of this training will include but are not limited to:

- Types and sources of ionizing radiation contributing to personnel exposure
- Biological effects and risks associated with exposure to ionizing radiation
- Radiation exposure limits, declared pregnant workers, and control levels
- Specifics for using time, distance, and shielding to maintain individual exposures ALARA
- Specific personnel dosimetry requirements
- Operating, maintenance, handling, and accountability procedures for radioactive sources
- Facility or site survey requirements and procedures
- Responsibilities of individuals
- Emergency procedures
- Specific survey instrument requirements and operating procedures

Specific training will be provided to pregnant female radiation workers to address the requirements of 10 CFR 20.1208 (Dose Equivalent to an Embryo/Fetus). An acknowledgement form will be completed by pregnant radiation workers indicating they have received the training, have been provided copies of NRC Regulatory Guide 8.29 Instruction Concerning Risks from Occupational Radiation Exposure (NRC 1996), and have been provided an opportunity to ask questions.

In addition to basic classroom instruction, performance-based (on-the-job) training specific to an individual's duties may be conducted. This will ensure safe handling of radioactive materials in accordance with ALARA principles.

5.3 PERSONNEL DOSIMETRY

As part of the radiological health and safety program for the project, occupational whole-body radiation exposures will be monitored, tracked, and recorded. Any personnel in RCAs will be issued and required to wear personal dosimetry.

Only National Voluntary Laboratory Accreditation Program (NVLAP)-approved dosimeters from an NVLAP-certified provider will be used. Personnel issued dosimetry will complete and sign an NRC Form 4. The official Form 4 will be maintained by the TtEC RSO with a copy of the original kept at the project field office.

5.4 AIR MONITORING

Radiological air monitoring will be conducted during the course of the project, in accordance with TtEC's SOP 9, Air Sampling and Sample Analysis, to monitor potential occupational exposures, establish PPE, and determine respiratory protection requirements. Trending for airborne radioactive material will be performed as necessary. Additional details can be found in the Dust Control and Air Monitoring Plan included as Attachment 9 to the RAWP.

Radiological air monitoring data will be evaluated by the RSOR and in consultation with the RASO. Airborne radioactive particulate concentration monitoring will be conducted to ensure no work areas exceed 10 percent of a derived air concentration (DAC) for ROCs for the project. Note that a separate DAC value is used for radioactive particulate alpha and beta/gamma concentrations because the ROCs emit alpha, beta, and gamma radiation. DAC values can be found by consulting the NRC regulation Title 10, CFR, Part 20, Appendix B for the relevant radionuclides. The more restrictive DAC value will be used for both alpha and beta/gamma radiation based upon the given ROCs. Therefore, the DAC values for ^{232}Th and ^{90}Sr will be used. Ten percent DAC values are listed in Table 5-1. If, during the course of work, an airborne concentration exceeds 10 percent of the DAC, ongoing activities will cease and the affected location will be posted as an airborne radioactivity area until the source of the airborne concentration is eliminated and levels are confirmed to be below 10 percent of the DAC. The RSOR will immediately notify the RASO of any air samples that exceed 10 percent of the DAC. Engineering controls, with concurrence from the RASO, will be implemented if required to maintain airborne concentrations below 10 percent of the DAC. In order to ensure that the MDC for the air samples based on the 10 percent DAC value for ^{232}Th is met, a minimum volume of 1.4×10^8 millimeters will be collected.

Air monitoring stations will be established at a minimum of two individual sites to collect ambient measurements during the project. Specifically, one upwind and one downwind monitoring station will be established. The number of monitoring locations may be altered in the field in consultation with the RASO.

An electronic master air sample tracking log will be maintained by the RSOR. The log will list items such as sample identification, location, type of sample (e.g., "upwind sample"), start and stop times, volumes, results, and result relative to the DAC.

5.5 BIOASSAYS

It is considered highly unlikely that personnel will receive an internal deposition of radioactive material during the project. However, should one occur or if the results of air monitoring suggest the need, bioassay measurements will be collected as necessary to determine the potential for internally deposited radioactive material. Selection of the bioassay type will be made by the RSO in consultation with the RASO.

5.6 RADIATION WORK PERMIT

All work performed in RCAs will be governed by an RWP. RWPs will be prepared in accordance with SOP 10, Issue and Use of Radiation Work Permits, and approved by the RSOR. All personnel assigned to work in RCAs will be required to review, understand, and sign the appropriate RWP prior to beginning work.

Each RWP will specify the appropriate personnel protective measures within the scope of the work based upon the radiological conditions in the area. The RWPs will also address radiological conditions, work scope and limitations, radiological limitations, PPE requirements, dosimetry requirements, ALARA considerations, and specific instructions to personnel.

5.7 DUST CONTROL

Dust prevention in the areas of the site where potentially radiologically impacted materials are staged or handled will be accomplished primarily by maintaining the material in a sufficiently moist condition to eliminate the possibility of dust generation. As needed, contingencies will be implemented to control dust generation and/or airborne hazards. These contingencies could include wetting material, applying a nontoxic "lockdown" material to suppress dust, or covering material with a fabric layer. Additional details can be found in the Dust Control and Air Monitoring Plan included as Attachment 9 to the RAWP.

Visible dust will not be permitted during the execution of the project. If visible dust is observed, work will stop and contingency measures (i.e., wetting, applying lockdown, or covering with fabric) will be implemented immediately. Work will not be allowed to continue until contingency measures have been determined to be effective.

5.8 DECONTAMINATION CONTROL

General vehicle and equipment cleaning will be conducted throughout the project for general housekeeping purposes and to prevent the spread of loose material and/or contamination.

In addition, radiological decontamination may be required for equipment used during the project to address radiological impacts and to prevent the spread of radiological contamination. Radiological decontamination will be performed in accordance with TtEC's SOP 7, Decontamination of Equipment and Tools. Equipment or material that cannot be easily or cost-effectively decontaminated will be evaluated for possible limited use in radioactive material areas or disposed of as LLRW.

5.9 RADIOLOGICAL WASTE CONTROL

Several steps will be followed to properly characterize project wastes for potential radiological impacts and to separate LLRW from non-LLRW for handling, management, and disposal. This process includes radiological scan surveys and radiological sampling to segregate LLRW from non-LLRW. All non-LLRW hauling vehicles will be screened using a radiation portal monitor prior to the vehicles being loaded and again prior to departing the site. The use of the radiation portal monitor is described further in Section 10.1.11.

LLRW will be immediately segregated and relinquished to the sole custody of the radiological waste broker selected and contracted separately by the Army Joint Munitions Command on behalf of the DON.

This page intentionally left blank.

6.0 PROJECT-SPECIFIC RADIOLOGICAL CONTROL PRACTICES

This section briefly describes the overall project in terms of radiological impacts and project-specific radiological control practices. Construction details, design drawings and specifications for the multi-layer cover are provided in the RAWP and the 100% Remedial Design (Attachment 1 to the RAWP).

6.1 PROJECT OVERVIEW

This project involves installing a cover over the IR Site 2 landfill. The project will be broken up into the following radiological work phases: Building up to subgrade, initial MARSSIM survey of subgrade prior to installation of cover, installation of the cover, final MARSSIM survey of the cover, and miscellaneous activities that will require radiological safety support.

6.2 BUILDING UP TO SUBGRADE

The first phase of the project is to build up to subgrade. This will involve grubbing plants, cutting into some of the current land surfaces, and building up the grade of some of the land surfaces with import material and materials that are cut from other areas. In order to minimize the hazards of disturbing the wastes found within the perimeter berm area, all efforts will be made to avoid any cuts within the berm as well as to the former land surface beneath the berm. Planned cuts will be of the berm itself and areas outside the berm to minimize potential exposure to waste materials. Soils from these cuts will be used to help bring other portions of the site up to subgrade.

IR Site 2 is currently posted as an RCA and will continue to be controlled as such. Radiological controls while performing cuts of the berms and areas outside of the berms will be minimal due to the unlikelihood of waste materials being found within the berm. RCTs will periodically scan the cut areas and the materials that are cut with Ludlum 2350 meters coupled to Ludlum 44-10 NaI scintillation detectors to ensure that no gross contamination is encountered greater than twice background in the berm. If levels are encountered greater than twice background within the berm material, then the work in the area will stop and RSOR will be immediately notified to assess the levels and determine a new course of action for these cuts.

All efforts will be taken to avoid making cuts within the landfill are within the berms to help keep dose to workers ALARA. However, if for some reason it becomes necessary to perform cuts within this area, the area to be cut will be posted as a Contaminated Area and controlled in accordance with TtEC's NRC Radioactive Materials License and SOP 12, Radiologically Controlled Areas Posting and Access Control. Specific radiological controls will be determined by the RSOR based upon the nature of the cut and documented in a RWP prior to performing any cuts within the berm. Cut materials will be laid out in 6-inch lifts and scanned with the Vehicle Towed Array (VTA) to ensure that no material greater than twice background was disturbed.

Operation of the VTA will be performed in accordance with TtEC's SOP 13, Vehicle Towed Array. If levels are found greater than twice background, then these areas will be remediated. Materials that do not indicate levels greater than twice background may be used to bring other portions of the site up to subgrade. VTA surveys of the cut areas will be performed to verify radiation levels prior to down posting the Contaminated Area. If levels are found greater than twice background, remediations will be performed in these areas up to a depth of 1 foot. Remediated areas will be filled in to bring the surface back up to subgrade. Remediated materials will be turned over to the sole custody of the radiological waste broker selected and contracted separately by the Army Joint Munitions Command on behalf of the DON.

6.3 INITIAL MARSSIM SURVEY OF SUBGRADE PRIOR TO INSTALLATION OF COVER

The initial MARSSIM survey will be performed once the subgrade is complete and prior to installation of the cover. The entire footprint of the subgrade will be subdivided into survey units no larger than 2,000 square meters in surface area. Each survey unit will be 100 percent gamma surveyed with the VTA or, in cases where the VTA is physically incapable of surveying, a Ludlum 2350 meter coupled to a Ludlum 44-10 NaI scintillation detector. Areas that indicate levels greater than twice the background during the gamma survey will be remediated to a depth of 1 foot and then filled in to bring the surface back up to subgrade. Remediated materials will be turned over to the sole custody of the radiological waste broker selected and contracted separately by the Army Joint Munitions Command on behalf of the DON.

Once the gamma surveys and any subsequent remediations are performed, a number of samples as determined in Section 8.0 will be collected and analyzed from each survey unit so as to perform baseline dose and risk assessments using RESRAD prior to installation of the cover. Samples will be analyzed by gamma spectroscopy for ^{137}Cs, ^{60}Co, and ^{226}Ra at a Department of Defense (DoD) Environmental Laboratory Accreditation Program (ELAP) accredited laboratory per the SAP. Samples locations will be generated using Visual Sampling Plan in a triangular grid pattern originating from a random start point. Additionally, 10 percent of the samples from each survey unit will be analyzed by alpha spectroscopy for ^{238}U and ^{232}Th, and total Sr/^{90}Sr analysis for ^{90}Sr. Furthermore, any soil sample exceeding the ^{137}Cs release criterion will be analyzed for total Sr/^{90}Sr analysis for ^{90}Sr. Once the samples have been collected from a given survey unit, the cover over that survey unit may be installed.

6.4 INSTALLATION OF THE COVER

During installation of the cover, the site will continue to be controlled as an RCA. Periodic coverage from the RCTs is required due to the reduced risk of encountering gross contamination within the area to be covered.

6.5 FINAL MARSSIM SURVEY OF THE COVER

The final MARSSIM survey of the cover will again entail subdividing the entire footprint of the cover into survey units no larger than 2,000 square meters in surface area. Each survey unit will be 100 percent gamma surveyed with the VTA or, in cases where the VTA is physically incapable of surveying, a Ludlum 2350 meter coupled to a Ludlum 44-10 NaI scintillation detector. Areas indicating levels exceeding the reference area mean + 3σ, where σ is the standard deviation of the gamma readings in the reference area will be further investigated to ensure no further action is needed. A number of samples as determined in Section 8.0 will be collected and analyzed from each material source used for cover material as characterization samples to ensure that the cover material meets the release criteria in Table 2-1. Samples will be analyzed by gamma spectroscopy for ^{137}Cs, ^{60}Co, and ^{226}Ra at a DoD ELAP accredited laboratory per the SAP. Additionally, 10 percent of the samples from each survey unit will be analyzed by alpha spectroscopy for ^{238}U and ^{232}Th, and total Sr/^{90}Sr analysis for ^{90}Sr.

6.6 MISCELLANEOUS ACTIVITIES THAT WILL REQUIRE RADIOLOGICAL SAFETY SUPPORT

Miscellaneous activities that will require radiological safety support include installation of monitoring wells.

Monitoring well installation will be performed within small Contamination Areas that will be set up around the drill rigs. Contamination Areas will be established and controlled in accordance with TtEC's NRC Radioactive Materials License and SOP 12, Radiologically Controlled Areas Posting and Access Control. Cuttings will be placed in drums and sampled to determine if they will be considered LLRW or non-LLRW.

This page intentionally left blank.

7.0 RADIOLOGICAL SURVEY TYPES, AREA CLASSIFICATION, AND SELECTION

Several types of radiological surveys will be conducted during the project. Surveys will be used to support the release of materials, equipment, open areas; support remedial actions; identify radionuclides and levels of contamination present; and support unforeseen work that may be necessary.

7.1 SURVEY TYPES

This section describes the types of surveys that will be performed.

7.1.1 Reference (Background) Area Survey

The reference area is a geographical area or structure from which representative radioactivity measurements are performed for comparison with measurements performed in an impacted area. The reference area selected should have physical, chemical, radiological, and biological characteristics similar to the impacted area(s) being investigated. The reference area must not be identified as impacted by the HRA (Weston 2007). All on-site and off-site locations selected as reference areas will be approved by the RASO. The same survey methods and equipment that will be used for conducting a survey in an impacted area will be used for the background area survey.

7.1.2 Initial and Final MARSSIM Surveys

These surveys provide data to use with RESRAD to model potential risk and dose prior to and once the cover has been installed. The purpose of these surveys is to identify and remove any radioactive contamination that exceeds twice the background, provide a baseline dose and risk estimate prior to installation of the cover, and provide a final dose and risk estimate once the cover is in place. One hundred percent of the surface of each survey unit will be surveyed with a RASO-approved towed array gamma radiation survey system such as the VTA and/or a Ludlum 2350-1 survey meter with 44-10 NaI detector or equivalent. Additionally, a number of samples as determined in Section 8.0 will be collected and analyzed by gamma spectroscopy for ^{137}Cs, ^{60}Co, and ^{226}Ra at a DoD ELAP accredited laboratory per the SAP. Additionally, 10 percent of the samples from each survey unit will be analyzed by alpha spectroscopy for ^{238}U and ^{232}Th, and total Sr/^{90}Sr analysis for ^{90}Sr. These sample results will provide information on the radionuclide concentrations in each survey unit to be used in subsequent RESRAD modeling for dose and risk to the public.

7.1.3 Personnel Surveys

Surveys will be performed on personnel leaving a radiological area to ensure that individuals are free of radiological contamination as identified in the RPP (Attachment 3 to the RAWP) and TtEC's SOP 5, Radiological Protective Clothing Selection, Monitoring, and Decontamination.

7.1.4 Equipment and Materials Surveys

Before being put into service or leaving a radiological work area, equipment and/or materials will be surveyed in an area of low background concentrations to ensure that the equipment and materials release criteria are not exceeded, using appropriate SOPs. Equipment incoming surveys will be performed in accordance with TtEC's SOP 1, Radiation and Contamination Surveys. Free release surveys will be performed in accordance with TtEC's SOP 3, Release of Materials and Equipment from Radiologically Controlled Areas.

- Equipment and/or materials being put into service in a radiological work area at Alameda Point that exceed the release criteria will be returned to the supplier for replacement or decontamination.
- Outgoing equipment and/or materials that do not meet the release criteria will be decontaminated before leaving the radiological work area or stored for disposal.

7.1.5 Truck Surveys

A radiation portal monitor will be used to screen all outbound non-LLRW hauling vehicles prior to the vehicles being loaded and again prior to the vehicles departing the site. The portal monitor will be operated in accordance TtEC's SOP 11, Gamma Screening of Trucks Using the Stationary Portal Monitor.

7.2 SURVEY AREA CLASSIFICATION

The HRA has identified IR Site 2 at Alameda Point as being radiologically impacted. All areas are considered Class 1 areas in accordance with recommendations from MARSSIM (DoD et al. 2000). Class 1 areas have (or had prior to remediation) a potential for radioactive contamination. This potential is based on site operating history or known contamination based on previous radiation surveys above the wide-area derived concentration guideline level ($DCGL_W$).

Examples of Class 1 areas include:

- Site areas previously subjected to remedial actions
- Locations where leaks or spills are known to have occurred
- Former burial or disposal sites
- Waste storage sites

7.3 CLASSIFICATION AND SURVEY UNIT SIZE

A survey unit is a physical area consisting of structures or land areas of specified size and shape for which a separate decision will be made as to whether or not that area exceeds the release criterion. This decision is made as a result of the FSS. As a result, the survey unit is the primary entity for demonstrating compliance with the release criteria.

Survey units will be limited in size to 2,000 square meters (m^2) based on the survey unit sizes recommended in MARSSIM (DoD et al. 2000).

7.4 REFERENCE COORDINATE SYSTEM

A triangular grid reference coordinate system will be laid out for each survey unit to identify survey/sample locations. The length between triangular grid data points (*L*) is determined by the total number of samples or measurements to be taken, using the following equation:

Equation 7-1

$$L = \sqrt{\frac{A}{0.866 * N}}$$

Where:

L	=	length of spacing (meters)
A	=	surface area of the survey unit (m^2)
0.866	=	constant factor from MARSSIM
N	=	number of data points

A second row of points is then developed, parallel to the first row, at a distance of 0.866 × L from the first row. Survey points along that second row are midway (on the X-axis) between the points on the first row. This process is repeated to identify a pattern of survey locations throughout the survey unit. If identified points fall outside the survey unit or at a location that cannot be surveyed, additional points are determined using the random process described above, until the desired total number of points is identified.

The triangular grid system is generally more efficient for locating small areas of elevated activity. A more detailed discussion is provided in Statistical Methods for Evaluating the Attainment of Cleanup Standards, Volume 3: Reference Based Standards for Soils and Solid Media (EPA 1992).

This page intentionally left blank.

8.0 SURVEY OVERVIEW

This section provides an overview of survey planning, implementation, and data assessment. Survey details are given in later sections of this Rad Work Plan.

8.1 DATA LIFE CYCLE

Compliance demonstration is simply a decision as to whether or not a survey unit meets the release criterion. This decision is based on the results of one or more surveys. Positive actions must be taken to manage the uncertainty in the survey results so that sound, defensible decisions may be made. These actions include proper survey planning to control known causes of uncertainty, proper application of QC procedures during implementation of the survey plan to detect and control significant sources of error, and careful analysis of uncertainty before the data are used to support decision making. These actions describe the flow of data throughout each type of survey, referred to as the Data Life Cycle.

There are four phases of the Data Life Cycle:

- *Planning Phase.* The survey design is developed and documented using the DQO process, which is summarized in Section 8.2.3.
- *Implementation Phase.* The survey design is carried out resulting in the generation of raw data. In addition, quality assurance and QC measurements will generate data and other important information that will be used during the Assessment Phase.
- *Assessment Phase.* The data generated during the Implementation Phase are first verified to ensure that the plans were actually followed and that the measurement systems were performed in accordance with the criteria specified in this plan. Then the data are validated to ensure that the results of data collection activities support the objectives of the survey or permit a determination that these objectives should be modified.
- *Decision-making Phase.* A decision is made, in coordination with the responsible regulatory agency, based on the conclusions drawn from the assessment process. The ultimate objective is to make technically defensible decisions with a specified level of confidence.

8.2 SURVEY PLANNING

The Radiation Survey and Site Investigation (RSSI) process includes a series of surveys that will be used at Alameda Point to demonstrate compliance with the release criterion. This process will be used as a framework for collecting the information required for scoping, characterization, remediation, and FSS activities. The methodology used at Alameda Point to implement the RSSI process consists of the following six principal steps:

1. Site identification

2. Historical site assessment
3. Scoping survey
4. Characterization survey
5. Remedial action support survey
6. FSS

Table 8-1 provides a simplified overview of the principal steps in the RSSI process and how the Data Life Cycle can be used in an iterative fashion within the process.

Figure 2.4 of MARSSIM (DoD et al. 2000) illustrates the RSSI process in terms of area classification and lists the major decision to be made for each type of survey. The flow chart, illustrated on Figures 2.5 through 2.8 of MARSSIM, presents the principal steps and decisions in the site investigation process and shows the relationship of the survey types to the overall assessment process.

The initial and final MARSSIM surveys described in Sections 6.0 and 7.0 will serve as RSSI principal steps 3 through 6.

8.2.1 Survey Design Elements

Survey and sampling process design includes, but is not limited to, the following elements:

- The *types of samples and sampling matrices* for the survey; solid samples for outdoor surveys and fixed measurements for indoor surveys
- The *measurement frequency* for direct measurement locations for each survey unit and scan percentage of each survey unit
- The *sampling frequency* for solid sample collection locations in the survey unit(s)
- The *methods* for performing remedial action support surveys and other ancillary surveys

However, before these elements can be established, a general strategy must be determined.

8.2.2 Survey Strategy

The selection of specific survey types for each area investigated under the Rad Work Plan will be based on information in the HRA (Weston 2007). The standard survey strategy will be based on using a MARSSIM (DoD et al. 2000) Scenario A approach.

8.2.3 Data Quality Objectives

MARSSIM recommends using the seven-step data quality objective (DQO) process in the design of radiological surveys. This process tailors the survey to the particular conditions of each survey situation. DQO elements are applicable to all the surveys to be performed under this Rad Work Plan.

The seven steps in the DQO process are as follows:

1. State the problem.

   It must be determined if the site-specific guideline has been met or if remediation is warranted. The decision to be made for the initial MARSSIM survey can be stated as, "Do the gamma scan survey results exceed two times background?" The decision to be made for the final MARSSIM survey can be stated as, "Do the risk and dose assessments meet the restricted release criteria of 15 millirems (mrem) per year and 3.0×10^{-4} for the critical group?"

   The successful completion of activities described in this Rad Work Plan will provide sufficient data for the restricted release of the IR Site 2 landfill with ICs. Resources available to provide the necessary data include the following:

   - Activities outlined in this Rad Work Plan
   - MARSSIM guidance (DoD et al. 2000) for ensuring statistically valid data
   - The use of trained and experienced workers

2. Identify the goal of the study.

   The need to provide data for the restricted release of the IR Site 2 survey units requires performing radiological surveys and sampling as specified in this Rad Work Plan. The primary uses of these data are to provide information and statistical verification of data obtained to support the restricted release of IR Site 2.

3. Identify information inputs.

   To support restricted radiological release of IR Site 2, the radiological surveys will include:

   - Gamma scan surveys of each survey unit with a RASO-approved towed array gamma survey system and/or 2-inch by 2-inch NaI detectors or equivalent
   - Systematic soil sampling of the survey units
   - Statistical analysis of collected radiological data

4. Define the boundaries of the study.

   The spatial boundaries for this effort are confined to the radiologically impacted IR Site 2. Each survey unit will undergo a 100 percent gamma scan of the exposed surfaces. Solid samples will be collected from systematic locations in each of the initial MARSSIM survey units. For the final MARSSIM survey units, systematic samples will be collected from each import source for the cover material.

5. Develop the analytical approach.

   Soil with readings greater than twice background during the initial MARSSIM survey will be remediated up to 1 foot in depth. For the final MARSSIM survey, risk and dose assessments will be performed, based on sample analytical results, with the cover installed, to ensure that the maximum annual dose to an individual of 15 mrem, and the excess lifetime cancer risk (ELCR) at 3×10^{-4} for the critical group, are not exceeded.

6. Specify performance or acceptance criteria.

   Actions to minimize errors will be instituted during the data collection phase of the radiological survey. Qualified radiation survey personnel will perform the survey and record the data. Automated recording of survey data will be used where possible to minimize errors. Data transcribing is the second phase where errors may arise. To avoid data errors for manual surveys, experienced personnel will record and transcribe data. The ongoing analyses and evaluation of survey results provide a final check for errors, which can be corrected if detected.

   A knowledgeable individual who is not involved in the direct data collection process will review the collected survey data on a daily basis. This will ensure an ongoing independent review for consistency of all survey data collected.

   There are two types of decision errors that can be made when performing the statistical tests described in this plan:

   - A Type I error occurs when the null hypothesis is rejected when it is actually true. Sometimes called a "false positive," the probability of a Type I error is usually denoted by α and the error rate is often referred to as the significance level or size of the test.
   - A Type II error occurs when the null hypothesis is not rejected when it is actually false. Sometimes called a "false negative," the probability of a Type II error is usually denoted by β. The power of a statistical test is defined as the probability of rejecting the null hypotheses when it is false. It is numerically equal to 1- β, where β is the Type II error rate.

   The surveys are designed to minimize the chances that areas exceeding the release criteria will be missed (Type I Error) and areas meeting the release criteria will be rejected as too high (Type II Error). The probability of either of these occurring will be set at a maximum of 5 percent. In demonstrating that this objective is met, the null hypothesis (H_o) is tested that residual contamination exceeds the release criterion; the alternative hypothesis (H_a) is then tested that residual contamination meets the release criterion.

7. Develop the plan for obtaining data.

   Data outputs and existing data will be reviewed for consistency. Radioactive source readings will be used to check instruments for consistency prior to use in each daily shift. The instrument will only be used after readings are compared and agree within +/- 20 percent of predetermined responses. The on-site Radiological Task Supervisor will review the information each day to verify that equipment is operating satisfactorily.

   A knowledgeable individual not involved in the direct data collection process will review the generated survey data on a daily basis. This will ensure an ongoing independent review for consistency of all survey data collected.

   Data collection design alternatives may be developed. The MARSSIM guidelines (DoD et al. 2000) will be used and a 95 percent confidence level for detecting radioactivity above the release levels will be assumed with Type I and Type II errors limited to 5 percent. The data collection design alternatives may change slightly if assumptions are revised based on conditions in the field being different than the furnished information derived from historical research and current knowledge of the area.

   The survey design specified for use in this Rad Work Plan was developed to perform radiological FSSs. Combined with the use of qualified and experienced personnel, this design is both efficient and resource effective.

   Operational details and theoretical assumptions will be documented. Operational details for the radiological survey process were developed for and are included as part of this Rad Work Plan. The theoretical assumptions are based on guidelines contained in MARSSIM (DoD et al. 2000). Specific assumptions regarding types of radiation measurements, instrument detection capabilities, quantities and locations of data to be collected, and investigation levels are contained in this Rad Work Plan.

8.3 SURVEYS

Survey implementation for each type of survey to be conducted at Alameda Point is discussed below. While implementation requires instrumentation and survey techniques, this section will concentrate on the general approach. The instrumentation to be used is discussed in Section 10.0 and survey techniques are presented in Section 11.0.

8.3.1 Scoping and Characterization Surveys

These surveys will be implemented as described in Sections 6.0 and 7.0 for the initial MARSSIM survey prior to cover installation.

8.3.2 Remedial Action Support Surveys

These surveys are implemented during the remedial activity. If areas indicate levels greater than twice background, coordinates will be recorded and the location marked or flagged. The field survey team will notify the TtEC RSOR. The TtEC RSOR will notify the RSO and Navy. Radiological support personnel under the supervision of an RCT will remove the radioactive material as directed by the RSOR in accordance with TtEC SOPs and best management practice radiological controls. Areas known or suspected to contain radioactive material will be isolated pending removal of the material. The assigned RCT will ensure that the removal action will first be evaluated by the RSOR for radiological impact.

Typical removal actions will involve an area within a radius of 1 foot around the coordinates of the suspected radioactive material. Under RCT oversight, the location with an elevated radiation level will then be excavated and placed directly into a waste bin. Soil removal will continue until a depth of one foot is reached. Following removal of the source of elevated gamma activity, an additional foot of soil in all directions from the source will be removed and disposed of as radioactive waste. After the radioactive material and surrounding soil are excavated, the resulting pit will be resurveyed by the assigned RCT. If significantly greater than twice background elevated gamma radiation levels persist, the project team will be consulted to determine whether additional actions, prior to bringing the surface back to subgrade, are warranted to ensure gamma radiation levels after placement of the cover are protective of the critical group.

If the radioactive material is a point source, it will be given a unique identification number and recorded in the radioactive material inventory. Radioactive point sources will be placed in plastic bags within metal drums and stored in a designated and posted radioactive material storage area for subsequent packaging and disposal by a certified waste broker under the direction of the DON LLRW Disposal Program. Areas that have been remediated will subsequently be filled in to bring the surface back to subgrade.

8.3.3 Final Status Surveys

For the FSS, the data analysis framework is critical to survey development because it drives the sampling requirements. The final MARSSIM survey after installation of the cover described in Sections 6.0 and 7.0 will serve as the FSS. For contaminants present in background, the analysis uses the Wilcoxon Rank-Sum (WRS) test. For contaminants not present in background, the analysis uses the Sign test. In each case, the minimum number (N) of samples (or fixed measurements) is calculated as follows: the method to calculate any additional number of required data points is stated in Section 9.1, and grid spacing methods and requirements are listed in Section 7.4. The statistical tests are described in Section 8.4. Although the FSS of IR Site 2 is not intended to provide for radiological release of IR Site 2, the sample density is designed to ensure data commensurate with a Class 1 survey is collected. Derived concentration guideline level (DCGLs) for each ROC are based on the exposure pathways and parameters presented in the Final Remedial Investigation Report IR Site 2, West Beach Landfill and Wetlands (Battelle and BBL 2006), and limit the maximum annual dose to an individual to 15 mrem and the ELCR to 3×10^{-4} for the critical group.

8.3.3.1 Determination of the Relative Shift

Using Equation 8-1, the value of the relative shift can be determined. For single radionuclide analysis, the values for the lower boundary of the gray region (LBGR) will be set at half the DCGL during the planning phase, and at the median concentration in a survey unit for the data assessment phase.

When analyzing multiple radionuclides, the values for the LBGR and σ are determined using Equation 8-1:

Equation 8-1

$$\frac{\Delta}{\sigma} = \frac{DCGL_W - LBGR}{\sigma}$$

Where:

$DCGL_W$	=	$DCGL_W$ as appropriate
$LBGR$	=	lower boundary of the gray region, as appropriate
σ	=	standard deviation from the survey unit, as appropriate

The value of the relative shift is used with the appropriate random measurement probability presented in MARSSIM (DoD et al. 2000) Tables I.2a and I.2b.

As multiple radionuclides are evaluated, $DCGL_W$ is set to 1. The LBGR and σ based on previous sample results in IR Site 2 are 0.05 and 0.01, respectively, resulting in a relative shift of 95 and a random measurement probability, P_r, of 1.

8.3.3.2 Determination of the Number of Data Points

When the contaminant is present in background, Equation 8-2 is used with the WRS test:

Equation 8-2

$$N = \frac{\left(Z_{1-\alpha} + Z_{1-\beta}\right)^2}{3\left(P_r - 0.5\right)^2}(1.2)$$

Where:

$Z_{1-\alpha}$	=	Type I decision error level

$Z_{1-\beta}$	=	Type II decision error level
P_r	=	random measurement probability
(1.2)	=	20 percent increase in number of samples over the minimum

At the 95 percent confidence level, $Z_{1-\alpha} = Z_{1-\beta} = 1.645$. Using these values gives a result of N=18 samples required to be taken: 9 in the background area, and 9 in each survey unit. In the interests of further conservatism, this number is increased to 10 samples in the background area, and 10 in each survey unit.

8.3.4 Error Control

Actions to minimize errors will be instituted during the data collection phase of the surveys. Qualified radiation survey personnel will perform the survey and record the data. Automated recording of survey data will be used where possible to minimize errors. Data transcribing is an activity where errors may arise. To minimize data errors for manual surveys, experienced personnel will record and transcribe data.

Standard applicable quality assurance and QC measures will be implemented to control error.

The ongoing on-site analyses and evaluation of survey results provide a verification check for errors, which will be corrected if detected.

A knowledgeable individual who is not involved in the direct data collection process will review the survey data on a daily basis. This will ensure an ongoing independent review for consistency of survey data collected.

8.4 ASSESSMENT OF SURVEY RESULTS

A preliminary evaluation of the data set will be conducted to better understand the structure of the data and thereby identify appropriate approaches and limitations for utilization. For non-FSSs, this may be merely identifying areas of elevated contamination or reviewing the mean, median, and standard deviation of the data set. FSS evaluations include, but are not limited to, reviewing quality assurance reports, calculating statistical quantities, and graphing the data.

8.4.1 Scoping and Characterization Surveys

Basic statistical quantities (mean, maximum, standard deviation) will be calculated from the data collected. Measurements that are twice background will be assessed for further action as described in Sections 6.0 and 7.0.

8.4.2 Remedial Action Support Surveys

The focus of these data assessments will also be the comparison of the survey data to the DCGL for the area. If measurements are twice background, the area will be remediated to a depth of 1 foot and then filled in to be brought back up to grade.

8.4.3 Final Status Surveys

When determining compliance with FSS goals, the survey data are examined. Compliance tests are summarized as follows:

- Compare the largest measurement to the DCGL (net of background, if present in background). If all measurements are lower than the release limits (net of background, if present in background), no statistical test is necessary.
- Compare the average measurement to the DCGL (net of background, if present in background).
- Use the appropriate statistical test to determine if the survey data exceed the release limits, if necessary.
- If scan measurements are above the DCGL, then a fixed measurement will be taken to confirm the elevated reading. If the elevated reading is confirmed, then the unit would fail.

This Rad Work Plan will use an analysis structure incorporating three possible common statistical procedures, as well as conventional qualitative and semi-quantitative comparisons for FSS data. The statistical tests are only applied to measurements made at fixed locations. The tests are:

- **Sign test** – The Sign test is a one-sample, nonparametric test that can be used to evaluate compliance with the release limit. The Sign test is the recommended compliance evaluation procedure when the contaminant(s) under evaluation are not present at significant levels in background. Any one of the individual samples (each individual survey unit is a "sample" in this context) or any combination can be compared to the release limit with the Sign test. For example, each of the Class 1 survey units could be pooled for an overall building comparison to the release limits rather than comparing an individual survey unit to the release limit.
- **Wilcoxon Rank-Sum test** – The WRS test is a two-sample, nonparametric procedure that can be used to evaluate compliance when the contaminant is present in background. The WRS test can be used as a two-sample test to compare medians between samples (contamination concentration measured in reference background materials versus the same parameter measured in site investigative materials) when either or both sampling distributions deviate significantly from normal.
- **Normal means test** – This is the traditional two-sample t-test based on the central limit theorem (i.e., normality). It can be used to assess compliance, derive confidence intervals, and compare between samples (mean removable surface contamination concentration in one survey unit versus the same parameter measured in another survey unit) when both sample distributions are normal or do not deviate appreciably from normality.

Both scan and fixed measurements are subject to the elevated measurement comparison. The result of this comparison is not conclusive as to whether the survey unit meets or exceeds the release criterion, but is a flag or trigger for further investigation.

8.5 DECISION MAKING

8.5.1 Scoping and Characterization Surveys

For a scoping survey, the decision rule is, "If the survey results meet the criteria defined, then design and perform an optimized FSS. If the survey results do not meet the criteria defined, then design and perform an optimized characterization survey." In practice, most scoping surveys will be tested against DCGLs. If contamination is found, then a characterization survey would be performed.

For a characterization survey, the decision rule is, "If the survey results meet the criteria defined, then design and perform an optimized FSS. If the survey results do not meet the criteria defined, then perform remedial action."

8.5.2 Remedial Action Support Surveys

The decision rule is, "If the survey results indicate that the remediation is complete, then design and perform an optimized FSS. If the survey results indicate that the remediation is incomplete, then reevaluate the remedial alternative and continue remediation if necessary."

8.5.3 Final Status Surveys

The results of the statistical testing of the data set for each survey unit will be used to evaluate whether to accept or reject the null hypothesis. Using the MARSSIM (DoD et al. 2000) Scenario A methodology, the null hypothesis is stated as "the residual activity in the survey unit exceeds the release criterion." Thus, in order to pass the survey unit (that is, release the area), the null hypothesis must be rejected. The objective of FSSs will be to demonstrate that residual radioactivity levels meet the release criterion. In demonstrating that the objective is met, the null hypothesis (H_o) is tested that residual contamination exceeds the release criterion; the alternative hypothesis (H_a) is then tested that residual contamination meets the release criterion.

To validate the use of a test, an evaluation will be made to determine that the data are consistent with the underlying assumptions made for the statistical procedure. Assumptions that can be made in the survey design are:

- The sample sizes determined for the tests are sufficient to achieve the DQO set for the Type I and Type II error.
- The data from the reference area or survey unit consist of independent samples from each distribution.

- The reference area and survey unit data distribution are similar, except for a possible shift in the medians.
- Whether the data represent a normal or asymmetric distribution.

Certain departures from these assumptions may be acceptable when given the actual data and other information about the study. One of the primary advantages of the nonparametric test is that it involves fewer assumptions about the data than the parametric test.

This page intentionally left blank.

9.0 RELEASE CRITERIA AND INVESTIGATION LEVELS

The release criteria for IR Site 2 are listed in Table 2-1. Release criteria for equipment and material are taken from Atomic Energy Commission (AEC) Regulatory Guide 1.86 (AEC 1974). Release criteria for soils are taken from the U.S. Environmental Protection Agency's (EPA's) (risk-based) Preliminary Remediation Goals for two future-use scenarios, or from negotiated agreements with regulators, as specified in the ROD. These release criteria are also listed in Table 2-1. Note that the soil release criteria apply to soils that are excavated from IR Site 2 and evaluated to determine if the material is LLRW. The site will have a cover installed to achieve a restricted release with institutional controls. Based on EPA guidance (EPA 1997), risk and dose assessments for the critical group will be used to demonstrate that the installed cover ensures that the maximum annual dose to an individual of 15 mrem, and the ELCR of 3×10^{-4} for the critical group are not exceeded.

To accomplish this goal, it is necessary to provide a means for calculating residual dose to the critical group. The most current version of RESRAD software will be used to model a scenario for the maximally exposed individual with the cover in place. All exposure pathways will be turned off for modeling with the exception of external exposure, soil inhalation, and soil ingestion. Soil ingestion rates, gamma shielding factors, and lifetime occupancy will reflect EPA recommended values. Occupancy will be modeled as 1 hour per day indoors and 1 hour per day outdoors, with a total of 250 days on-site per year. The actual surface area of the survey unit, cover depth, and net concentrations above background will also be used. All other input parameters will remain as default values. Additional RESRAD modeling changes from default values may be approved by the DON based on physical parameters of the survey units and the professional judgment of the project team.

Release criteria organized by survey type are as follows:

- A remedial action support survey will use the release criteria for equipment, material, structures, and soil.
- An FSS will use the limit of the maximum annual dose to an individual of 15 mrem and the ELCR of 3×10^{-4} for the critical group.

9.1 ASSESSING MULTIPLE RADIONUCLIDES

Because multiple radionuclides are present, a combined DCGL is calculated using Equation 9-1:

Equation 9-1

$$\text{Combined DCGL} = \frac{1}{\frac{f_1}{DCGL_1} + \frac{f_2}{DCGL_2} + \ldots + \frac{f_n}{DCGL_n}}$$

Where f_n is the anticipated fraction of each radionuclide versus the total, and $DCGL_n$ is the DCGL for each radionuclide present, the sum of f_1, f_2,…f_n equals one.

9.1.1 $DCGL_W$ for Multiple Radionuclides

As stated in MARSSIM (DoD et al. 2000) the $DCGL_W$, when using multiple radionuclides, is established by definition at 1.0. The unity rule, represented in the expression below (Equation 9-2), is satisfied when the radionuclide mixture yields a combined fractional concentration limit that is less than or equal to 1.0. Statistical tests will be used to prove that the total sum of all radionuclides does not exceed the applicable release criterion.

9.1.2 Determination of LBGR for Multiple Radionuclides

The LBGR is the net median concentration of the contaminant in the survey unit. Since this value is unknown, MARSSIM (DoD et al. 2000) suggests using a value for the LBGR of half the DCGL during planning purposes. However, once the median concentration activity in the survey unit is established, this value is used as a ratio to the lowest DCGL for the decay method to determine the LBGR. Equation 9-2, taken from MARSSIM, gives the method used to determine the LBGR:

Equation 9-2

$$LBGR = \frac{C_1}{DCGL_1} + \frac{C_2}{DCGL_2} + \frac{C_2}{DCGL_2} + \ldots + \frac{C_i}{DCGL_i} \leq 1$$

Where:

C_i = median concentration of radionuclide "i"
$DCGL_i$ = DCGL of radionuclide "i"

9.1.3 Determination of Standard Deviation for Multiple Radionuclides

There is no estimate of the standard deviation of the contaminant in a survey unit, especially if no contaminant is initially expected or if concentrations of radionuclides are spatially unrelated. Therefore, σ is assigned the value of the standard deviation of the adjusted measurement values in the survey unit as shown in Equation 6-8 from Section 6.2.3 of Decommissioning Health Physics (Abelquist 2001):

Equation 6-8

$$\sigma = \sqrt{\left(\frac{\sigma_{C1}}{DCGL_1}\right)^2 + \left(\frac{\sigma_{C2}}{DCGL_2}\right)^2 + \ldots + \left(\frac{\sigma_{Ci}}{DCGL_i}\right)^2}$$

Where:

σ_{Ci} = standard deviation from radionuclide "i"
$DCGL_i$ = DCGL of radionuclide "i"

9.2 CONVERTING DCGL UNITS

At times, it may be necessary to convert the DCGL from pCi/g to cpm in order to calculate the number of samples required in a given survey unit. To perform this conversion, an arbitrary concentration of the radionuclide is divided by the associated exposure rate produced by the concentration. The resulting number is then divided by the average net cpm per microroentgens per hour (μR/hr) for the detector being used. Once the number is derived, the release criterion is divided by this number, as shown in Equation 9-3 below:

Equation 9-3

$$cpm = \frac{DCGL}{DCGL_{AC} / M * DCGL_{AC} / \mu Rcpm}$$

Where:

$DCGL$ = release criterion (pCi/g)
$DCGL_{AC}$ = arbitrary concentration of radionuclide (pCi/g)
M = exposure rate calculated by MicroShield™ (Grove Engineering 1996)
$\mu Rcpm$ = counts per minute per μR/hr for the detector

9.3 INVESTIGATION LEVELS

Investigation levels are specific levels of radioactivity used to indicate when additional investigation may be necessary. Investigation levels also serve as a QC check. For example, in addition to indicating potential contamination, a measurement that exceeds the investigation level may indicate that the survey unit has been improperly classified or may indicate a failing instrument.

When determining an investigation level using a statistical-based parameter (e.g., standard deviation), the following may be considered: survey objectives, underlying radionuclide distributions (e.g., normal, log normal, nonparametric), data population descriptors (e.g., standard deviation, mean, median), and prior survey and historical information.

When an investigation level is exceeded, the measurement will be confirmed to ensure that the initial measurement/sample actually exceeds the particular investigation level. This will involve taking further measurements to confirm the initial result, and as appropriate, to quantify the area of elevated residual radioactivity.

9.3.1 Investigation Levels for Gamma Radiation Surveys Prior to Installation of Cover

For gamma surveys prior to installation of the 2-foot cover, the investigation level is established at twice the reference area mean or twice background. The purpose of this survey is to identify and remove any radioactive anomalies or gross radioactive contamination to ensure the health and safety of the workers installing the cover, and is not intended as a radiological free release of the surface. Any area exceeding twice the background radiation level will be removed to a depth of 1 foot for further investigation on a radiological screening pad. The soil will be scan surveyed and soil samples will be collected at a rate of two samples per 40 cubic yards. Samples will be analyzed by gamma spectroscopy for ^{137}Cs, ^{60}Co, and ^{226}Ra. ^{90}Sr will be analyzed for total strontium/^{90}Sr; ^{238}U by Isotopic Uranium, and ^{232}Th by Isotopic Thorium. All samples will be analyzed at a DoD ELAP accredited laboratory in accordance with the SAP. If any of the release criteria listed in Table 2-1, the associated pile will be disposed of as LLRW.

9.3.2 Investigation Levels for Gamma Radiation Surveys After Cap Installation

For gamma surveys after installation of the 2-foot cover, the investigation level is established at the reference area mean + 3σ, where σ is the standard deviation of the gamma readings in the reference area. Any area exceeding the reference area mean + 3σ, where σ is the standard deviation of the gamma readings in the reference area, will be further investigated to determine if further action is required.

.

10.0 INSTRUMENTATION

Instruments will be selected that are suitable for the physical and environmental conditions at the site. The instruments and measurement methods selected will be able to detect the ROC or radiation types of interest, and are, in relation to the survey or analytical technique, capable of measuring levels sufficient to support the DQOs. Table 10-1 identifies the instrumentation resources available to support the survey objectives.

10.1 FIELD SURVEY INSTRUMENTS

Portable survey instruments will be used to perform measurements in the field. Table 10-1 lists the types of portable survey equipment expected to be used during survey activities at Alameda Point, and Table 10-2 provides examples of field radiological survey instrument calculations.

10.1.1 Calibration

Portable survey instrument calibration will be completed on an annual frequency. Instrument calibration will also be performed after repairs or modifications have been performed on the instrument. The instrument will be calibrated in accordance with the manufacturer's recommended method.

10.1.2 Daily Performance

Prior to use of the portable survey instruments, calibration verification, physical inspection, battery check, and source-response check will be performed per SOP 2, Preparation of Portable Radiation and Contamination Survey Meters and Instruments for Field Use.

All portable survey instruments will have a current calibration label that will be verified daily prior to use of the instrument.

Physical inspection of the portable survey instrument will include:

- General physical condition of the instrument and detector prior to each use
- Knobs, buttons, cables, connectors
- Meter movements/displays
- Instrument cases
- Probe/probe window(s)
- Other physical properties that may affect the proper operation of the instrument or detector

Any portable survey instrument or detector having a questionable physical condition will not be used until the problems have been corrected.

A battery check will be performed to ensure that sufficient voltage is being supplied to the detector and instrument circuitry for proper operation. This check will be performed in accordance with the instrument's operations manual.

The instrument will be exposed to the appropriate (alpha, beta, gamma) check source to verify that the instrument response is within the plus or minus percent range determined during the initial response check.

The results of the daily operation checks discussed above will be documented. Instruments that do not pass the daily operation checks will be removed from service until all deficiencies have been corrected.

10.1.3 Instruments for Surface Scan Surveys for Alpha Activity

Scan surveys for alpha radiation will be performed using a Ludlum Model 2360 data logger (or equivalent) equipped with either a Ludlum Model 43-68 or Model 43 series alpha-beta gas proportional probes (or equivalent) or a Ludlum Model 43-89 or 43-93 ZnS(Ag) plastic scintillation detector (or equivalent).

10.1.4 Instruments for Surface Scan Surveys for Beta Activity

Scan surveys for beta radiation will be performed using a Ludlum Model 2360 data logger (or equivalent) equipped with either a Ludlum Model 43-68 or Model 43-37 alpha-beta gas proportional probes (or equivalent) or a Ludlum 43-89 or 43-93 ZnS(Ag) plastic scintillation detector (or equivalent).

10.1.5 Instruments for Direct Measurement Static Surveys for Alpha Activity

Static surveys for alpha radiation will be performed using a Ludlum Model 2360 data logger (or equivalent) equipped with either a Ludlum Model 43-68 or Model 43-37 alpha-beta gas proportional probes (or equivalent) or a Ludlum Model 43-89 or 43-93 ZnS(Ag) plastic scintillation detector (or equivalent).

10.1.6 Instruments for Direct Measurement Static Surveys for Beta Activity

Static surveys for beta radiation will be performed using a Ludlum Model 2360 data logger (or equivalent) equipped with either a Ludlum Model 43-68 or Model 43-37 alpha-beta gas proportional probes (or equivalent) or a Ludlum Model 43-89 or 43-93 ZnS(Ag) plastic scintillation detector (or equivalent).

10.1.7 Instruments for Scan Surveys for Gamma Activity

Scan surveys for gamma radiation will be performed using a Ludlum Model 2350-1 data logger (or equivalent) equipped with a Ludlum Model 44-10 2-inch by 2-inch NaI scintillation detector (or equivalent) and/or VTA with a TSA SC-770 data controller coupled to two TSA DA372 gamma scintillation detector assemblies.

10.1.8 Instruments for Direct Measurement Static Surveys for Gamma Activity

Direct measurement static surveys for gamma radiation will be performed using a Ludlum Model 2350-1 data logger (or equivalent) equipped with a Ludlum Model 44-10 2-inch by 2-inch NaI scintillation detector (or equivalent).

10.1.9 Instruments for Direct Measurement Surveys for Beta Gamma Activity

Direct measurement surveys for beta and gamma radiation will be performed using Ludlum Model 3, Model 12, Model 177, Model 2360 or equivalent, with a model 44-9 Geiger Mueller pancake probe, Ludlum Model 43-89 or 43-93 ZnS(Ag) plastic scintillation detector (or equivalent). These instrument combinations are normally used for routine surveys associated with operational aspects of decommissioning activities such as monitoring personnel and equipment exiting a radiologically controlled area.

10.1.10 Instrument for Exposure Rate Surveys

Exposure rate surveys are conducted with use of a Ludlum Model 19 MicroR meter (or equivalent). Compatible with anticipated exposure rates, the instrument is equipped with an internally mounted 1-inch by 1-inch NaI scintillation detector that is integral to the meter housing.

10.1.11 Instrument for Portal Monitor Truck Surveys

The Ludlum Model 3500-1000RWM Radiation Monitor System is designed to detect low levels of radiation in loads passing through the system. Two scintillation detectors, each containing approximately 480 cubic inches of plastic detector media, provide coverage to both sides of the vehicle. The detector's large size (48 inches long by 5 inches wide by 2 inches thick) provides a large area for the detection of gamma radiation.

10.2 INSTRUMENTATION EQUATIONS

The following equations are used to calculate efficiencies, MDCs, and minimum detectable count rates (MDCRs).

10.2.1 Instrument Efficiency

The instrument efficiency (ε_i) is defined as the ratio between the net count rate, in cpm, of the instrument and the surface emission rate of the calibration source for a specified geometry. The surface emission rate is the 2π particle fluence that is affected by both the attenuation and backscatter of the radiation emitted from the calibration source.

Equation 10-1 will be used to calculate the instrument efficiency in counts per particle, although efficiency is typically reported as having no units or unitless:

Equation 10-1

$$\varepsilon_i = \frac{R_{S+B} - R_B}{q_{2\pi}\left(\frac{W_A}{S_A}\right)}$$

Where:

R_{S+B}	=	the gross count rate of the calibration measurement (cpm)
R_B	=	the background count rate in cpm
$q_{2\pi}$	=	surface emission rate of the calibration source (National Institute of Standards and Technology [NIST] traceable) in particles per minute
W_A	=	active area of the detector window (square centimeters [cm^2])
S_A	=	area of the source (cm^2)

The instrument efficiency procured from the instrument calibration service is determined by obtaining static counts with the detector over a calibration source that has a NIST-traceable surface emission rate. The 2π particle fluence rate is corrected for decay, attenuation, and scatter. Then the surface emission rate of the source must be corrected for the area subtended by the probe. Factors that can also affect instrument efficiency are discussed below:

- Efficiency Check Sources. Efficiency check sources that emit alpha or beta radiation with energies similar to those expected from the contaminant in the field (similar to the expected ROCs) will be selected.
- Source Geometry Factors. Instrument efficiency will usually be determined with an efficiency check source equal to or greater than the area of the probe. If a source smaller than the probe is used, a conversion factor is applied to the minimum detectable concentration (MDC) to account for the active region of the probe.
- Source-to-Detector Distance. The detector efficiency will be calculated at a source-to-detector distance the same as the detector-to-surface distance used in the field.

10.2.2 Surface Activity Measurements

Surveillance measurements are used to quantify surface activity levels on concrete and other building surfaces. International Organization for Standardization (ISO) 7503-1 (ISO 1988), NUREG/CR-1507 (NRC 1997), and Selection and Use of Portable Radiological Survey Instruments for Performing In-Situ Radiological Assessments in Support of Decommissioning (American Society for Testing and Materials 1998) are used as technical guidance to ensure accuracy in the measurement of surface activity.

Equation 10-1a is used to calculate the surface activity in units of disintegrations per minute (dpm) per 100 cm^2:

Equation 10-1a

$$A_S = \frac{R_{S+B} - R_B}{\varepsilon_i \varepsilon_s \frac{W_A}{100\,cm^2}}$$

Where:

A_S	=	total surface activity (dpm/100 cm^2)
R_{S+B}	=	the gross count rate of the measurement in cpm
R_B	=	the background count rate in cpm
ε_i	=	the instrument efficiency
ε_s	=	the contaminated surface efficiency
W_A	=	the area of the detector window (cm^2)

10.2.3 Count Detection Probability for Alpha Scans (≤ 126-cm^2 Probe)

Scanning for alpha emitters differs significantly from scanning for beta and gamma emitters in that the expected background response of most alpha detectors is very close to zero. The following sections cover scanning for alpha emitters.

Since the time a contaminated area is under the probe varies and the background count rate of some alpha instruments is less than 1 cpm, it is not reasonable to determine a fixed MDC for scanning. Instead, it is more practical to determine the probability of detecting an area of contamination at a predetermined DCGL for given scan rates.

For alpha survey instrumentation with backgrounds ranging from less than 1 to 3 cpm, a single count provides a surveyor sufficient cause to stop and investigate further. Assuming this to be true, the probability of detecting given levels of alpha surface contamination can be calculated by use of Poisson summation statistics.

Given a known scan rate and a surface contamination release limit, the probability of detecting a single count while passing over the contaminated area is given by Equation 10-2:

Equation 10-2

$$P(n \geq 1) = 1 - e^{-\frac{GEd}{60v}}$$

Where:

$P(n \geq 1)$	=	probability of observing a single count
G	=	contamination activity (dpm)
E	=	detector efficiency (4π)
d	=	width of detector in direction of scan (cm)
v	=	scan speed (centimeters per second [cm/s])

Once a count is recorded and the guideline level of contamination is present, the surveyor should stop and wait until the probability of getting another count is at least 90 percent. This time interval can be calculated using Equation 10-3:

Equation 10-3

$$t = \frac{13,800}{CAE}$$

Where:

t	=	time period for static count(s)
C	=	contamination guideline (dpm/100 cm^2)
A	=	physical probe area (cm^2)
E	=	detector efficiency (4π)

10.2.4 Count Detection Probability for Alpha Scans (582-cm^2 Probe)

The larger (582 cm^2) gas-proportional detectors have background count rates on the order of 5 to 10 cpm, and a single count will not cause a surveyor to investigate further. A counting period long enough to establish that a single count indicates an elevated contamination level would be prohibitively inefficient. For these types of instruments, the surveyor usually will need to get at least two counts while passing over the source area before stopping for further investigation.

Assuming this to be a valid assumption, the probability of getting two or more counts can be calculated using Equation 10-4:

Equation 10-4

$$P(n \geq 2) = 1 - \left[1 + \frac{(GE + B)t}{60}\right]\left[e^{\frac{-(GE+B)t}{60}}\right]$$

Where:

$P(n\geq 2)$	=	probability of getting two or more counts during the time interval t
t	=	time interval (s)
G	=	contamination activity (dpm)
E	=	detector efficiency (4π)
B	=	background count rate (cpm)

10.2.5 Minimal Detectable Count Rate and Minimum Detectable Concentration for Beta Scans

The minimum detectable number of net source counts in the scan interval can be arrived at by multiplying the square root of the number of background counts (in the scan interval) by the detectability value associated with the desired performance (as reflected in d') as shown in Equation 10-5:

Equation 10-5

$$MDCR = \mathrm{d'}\sqrt{\mathrm{b_i}}\left(\frac{60}{i}\right)$$

Where:

d'	=	index of sensitivity (α and β errors [performance criteria])
b_i	=	number of background counts in scan time interval (count)
i	=	scan or observation interval(s)

The required rate of true positives will be 95 percent, and the false positives will be 5 percent. From Table 6.5 of MARSSIM (DoD et al. 2000), the value of d', representing this performance goal, is 3.28.

The minimum detectable number of net source counts in the interval is given by S_i. Therefore, for an ideal observer, the number of source counts required for a specified level of performance can be arrived at by multiplying the square root of the number of background counts by the detectability value associated with the desired performance (as reflected in d'), as shown in Equation 10-5a:

Equation10-5a

$$S_i = d'\sqrt{b_i}$$

The scan MDC is determined from the MDCR by applying conversion factors that account for detector and surface characteristics and surveyor efficiency. As discussed below, the MDCR accounts for the background level, performance criteria (d'), and observation interval. The observation interval during scanning is the actual time that the detector can respond to the contamination source. This interval depends on the scan speed, detector size in the direction of the scan, and area of elevated activity.

The scan MDC for structure surfaces is calculated using Equation 10-6:

Equation 10-6

$$Scan\ MDC = \frac{MDCR}{\sqrt{p}\ \varepsilon_i \varepsilon_s \dfrac{W_A}{100\ cm^2}}$$

Where:

MDCR is discussed above
p = surveyor efficiency factor
ε_i = instrument efficiency (count per particle)
ε_s = contaminated surface efficiency (particle per disintegration)
W_A = area of the detector window (cm^2)

10.2.6 MDC for Static Alpha and Beta Counts

The static MDC is the level of radioactivity practically achievable by the overall measurement process. Equation 10-7 is used to calculate instrument MDC in dpm per 100 cm^2 when the background and sample are counted for the same time intervals:

Equation 10-7

$$MDC = \frac{3 + 4.65\sqrt{R_B T_B}}{\varepsilon_s \varepsilon_i \frac{W_A}{100} T_B}$$

Where:

R_B = background count rate (cpm)
T_B = background counting time (minute [min])
ε_i = instrument efficiency (counts per particle)
ε_s = contaminated surface efficiency (particles per disintegration)
W_A = active area of the detector window (cm^2)

In Equation 10-7, W_A is the size of the "active" area of the detector window. If the area of the detector window (cm^2) does not equal 100 cm^2, it is necessary to convert the detector response to units of dpm per 100 cm^2.

If the background and sample are counted for different time intervals, Equation 10-8 is used to calculate the MDC in dpm per 100 cm^2:

Equation 10-8

$$MDC = \frac{3 + 3.29\sqrt{R_B T_{S+B}\left(1 + \frac{T_{S+B}}{T_B}\right)}}{\varepsilon_i \varepsilon_s \frac{W_A}{100\ cm^2} T_{S+B}}$$

Where:

R_B	=	background count rate (cpm)
T_B	=	background counting time (min)
T_{S+B}	=	sample counting time (min)
ε_i	=	instrument efficiency (counts per particle)
ε_s	=	contaminated surface efficiency (particles per disintegration)
W_A	=	active area of the detector window (cm^2)

10.2.7 Surface Efficiency (ε_s) for Surface Activity Measurements

The surface efficiency term in the preceding equations is used to determine the 4π total efficiency for a particular surface and condition. Suitable values are based on the radiation and radiation energy, and are primarily impacted by the backscatter and self-absorption characteristics of the surface on which the contamination exists in the field. Backscatter is most affected by the energy of the radiation and the density of the surface material. Self-absorption characteristics or attenuation are also a function of the radiation's energy and surface condition. Surfaces typically encountered in the field include concrete, asphalt, wood, drywall, plaster, carpet, and metal. Surface conditions include both physical effects, such as scabbled concrete, and the effect of surface coatings: dust, paint, rust, water, and oil.

In the absence of experimentally determined surface efficiencies, ISO-7503-1 (ISO 1988) and NUREG-1507 (NRC 1997) provide conservative recommendations for surface efficiencies. ISO-7503-1 recommends a surface efficiency of 0.5 for maximum beta energies exceeding 0.5 megaelectron volt (MeV) and to use a surface efficiency of 0.25 for beta energies between 0.15 and 0.4 MeV and for alpha emitters (ISO 1988; NRC 1997). NUREG-1507 provides surface efficiencies based on studies performed for the NRC. In general, NUREG-1507 indicates that the ISO rule of thumb for surface efficiencies is conservative, particularly for beta-emitting radionuclides with end-point energies between 0.25 MeV and 0.4 MeV. A surface efficiency of 0.25 will be used for alpha and beta emitters at Alameda Point.

10.2.8 MDC for Gamma Scans of Surface Areas

The scan MDC (in pCi/g) for land areas is based on the area of elevated activity, depth of contamination, and the radionuclide (energy and yield of gamma emissions). To establish the scan MDC, the relationship between the detector's net count rate to net exposure rate must be established first. This is accomplished by determining the MDCR using Equation 10-5 and then applying a surveyor efficiency factor *p* to get the minimum detectable count rate calculated assuming a surveyor efficiency ($MDCR_{Surveyor}$) as shown below in Equation 10-9:

Equation 10-9

$$MDCR_{Surveyor} = MDCR \big/ \sqrt{p}$$

The $MDCR_{Surveyor}$ is then converted into the corresponding minimum detectable exposure rate (MDER) by use of a calibration constant specific to the detector being used and the ROC. For example, when used with the Ludlum Model 2350-1, the calibration records for the Ludlum Model 44-10 2-inch by 2-inch NaI scintillation detector provide a calibration constant that can be used to determine the ratio of cpm to μR/hr, as shown in Equation 10-10 below:

Equation 10-10

$$MDER\ (\mu R / hr) \quad = \quad \frac{MDCR_{Surveyor} * 6 \times 10^{7}}{cc}$$

Where:

$MDCR_{Surveyor}$	=	as calculated in Equation 10-9
6×10^{7}	=	a conversion factor accounting for differences in time and activity units ([μR-min]/[R-hr])
cc	=	calibration constant ([counts]/[R])

Next, the relationship between the radionuclide concentration and exposure rate is established. This is accomplished by modeling (using MicroShield) to determine the net exposure rate produced by the radionuclide at a distance above the ground. The factors considered in modeling include:

- The dose point above the surface
- The density of material in grams per cubic centimeter
- DCGL of the ROC in pCi/g
- The depth of detection for the DCGL
- The circular dimension of the cylindrical area of detector capability (m^2)

The concentration of the ROC (Scan MDC) necessary to yield the MDER may be calculated by taking the ratio of the MDER to the exposure rate calculated by MicroShield or Monte Carlo *N*-Particle code, as shown in Equation 10-11:

Equation 10-11

$$Scan\ MDC\,(pCi / g) = \frac{DCGL\ pCi / g * MDER\,\mu R / hr}{Microshield\ Exposure\ Rate\,\mu R / hr}$$

10.2.9 Minimum Detectable Count Rate for Static Gamma Counts

For gamma surveys, MDCR, rather than MDC, is calculated in cpm. If the background and sample are counted for the time intervals, Equation 10-12 is used to calculate the MDCR:

Equation 10-12

$$MDCR = \frac{3 + 4.65\sqrt{R_B T_B}}{T_B}$$

Where:

3 + 4.65	=	constant factor provided by MARSSIM
R_B	=	background count rate (cpm)
T_B	=	background counting time (min)

Surveys will not normally be designed to use different background and sample count times for gamma scan surveys; any deviation from this requires RASO approval. If the background and sample are counted for different time intervals, Equation 10-13 is used to calculate the MDC:

Equation 10-13

$$MDC = \frac{3 + 3.29\sqrt{R_B \cdot T_{S+B} \cdot (1 + \frac{T_{S+B}}{T_B})}}{T_{S+B}}$$

Where:

3 + 3.29	=	constant factor provided by MARSSIM
R_B	=	background count rate (cpm)
T_{S+B}	=	background counting time (min)
T_B	=	background counting time (min)

10.3 LABORATORY INSTRUMENTS

Laboratory equipment will be used to analyze samples collected in the field. The SAP lists the types of laboratory equipment expected to be used at for sample analysis.

10.3.1 Quality Assurance Checks

Quality assurance checks shall be performed on laboratory instrumentation to ensure proper operation and to maintain calibration. The quality checks shall be documented, reviewed, and maintained. Data trends outside the tolerance limits shall be investigated to determine the cause and potential effect on measurement results.

10.3.2 Gross Alpha/Beta Loose Surface Contamination Surveys

Swipe samples will be processed using a Ludlum Model 3030P scaler and scintillation probe (or equivalent). Data are reported in units of dpm per 100 cm^2.

10.3.3 Gamma Spectroscopy

Gamma spectroscopy analysis is performed using EG&G ORTEC® detector systems equipped with beryllium end caps (windows), which allow for enhanced quantification of low-energy gammas (such as ^{226}Ra). Hardware features include a High-Purity Germanium Detector (gamma photon detector) supported by a multi-channel analyzer and analysis software. Instrument hardware is calibrated using a multi-energy NIST-traceable source ranging from 50 kiloelectron volts to 2.6 MeV. All results are reported in pCi/g, picocuries per milliliter (pCi/mL), or picocuries per liter (pCi/L), depending on the media analyzed. The Laboratory Manager reviews all data results, including energy spectrums, for quality assurance and to verify count integration, efficiency, and background corrections, as well as the identification of overlapping peaks. If there is any question on the analysis results, the sample is reprocessed and possibly counted for a longer interval.

10.3.4 Total Strontium/Strontium-90 Analysis

Total strontium analysis will be performed in accordance with the SAP by a DoD ELAP accredited laboratory. If the total strontium release criterion is exceeded for any sample, ^{90}Sr analysis will be performed in accordance with the SAP by a DoD ELAP accredited laboratory. The results of ^{90}Sr analysis typically are reported in pCi/g, pCi/mL, or pCi/L, depending on the media analyzed.

10.3.5 Alpha Spectroscopy Analysis

Analysis of alpha-emitting radioisotopes will be performed in accordance with the SAP by a DoD ELAP accredited laboratory. The results of alpha spectroscopy analysis are reported in pCi/g, pCi/mL, or pCi/L, depending on the media analyzed. Alpha spectroscopy will be used to determine concentrations of ^{238}U through Isotopic Uranium analysis and ^{232}Th by Isotopic Thorium analysis.

11.0 SURVEY IMPLEMENTATION

This section discusses the types of surveys and their implementation in the field with a focus on the methods for conducting each type of survey. The survey procedures described in this section will be performed in accordance with approved SOPs.

11.1 REFERENCE (BACKGROUND) AREAS

An average background level will be determined by performing measurements at systematic or random locations within the designated background area. The detector probe will be held approximately 10 centimeters (4 inches) from the surface area for gamma radiation and 0.25 inch from the surface area for alpha/beta radiation. Instrumentation will be allowed to stabilize before background readings are taken. The average of the larger of the readings or the method detection limit or minimum detectable activity reported by the laboratory for all of the readings taken will determine the background. Background scan ranges, swipes, and exposure rates will also be collected for reference data. In some cases, solid samples will need to be collected in the background area for comparative analyses of specific survey units. The same survey methodology and instruments used to collect the background data will be used to perform measurements within survey units.

For the FSS of survey units with the cover installed, a reference area constructed from import fill material used in cover construction will be established with concurrence from the RASO in a non-radiologically impacted area.

11.2 SCAN SURVEYS

Scan surveys are an integral part of survey programs conducted to determine contamination levels. The surveys are an evaluation technique performed by moving a detection device over a surface at a specified speed and distance above the surface to detect radiation. It will be used to identify areas that may require additional survey measurements.

11.2.1 Scan Surveys for Alpha/Beta Radiation

Surface scan surveys for alpha and beta radiation will be performed by moving the detector over the surface being surveyed at a rate of approximately 1 inch per second. The detector will be held within 0.635 centimeter (0.25 inch) over the surface being surveyed.

11.2.2 Scan Surveys for Gamma Radiation

Gamma scan survey measurements are obtained by traversing a path at a maximum speed (scan rate) of approximately 0.5 meter per second (m/s) and slowly moving the detector assembly in a serpentine (S-shaped) pattern, while maintaining the detector approximately 10 centimeters

(4 inches) above the area being surveyed. Gamma scan surveys with VTA will be performed at a rate not to exceed 0.5 m/s with the detector's height at approximately 4 inches.

11.3 STATIC SURVEYS

Static contamination surveys are used to determine contamination levels on surface areas for scoping, characterization, and/or release surveys. The surveys are an evaluation technique performed by holding a detection device over a surface for a specified time at a set distance to detect radiation.

11.3.1 Static Surveys for Alpha and Beta Surface Activity

Direct measurements will be conducted with the detector within 0.635 centimeter (0.25 inch) above the surface. Count time for conducting the measurement will be dependent upon the ROC.

11.3.2 Static Surveys for Gamma Radiation

Static gamma measurements require positioning the detector assembly approximately 10 centimeters (4 inches) above the surface and completing a stationary 60-second survey.

11.4 EXPOSURE RATE MEASUREMENTS

Exposure rate surveys are performed to measure ambient gamma radiation levels. These measurements are obtained by holding the detection device at the required distance from the surface being surveyed. Instrumentation will be allowed to stabilize before taking the measurement.

11.5 SWIPE SAMPLE MEASUREMENTS

Swipe sampling will be performed to assess the presence of radioactive contamination that is readily removed from a surface. Swipe samples will be taken to evaluate the presence of alpha and beta surface activity.

11.6 EQUIPMENT AND MATERIAL SURVEYS

Equipment and materials surveys will be performed in accordance with SOPs. Table 2-1 lists acceptable levels of contamination based on the AEC Regulatory Guide 1.86 limits. In the event that survey results indicate levels of contamination exceeding the limits listed in Table 2-1 (for surfaces), appropriate decontamination methods will be performed using methods described in these SOP 7, Decontamination of Equipment and Tools.

11.7 PERSONNEL SURVEYS

Properly trained staff will perform personnel surveys in a predesignated low-background area before leaving a radiologically controlled area, as specified in the RWP or when deemed necessary by the RCT. Personnel who are not qualified to administer a self-survey will be monitored by a qualified technician. Personnel surveys will be performed using the appropriate survey methods described above and in accordance with appropriate SOP 1, Radiation and Contamination Surveys.

11.8 MEDIA SAMPLING

Various samples may be collected for radiological analysis; however, soil is the only planned media type. The SAP describes the methods for collecting samples, sample numbering, sample labeling, sample shipment, and completion of the associated chain-of-custody and other required documentation.

11.9 TRUCK SURVEYS

During the course of work at Alameda Point, soils and debris may be transported via truck to recycling centers, landfills, and other licensed disposal sites. Most of these items and materials will require radiological surveys prior to leaving the site. However, some stockpiles of soil, debris, and miscellaneous materials may not be surveyed because the likelihood of contamination is very low. As an added measure against inadvertently sending radioactive materials to a landfill or disposal site, trucks carrying material from potentially impacted sites will be surveyed for gamma radiation. Truck surveys will be performed using SOP 11. The RSO, RSOR, and Project Manager will be immediately notified of any truck rejected at the Alameda Point portal monitor.

11.10 GLOBAL POSITIONING SYSTEM MEASUREMENTS

Global positioning system (GPS) units will be used while performing area field surveys. For example, during an outdoor gamma scan survey, a GPS unit may be carried adjacent to the gamma detector. The GPS output will be logged along with the gamma count rates, so that each gamma reading will have an associated location point. After the survey, gamma data may be color coded and plotted on a survey map.

In addition, outdoor survey units may be mapped by walking the perimeter with a GPS unit. Once the outline is digitized, static reading locations for that survey unit can be generated in latitude and longitude, using Visual Sample Plan software (Gilbert et al. 2001). These points can be located using the GPS unit followed by the collection of static readings and samples, as appropriate.

This page intentionally left blank.

12.0 DECONTAMINATION AND DISPOSITION

Decontamination and disposition activities will be performed as part of radiological remedial action activities at Alameda Point. Decontamination is the removal, by chemical or physical means, of radioactive material from various types of internal and external surfaces including equipment, materials, components, systems, and structures. To assess the extent and type of contaminants identified during the course of ongoing fieldwork, various remedial activity support surveys will be necessary.

12.1 DECONTAMINATION

To support ongoing work at Alameda Point, decontamination of materials, equipment, and structures may be necessary. There are numerous decontamination methods available for use. If practical, manual decontamination methods should be used. Abrasive methods may be necessary if areas of fixed contamination are identified. Chemical decontamination can also be advantageous by using detergents for nonporous surfaces with contamination present. Chemicals should be selected for decontamination that will minimize the creation of mixed waste.

Decontamination activities will be conducted using SOP 7, Decontamination of Equipment and Tools.

12.2 DISPOSITION

Disposition is the methodology of identifying the radiological status of equipment, materials, and structures for its end use. Disposition will be conducted after the decontamination and/or dismantling activities have been completed. This will include the following key elements:

- Control of equipment and materials
- Free release
- Decontaminate for free release
- Off-site disposal

Controlling equipment and materials is essential to ensure that contaminated items are not used in uncontrolled areas to prevent the inadvertent spread of contamination. If decontamination methods are unsuccessful, some materials and equipment may be stored for future use in radiologically controlled areas. If it is not feasible or cost-effective to control contaminated equipment and materials, they will be disposed of as LLRW.

This page intentionally left blank.

13.0 RADIOACTIVE MATERIALS MANAGEMENT

Planned site activities are expected to involve the presence of radioactive materials. These activities will be conducted by trained and qualified personnel who are designated to apply management and control measures as regulated by the appropriate regulatory agencies. The management of radioactive materials including handling and control will be performed in accordance with TtEC's NRC radioactive materials license number 29-31396-01 and the RPP (Attachment 3 to the RAWP).

This page intentionally left blank.

14.0 DOCUMENTATION AND RECORDS MANAGEMENT

The purpose of this section is to define standards for the maintenance and retention of radiological records. Radiological records provide historical data, document radiological conditions, and record personnel exposure.

Sample collection, field measurements, and laboratory data will be recorded both electronically and on paper, to the extent practicable. Electronically recorded data and information will be backed up to the Alameda server and TtEC's mainframe on a weekly basis. Data and information recorded on paper will be recorded using indelible ink. Both electronic and paper records of field-generated data will be reviewed by the RSOR or a designee knowledgeable in the measurement method for completeness, consistency, and accuracy. Data manually transposed to paper from electronic data collection devices will be compared to the original data sets to ensure consistency and to resolve noted discrepancies. Electronic copies of original electronic data sets will be preserved on a nonmagnetic retrievable data storage device. No data reduction, filtering, or manipulation will be performed on the original electronic versions of data sets.

Changes or corrections to project documentation will be made by crossing out the erroneous item with a single line, initialing (by the person performing the correction), and dating the correction. The original item, although erroneous, must remain legible beneath the cross-out line. The new information will be written above the crossed-out item. Corrections must be written clearly and legibly with indelible black or blue ink.

14.1 REQUIREMENTS

Records resulting from implementation of this Rad Work Plan shall meet the quality standards as outlined herein. All records must be retrievable and maintained for their prescribed retention time defined in the Project Contractor Quality Control Plan (Attachment 5 to the RAWP). Working copies of records used for reference will be stored separately from the original.

Completed records awaiting transfer to long-term storage shall be stored in an appropriate manner to minimize loss and damage that could result from exposure to weather, fire, or other conditions.

Principal personnel who create, review, and approve radiological records must sign and date the record and follow quality standards specified in the Project Contractor Quality Control Plan.

14.2 DOCUMENT QUALITY STANDARDS

Records shall be legible and completed with an indelible ink that provides reproducible and legible copies. Records shall be dated and contain a verifiable signature of the originator. Errors shall be corrected by marking a single line through the error and by initialing and dating the correction. Radiological records shall not be corrected using an opaque substance. Shorthand or nonstandardized terms may not be used.

To ensure traceability, each record shall clearly indicate:

- Identification of the facility
- Specific location
- Function and process
- Date
- Document number (if applicable)

The quantities used in records shall be clearly indicated in standard units (curie, rad, rem, dpm, becquerel), including multiples and subdivisions of these units.

14.3 DOCUMENTATION

The types of documentation that will be maintained and assessed are field operation records, laboratory records, and work support documents.

14.3.1 Field Operation Records

The information contained in field operation records will document overall field operations and may consist of the following:

- Field measurement records – At a minimum, this documentation will identify the names of the persons conducting the activity, measurement identification, measurement locations, measurement results, maps and diagrams, equipment, and unusual observations. Data record forms, bound field notebooks, and electronic data loggers will be used to record raw data and make references to prescribed procedures and changes in planned activities.
- Sample tracking records – These records will be documented as identified in the SAP.
- QC records – QC records will be prepared as indicated in the Project Contractor Quality Control Plan.
- Deficiency and problem identification reports – These reports will be prepared as indicated in the Project Contractor Quality Control Plan.
- Corrective action reports – Corrective action reports will be prepared as identified in the Project Contractor Quality Control Plan.

14.3.2 Laboratory Records

Laboratory records will be prepared as indicated in the SAP.

14.3.3 Work Support Documents

Work support documents may include RWPs, reports, and work instructions that will be prepared, reviewed, and approved.

This page intentionally left blank.

TABLE 2-1
RELEASE CRITERIA

Radionuclide[a]	Soil[b] (pCi/g)	Surfaces Fixed[g] (dpm/100cm^2)	Water[h] (pCi/L)
Cesium-137+D	0.113[c]	5,000 βγ	119
Cobalt-60	0.0361[c]	5,000 βγ	100
Radium-226	1.0 [c,d]	100 α	5
Strontium-90	0.331[c]	1,000 βγ	8
Thorium-232	1.69[c,f]	1,000 βγ	15
Uranium-238+D	0.742[e,f]	5,000 α	30

Notes:

Table 2-1 values for soil and notes a through e are directly taken from Table 2-6 of the Final Record of Decision for IR Site 2 (DON 2010).

[a] Ra-226 was identified as posing a potentially unacceptable risk to one or more of the human receptors considered in the site-specific HRA conducted at IR Site 2. All radionuclides are identified based on the findings of the Final HRA (Weston Solutions, Inc. 2007).

[b] The RGs for radionuclides meet or are more protective than the 15 millirem per year residual dose level consistent with the 1997 U.S. EPA Office of Solid Waste and Emergency Response Directive 9200.4-18. The RGs for radionuclides are conservatively based on residential or outdoor construction worker receptors even though institutional controls will be implemented throughout IR Site 2 to effectively mitigate potential risks to these receptors.

[c] DON. 2006. Final Basewide Radiological Removal Action Memorandum, Revision 2006, Hunters Point Shipyard, San Francisco, California. April 21.

[d] Remediation goal is 1 pCi/g above background per agreement with EPA.

[e] EPA. 2009. Preliminary Remediation Goals for Radionuclides. http://epaprgs.ornl.gov/radionuclides/.

[f] Background concentrations will be added to NORM radionuclides.

[g] These limits are based on AEC Regulatory Guide 1.86 (1974). Limits for removable surface activity are 20 percent of these values.

[h] Release criteria for water have been derived from Radionuclides Notice of Data Availability Technical Document (EPA 2000) by comparing the limits from two criteria and using the most conservative limit.

Abbreviations and Acronyms:

AEC – Atomic Energy Commission
cm^2 – square centimeter
+D – daughter products
dpm – disintegrations per minute
EPA – U.S. Environmental Protection Agency
HRA – Historical Radiological Assessment
IR – Installation Restoration (Program)
NORM – naturally occurring radioactive material
pCi/g – picocuries per gram
pCi/L – picocuries per liter
RG – remediation goal

1.0 PURPOSE/INTRODUCTION

The purpose of this Radiation Protection Plan (RPP) is to detail Tetra Tech EC, Inc's. (TtEC's) requirements for activities conducted under Radioactive Material License (RML) No. 29-31396-01, issued and subject to regulatory enforcement by the United States Nuclear Regulatory Commission (NRC) and activities conducted under a State of California Agreement State license, once issued, if activities are conducted in areas not under exclusive federal jurisdiction. The following activities are subject to this RPP: project activities that involve the use and/or handling of licensed by-product, source, and/or special nuclear material (hereafter referred to as radioactive material); tasks with the potential for radioactive material to be present based on available data and historical records; and work in locations posted and controlled because of radioactive material. Project activities will incorporate the requirements within to maintain compliance in parallel with the current version of corporate procedure RP1-1, Radiological Protection Program.

Project activity performance steps are detailed in site-specific Work Plans, e.g., Standard Operating Procedures (SOPs), Work Instructions, and Task-specific Plans. (Agencies that may have jurisdiction or an interest in project activities are also identified in such documents.) Project staff tasked to perform assignments involving the presence of radioactive material (i.e., those identified in the applicable portions of Section 2.0) will complete a review of this document and indicate an understanding of all requirements by completing a Radiation Protection Plan Acknowledgement Form (Appendix A).

1.1 POLICY

It is TtEC's policy that work with radioactive material be purposeful and performed in a manner that protects project staff, members of the general public, and the environment. Radiologically oriented work may not begin unless it can be performed in a safe and reliable manner that is compliant with the exposure reduction rules, regulations, and principles described in Section 1.3.

1.2 PROJECT-SPECIFIC RADIATION PROTECTION PLAN

Corporate procedure RP1-1, Radiological Protection Program, provides the foundation for the RPP and its use for any project or activity that involves the possession or use of radioactive materials, including the subsequent potential for exposure to ionizing radiation. Content provided within this RPP reflects corporate policy and provides the guidance needed for project management to execute the scope of work in a safe manner. Site-specific guidance for radiological safety and control is further detailed in SOPs. SOPs are subject to approval by the Radiation Safety Officer (RSO) or designee and authorized for use as indicated on a Radiation Protection Program SOP Crossover Document. This document may be revised separately from the RPP. A current copy for each viable project is available upon request. The RSO is also the company's Corporate Health Physics Manager (CHPM).

1.3 AS LOW AS REASONABLY ACHIEVABLE

Work involving radioactive material and any corresponding exposure to ionizing radiation must be purposeful and performed in a manner sufficient to ensure the protection of staff, members of the public, and the environment. TtEC applies industry recognized principles to radiological work so that exposure to ionizing radiation is maintained in accordance with corporate procedure NLP-01, As Low As Reasonably Achievable (ALARA) Program.

1.4 AUTHORIZATION TO STOP WORK

In accordance with corporate procedure RP1-1, Radiological Protection Program, and as detailed in Section 2.9, employees are authorized to stop work if an unsafe condition exists or safety protocol is being violated, and immediately report the condition to project management.

Work performed under a Radiation Work Permit (RWP) will stop, and the Navy Radiological Affairs Support Office (RASO) will be notified if any of the following atypical work site conditions are encountered:

- An individual total effective dose equivalent (TEDE) exceeding 500 millirems
- The collective TEDE for the job exceeding 1 rem
- Individual airborne exposures exceeding 10 derived air concentration (DAC) hours in a 7-day period
- General area exposure rates exceeding limits of current radiological posting
- Contamination levels exceeding 100 times the limits requiring classification of an area as a Contaminated Area

In cases where the Navy must be notified, the license RSO, with concurrence from the Navy's Radiological Environmental Protection Manager, RASO, must approve the RWP prior to restarting work.

1.5 SCOPE OF WORK

The scope of work involves the following activities:

- Task-specific training of personnel
- Site controls and establishment of work zones at sites with, or having the potential for, radioactive commodities or contaminants

- Handling and management of collected radioactive commodities, radiologically contaminated soil, construction and building materials, or other associated radiologically contaminated material
- Site investigation and remediation including characterization surveys and sampling; excavation; demolition; screening for and removal of commodities, and building and construction materials; and surveys and sampling to document final conditions

1.6 QUALITY CONTROL AND AUDITING

To maintain continued compliance and evaluate overall RPP effectiveness, quality control (QC) measures including self-assessment and management reviews will be used. Formal audits, including those conducted at field projects, will be coordinated and tracked to completion by the RSO as will any need for adjustments to audit frequencies.

1.6.1 Self-Assessment, Management Reviews, and Audits

A self-assessment and management review of RPP use, as detailed in corporate procedure NLP-08, Radiation Protection Program Audits, will be conducted. Project personnel including the Project Manager (PjM), project Radiation Safety Officer Representative (RSOR), and on-site personnel will support and cooperate with any audit conducted.

1.6.2 Responses and Corrective Actions

Radiological deficiencies must be responded to in a timely fashion. Deficiencies that represent an imminent threat to radiological control or safety (e.g., compromise of procedural protocol) will be immediately reported to the RSOR, RSO, and PjM or designee(s). Subsequent corrective actions will be tracked to completion by the RSO or designee. Radiological deficiencies, including corrective actions, will be promptly reported by the RSO to the Navy. (For the purposes of this RPP, the Navy means U.S. Department of the Navy, Naval Facilities Engineering Command Southwest; U.S. Department of the Navy, Base Realignment and Closure, Program Management Office; and Naval Sea Systems Command Detachment, [RASO]). Responses to findings will be submitted to the RSO or designee for review, approval, and final disposition.

1.6.3 Daily Instrumentation Check

As addressed in Section 3.16, survey instruments procured for field use will have proof of current calibrations in accordance with the manufacturers' procedures, employing applicable standards and sources traceable to the National Institute of Standards and Technology. Copies of instrument calibration certificates will be maintained on-site for reference. Instruments will be response-checked daily in accordance with applicable SOPs. (In addition to the manufacturers' instruction manuals, typical project instruments and their performance characteristics are identified in site-specific controlling documents such as a Site-specific Radiological Work Plan.)

This page intentionally left blank.

2.0 RADIATION PROTECTION PERSONNEL

This section details the radiological safety responsibilities vested with key personnel within the project. (Nonradiological safety responsibilities will be detailed in a separate project-specific Accident Prevention Plan (APP)/Site Safety and Health Plan (SSHP). Reporting relationships between TtEC support personnel and the Navy will be referenced in a site-specific controlling document as well (e.g., Site-specific Radiological Work Plan).

2.1 VICE PRESIDENT FOR ENVIRONMENTAL SAFETY AND QUALITY SERVICES

The Vice President for Environmental Safety and Quality Services (VPESQ) has overall responsibility for TtEC's safety operations. The VPESQ is responsible for:

- Ensuring proper maintenance of the RPP consistent with applicable regulatory mandates, TtEC corporate policy, and recognized industry practice
- Establishing and maintaining all necessary management oversight specific to the RPP
- Implementing a management review process to ensure applicable use of RPP requirements

2.2 LICENSE RADIATION SAFETY OFFICER (CORPORATE HEALTH PHYSICS MANAGER)

The CHPM (also referred to as the RSO) is appointed by the VPESQ as the senior health physicist and the Health Physics Resource Manager for TtEC. The CHPM is responsible for:

- Reviewing and making recommended revisions to:
  - The RPP, RML procedures, radiation protection guidelines, and supporting documents
  - Project plans involving the use or handling of radioactive materials, or access to areas of radiological concern to ensure compliance with RPP requirements and supporting guidelines
- Acting as the Health Physics Resource Manager, also referred to as the corporate-level or license RSO
- Designating a Project Health Physicist, also referred to as the project-level RSOR, to provide day-to-day guidance on radiological protection issues
- Compliance as the license RSO, with RML No. 29-31396-01, or California Agreement State license, as applicable, including:

- Primary point of contact for all communications to the NRC and California Department of Public Health (CDPH)
- Identification and training of RML authorized users
- Assignment of project RSORs
- Coordination of investigations involving radiological occurrences to include review and approval of a resulting Corrective Action Plan
- Advance NRC or CDPH (as applicable) notification in writing at least 14 days before initiating at a temporary job site under TtEC RML jurisdiction any activity, or change to scope involving new activities, in areas of radiological concern (excluding routine packaging or repackaging for purposes of transporting and not requiring a job- or site-specific work package, and characterization and/or final surveys where radioactive materials and/or radiation are not likely to be detected)
- Refrain from taking ownership of licensed materials in excess of possession limits without prior notification and written NRC or CDPH approval (as applicable)
- Advance NRC or CDPH (as applicable) notification in writing within 30 days of the temporary job site completion status involving decontamination and decommissioning activities, and disposition of any licensed material as related to RML jurisdiction
- Placement of reciprocity request with applicable Agreement States when necessary
- Maintenance of radiological exposure records
- Development and/or approval of radiation safety training materials and/or courses
- Performance of program audits as detailed in corporate procedure NLP-08, Radiation Protection Program Audits
- Providing guidance on radiological protection issues
- Identification of appropriate project staffing needs to implement RPP requirements
- Assistance with the development of site Environmental Health and Safety (EHS) plans and approval of EHS plans for projects that involve the use or handling of radioactive materials or access to areas of radiological concern
- Resource Specialist review for Task Initiation Procedures (TIPs) for proposed projects involving exposure to radiation or radioactive materials

• Delegating project responsibilities to other company health physicists (also referred to as RSORs), as necessary

2.3 PROJECT RADIATION SAFETY OFFICER REPRESENTATIVE (PROJECT HEALTH PHYSICIST)

The project RSOR, also referred to as the Project Health Physicist, is assigned by the RSO and vested with corporate-level authority to implement the RPP and the TtEC RML at a project site.

Whenever radiological work is actively ongoing under the TtEC RML, the RSOR or designee identified as an authorized user will be present at the project site. The RSOR is vested with the following responsibilities at projects subject to jurisdiction involving the TtEC RML:

- Providing health physics guidance on an as-needed basis
- Conducting required radiological safety training
- Reviewing and approving project field procedures that involve the handling of radioactive materials or access to areas of radiological concern
- Conducting radiation incident investigations and project inspections
- Maintaining a project site file that details radiological protection training provided, dosimetry records generated, radiological surveys performed, and other documentation pertinent to the RPP, RML procedures, radiation protection guidelines, and supporting documents; copies of these will be provided to the CHPM at the conclusion of the project
- Arranging for and assisting in program radiation protection audits as detailed in the most current version of corporate procedure NLP-08, Radiation Protection Program Audits
- Assisting in the development and approval of the site EHS plan
- Helping in the identification of project radiological analysis needs and selection of analytical support contractors
- Coordinating required ALARA reviews
- Ensuring appropriate staff work practices are employed to maintain occupational radiation exposures ALARA
- Ensuring items needed to perform work in accordance with the RPP, RML, and supporting documents are available, such as appropriate instrumentation, protective devices, dosimetry, etc.
- Directing the preparation of, and performing the review and approval of, RWPs
- Stopping work if necessary to ensure radiological safety
- Communicating with the PjM and RSO as needed to ensure the RPP is implemented correctly
- Ensuring proper operation of radiation-measuring equipment, including the performance of daily function and QC tests, and removing out-of-compliance instruments from service
- Maintaining radiation-measuring equipment in accordance with manufacturers' recommendations
- Directing and supervising the performance of radiological surveys and sampling in accordance with the most current version of this RPP and supporting TtEC SOPs

- Reviewing survey reports and instrument performance data for accuracy, completeness, and compliance with project, procedural, and regulatory requirements
- Ensuring work is performed in accordance with current versions of project plans, procedures, and the RPP

The project RSOR reports to and receives technical direction from the RSO, advises the PjM on radiation protection and radiological operation matters, coordinates with the PjM on day-to-day project activities, and communicates and coordinates radiation protection and radiological operation activities with the RSO and the client. Company Health Physicists (also referred to as RSORs) may delegate project responsibilities to other staff members deemed qualified for the task assigned.

2.4 PROJECT MANAGER

The PjM is responsible for:

- Ensuring implementation of and compliance with the RPP requirements and current versions of the following support documents applicable to the project:
  - TtEC RML procedures (i.e., applicable NRC License Procedures)
  - TtEC Radiation Protection Guidance (RPG) documents
- Forwarding any TIP or modified TIP involving exposure to ionizing radiation or radioactive material to the RSO or designee for input and review (involvement includes the use of subcontractors who may use radioactive materials or radiation-generating devices in the course of corresponding work such as field radiography, soil density gauges, well logging, etc.)
- Determining with the assistance of the RSO or designee if the project is required to use the TtEC RML or if activities will fall under a Department of Energy, NRC, Agreement State, or other license
- Working with the license RSO in accordance with corporate procedure RP1-1, Radiological Protection Program, to identify applicable NRC and Agreement State requirements for projects that will not use the TtEC RML
- The safe conduct of work in compliance with all permits, client contracts, and other controlling documents that apply
- Exposure to radiation ALARA by project staff
- Adequate resources and staffing to develop and implement this RPP in compliance with applicable regulations and requirements

The PjM reports to the TtEC Program Manager.

2.5 CONSTRUCTION MANAGER/PROJECT SUPERINTENDENT

Responsibilities for the Construction Manager/Project Superintendent include:

- Ensuring assigned personnel comply with radiological requirements
- Supplying relevant information to the RSOR regarding planned work activities and proposed applications necessary to maintain occupational radiation exposures ALARA
- Timely RSOR and PjM notification of radiological problems or issues encountered
- Verifying staff is sufficiently prepared for assigned tasks (e.g., appropriate tools and equipment needed to minimize the time spent in areas of radiological concern)
- Confirming that escorted visitors accessing areas of radiological concern are properly supervised and exhibiting safe work practices in accordance with RPP protocol

The Project Superintendent/Construction Manager reports to the PjM.

2.6 RADIOLOGICAL TASK SUPERVISOR

The Radiological Task Supervisor (RTS) is the TtEC representative responsible for Radiological Control Technician (RCT) oversight and corresponding field operations conducted in areas of radiological concern. Designated as an authorized user at projects subject to jurisdiction under the TtEC RML, the RTS is vested with the following responsibilities:

- Supporting required ALARA reviews
- Coordinating plans for field activities with the Construction Manager/Project Superintendent to ensure exposure to radiation is maintained ALARA and in accordance with corresponding RWPs
- Supervising the preparation of, and performing review of, RWPs
- Stopping work if necessary to ensure radiation safety
- Maintaining communication with the RSO, RSOR, PjM, Construction Manager, and Project Superintendent as needed to ensure the RPP is fully implemented
- Confirming proper operation of radiation survey instruments, including the validation of daily function and QC checks, and removing noncompliant instruments from service
- Ensuring radiation survey instruments are maintained in a way that complies with manufacturer instructions and recommendations
- Directing and supervising the performance of radiological survey and sampling practices in accordance with the RPP, current versions of applicable SOPs, and corresponding RWPs
- Validating field survey reports and instrument performance data for accuracy, completeness, and compliance with the RPP, applicable SOPs, and corresponding RWPs
- Participating in periodic internal and external reviews of RPP content and implementation

- Supporting self-assessments and management reviews as needed and correcting identified deficiencies within the allotted time frame

The RTS reports to and receives technical direction from the RSOR.

2.7 RADIOLOGICAL CONTROL TECHNICIANS

The RCTs are responsible for:

- Ensuring occupational exposure to radiation is maintained ALARA
- RWP preparation, use, and adherence
- Stopping work if necessary to ensure radiological safety
- Performing radiation surveys and other radiological safety tasks in accordance with the RPP, applicable SOPs, and corresponding RWPs
- Confirming proper operation of assigned radiation survey instruments prior to field use to include verification of daily function and QC performance checks, and removing noncompliant instruments from service
- Using radiation survey instruments in accordance with the RPP, applicable SOPs, and corresponding RWPs and maintaining the instruments in a way that complies with manufacturers' instructions and recommendations

The RCTs report to and receive technical direction from the RTS.

2.8 RADIATION WORKERS (FIELD PERSONNEL)

Project staff (including the general labor force associated with the TtEC and subcontractors) who have the potential to receive occupational exposure to radiation while on the job site, and who are expected to work under the requirements of this RPP as radiation workers, will:

- Receive sufficient training, prior to beginning work, in accordance with the most current version of corporate document RPG 2-5, Radiation Safety Training.
- Report to the RTS or RCT non-occupational radiation exposures that result from the use of medical or dental applications more aggressive than a standard X-ray.
- Comply with requirements of all procedures and guidelines applicable to the project.
- As required, exercise stop work authority and report radiological safety issues or concerns, including incidents and unplanned events, immediately to project management and Environmental Safety and Quality staff in writing, verbally, or with a Zero Incident Performance® slip; respond promptly to any stop-work and/or evacuate orders.
- Display use of industry recognized radiological work practices when inside areas of radiological concern, and conform promptly to instructions when provided by RCTs.

- Strictly adhere to radiological control procedures, guidelines, and postings including information provided in RWPs.
- Immediately report lost dosimetry devices to the RCT.
- Report planned medical radiation treatments in advance to supervision and the project RSOR and prior to entering areas of radiological concern or wearing dosimetry.
- Periodically confirm personal radiation exposure status and ensure that administrative dose guidelines are not exceeded.
- Notify the RCT of faulty or alarming radiological protection equipment.

When in areas of radiological concern, workers report to the RTS.

2.9 STOP WORK AUTHORITY

Company and subcontractor personnel will have the responsibility and authority to stop work when controls are inadequate or imminent danger exists.

In any situation in which stop work authority is used, the following requirements will apply:

- Exercise stop work authority in a justifiable and responsible manner.
- Once work is stopped, do NOT resume until proper controls have been established.
- Resumption of work will require concurrence by the PjM or designee.

This page intentionally left blank.

3.0 TASK-SPECIFIC HAZARD ANALYSIS/CONTROLS

A task-specific hazard analysis is performed on a daily basis to allow for risk identification associated with site work, including physical, chemical, and radiological components. (Radiation exposures that result from naturally occurring background sources and medical applications conducted under the care of a physician are examples of dose that is independent of occupational monitoring requirements but considered when planning task assignments. In instances of verifiable therapeutic applications, employee-furnished notifications will be used as an informational reference and included as part of a corresponding radiation exposure file.) Risk-based hazards and controls are defined in a site-specific Activity Hazard Analysis. Anticipated physical and chemical risks are described in detail in the project-specific APP/SSHP. Radiological risk controls are categorized in the sections to follow, and protective measures apply as defined in task-specific RWPs and corresponding SOPs.

3.1 IDENTIFICATION OF RADIATION RISKS

Project tasks subject to RPP protocol indicate a known or suspected likelihood of activities occurring in radiologically impacted areas (e.g., locations with sources of radium-226 [Ra-226], areas with similar radionuclides of concern as identified in a site-specific Historical Radiological Assessment [HRA]).

3.2 CONTROLLING DOCUMENTS

Unless indicated otherwise in Section 1.0, work conducted under the RPP will be subject to requirements detailed in TtEC RML No. 29-31396-01 or California Agreement State license (as applicable) and in accordance with any project-specific Memorandum of Understanding (MOU) criteria and applicable radiological control work documents (e.g., site-specific Base-wide Radiological Work Plan, SOPs). TtEC will incorporate site-specific versions of SOPs as needed to implement and satisfy license commitments. Title 10 of the *Code of Federal Regulations* (CFR) Section 20 applies to the RPP standards used. In parallel, industrial safety requirements and U.S. Environmental Protection Agency regulations detailed in 29 and 40 CFR also have applicability for a variety of regulatory subjects including Comprehensive Environmental Response, Compensation, and Liability Act; the Resource Conservation and Recovery Act; and the National Emission Standards for Hazardous Air Pollutants.

3.3 EVALUATION OF POTENTIAL EXPOSURE TO WORKERS

RPP dose limits for the control of occupational exposure to ionizing radiation are listed in 10 CFR 20.1201–1208. Dose limits for individual members of the pubic are detailed in 10 CFR 20.1301–1302. In accordance with company policy, all exposures will be minimized to the extent practical. Administrative guidelines, established below the federal limits, will be used as detailed in the current version of corporate procedure NLP-01, As Low As Reasonably

Achievable Program. Occupational exposures for project personnel will be maintained below TtEC administrative values for annual TEDE.

Occupational dose, if any, is expected to originate from external sources (e.g., Ra-226, cesium-137, or strontium-90 or similar known radionuclides of concern as listed in a site-specific reference document [e.g., HRA]). Dose resulting from internal exposures are not anticipated. External exposure controls are addressed in Section 3.8, and controls to prevent or limit internal exposures are detailed in Section 3.9. Dose rates for general area work sites are expected to reflect naturally occurring background values.

3.4 EVALUATION OF PUBLIC DOSE

Based on the scope of planned work, the limited activity of radionuclides expected, and low concentration of naturally occurring radioactive material anticipated, public dose associated with tasks performed under this RPP is not projected. To validate the maintenance of public dose goals, TtEC will implement necessary survey and sampling protocol in areas of intrusive work, conspicuously post and restrict access to intrusive work locations that require monitoring (e.g., areas where soil excavations and/or handling, etc., may disturb sources of radioactive material), and validate survey and sampling results and frequencies with the RASO, RSO, RSOR, and RTS representatives to ensure established controls are effective.

3.5 TRAINING PROGRAM

Site personnel tasked to conduct project-oriented activities must satisfy corresponding APP/SSHP training requirements. Persons subject to assignments involving a known or suspected potential for occupational radiation dose will receive additional training commensurate with radiological awareness requirements as defined in 10 CFR 19.12, Instructions to Workers. Visitors and escorted persons must receive a site briefing and will be assigned to a qualified radiation worker aide when in an area of radiological concern.

3.5.1 Site Briefing

An RPP site briefing is designed for an escorted person and is presented when access is needed to radiologically impacted locations. Specific to the area(s) of concern where access is needed, the RPP brief will cover at a minimum:

- Applicable portions of 10 CFR 19, 10 CFR 20, the RPP, RWPs, site-specific reference documents (e.g., HRA), and supporting SOPs
- A description of radiation exposure risks and monitoring requirements
- Access and egress protocol specific to the radiologically impacted location(s) requiring entry
- Radiation exposure reduction techniques for an embryo/fetus

- Completion of applicable briefing/exposure monitoring documentation
- Notification of contacts as needed to complete training requirements

3.5.2 Radiation Worker Training

RPP training for the radiation worker is provided when unescorted access is needed to impacted site locations subject to radiological control. Inclusive of material that may be required by project-specific Work Plans and documents (e.g., APP/SSHP, Task-specific Plans), training may be presented in the form of a group overview, video presentation, etc., with use of printed handouts approved by the RSOR. Training will address at a minimum:

- Applicable portions of 10 CFR 19, 10 CFR 20, the RPP, site-specific reference documents (e.g., HRA), and supporting SOPs specific to task performance
- A description of radiation exposure risks, monitoring requirements, and techniques
- Access and egress protocol specific to radiologically impacted locations
- Required contacts and expected actions in the event of an emergency (in accordance with the current version of corporate procedure NLP-06, Managing Radiological Emergencies)
- Expected actions and contacts if radioactive material is discovered in an area where it is not expected
- Understanding “hands and feet” and “whole body” monitoring requirements
- Risks with radioactive material and radiation-producing devices unique to the site
- ALARA work principles and techniques
- Understanding the requirements for and compliance with RWPs including protocol for dosimetry and personal protective equipment (PPE)
- Radiation exposure reduction techniques for the embryo/fetus
- Completion of applicable training and exposure monitoring documentation
- Notification of contacts as needed to complete training requirements

3.5.3 Radiological Control Technician Training Qualification

As coordinated between the RSO and RSOR, TtEC will evaluate and ensure acceptable qualification of RCTs. When selected for project assignment, RCT qualifications are evaluated between the RSO and RSOR in accordance with the requirements detailed in NRC License No. 29-31396-01 or California Agreement State license (as applicable). Project-specific training is provided to RCTs commensurate with anticipated duties and assignments.

3.6 DECLARED PREGNANT FEMALE WORKER

To maintain embryo/fetus radiation exposure ALARA, female employees who are pregnant or attempting to become pregnant are encouraged to declare this information to project management in writing to allow for criteria to be exercised as detailed in:

- 10 CFR 20.1208, Dose Equivalent to an Embryo/Fetus
- NRC Regulatory Guide 8.13, Instruction Concerning Prenatal Radiation Exposure, Revision 3, Washington, DC (NRC 1999)
- NRC Regulatory Guide 8.29, Instruction Concerning Risks from Occupational Radiation Exposure, Revision 1, Washington, DC (NRC 1996)

Because of the small anticipated annual dose for workers associated with project activities (i.e., less than 10 millirems/year) it is unlikely in instances of pregnancy that separate dose tracking for the embryo/fetus will be necessary. Managing occupational exposures for all staff within annual TtEC administrative TEDE guidelines is expected to satisfy parallel maintenance of less than 500 millirems total dose for any pregnant female worker over the course of an entire gestation period.

3.7 AS LOW AS REASONABLY ACHIEVABLE PROGRAM

TtEC is committed to maintaining radiation exposure to workers and the public as far below company guidelines and regulatory limits as practical. RPP requirements are established for field operations in an effort to meet that commitment in accordance with the current version of corporate procedure NLP-01, As Low As Reasonably Achievable Program.

3.8 EXTERNAL EXPOSURE CONTROL

The following steps will be taken to control external radiation exposure to levels that are ALARA:

- Employ basic dose reduction strategies as detailed in corporate procedures and site-specific SOPs using the ALARA concepts of time, distance, and shielding.
- Use instruments at frequencies sufficient to accurately determine the level and extent of radiation fields.
- Present adequate staff training to ensure the ability to recognize situations involving objects that might be radioactive, to be wary of objects that are unfamiliar, and to rely on valid instrument readings to limit and safely manage external exposure.

3.9 INTERNAL EXPOSURE CONTROL

Internal exposure is expected to be below all the recognized DAC values as specified in 10 CFR 20. Should the potential for internal dose be confirmed during fieldwork (e.g., due to the nature of the planned activity such as remediation efforts), the activity will be temporarily suspended and the work area secured pending determination and use of corrective protocol as decided among the RSO, RSOR, and PjM.

3.10 MONITORING AND MEASURING EXTERNAL EXPOSURE

A vendor accredited by the National Voluntary Laboratory Accreditation Program will be used to provide project-related dosimetry services. Dosimetry applications and considerations will apply to field staff designated as radiation workers (i.e., personnel needing unescorted access to impacted site locations subject to radiological control). Prior to dosimetry issue, a radiation worker will have satisfactorily completed requirements as detailed in Section 3.5.2.

3.11 MONITORING AND MEASURING INTERNAL EXPOSURE

The monitoring of work practices conducted in areas of radiological concern will be coordinated among the RCTs, RTSs, and members of project management designated as radiation workers using frequencies necessary to confirm the application of correct techniques and PPE to minimize potential transfer of external contaminants inside the body.

Air sampling will be performed during intrusive activities conducted in areas of radiological concern. Air sample results will be reviewed and tracked among the RSO, RSOR, RTS, and designated RCTs to determine whether trends (e.g., concentrations greater than 10 percent of DAC) exist that require work stoppage and/or re-engineering of task-specific contamination controls.

3.12 SURVEYS AND MONITORING

A project-based summary of historic survey and monitoring information is typically available in site-specific documentation (e.g., an HRA or Base-wide Radiological Work Plan). Protection of workers, the public, and the environment depends on accurate assessment and interpretation of past historic information as compared to present-day survey data collected in accordance with prescribed procedures and project support documents.

In situations subject to this RPP, guidance for determining survey frequency and technique is detailed in applicable portions of corporate procedures NLP-04, Radiological Entry Control Program, NLP-05, Radioactive Contamination Control, and RPG 2-9, Radiological Surveys and Operational Checks. In parallel, supplemental site-specific documentation may be authorized by the RSO for use if indicated on a Radiation Protection Program SOP Crossover Document.

3.12.1 Surveys of Equipment and Materials

Equipment and material passing through areas controlled for radiological concern will be subject to survey criteria and techniques detailed in applicable portions of corporate procedure NLP-05, Radioactive Contamination Control. In parallel, supplemental site-specific documentation may be authorized for use by the RSO if indicated on a Radiation Protection Program SOP Crossover Document.

3.13 ACTION LEVELS

Action levels represent transition points at which concentrations of radioactivity require additional response and/or investigation (e.g., PPE upgrades or increased work technique controls). Action levels for radiological controls are detailed in corporate procedure NLP-01, As Low As Reasonably Achievable Program, and NLP-04, Radiological Entry Control Program. In parallel, supplemental site-specific documentation may be authorized by the RSO for use if indicated on a Radiation Protection Program SOP Crossover Document. Modification to project-specific action levels requires Navy concurrence.

3.14 RADIOLOGICALLY CONTROLLED AREAS AND POSTING

Site structures, outdoor locations, and/or perimeter boundaries posted with yellow and magenta markings are established to identify areas designated for radiological control, prevent (to the extent practical) access by unauthorized persons, and protect members of the public from exposure to radiation. A description of scenarios and postings employed for control purposes are detailed in applicable portions of corporate procedure NLP-04, Radiological Entry Control Program. In parallel, supplemental site-specific documentation may be authorized by the RSO for use if indicated on a Radiation Protection Program SOP Crossover Document.

3.14.1 Controlled Area

A Controlled Area may be established where access to impacted portions of a work site requires specialized qualification and approval. A Controlled Area (which may also be called a Restricted Area) is intended to serve as the outermost boundary around planned and established work zones.

Controlled Area access requires prior authorization and use of PPE as defined in a project specific APP/SSHP. Visitors must have requisite training as specified in an SSHP. Personnel who enter a Controlled Area may not cross into more restrictive areas posted within unless prior authorization is obtained.

Where the perimeter to a Controlled Area is first encountered for radiological purposes, posting applications will have the wording "Caution Controlled Area" (or Restricted Area) and provide a contact phone number. (Supplemental information as specified by the RSOR or designee may also be included as magenta [preferred], purple, or black markings on a yellow [preferred] or white background). A minimum of one sign will be posted on each straight run of the Controlled Area (or Restricted Area) boundary. Note that areas not typically accessed by pedestrians (e.g., windows) need not be posted. Additional signs should be placed at approximately 30-meter intervals on long runs of any boundary.

3.14.2 Access Control Point

When used, an Access Control Point is part of a Controlled Area (or Restricted Area) boundary. Intended to serve as a transition corridor, an Access Control Point allows for the accountability of personnel, tools, and equipment that pass through. When established as a radiological control mechanism, an Access Control Point RCT will be present any time activities within are ongoing. During periods of inactivity, control point gates (part of the contiguous area boundary) are closed and locked.

3.14.3 Radiologically Controlled Area

A Radiologically Controlled Area (RCA) represents an area in which a person who works for 1 year might receive a whole body dose in excess of 100 millirems from all pathways (excluding natural background and medical exposures). For external sources, the RCA is typically posted when the dose rate of 30 centimeters exceeds 50 microrems per hour, although this may be modified at the discretion of the license RSO based on accurately assessed occupancy factors. Intended to include (for posting purposes) the nearest boundary or perimeter associated with the affected area, RCA restrictions and corresponding access protocol can be located in supplemental site-specific documentation and authorized by the RSO for use if indicated on a Radiation Protection Program SOP Crossover Document.

When used, a minimum of one sign will be posted on each straight run of the RCA boundary. Additional signs should be placed at approximately 30-meter intervals on long runs of any boundary. For waterfront areas, signs should be posted at areas accessible by watercraft.

3.14.3.1 Radioactive Materials Area

A Radioactive Materials Area (RMA) identifies any area or room in which there is used or stored an amount of licensed material exceeding 10 times the quantity of such material specified in Appendix C, Title 10 Part 20 of the CFR. Intended to warn of the potential for occupational dose, a description of RMA scenarios and postings employed for control purposes can be located in applicable portions of corporate procedure NLP-04, Radiological Entry Control Program. In parallel, supplemental site-specific documentation may be authorized by the RSO for use if indicated on a Radiation Protection Program SOP Crossover Document.

When used, a minimum of one sign will be posted on each straight run of the RMA boundary. Additional signs should be placed at approximately 30-meter intervals on long runs of any boundary.

3.14.4 Contaminated Area

A Contaminated Area is any area, accessible to individuals, where removable surface contamination levels exceed or are likely to exceed the removable surface contamination values specified in Regulatory Guide 1.86, Termination of Operating Licenses for Nuclear Reactors

(AEC 1974), but do not exceed 100 times those values. Contamination is radioactive material that is deposited on a surface where it is unwanted. Subject to license control, a description of Contaminated Area scenarios and postings employed for control purposes can be located in applicable portions of corporate procedure NLP-04, Radiological Entry Control Program. In parallel, supplemental site-specific documentation may be authorized by the RSO for use if indicated on a Radiation Protection Program SOP Crossover Document.

When used, a minimum of one sign will be posted on each straight run of the RCA boundary. Additional signs should be placed at approximately 30-meter intervals on long runs of any boundary.

3.14.5 High Contamination Area

A High Contamination Area is any area, accessible to individuals, where removable surface contamination levels exceed or are likely to exceed 100 times the removable surface contamination values specified in Regulatory Guide 1.86 (AEC 1974). High Contamination Area scenarios and postings employed for control purposes are detailed in applicable portions of supplemental site-specific documentation (e.g., Department of Energy Procedures for Radiologically Restricted Areas – Posting and Access Control per 10 CFR 835) and may be authorized by the RSO for use if indicated on a Radiation Protection Program SOP Crossover Document.

When used, a minimum of one sign will be posted on each straight run of the High Contamination Area boundary. Additional signs should be placed at approximately 30-meter intervals on long runs of any boundary.

3.14.6 Radiation Area

A Radiation Area means any area accessible to individuals in which radiation levels could result in an individual receiving a deep dose equivalent in excess of 0.005 rem (0.05 millisievert) in 1 hour at 30 centimeters from the source or from any surface that the radiation penetrates. A description of Radiation Area scenarios and postings employed for control purposes can be located in applicable portions of corporate procedure NLP-04, Radiological Entry Control Program. In parallel, supplemental site-specific documentation may be authorized by the RSO for use if indicated on a Radiation Protection Program SOP Crossover Document.

When used, a minimum of one sign will be posted on each straight run of the Radiation Area boundary. Additional signs should be placed at approximately 30-meter intervals on long runs of any boundary.

3.14.7 High Radiation Area

A High Radiation Area means any area, accessible to individuals, in which radiation levels could result in an individual receiving a deep dose equivalent in excess of 0.1 rem (0.001 sievert) in 1 hour at 30 centimeters from the radiation source or from any surface that the radiation penetrates. A description of High Radiation Area scenarios and postings employed for control purposes can be located in applicable portions of corporate procedure NLP-04, Radiological Entry Control Program. In parallel, supplemental site-specific documentation may be authorized by the RSO for use if indicated on a Radiation Protection Program SOP Crossover Document.

When used, a minimum of one sign will be posted on each straight run of the High Radiation Area boundary. Additional signs should be placed at approximately 30-meter intervals on long runs of any boundary.

3.14.8 Airborne Radioactivity Area

An Airborne Radioactivity Area is a room, enclosure, or area in which airborne radioactive materials, composed wholly or partly of licensed material, exist in concentrations:

- In excess of the DACs specified in Appendix B to 10 CFR 20.1001–20.2401, or
- To such a degree that an individual present in the area without respiratory protective equipment could exceed, during the hours an individual is present in a week, an intake of 0.6 percent of the annual limit on intake or 12 DAC hours.

As an example, for Ra-226, the most likely airborne contaminant at Navy radiological remediation projects, the applicable DAC value is 3.0E-10 microcuries/milliliter. A description of Airborne Radioactivity Area scenarios and postings employed for control purposes can be located in applicable portions of corporate procedure NLP-04, Radiological Entry Control Program. In parallel, supplemental site-specific documentation may be authorized for use by the RSO if indicated on a Radiation Protection Program SOP Crossover Document.

When used, a minimum of one sign will be posted on each straight run of the Airborne Radioactivity Area boundary. Additional signs should be placed at approximately 30-meter intervals on long runs of any boundary.

3.15 CONTAMINATION CONTROL

Contamination control practices are established to preclude the spread of contaminants into uncontrolled areas. Recognized applications are detailed in corporate procedure NLP-05, Radioactive Contamination Control.

In parallel, supplemental site-specific documentation may be authorized by the RSO for use if indicated on a Radiation Protection Program SOP Crossover Document.

3.15.1 Physical Boundary

A physical boundary will be established using criteria referenced in Section 3.14.4 to fully enclose a location established as a Contaminated Area.

3.15.2 Entry

Entry into a Contaminated Area will be compliant with pre-established requirements as detailed on a job-specific RWP. In such instances, an RCT will be present to assist in radiological control and support. (See Section 3.17.1 for details related to RWP use.)

3.15.3 Exit

Exit from a Contaminated Area will be compliant with pre-established requirements as detailed on a job-specific RWP. In such instances, an RCT will be present to assist in radiological control and support. (See Section 3.17.1 for details related to RWP use.)

3.15.4 Limitations on Entry

Personnel with open wounds or sores are not generally granted access into a Contaminated Area. Entry may be authorized by the RSOR or designee, on a case-by-case basis, if appropriate protection of the wound or sore is verified, planned work activities are unlikely to compromise the protection, and there is no other medical reason to restrict entry.

Jewelry and personal items are not allowed in Contaminated Areas; only project furnished tools, materials, and equipment necessary to accomplish the planned task are acceptable. Container wrappings, packing, and similar materials must be segregated from essential items prior to entry.

3.15.5 Control of Items

Items such as equipment and tools to be removed from a Contaminated Area must meet unconditional release criteria as detailed in applicable portions of corporate procedure NLP-05, Radioactive Contamination Control. In parallel, supplemental site-specific documentation may be authorized by the RSO for use if indicated on a Radiation Protection Program SOP Crossover Document.

3.16 INSTRUMENTATION

As detailed in applicable portions of corporate procedure RPG 2-9, Radiological Surveys and Operational Checks, field survey instruments will be calibrated annually at a minimum in accordance with the manufacturers' specifications. Instruments will be removed from service on or before calibration due dates and returned to the supplier for recalibration. In parallel, supplemental site-specific documentation may be authorized by the RSO for use if indicated on a Radiation Protection Program SOP Crossover Document.

3.17 CONTROL OF RADIOLOGICAL WORK

All radiological work activities will be planned in consultation with the RSOR, the PjM, and other project personnel tasked with oversight responsibilities. Work performed in areas of radiological concern require establishment of an RWP, which details radiologically based requirements and protective measures.

3.17.1 Radiation Work Permits

RWPs detail the protective measures and controls needed to perform tasks in areas of radiological concern. Information considered during RWP development is detailed in applicable portions of corporate procedure NLP-04, Radiological Entry Control Program. In parallel, supplemental site-specific documentation may be authorized by the RSO for use if indicated on a Radiation Protection Program SOP Crossover Document.

3.17.2 Task-specific Work Instructions

Task-specific work instructions are used to supplement RWP requirements and address in greater detail corresponding activities planned while personnel are inside areas of radiological concern. These instructions are required for tasks scheduled to occur in locations as determined by the PjM, RSO, RSOR, or the Construction Manager. The RSO or designee will finalize, control, and issue radiologically based work instructions.

3.18 CREDENTIALING OF STAFF

Qualification and training requirements for RCTs are provided in NRC License No. 29-31396-01 and as detailed in applicable portions of corporate procedure RPG 2-5, Radiation Safety Training. The RSO verifies qualifications and conducts required license-specific training with any RSOR designated on the license as an authorized user.

To supplement and validate the correct use and implementation of this RPP and NRC License No. 29-31396-01 or California Agreement State license (as applicable), a Health Physicist certified by the American Board of Health Physicists provides support to active field projects.

3.19 PROCUREMENT, RECEIPT, AND INVENTORY OF SEALED RADIOACTIVE SOURCES

It is not anticipated that field projects will receive radioactive material shipments other than exempt-quantity radioactive check sources. As detailed in corporate procedures NLP-02, Radioactive Material Accountability, and NLP-03, Sealed Radioactive Source Control, check sources are controlled, stored, posted, and managed as radioactive material.

3.19.1 Leak Testing

Radioactive sealed sources with quantities exceeding the licensable threshold will be leak-tested as detailed in applicable portions of corporate procedures NLP-02, Radioactive Material

Accountability and NLP-03, Sealed Radioactive Source Control. In parallel, supplemental site-specific documentation may be authorized by the RSO for use if indicated on a Radiation Protection Program SOP Crossover Document.

3.19.2 Transport of Sources

Check sources will be used on field projects only for the period of time necessary to execute planned work, will not be introduced onto a project location prior to project initiation, and will be returned to the provider immediately following the completion of planned field activities.

Check sources will be maintained as detailed in applicable portions of corporate procedures NLP-02, Radioactive Material Accountability, and NLP-03, Sealed Radioactive Source Control. In parallel, supplemental site-specific documentation may be authorized for use by the RSO if indicated on a Radiation Protection Program SOP Crossover Document.

3.19.3 Reporting Lost, Damaged, or Stolen Sources

As detailed in applicable portions of corporate procedures NLP-02, Radioactive Material Accountability, and NLP-03, Sealed Radioactive Source Control, if a check source is lost, damaged, or stolen, the event will be reported immediately to the RSOR or designee. The RSOR will immediately notify the RSO, the PjM, and the Navy and initiate appropriate recovery actions. In consultation with the Navy, a report will be filed by the RSO or designee with the appropriate law enforcement agency if it is determined that radioactive material was stolen. The RSO will make any necessary notifications to the NRC.

Supplemental site-specific documentation may be authorized for use by the RSO if indicated on a Radiation Protection Program SOP Crossover Document.

3.20 SHIPPING AND TRANSPORTATION OF RADIOACTIVE MATERIALS

Off-site shipment of radioactive materials other than exempt-quantity radioactive check sources by TtEC is not anticipated. Information pertinent to an authorized shipper for a field project is provided in Section 6.0.

3.21 CONTROL OF RADIOACTIVE WASTE

Radioactive waste will be minimized by compliance with contamination control practices (Section 3.15) combined with segregation and survey practices. A waste shipment provider contracted to the Navy through the Army Joint Munitions Command will provide brokerage services including waste characterization sampling, waste containers, and transportation of radioactive materials/waste generated from a field project. Soil and used PPE will typically be processed for final disposition in disposal bins. When filled, bins will be transferred to the custody and control of the authorized shipper. As detailed in corporate procedure NLP-02, Radioactive Material Accountability, commodities are stored in a locked radioactive materials storage area, controlled by the RSOR or designee, and will periodically be packaged and transferred to the authorized shipper for disposal. Radioactive material will be packaged, stored, shipped, and disposed of as required by U.S. Department of Transportation (DOT) regulations.

In parallel, supplemental site-specific documentation may be authorized by the RSO for use if indicated on a Radiation Protection Program SOP Crossover Document.

3.22 RADIATION PROTECTION RECORDS

As detailed in the applicable portions of corporate procedure NLP-07, Radiological Protection Records, the RSO or designee is responsible for ensuring that airborne monitoring, contamination surveys, and exposure/dose rate surveys are reviewed for accuracy and completeness as an ongoing process. Individual exposure records including dosimetry and bioassay reports for personnel are reviewed for results as generated.

3.23 REPORTS AND NOTIFICATIONS

Workers who have previous occupational work history with radiological environments will supply the RSO or designee with prior estimated or reported dose histories on an NRC Form 4 or equivalent as defined in 10 CFR 20.2104.

Records of radiation exposures to workers who have been issued external dosimetry monitoring devices will be maintained. Dosimetry monitoring results for workers will be reported to the RSO annually at a minimum. Annual occupational exposure greater than or equal to 100 millirems for the previous calendar year, or otherwise when requested, requires a summary of individual exposure to be reported to the employee monitored.

3.24 LICENSES

Entities subject to the use of this RPP will conduct radiological-based tasks with use of TtEC NRC License No. 29-31396-01 or California Agreement State license (as applicable). TtEC will ensure that the Radiological Control Program and work practices are implemented and performed in accordance with the NRC or California Agreement State license requirements (as applicable) and the RPP. (Any client-designated waste shipment provider may implement their NRC-issued license to conduct waste characterization sampling of waste material in support of low-level radioactive waste shipment and disposal. An MOU between TtEC and a waste shipment provider will be developed, identifying interfaces and commitments for the transfer of radioactive materials. Active MOUs will be maintained by the RSO or designee.)

3.25 REVIEW AND APPROVALS OF RADIATION PROTECTION PLANS

The RSO or designee will prepare the RPP, which will then be reviewed for approval with subject matter experts (e.g., the PjM, RSOR). In addition, the Navy will have an opportunity to review the draft content, provide input, and indicate acceptance of the plan. Changes to the RPP will be reviewed and accepted following the same process.

3.26 PLANNED SPECIAL EXPOSURES

No anticipated event within work scopes subject to this RPP will require use of a planned special exposure. In the event it is necessary to initiate such a need, an activity-specific work instruction including a formal ALARA review and an RWP will be prepared and submitted for acceptance following the same process as the RPP submittal in Section 3.25.

4.0 PERSONAL PROTECTIVE EQUIPMENT

Minimum PPE requirements based on chemical contaminants are established by the Health and Safety Manager (in a project-/task-specific APP/SSHP). This primary level of PPE, Modified Level D, is historically sufficient for radiological work activities and is supplemented by activity-specific RWPs based on the radiological conditions and field tasks required to perform planned activities. Information considered for PPE during RWP development is detailed in applicable portions of corporate procedure NLP-04, Radiological Entry Control Program. In parallel, supplemental site-specific documentation may be authorized by the RSO for use if indicated on a Radiation Protection Program SOP Crossover Document.

4.1 SELECTION OF PERSONAL PROTECTIVE EQUIPMENT

Personnel must wear PPE commensurate with contamination hazards associated with both the work area and the planned activity. Activities that require heavy physical effort or that have an increased potential for damage to PPE may require additional layers or different PPE materials, even in areas of low contamination. Site- or task-specific PPE requirements beyond the minimum traditionally used will be detailed in a corresponding RWP.

In parallel, supplemental site-specific documentation may be authorized for use by the RSO if indicated on a Radiation Protection Program SOP Crossover Document.

4.2 DONNING AND DOFFING PPE

To prevent contamination of personnel or the spread of contamination, PPE must be donned and doffed in a specific manner. Directions for donning and doffing standard PPE ensembles are provided in the applicable sections of corporate procedure NLP-05, Radioactive Contamination Control. In parallel, supplemental site-specific documentation may be authorized by the RSO for use if indicated on a Radiation Protection Program SOP Crossover Document. Additional instructions for non-standard site- or task-specific PPE requirements will be provided in the applicable RWP.

This page intentionally left blank.

5.0 DECONTAMINATION PROCEDURES

Contamination control when handling radioactively contaminated materials will be conducted in accordance with corporate procedure NLP-05, Radioactive Contamination Control. Decontamination of materials and equipment will be performed at a dedicated location (e.g., decontamination pad, room) in accordance with site-specific procedure SOP 7, Decontamination of Equipment and Tools.

This page intentionally left blank.

6.0 SHIPPING AND TRANSPORTATION OF RADIOACTIVE MATERIALS

Field projects subject to the use of this RPP will conduct radiological-based activities with use of TtEC NRC License No. 29-31396-01 or California Agreement State license, as applicable. The client-designated waste shipment provider associated with a field project may implement their NRC-issued or California Agreement State license to conduct waste characterization sampling of waste material in support of low-level radioactive waste shipment and disposal. An MOU between TtEC and a waste shipment provider will be used, identifying interfaces and commitments for the transfer of radioactive materials. In such instances, a current MOU will be maintained by the project RSOR for projects subject to the requirements of the RPP.

Environmental samples shipped for off-site analysis and exempt-quantity radioactive check sources are packaged and shipped in accordance with DOT regulations via commercial carriers.

EXECUTIVE SUMMARY

The Department of the Navy (DON) contracted with Tetra Tech EC, Inc. (TtEC) to provide support for the remedial action at Installation Restoration (IR) Site 2 at Alameda Point, Alameda, California, which includes radiological surveys and sampling prior to and after installation of a multilayer soil cover. The radiological work will be performed under TtEC's United States Nuclear Regulatory Commission Service Provider Radioactive Materials License. This project will be conducted under Contract No. N62473-10-D-0809, Contract Task Order (CTO) No. 0009. This Sampling and Analysis Plan (SAP) has been prepared by TtEC to provide guidance on sampling, analysis, and quality control (QC) in support of the remedial action at IR Site 2.

BACKGROUND

IR Site 2 is located at the southwestern edge of Alameda Point and encompasses approximately 110 acres bordered by San Francisco Bay to the south and west. IR Site 2 consists of a former landfill, wetlands area, the interior margin, and the coastal margin. The landfill covers approximately 60 acres and is bounded to the north by the interior margin and the east by runways and tarmacs. The wetland covers approximately 33 acres and is bounded by the landfill to the north and east and by the coastal margin adjacent to the San Francisco Bay on the south and west. The remaining 17 acres within the IR Site 2 boundary is known as the interior margin and the coastal margin.

As part of the environmental investigations being performed to facilitate transfer of Alameda Point, Weston Solutions, Inc., prepared a Historical Radiological Assessment (HRA) that documents the history of radiological materials at Alameda Point. The HRA states that IR Site 2 is also called the West Beach Landfill. This landfill received essentially all wastes generated by the former Naval Air Station (now called Alameda Point) from 1956 to 1978. As early as 1973, the radioactive wastes generated were being disposed of by licensed radioactive waste disposal firms at approved disposal facilities. IR Site 2 was used for general disposal purposes. Wastes known to have been disposed of include solvents, metal cleaning compounds, electroplating solutions, paint, paint removers and thinners, sludges, oil, sand blast grit, PCB-contaminated oils, TAC rags, infectious wastes, laboratory wastes, asbestos, tear gas, mercury wastes, inert ordnance, and pesticides. Radioactive items potentially disposed of in the IR Site 2 (West Beach) landfill could have included but are not limited to wastes from radium painting operations, damaged instruments, and other radioluminescent devices including both radium and strontium deck or bridge markers, thoriated glass optical devices, depleted uranium counterweights, and residue from washdown of aircraft participating in nuclear weapons testing. An earthen berm surrounds most of the IR Site 2 site. The HRA and the ROD list radium-226 (^{226}Ra), cesium-137 (^{137}Cs), strontium-90 (^{90}Sr), cobalt-60 (^{60}Co), thorium-232 (^{232}Th), and uranium-238 (^{238}U) as radionuclides of concern (ROCs).

The DON conducted a feasibility study (Battelle and BBL 2008) to evaluate potential remedial alternatives for IR Site 2 and prepared a record of decision (ROD) (DON 2010) to document the selected remedy for the site. The selected remedy for soil, as outlined in the ROD, is Alternative

2, a multilayer soil cover, engineering and institutional controls (ICs), and monitoring. This alternative consists of installation of an engineered soil cover over the former landfill to isolate buried waste and soil contaminants and prevent animal burrowing; implementation of engineering and land use controls to protect human health and soil cover integrity; provide for any necessary wetlands mitigation if impacts to wetlands occurs; monitor the soil cleanup action and wetlands mitigation to ensure their proper construction and long-term effectiveness; and conduct methane gas monitoring as necessary.

The selected remedy for groundwater, as outlined in the ROD, is Alternative 2 – Monitored Natural Attenuation. This alternative consists of regularly monitoring groundwater quality using shoreline groundwater monitoring wells to ensure that there are continued stable to decreasing trends in contaminant concentrations, and protection of the beneficial uses of surface water in San Francisco Bay; and implementation of engineering controls and ICs to protect human health and the groundwater remedy. A Post-closure Operations, Maintenance, and Monitoring Plan is provided in Attachment 11. Monitoring activities for groundwater which include groundwater sampling are not discussed in this SAP since these activities are not part of the TtEC scope for this project. A separate SAP will be prepared by the contractor who receives that scope of work.

OBJECTIVES

The objectives of the project as related to the sampling activities associated with the installation of a multilayer soil cover are as follows:

- Clearing vegetation and subgrading at IR Site 2
- Performing an initial radiological survey of the subgrade prior to installation of the cover to establish baseline risk and dose estimates
- Removing identified radioactive contamination at twice background radiation levels based on the initial survey
- Collecting soil samples from the subgrade surface for radiological dose and risk modeling
- Providing modeling, based on analysis of soil samples collected from the subgrade surface, to demonstrate that with the 2-foot cover installed, the maximum annual dose to an individual of 15 mrem, and the excess lifetime cancer risk (ELCR) at 3×10^{-4} for the critical group, are not exceeded
- Disposing of soil exceeding the criteria for the ROCs as low-level radioactive waste (LLRW)
- Performing a final radiological survey of the cover to document effectiveness of the remedy

Where applicable, radiological survey activities will be conducted in accordance with the guidelines in the Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM), Nuclear Regulatory Commission (NRC) NUREG-1575 (DoD et al. 2000), as discussed in the Radiological Work Plan (Attachment 2 to the Remedial Action Work Plan).

SAP Worksheet #2 – SAP Identifying Information

Site Name/Number: **Installation Restoration (IR) Site 2 Remedial Action at Alameda Point**
Contractor Name: **Tetra Tech EC, Inc. (TtEC)**
Contract Number: **N62473-10-D-0809**
Contract Title: **Radiological Environmental Multiple Award Contract**

1. This Sampling and Analysis Plan (SAP) was prepared in accordance with the requirements of the Uniform Federal Policy for Quality Assurance Project Plans (EPA 2005) and U.S. Environmental Protection Agency (EPA) Guidance for Quality Assurance Project Plans, EPA QA/G-5, QAMS (EPA 2002).

2. Identify regulatory program: Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)

3. This SAP is a project-specific SAP.

4. List dates of scoping sessions that were held.

Scoping Session	Date
Kick-off meeting to discuss scope of project with DON.	September 8, 2011

5. List dates and titles of any SAP documents written for previous site work that are relevant to the current investigation.

Title	Date
Not applicable	

6. List organizational partners (stakeholders) and connection with lead organization: The EPA, California Environmental Protection Agency (Cal/EPA), Department of Toxic Substances Control (DTSC), California Department of Public Health (CDPH), Regional Water Quality Control Board (Water Board) San Francisco Region, Radiological Affairs Support Office (RASO), and United States Fish and Wildlife Service (USFWS) (for sensitive species) will provide regulatory oversight and guidance.

7. Lead organization: Department of the Navy (DON)

8. If any required SAP elements or required information is not applicable to the project or is provided elsewhere, then note the omitted SAP elements and provide an explanation for its exclusion below:

    - Worksheet #12 (Measurement Performance Criteria Table) is not applicable for this project as field QC samples are not required.
    - Worksheet #21 (Project Sampling SOPs Reference Table) is not included in this SAP since the sampling procedures are described in detail in Worksheet #14.

SAP Worksheet #2 – SAP Identifying Information (Continued)

SAP elements and required information that are not applicable to the project are noted below. An explanation is provided above and in the appropriate SAP worksheet(s), as necessary.

SAP Worksheet #4 – Project Personnel Sign-Off Sheet

The key personnel listed below will read the final version of this SAP. Their signature and date will be filled in below and included in the project file.

Name	Organization/Title/Role	Signature/Email Receipt	SAP Section Reviewed	Date SAP Read
Mr. Hedy Abedi	TtEC/PjM		Entire document	
Mr. Nathan Smith	TtEC/RSOR		Entire document	
Mr. Vincent Richards	TtEC/PQCM		Entire document	
Mr. Michael O'Hare	TtEC/Alternate PQCM		Entire document	
Ms. Sabina Sudoko	TtEC/Project Chemist		Entire document	
Mr. Phil Smith	Curtis and Tompkins/Laboratory Supervisor		Entire document	
Ms. Erika Starman	TestAmerica-St. Louis /Laboratory Project Manager		Entire document	
Ms. Linda Rauto	LDC/Data Validator Project Manager		Entire document	
TBD [a]	TtEC/Field Crews		Entire document	

Notes:

[a] Field crews include multiple persons and vary from project to project. Therefore, persons identified by the PQCM will read the SAP and sign this worksheet as required.

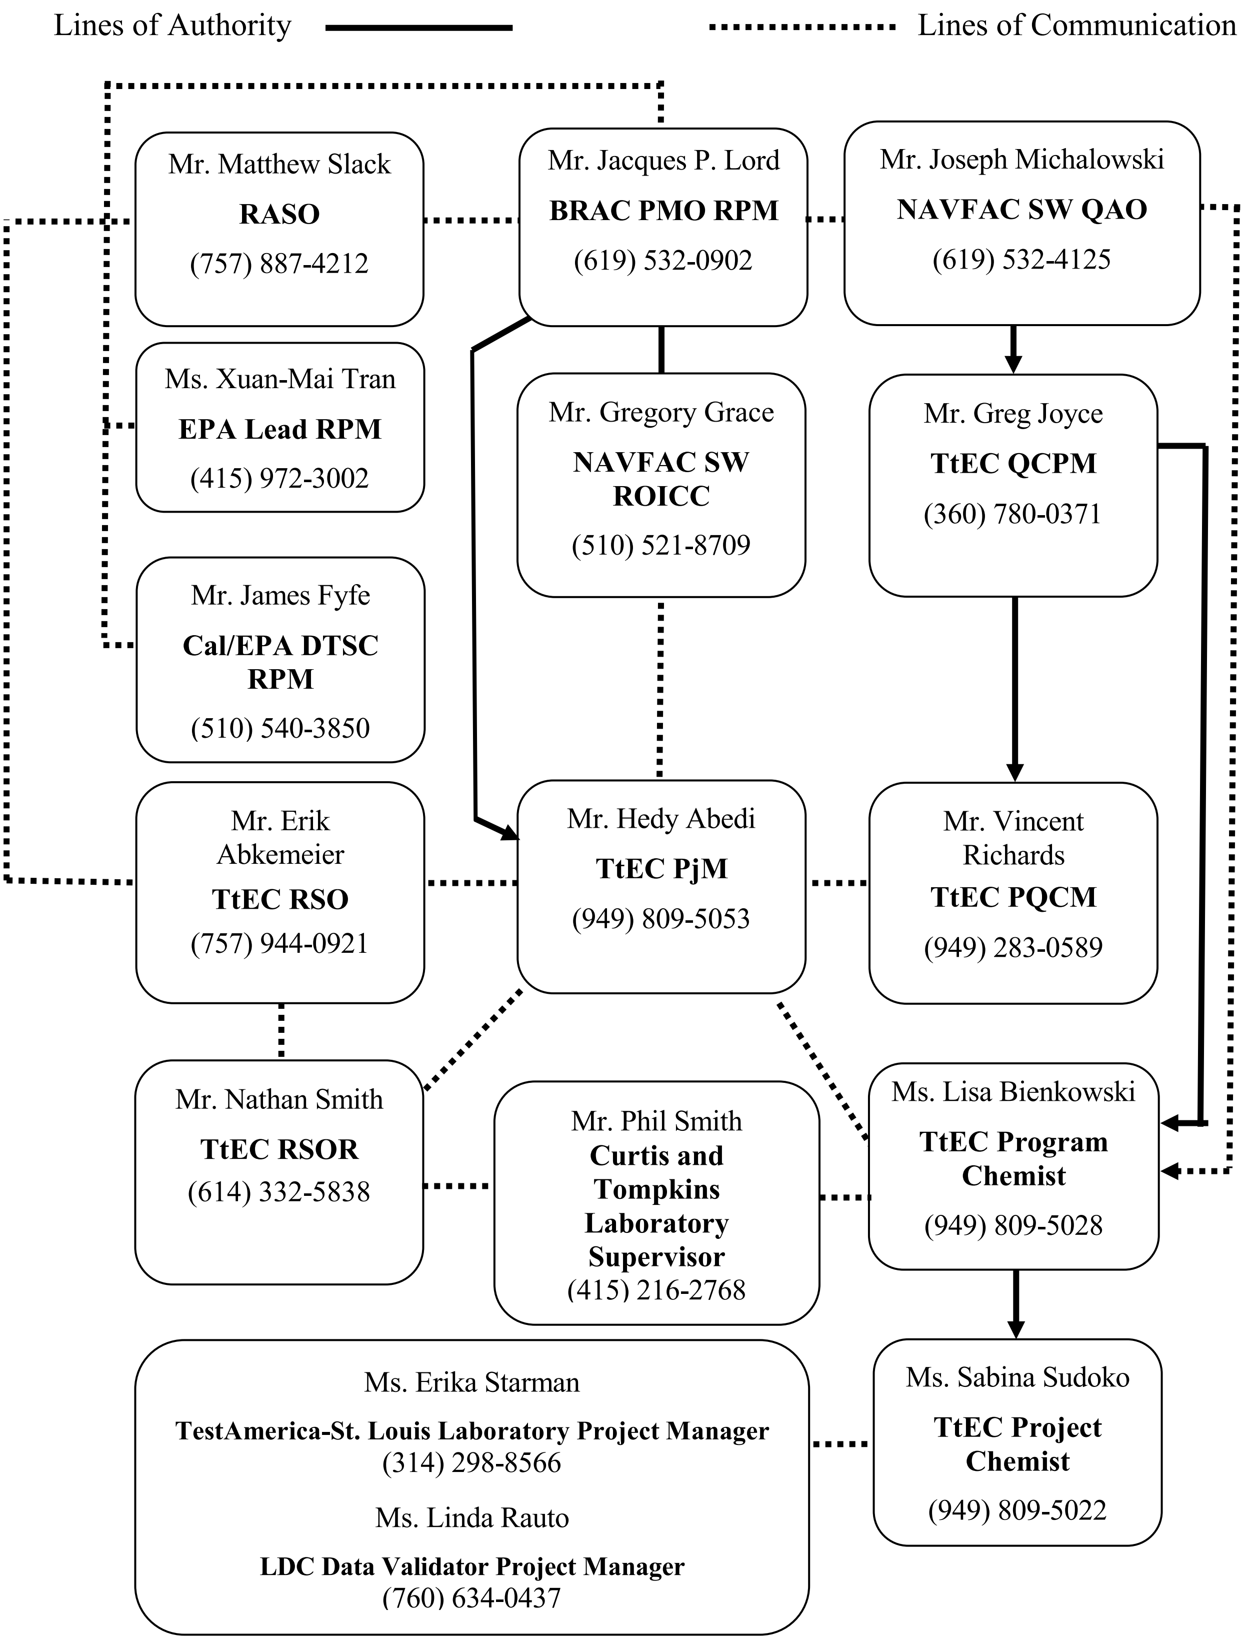
SAP Worksheet #5 – Project Organizational Chart



This page intentionally left blank.

SAP Worksheet #6 – Communication Pathways

Communication Drivers	Responsible Affiliation	Name	Phone Number	Procedure
Point of contact for DON quality issues	NAVFAC SW QAO	Mr. Joseph Michalowski	(619) 532-4125	SAP and its addendum (if applicable) will be approved by the QAO prior to start of sampling. If during sampling, a major change in sampling procedures or strategy is required, the QAO will be notified via email and give concurrence to issue a field change request or SAP Addendum. In addition, the QAO has the authority to suspend project execution if quality assurance requirements are not adequately followed.
Point of contact for contractor quality issues	TtEC QCPM	Mr. Greg Joyce	(360) 780-0371	The QCPM is responsible for overseeing program quality control (QC), including construction and analytical data acquisition. The QCPM has the authority to suspend project activities if quality standards are not maintained.
Project management	TtEC PjM	Mr. Hedy Abedi	(949) 809-5053	If changes are necessary, the PjM is responsible for communicating the changes via phone and/or e-mail to the project staff and is authorized to stop work, if necessary.
Point of contact for significant changes or corrective actions	BRAC PMO RPM	Mr. Jacques P. Lord	(619) 532-0902	If significant changes or corrective actions occur during the project, the RPM will notify the EPA and other regulators involved in this project.
SAP review and radiological concurrence	RASO	Mr. Matthew Slack	(757) 887-4212	The RASO will review and concur with the SAP as related to the radiological aspects.
SAP review	QCPM	Mr. Greg Joyce	(360) 780-0371	The SAP will be written by the Program Chemist and reviewed by the QCPM prior to submittal to the NAVFAC SW QAO.
Notification of nonusable analytical data	TtEC Program Chemist	Ms. Lisa Bienkowski	(949) 809-5028	If significant problems are identified by the laboratory or the project team that impact the usability of the data (i.e., the data is rejected or data quality objectives are not met), the Program Chemist will notify the NAVFAC SW RPM and QAO within 24 hours.

SAP Worksheet #6 – Communication Pathways (Continued)

Communication Drivers	Responsible Affiliation	Name	Phone Number	Procedure
Coordination of laboratory supplies for field sampling activities	TtEC Project Chemist	Ms. Sabina Sudoko	(949) 809-5022	The Project Chemist will contact the laboratory to provide all necessary sample containers and appropriate shipping materials (such as coolers and bubble wrap) to be delivered on-site prior to commencement of field sampling activities and throughout the course of the project.
Reporting laboratory data quality issues or analytical corrective actions	Curtis and Tompkins Laboratory Supervisor TestAmerica-St. Louis Laboratory Project Manager	Mr. Phil Smith Ms. Erika Starman	(415) 216-2768 (314) 298-8566	All Curtis and Tompkins data quality issues will be reported in writing by the Laboratory Supervisor to the RSO and Program Chemist within 24 hours. All TestAmerica-St. Louis data quality issues will be reported in writing by the Laboratory Project Manager to the Project Chemist and Program Chemist within 24 hours. Any corrective actions will be documented and verified by the Program Chemist who will notify in writing the QCPM, RSO, and PjM. The PjM will notify the BRAC PMO RPM and RASO.
Field corrective actions	TtEC PQCM	Mr. Vincent Richards	(949) 283-0589	All field corrective actions will be documented in writing by the PQCM who will notify in writing the QCPM, RSO, and PjM. The PjM will notify the BRAC PMO RPM and RASO.
Release of analytical data	TtEC RSO TtEC Project Chemist	Mr. Erik Abkemeier Ms. Sabina Sudoko	(757) 944-0921 (949) 809-5022	The RSO (or designee) will review Curtis and Tompkins analytical results to verify that the requirements in this SAP have been met prior to releasing the data to the project team for evaluation. The Project Chemist will review TestAmerica-St. Louis analytical results to verify that the requirements in this SAP have been met prior to releasing the data to the project team for evaluation.

SAP Worksheet #6 – Communication Pathways (Continued)

Communication Drivers	Responsible Affiliation	Name	Phone Number	Procedure
Review of radiological data and concurrence on radiological actions	RASO	Mr. Matthew Slack	(757) 887-4212	The RASO will review all appropriate radiological data provided by the RSO (or designee) and will provide concurrence with actions proposed.
SAP procedure revision during field activities	TtEC Program Chemist	Ms. Lisa Bienkowski	(949) 809-5028	The Program Chemist (or designee) will prepare a Field Change Request (FCR) for any changes in sampling procedures that occur due to conditions in the field.
SAP amendments	TtEC Program Chemist	Ms. Lisa Bienkowski	(949) 809-5028	Significant changes to the SAP such as additional scope of work that is not covered in this SAP will require that the Program Chemist prepare an addendum, which will be reviewed and approved by the NAVFAC SW QAO prior to initiating the affected field activities.

This page intentionally left blank.

SAP Worksheet #7 – Personnel Responsibilities and Qualifications Table

Name	Title/Role	Organizational Affiliation	Responsibilities
Mr. Joseph Michalowski	QAO	NAVFAC SW	• Reviewing and approving this SAP • Providing DON oversight of TtEC's Quality Assurance (QA) Program • Providing technical and administrative oversight of TtEC's surveillance audit activities • Acting as point of contact for matters concerning QA and the Department of Defense's (DoD) Laboratory QA Program • Coordinating training on matters pertaining to generation and maintenance of quality of data • Authorizing the suspension of project execution if QA requirements are not adequately followed
Mr. Jacques P. Lord	RPM	BRAC PMO	• Performing project management for the DON • Ensuring that the project scope of work requirements are fulfilled • Overseeing the project cost and schedule • Providing formal technical direction to the TtEC project team, as needed • Acting as lead interface with agencies
Mr. Hedy Abedi	PjM	TtEC	• Coordinating work activities of subcontractors and TtEC personnel, and ensuring that all personnel adhere to the administrative and technical requirements of the project • Monitoring and reporting the progress of work, and ensuring that the project deliverables are completed on time and within project budget • Monitoring the budget and schedule, and notifying the client and the RPM of any changes that may require administrative actions • Ensuring adherence to the quality requirements of the contract, project scope of work, and the QC plans • Ensuring that all work meets the requirements of the technical specifications and complies with applicable codes and regulations

SAP Worksheet #7 – Personnel Responsibilities and Qualifications Table (Continued)

Name	Title/Role	Organizational Affiliation	Responsibilities
Mr. Hedy Abedi (Continued)	PjM	TtEC	• Ensuring that all work activities are conducted in a safe manner in accordance with the Site-Specific Safety and Health Plan, United States Army Corps of Engineers' Safety and Health Requirements (Engineer Manual 385-1-1), and all applicable Occupational Safety and Health Administration (OSHA) regulations • Serving as the primary contact between the DON and TtEC for actions and information related to the work and including appropriate TtEC technical personnel in the decision-making • Coordinating satisfactory resolution and completion of evaluation and acceptance report for nonconformance reports • Suspending project activities if standards are not maintained
Mr. Matthew Slack	Radiological Environmental Protection Manager	RASO	• Reviewing radiological laboratory data on a routine basis • Performing on-site reviews of all radiological site operations • Reviewing and approving all radiological work plans and final reports • Providing review and concurrence on data for proposed radiological actions • Ensuring that all necessary sample results are provided and are consistent with proposed radiological actions • Comparing radiological data with the requirements of the Work Plan, Design Plans, Task-specific Plans, and SAP to ensure that all proper conditions have been met to implement the action requested

SAP Worksheet #7 – Personnel Responsibilities and Qualifications Table (Continued)

Name	Title/Role	Organizational Affiliation	Responsibilities
Mr. Matthew Slack (Continued)	Radiological Environmental Protection Manager	RASO	• Ensuring that the radiological data reported are consistent with the intent for which the data were provided • Comparing the sample number matrix with the intent of the data package to ensure that the sample number is consistent with the intent of the data package • Reviewing sample acquisition information to ensure that the sample analytical duration meets the minimum required time necessary to meet the minimum detectable activity (MDA) • Comparing each radionuclide's specific activity with the release criteria to ensure that the decision made is consistent with the specific activity reported • Comparing the MDA with the release criteria to ensure that it is sufficiently below the release levels • Evaluating the qualifiers provided with the sample results to ensure that the information provided is consistent with the results provided • Reviewing uncertainty counting and the 2-sigma total uncertainty data along with the laboratory qualifiers to determine if the data are of sufficient quality
Mr. Erik Abkemeier	RSO	TtEC	• Overseeing overall radiological operations and documentation for the project • Supporting projects as the technical lead for radiological data collection and analysis • Ensuring that RSOR and field sampling personnel have adequate training in radiological sample collection • Receiving and reviewing data from the laboratory to ensure the data quality objectives have been met • Reviewing and evaluating scan survey data and requiring additional scan data, as necessary

SAP Worksheet #7 – Personnel Responsibilities and Qualifications Table (Continued)

Name	Title/Role	Organizational Affiliation	Responsibilities
Mr. Nathan Smith	RSOR	TtEC	• Supervising day-to-day radiological operations • Overseeing performance of radiological static surveys • Identifying and assessing radiological contamination • Concurring on the identification of elevated areas for collection of biased samples and the locations of systematic samples • Overseeing the preparation of a remediation plan and the performance of remedial activities when sampling activities indicate the presence of radioactive materials at levels above the release criteria • Directing any additional biased sampling activities to ensure the isolation and removal of radioactive material • Reviewing and evaluating biased sampling data and identifying any additional radiological activities • Recommending radiological activities to the RASO for concurrence including additional sampling, backfilling of trenches, identification of material that can be used as backfill, etc. • Overseeing the plotting of systematic sample locations and collection of the appropriate number of samples • Reviewing and evaluating static survey readings used to verify scan surveys or to get a reading of a sampling point

SAP Worksheet #7 – Personnel Responsibilities and Qualifications Table (Continued)

Name	Title/Role	Organizational Affiliation	Responsibilities
Mr. Greg Joyce	QCPM	TtEC	• Establishing and maintaining the Quality Program • Overseeing program QC, including construction and analytical data acquisition • Working directly with the PjM and the DON to ensure implementation of the program QC Plans • Acting as a focal point for coordination for quality matters across all projects and resolving quality issues • Suspending project activities if quality standards are not maintained • Interfacing with the DON, including NAVFAC SW QAO, on quality-related items • Conducting field QC audits to ensure project plans are being followed • Performing reviews of audit and surveillance reports conducted by others • Implementing the DON technical direction letters related to quality topics • Approving any FCRs and reviewing addendums to the SAP
Ms. Lisa Bienkowski	Program Chemist	TtEC	• Developing the SAP and any addendums to the SAP • Implementing contract requirements for data collection • Supporting projects as the technical lead for data collection and analysis • Evaluating and selecting a qualified laboratory and third-party data validation subcontractor • Providing oversight of the laboratory with regards to deliverable requirements • Monitoring performance of laboratory and data validator • Overseeing preparation of the Navy Electronic Data Deliverable (NEDD) deliverable to the Naval Installation Restoration Information Solution (NIRIS) website of the analytical data • Coordinating submittal of hard-copy analytical data packages with DON Administrative Record

SAP Worksheet #7 – Personnel Responsibilities and Qualifications Table (Continued)

Name	Title/Role	Organizational Affiliation	Responsibilities
Ms. Sabina Suduko	Project Chemist	TtEC	• Tracking samples sent to laboratory to ensure laboratory receipt of samples and proper login of samples for analysis • Tracking receipt of analytical data from the laboratory • Reviewing laboratory data prior to use against requirements in this SAP • Coordinating third-party data validation of the laboratory data • Reviewing data validation reports • Coordinating upload of electronic data to database

SAP Worksheet #8 – Special Personnel Training Requirements Table

Project Function	Specialized Training By Title or Description of Course	Training Provider	Training Date	Personnel / Groups Receiving Training	Personnel Titles / Organizational Affiliation	Location of Training Records / Certificates

Mr. Ray Seamons	Project Engineer	TtEC	(510) 523-1582	ray.seamons@tetratech.com

Meeting minutes:

Project Technical Information

Jacques wanted to discuss several broad aspects of the project and wanted to point out key points regarding the work.

SAP Worksheet #9 – Project Scoping Session Participants Sheet (Continued)

1. The IR Site 2 project is not a Title 27 closure but a ROD based cover to interrupt receptor pathways. Although the team may be developing plans and performing work similar and in conformance to a Title 27 closure, the Navy is not required to close the landfill to comply with that law.
2. The Navy must deal with the radiological issues of the site and to obtain as much information as possible from all the past work at IR Site 2 to fully understand the data Jacques wants to be able to identify gaps in the data and be able to determine if it is possible to deal with radiological concerns by use of cover materials or other controls to minimize radiological impacts. Jacques feels the radiological issues are one of the most important aspects of the work and difficult since there is not a clear indication on where all the radiological contamination specifically is located and the current design may not identify all the subgrade cut areas that would be required to make grade.
3. The seismic engineering mitigations are another important aspect to the job. Jacques feels that the detailed evaluation of the seismic aspects for the site will dictate how TtEC plans to mitigate their affects. Jacques mentioned dynamic compactions, possible set-backs slope grades and thickness as all potentially key issues that need evaluation before the design plan can be completed.
4. The most important political issue at the site with the regulators and community is the wetlands. Jacques feels this is not a difficult challenge since the Navy has delineated the main wetland area within the site. Regarding the 9 acres of seasonal wetlands in the north, northeast bunker area of the site, Jacques feels that any disruption of those areas during construction can be mitigated. Jacques envisions those disturbances as temporal and easily repaired without having to consider creating new wetland areas.
5. Institutional controls that had been considered in the ROD, although not specific, are important to the Navy. Jacques felt if the project could be designed to include public access, even with a path around the area, that effort will go a long way with the community buying into the project.
6. Regarding drainage Jacques was not specific in addressing any one issue except to say that controls need to mitigate erosion of the cover.
7. Material sources are important to the Navy in a way to control cost. Jacques is aware that TtEC plans to barge in off-site soils; however, the Navy has identified on-site sources of concrete and asphalt that he envisions can be used in the bio-barrier. In addition Jacques stated that IR Site 17 nonhazardous soils are expected to be stockpiled at the site. Hedy indicated that the task is already in progress and those soils are already being stockpiled. Jacques indicated that others had proposed mining soils at the site. Jacques does not feel that there is much potential in that but wants to pursue it by reviewing the site information in case an argument could be made for it.

Everyone appreciated the summary that Jacques provided. Jacques felt the above items were critical to the project and wanted them identified at this time so the team can be focused with their work throughout the entire period of performance. Doug raised a question regarding drainage and asked if the wetland culvert was part of the contract. Jacques indicated that the

SAP Worksheet #9 – Project Scoping Session Participants Sheet (Continued)

culvert is covered but he was considering other issues above regarding the drainage. The final cover surface could have many facets and those need to be evaluated to address erosion control and settlement issues that will impact the operation and maintenance (O&M) of the cover over the long term.

Task Summary

Hedy reviewed the current contract award and read the items in the Task Summary

1. **Project Plans (initial award)**

   - Prepare Work Plan including QA/QC Plan, Post-Closure Monitoring plan, Sampling and Analysis Plan, Dust Control Plan, Traffic Control Plan, Data Management Plan, Waste Management Plan, Storm Water Pollution Prevention Plan, Radiological Work Plan/ Protection Plan (four versions).
   - Prepare the 90% Design (including RTCs to the 60% Design) and Final Design including Design Drawings, Specifications, Engineering Calculations, Land Use Controls Remedial Design, Pre-Design Field Investigation, and Geotechnical Report. Design submittals will accompany the Work Plan.

     Hedy indicated that TtEC was expecting the agencies comments on the 60% design mid-October. Jacques confirmed this but he envisioned that by the time the comments come back he expects the majority of the comments can be answered by referring to the 90% design. Jacques expects that TtEC will be modifying the design significantly and some of the comments by the agencies may not be relevant to the new concepts. Pete stated that TtEC has been discussing this issue extensively and will be preparing a technical summary of the new design concepts based on early review of the 60% design and adherence to the key issues addressed above. Pete asked Jacques if it would be advantageous to meet with the Water Board at this time to review those ideas. Jacques indicated that the Water Board is aware of the back story for the project and he feels that the team should take a close look at the comments the board submits and then considering a one-on-one meeting with them. The meeting could focus on the synergistic effect the proposals could have on the project and discuss a path forward.
   - Prepare separate SOPs and Project Specific Work Instructions for radiological work to be submitted for Navy review including RASO.

     Matt asked Nathan if TtEC was planning to work under TtEC's federal NRC radiological license or the State's. Nathan indicated that TtEC always works under the federal license but the Navy scope had mentioned the contractor having a State license. However, at this time Nathan is not sure if they will envoke the State license. Matt suggested that Jacques confer with the Navy's legal department to determine if the IR Site 2 work falls under the federal exclusive jurisdiction or concurrent jurisdiction. Matt indicated that most of Alameda is under concurrent jurisdiction but he understands that IR Site 2 is a federal to

SAP Worksheet #9 – Project Scoping Session Participants Sheet (Continued)

federal transfer and therefore may not require concurrent jurisdiction. Using the federal NRC license eliminates the oversight that the State would provide. Jacques asked Nathan if a concurrent jurisdiction is required does TtEC have or are they in the process of obtaining a state license. Nathan indicated that TtEC is in the process of obtaining one. Doug added that working with the state license opens up other issues that make the work more challenging. Doug feels that Site 2 will be considered an exclusive federal jurisdiction. Jacques agreed but will wait for final word from his legal department.

- Prepare separate document for the Accident Prevention Plan/Health & Safety Plan (two versions).

  Hedy mentioned that Keith Rademacher in Alameda and Roger Margotto in San Diego will take the lead on this document.

- Prepare Fact Sheet for presentation at Public Meeting (three versions).

Jacques mentioned to the ROICCs and RASO that when TtEC presents internal drafts of all the documents he is satisfied with receiving an electronic copy of the document for his review. Jacques envision that the document would be reviewed with track changes and those changes documented by TtEC. Jacques asked the Navy personnel if they would also be amenable to this method. Matt mentioned that he is used to getting a CD of the document and for large documents he prefers to have a hard copy handy to refer to. Nathan mentioned that to create the hard copy takes a few extra days. Matt indicated that TtEC can send a CD with word and pdf files and his review could officially start at this time with TtEC following up with a hard copy. Matt is fine with being able to place comments directly into the document with track changes. Jacques mentioned that TtEC does not need to do formal RTCs for the internal draft as indicated in the schedule. Nathan indicated that the way TtEC is used to doing this is by inserting the RTC directly under the changes made by the Navy and include the changes in the document using "tracked changes" format. Matt mentioned that he has reviewed numerous documents with TtEC and feels everyone is on the same page on how this will work. Matt saw no issues with what Jacque was proposing. Jacques indicated the reason for this request was to help save on paper and to expedite the document schedule.

Hedy mentioned that Matt would be on-site September 15, 2011, with Jacques and this could be discussed further. Hedy resumed the task summary.

2. **Field Work**

   Initial Award

   - Site preparation including demolition of features per Work Plan, and establishing subgrade elevations to the extent practicable without import soil (soil import is optional work)
   - Radiological surface scan and removal of radiologically impacted soil

SAP Worksheet #9 – Project Scoping Session Participants Sheet (Continued)

Hedy mentioned that Nathan has been preparing information in preparation for the meeting on September 15, 2011.

- Procurement of general fill for subgrade

  Hedy mentioned that the procurement process is already underway to secure pricing and schedule.

Options

- Place fill to establish subgrade elevation
- Procurement and placement of animal intrusion barrier
- Procurement and placement of 1-foot thick general soil layer and 0.5-foot thick vegetative topsoil layer.

  Pete asked Jacques if the Navy would be interested in discussing a geosynthetic liner as a bio-barrier. Jacques indicated that the current design uses available on site concrete and asphalt material but if TtEC has a cost effective alternative he would be willing to consider it. Jacques added that burrowing animals are one of the biggest problems with these types of projects. Jacques also mentioned that if the geosynthetic barrier is used it could reduce that amount of material IR Site 2 needed and those could be made available to the Site 1 project.
- Install drainage, monitoring wells, fencing, other IC features
- Final radiological surface scan

3. **Reports and Data Submission (Option)**
   - Data submittals including NIRIS
   - Remedial Action Completion Report

Project Schedule

Hedy mentioned the project schedule was attached and asked if Jacques had any questions on it. Jacques mentioned he had looked at it and he felt it was very optimistic like most projects are at the beginning. He did not want to review the schedule now but wanted TtEC to concentrate on meeting the 90% design submittal to the regulators. Pete indicated that TtEC is committed to that schedule and that is the reason he is already working on an initial technical memorandum identifying key design concerns while the 60% design is in agency review.

Additional Items

1. Hedy asked Jacques when he would be at the Alameda site on September 15, 2011. Jacques indicated that he is meeting with the team for the Building 5 and 400 remediation at 0930 hrs. They plan to discuss with Matt the decontamination proposal. Matt asked Jacques if he was aware that Robert Wilson of the CDPH may join the meeting. Jacques thought that he was not interested because work was EPA driven and not by him. Matt

SAP Worksheet #9 – Project Scoping Session Participants Sheet (Continued)

indicated he may come out just to see what was going on but not in an official capacity. Jacques had no issue with this and felt it may be beneficial.

2. Hedy asked Jacques if he was able to provide any documentation from Site 1 as requested. Jacques had not remembered that request but he instructed Hedy that he can contact Cecily Sabedra (Navy RPM IR Site 1) whenever he wants to provide this information. Jacques has already spoken with Cecily and she is aware of our schedule and will make any information she has available. Jacques will provide her contact information to Hedy after the meeting.

3. Pete asked Jacques if any more information from pre-design site investigations would be coming from the previous contractors. Jacques indicated that the Navy was very unhappy with the recommendations from the contractors because they had done modeling to show that at the maximum credible earthquake it all turned to "soup" from liquefaction at the site and wanted to pursue a waiver and do more research to find out what the minimum earthquake would be to minimize the mitigation measures. Jacques felt the lesson learned from Site 1 is that the contractors have proposed dynamic compaction and a deep driven pile wall to militate against liquefaction. Jacques feels that there is already enough information about the seismic hazards and it is time to design something rather than study it further. Based on that data the Navy denied the additional research work.

   Caleb mentioned that the 60% design report had indicated that ongoing geotechnical work was in progress at the site and wanted to be sure that more data was not forthcoming. Jacques reiterated that the Navy stopped the KCH funding and felt that the statement in the report was probably there in anticipation of them receiving more money for research.

4. Pete also requested if TtEC could get a hold of the CAD files for the 60% design to help alleviate cost in reproducing them. Jacques indicated that he has instructed Anne Estabrook at KCH to provide that data to TtEC and TtEC can contact her directly.

5. Pete and Caleb indicated that they are anxious to have the technical meeting with Jacques to discuss the geotechnical issues of the project in detail.

SAP Worksheet #10 – Problem Definition

The main problem defined for this project is: The DON has determined (based on site-specific investigative data) that low-level radioactive contamination potentially present at IR Site 2 requires a response action prior to installation of a multilayer soil cover. Therefore, the DON initiated removal actions for the screening, characterization, and remediation of radiologically impacted materials at IR Site 2 up to a maximum depth of 1 foot to protect the public health and welfare, and the environment, from actual or potential releases of radiological contaminants during installation of the cover. Installation of the cover is intended to isolate buried waste and soil contamination, and prevent contact with any contamination that may be present at the existing ground surface.

BACKGROUND

Alameda Point was an active military installation from the 1930s to the 1990s, which primarily provided facilities and support for fleet aviation activities. The area of present day IR Site 2 was originally open water until 1956 when a sea wall was constructed along the southern and western shorelines to confine and protect the area. Dredged fill was hydraulically placed within the seawall creating the area encompassed by IR Site 2.

IR Site 2, also called the West Beach Landfill, was used as the main disposal area for the Alameda Point from approximately 1952 through 1978. An estimated 1.6 million tons of waste was deposited (E&E 1983). Historical waste disposal methods at the site generally consisted of trench-and-fill operations. Wastes included municipal solid waste, waste chemical drums (contents unknown), solvents, oily waste and sludge, paint waste, plating wastes, industrial strippers and cleaners, acids, mercury, polychlorinated biphenyl (PCB)-containing liquids, batteries, low-level radiological waste from radium dials and dial painting, scrap metal, inert ordnance, asbestos, several pesticides (solid and liquid), tear gas agent, biological waste from the Oak Knoll Naval Hospital, creosote, dredge spoils, and waste medicines and reagents (E&E 1983). Ordnance and explosives waste (OEW) may have also been deposited in the 2.5-acre (approximate) OEW burial site located in the southern part of the landfill.

The former landfill is defined as extending into wetland areas. The wetland area contains two surface perennial ponds. The northern pond (North Pond), which is connected to San Francisco Bay via a culvert, contains water year-round. The southern pond (South Pond) was created by excavating soil for landfill cover and subsequently was filled in with fresh water via precipitation. The presence of water in the South Pond is seasonally variable and is directly related to precipitation and run-off.

In 1978, the DON developed plans to close the landfill in accordance with the requirements of the Water Board's *Minimum Criteria for Proper Closure of Class II Solid Waste Disposal Sites* (Resolution No. 77-7). In 1983, the San Francisco Bay Regional Water Quality Control Board (Water Board) issued Order No. 83-35 to implement a final cover, leachate cutoff barrier, methane gas control, earthquake damage control, drainage control, and erosion control, and to generate compliance reports for the former landfill. Between 1983 and 1995, the DON responded by placing a partial clay-soil cover, installing an 820 foot-long, 2-foot-wide and 20- to 30-foot-deep slurry wall to restrict potential contaminant migration to San Francisco Bay. A gas

SAP Worksheet #10 – Problem Definition (Continued)

venting system was installed for methane gas control and repairs were made to the seawall also during this time period. In 1986, 20,000 cubic yards of imported fill soil was spread on the former landfill, which was insufficient in achieving a uniform cover layer of appropriate thickness over the landfill area. Also in 1986 the landfill was graded to prevent ponding, and an earthen perimeter berm was constructed around the landfill. In August 1999, IR Site 2 was officially added to the EPA's National Priority List of Superfund sites.

Most recently, the DON conducted a feasibility study (Battelle and BBL 2008) to evaluate potential remedial alternatives for IR Site 2 and prepared a ROD (DON 2010) to document the selected remedy for the site. The DON, the EPA, California EPA, Department of Toxic Substances Control (DTSC), and the Water Board concurred on the selected remedy for the site. The decision presented in the ROD is based on information contained in the administrative record file as well as on extensive field investigations, laboratory analyses, interpretation of the data, review of current and future conditions, and assessment of the potential human health and ecological risks, and an evaluation of potential remedial alternatives.

The selected remedy for soil, as outlined in the ROD, is Alternative 2, a multilayer soil cover, engineering and institutional controls (ICs), and monitoring. This alternative consists of installation of an engineered soil cover over the former landfill to isolate buried waste and soil contaminants and prevent animal burrowing; implementation of engineering and land use controls to protect human health and soil cover integrity; provision for any necessary wetlands mitigation if impacts to wetlands occurs; monitoring of the soil cleanup action and wetlands mitigation to ensure their proper construction and long-term effectiveness; and conducting of methane gas monitoring as necessary. This SAP includes any sampling activities associated with installation of the soil cover.

The selected remedy for groundwater, as outlined in the ROD, is Alternative 2 – Monitored Natural Attenuation. This alternative consists of regularly monitoring groundwater quality using shoreline groundwater monitoring wells to ensure that there are continued stable to decreasing trends in contaminant concentrations, and to protect the beneficial uses of surface water in San Francisco Bay; and implementation of engineering controls and ICs to protect human health and the groundwater remedy. A Post-closure Operations, Maintenance, and Monitoring Plan is provided in Attachment 11. Monitoring activities for groundwater, which include groundwater sampling, are not discussed in this SAP since these activities are not part of the TtEC scope for this project. A separate SAP will be prepared by the contractor who receives that scope of work.

SAP Worksheet #11 – Project Quality Objectives/Systematic Planning Process Statements

The Data Quality Objectives (DQOs) specify project objectives, data collection boundaries and limitations, the most appropriate type of data to collect, and the level of acceptable decision error. The quality and quantity of data required to implement environmental removal actions are also defined.

The DQOs, as defined through the seven-step process (EPA 2006a), are as follows:

1. State the problem

The main problem defined for this project is: The DON has determined (based on site-specific investigative data) that low-level radioactive contamination potentially present at IR Site 2 requires a response action prior to installation of a multilayer soil cover. Therefore, the DON initiated removal actions for the screening, characterization, and remediation of radiologically impacted materials at IR Site 2 up to a maximum depth of 1 foot to protect the public health and welfare, and the environment, from actual or potential releases of radiological contaminants during installation of the cover. Installation of the cover is intended to isolate buried waste and soil contamination, and prevent contact with any contamination that may be present at the existing ground surface.

Any chemical analysis discussed hereafter in this SAP is for the purpose of classification (non-hazardous or hazardous) of any soil prior to its use as fill material. If the soil is classified as non-hazardous (i.e., meets criteria listed in footnotes d, f, and g of Worksheet #15.1), then the material will be used as fill. Otherwise, the material will be disposed of accordingly.

2. Identify the goal of the study

a) Does the initial gamma survey (conducted after installation of the subgrade and prior to the installation of the cover) identify areas greater than twice background?

b) Does the final gamma survey (conducted after the installation of the cover) identify areas greater than the reference area mean + 3σ?

c) Do the risk and dose assessments, calculated from the soil data generated by the MARSSIM [DoD et al. 2000] guidelines used for the final survey conducted after the installation of the cover, exceed the maximum annual dose to an individual of 15 mrem and/or the excess lifetime cancer risk (ELCR) of 3×10^{-4} for the critical group?

d) Are the radiological analytical results of the soil generated from excavation of any areas prior to installation of the cover above the criteria listed in Worksheet #15.1?

e) Do the analytical results for material to be used as fill meet the criteria described in footnotes d, f, and g of Worksheet #15.1?

3. Identify information inputs

Radiological field technicians will gather the following types of data for this project for subsequent use/evaluation by the RSO (or designee):

SAP Worksheet #11 – Project Quality Objectives/Systematic Planning Process Statements (Continued)

- Reference (background) area readings
- Gamma scan survey readings
- Systematic gamma static measurements
- Analytical results of samples collected during this project
- Risk and dose modeling

The above data will be gathered using field instruments and analytical techniques described in Step 6 and 7 below. The data will be used to make decisions described in Step 5 below.

4. Define the boundaries of the study

Spatial boundaries: IR Site 2 is located at the southwestern edge of Alameda Point and encompasses approximately 110 acres bordered by San Francisco Bay to the south and west. IR Site 2 consists of a former landfill, wetlands area, the interior margin, and the coastal margin. The landfill covers approximately 60 acres and is bounded to the north by the interior margin and the east by runways and tarmacs. The cover will be installed over approximately 70 acres ensuring that the entire landfill is covered.

Temporal boundaries: There are no temporal boundaries for this project.

5. Develop the analytic approach

a) If the initial gamma survey (conducted after installation of the subgrade and prior to the installation of the cover) identifies areas greater than twice background, then each area determined to be above twice background will be excavated to a depth of 1 foot. Samples will be collected in the excavated area, and then the area will be filled in to bring the surface back up to subgrade. If the initial gamma survey does not identify areas greater than twice background, then no further action is required and installation of the cover will commence. Since a soil cover is being installed as the final remedy for the site, the limit of the excavation will be one foot.

b) If the final gamma survey (conducted after the installation of the cover) identifies areas greater than the reference area mean + 3σ, then the area will be further investigated with concurrence from the project team to ensure that remediation is warranted taking into consideration the risk and dose assessment performed based upon analytical results for the soil to be used for the cover. If remediation is warranted, then the area will be excavated as directed by the project team, then filled in to bring the surface back up to grade, and another gamma survey will be conducted. If the final gamma survey does not identify areas greater than the reference area mean + 3σ, then no further action is required.

c) If the risk and dose assessments, calculated from the soil data generated by the MARSSIM (DoD et al. 2000) guidelines used for the final survey conducted after the

SAP Worksheet #11 – Project Quality Objectives/Systematic Planning Process Statements (Continued)

installation of the cover, exceed the maximum annual dose to an individual of 15 mrem and/or the ELCR of 3×10^{-4} for the critical group, then the data will be presented to the project team for further direction. If the data indicate doses and risk levels are below acceptable criteria, then no further action is required for the subgrade of the landfill.

d) If the radiological analytical results of the soil generated from excavation of areas prior to installation of the cover are above the criteria listed in Worksheet #15.1, then the material will be disposed of as low-level radioactive waste (LLRW). Otherwise, the material may be used as fill for the cover.

e) If the analytical results for the material to be used as fill meet the criteria described in footnotes d, f, and g of Worksheet #15.1, then the soil may be used as fill material for subgrade or the cover depending on criteria met according to footnotes d, f, and g of Worksheet #15.1. Otherwise, the soil may not be used and additional sources of soil will be identified and sampled.

6. Specify performance or acceptance criteria

Actions to minimize decision errors will be instituted during the data collection phase of the radiological survey. Qualified radiation survey personnel will perform the surveys and record the data. Automated recording of survey data will be used where possible to minimize errors. Data transcribing is the second phase where errors may arise. To avoid data errors for manual surveys, experienced personnel will record and transcribe data.

A knowledgeable individual who is not involved in the direct data collection process (RSO, RSOR, or designee) will review the survey data on a daily basis. This will ensure an ongoing independent review for consistency of all survey data collected.

Field crews will review this SAP prior to collection of samples and sign off on Worksheet #4. An equivalent form to Worksheet #4 may be used.

7. Develop the plan for obtaining data

Radioactive source readings will be used to check instruments for consistency prior to use in each daily shift. The instrument will only be used after readings are compared and agree within +/- 20 percent of predetermined responses. The on-site RSOR will review the information to verify that equipment is operating satisfactorily. In addition, background levels will be determined by conducting gamma scan surveys of a reference area of approximately 1,000 square meters, as agreed upon by the project team. The mean of all readings for the respective survey instrument (Vehicle Towed Array or Ludlum 2350-1 survey meter with 44-10 2-inch by 2-inch sodium iodide [NaI] detector) will be used to calculate the mean reference area gamma background rate.

The MARSSIM (DoD et al. 2000) guidelines will be used for the intial gamma surveys. A 95 percent confidence level for detecting radioactivity above the levels corresponding to a maximum annual dose to an individual of 15 mrem, and the ELCR of 3×10^{-4} for the critical

SAP Worksheet #11 – Project Quality Objectives/Systematic Planning Process Statements (Continued)

group in soil samples will be assumed with Type I and II errors limited to 5 percent. Survey units will be limited in size to 2000 square meters (m^2) based on the survey unit sizes recommended in MARSSIM (DoD et al. 2000). A triangular grid reference coordinate system will be laid out for each of the initial survey units prior to cover installation to identify survey locations. Combined with the use of qualified and experienced personnel, this design is considered both efficient and resource effective. The theoretical assumptions of the survey design are based on guidelines contained in MARSSIM (DoD et al. 2000).

Details on collection and analysis of samples are in Worksheet #14.

SAP Worksheet #12 – Measurement Performance Criteria Table for Samples

Field QC samples are not required for this project since any samples collected are for modeling dose/risk, waste characterization purposes, or for evaluation of fill material. Therefore, measurement performance criteria for field QC sample collection are not applicable.

SAP Worksheet #13 – Secondary Data Criteria and Limitations Table

Secondary Data	Data Source (Originating Organization, Report Title, and Date)	Data Generator(s) (Originating Org., Data Types, Data Generation/ Collection Dates)	How Data Will Be Used	Limitations on Data Use
Historical Radiological Assessment	Weston Solutions, Inc.; Historical Radiological Assessment, Alameda Naval Air Station, Use of General Radioactive Materials 1941–2005; 2007.	Assess the likelihood of potential radioactive contamination and migration pathways. Designate sites as impacted or non-impacted.	Data were used to perform the Time-Critical Removal Action by TtEC.	None
Time-Critical Removal Action	TtEC; Final Time-Critical Removal Action Post-Construction Report for Installation Restoration Sites 1, 2, and 32, Alameda Point, Alameda, California; 2009	Mitigate the potential risk posed by material potentially presenting an explosive hazard and radiological contamination at IR Sites 1, 2, and 32.	Data were part of the Record of Decision document prepared by the Navy in 2010.	None
ROD	DON; Final Record of Decision (ROD) for IR Site 2, Former Naval Air Station Alameda, California; 2010	The selected remedy for soil, as outlined in the ROD, is Alternative 2, a multilayer soil cover, engineering controls and ICs, and monitoring. This alternative consists of installation of an engineered soil cover over the former landfill to isolate buried waste and soil contaminants and prevent animal burrowing; implementation of engineering controls and LUCs to protect human health and soil cover integrity; provision for any necessary wetlands mitigation if impacts to wetlands occurs; monitoring of the soil cleanup action and wetlands mitigation to ensure their proper construction and long-term effectiveness; and conducting of methane gas monitoring as necessary.	ROCs identified in the ROD for soil at IR Site 2 include cesium-137 (^{137}Cs), cobalt-60 (^{60}Co), ^{226}Ra, strontium-90 (^{90}Sr), thorium-232 (^{232}Th), and uranium-238 (^{238}U).	None

This page intentionally left blank.

SAP Worksheet #14 – Summary of Project Tasks

The following is a list of summary of project tasks as related to sampling activities.

BUILDING UP TO SUBGRADE

The first phase of the project is to build up to subgrade. This will involve grubbing plants, cutting into some of the current land surfaces, and building up the grade of some of the land surfaces with import material and materials that are cut from other areas. In order to minimize the hazards of disturbing the wastes found within the berm, efforts will be made to avoid any cuts within the berm. All planned cuts will be of the berm itself and areas outside the berm.

IR Site 2 is currently posted as a radiologically controlled area (RCA) and will continue to be controlled as such. Radiological controls while performing cuts of the berms and areas outside of the berms will be minimal due to the unlikelihood of waste materials being found within the berm. Radiological control technicians (RCTs) will periodically scan the cut areas on a frequency based on the professional judgment of the RSOR taking into consideration the previous survey results, accessibility of the affected areas, and soil movement in the area. At a minimum, the affected area will be surveyed each time a lift is excavated, a new surface area is exposed, or when personnel entry is required into the affected area. These radiological scans will be performed for health and safety reasons during soil moving operations to ensure that radiological contaminants are not disturbed. The radiological scans will be documented in the field and in the remedial action completion report if a radiological scan identifies an area with levels greater than twice background using a Ludlum 2350 meter with a Ludlum 44-10 NaI detector or equivalent. If levels are encountered that are greater than twice background within the berm, then the work in the area will stop and the RSOR will be immediately notified to assess the levels, and determine a new course of action for these cuts. Soils from these cuts will be used to help bring other portions of the site up to subgrade.

All efforts will be taken to avoid making cuts within the berms to help keep dose to workers ALARA. However, if for some reason it becomes necessary to perform cuts within this area, the area to be cut will be posted as a Contaminated Area and controlled in accordance with TtEC's NRC Radioactive Materials License and SOP 12, Radiologically Controlled Areas Posting and Access Control. Specific radiological controls will be determined by the RSOR based upon the nature of the cut and documented in a Radiation Work Permit prior to performing any cuts within the berm. Cut materials will be scanned in place with the Vehicle Towed Array (VTA) and removed in 6 inch lifts to ensure that no material greater than twice the background level was disturbed. If levels are found greater than twice background, then these areas will be remediated. Materials that do not indicate radiation levels greater than twice background may be used to bring other portions of the site up to subgrade. Note that these materials have not been radiologically released and must either be used to bring depressions up to subgrade or ultimately disposed of as LLRW. VTA surveys of the cut areas will be performed to verify radiation levels prior to down posting the Contaminated Area. If levels are found greater than twice background, remediations will be performed in these areas up to a depth of one foot. Remediated areas will be filled in to bring the surface back up to subgrade.

SAP Worksheet #14 – Summary of Project Tasks (Continued)

INITIAL MARSSIM SURVEY OF SUBGRADE PRIOR TO INSTALLATION OF COVER

The initial MARSSIM survey will be performed once the subgrade is complete and prior to installation of the cover. The entire footprint of the subgrade will be subdivided into survey units no larger than 2,000 square meters in surface area. Each survey unit will be 100% gamma surveyed with the VTA or a Ludlum 2350 meter coupled to a Ludlum 44-10 NaI scintillation detector, in cases where the VTA is physically incapable of surveying. Areas that indicate levels greater than twice background during the gamma survey will be excavated to a depth of 1 foot, sampled (the number of samples will be determined by the RSOR based on the size of the area) and analyzed for gamma isotopes. Additionally, any sample result exceeding the release criterion for ^{137}Cs will also be analyzed for total strontium and/or ^{90}Sr. The area will then be filled in to bring the surface back up to subgrade.

In addition, ten samples will be collected from each survey unit and analyzed for gamma isotopes and one of those samples will be randomly chosen for total strontium and/or ^{90}Sr, and alpha isotope (^{238}U) analyses. Additionally, any sample result exceeding the release criterion for ^{137}Cs will also be analyzed for total strontium and/or ^{90}Sr. These sample results will be used to perform dose and risk assessments for the final MARSSIM survey of the cover.

Any soil that is excavated (due to the intial gamma surveys) will be placed in 6-inch lifts. The soil will be surveyed again and soil samples will be collected at a rate of two samples per 40 cubic yards. All samples will be analyzed for gamma isotopes. Ten percent of the samples will also be randomly chosen for total strontium and/or ^{90}Sr, and alpha isotope (^{238}U) analyses. Additionally, any sample result exceeding the release criterion for ^{137}Cs will also be analyzed for total strontium and/or ^{90}Sr. These results will be used to determine if the material is LLRW or non-LLRW. LLRW material will be transported to the waste broker for disposal. Non-LLRW will be sampled at a minimum of one sample per 500 cubic yards for chemical analyses as listed in Worksheet #18. These chemical results will determine if any of the material can be reused as fill material for IR Site 2 or if off-site disposal of the material is required.

INSTALLATION OF THE COVER

During installation of the cover, the site will continue to be controlled as an RCA. Periodic coverage by the RCTs is required due to the reduced risk of encountering gross contamination.

FINAL MARSSIM SURVEY OF THE COVER

The final MARSSIM survey of the cover will again entail subdividing the entire footprint of the cover into survey units no larger than 2,000 square meters in surface area. Each survey unit will be 100% gamma surveyed with the VTA or a Ludlum 2350 meter coupled to a Ludlum 44-10 NaI scintillation detector, in cases where the VTA is physically incapable of surveying. Areas indicating levels exceeding the reference area mean + 3σ, where σ is the standard deviation of the gamma readings in the reference area, will be further investigated with concurrence from the project team to ensure that remediation is warranted taking into consideration the risk and dose assessment performed based upon analytical results for the soil to be used for the cover. If remediation is warranted, then the area will be excavated as directed by the project team, then

SAP Worksheet #14 – Summary of Project Tasks (Continued)

filled in to bring the surface back up to grade, and another gamma survey will be conducted. If the final gamma survey does not identify areas greater than the reference area mean + 3σ, then no further action is required.

Any soil that is excavated during this time will be placed in 6-inch lifts. The soil will be surveyed again and soil samples will be collected at a rate of two samples per 40 cubic yards. All samples will be analyzed for gamma isotopes. Ten percent of the samples will also be randomly chosen for total strontium and/or ^{90}Sr, and alpha isotope (^{238}U) analyses. Additionally, any sample result exceeding the release criterion for ^{137}Cs will also be analyzed for total strontium and/or ^{90}Sr. These results will be used to determine if the material is LLRW or non-LLRW. LLRW material will be transported to the waste broker for subsequent disposal. Non-LLRW will be sampled at a minimum of one sample per 500 cubic yards for chemical analyses as listed in Worksheet #18. These chemical results will determine if any of the material can be reused as fill material for IR Site 2 or if off-site disposal of the material is required.

SOIL SAMPLING PROCEDURES

Soil samples for any of the above activities described will be collected as follows:

1. Sampling personnel will don a new pair of disposable nitrile gloves immediately before collecting soil samples at each location.
2. Soil will placed into containers specified in Worksheet #19 in conjunction with analyses identified in Worksheet #18. Containers will be filled with no headspace. A disposable scoop or equivalent may be used to fill the containers.
3. Sample numbering, labeling, documentation, and packaging procedures will be followed as described below and in Worksheets #27 and #29.

FILL MATERIAL SAMPLING PROCEDURES

The DON is currently stockpiling soil (and rock) material generated by other projects in the runway areas north and east of IR Site 2. Only materials that have been characterized as non-hazardous have been placed in this area and are envisioned to be placed as part of the subgrade layer at IR Site 2. Previous chemical and radiological analytical results of these soil stockpiles will be reviewed against the criteria in Worksheet #15.1, as applicable, prior to use of the material as subgrade. The material may not have been analyzed for all analytes listed in Worksheet #15.1 because the material may have been sampled based on the contaminants of concern at the site where the material was generated. However, for evaluation of the material to be used as subgrade, at a minimum a) 10 samples of the material will have been collected and analyzed for chemical analyses (even though the analyte lists may not exactly match Worksheet #15.1); b) those 10 samples will also have been analyzed for gamma isotopes as listed in Worksheet #15.1, which includes meeting the minimum detectable activity (MDA) criteria; and c) 1 of those 10 samples will also have been analyzed for total strontium and/or ^{90}Sr, and alpha isotope (^{238}U) as listed in Worksheet #15.1, which includes meeting the MDA criteria. If the evaluation of the data indicates that the material is non-hazardous (i.e., meets criteria in Worksheet #15.1), then the material may be used as fill material for the subgrade at IR Site 2.

SAP Worksheet #14 – Summary of Project Tasks (Continued)

If other sources of material are identified (Navy or off-site sources) that are not currently stockpiled near IR Site 2 but have analytical results, those results will also be evaluated as described in the paragraph above prior to use of this material for the subgrade at IR Site 2.

In the event that additional soil material sources are needed for the subgrade that do not have analytical results or for the import sand material that is needed for the cover at IR Site 2, a minimum of 10 soil samples will be collected per source and analyzed for gamma isotopes and all chemical analytes listed in Worksheet #15.1. One of those 10 samples will also be analyzed for total strontium and/or ^{90}Sr, and alpha isotope (^{238}U) as listed in Worksheet #15.1. Analytical results for the subgrade or cover material will be evaluated as described in Worksheet #15.1. These samples will be collected as follows:

1. Sampling personnel will don a new pair of disposable nitrile gloves immediately before collecting soil samples at each location.
2. Only soil/sand material will be sampled. (Gravel/rock is not required to be sampled for the cover material.) The source material pile sample locations will be determined by generating random x, y, and z coordinates.
3. A disposable scoop or equivalent will be used to access each x, y, and z coordinate. (Due to limitations in accessing deep depths in a large stockpile of soil, z coordinates will be limited to 10 feet.) In the event the source material cannot be sampled at the source site, then the source will provide four bags of material, and one sample will be collected from each bag.
4. Soil samples will be collected in containers in Worksheet #19 in conjunction with chemical and radiological analyses identified in Worksheet #18 for fill material samples (subgrade or cover). Containers will be filled to ensure no headspace.
5. Sample numbering, labeling, documentation, and packaging procedures will be followed as described in Worksheets #27 and #29.

WASTEWATER SAMPLING PROCEDURES

In the event wastewater is generated during this project, a minimum of one wastewater sample per container will be collected as follows:

- Sampling personnel will don a new pair of disposable nitrile gloves immediately before collecting wastewater samples.
- Wastewater samples will be collected using a disposable bailer or similar device. Samples will be transferred from the bailers to pre-preserved, pre-cleaned sample containers listed in Worksheet #19 in conjunction with analyses identified in Worksheet #18.
- If vials for volatile organic compound (VOC) analysis are required to be collected, the vials will be filled as follows:
    a. The water samples will be carefully collected into 40-milliliter volatile organic analysis (VOA) vials using techniques to minimize aeration.

SAP Worksheet #14 – Summary of Project Tasks (Continued)

b. The vial will be filled up to the lid until a positive meniscus is formed.

c. The vial will be capped immediately, but slowly.

d. The sample will be checked for the presence of air bubbles.

e. If an air bubble is present, the collected sample will be discarded and resampled using a new vial.

f. The previous steps will be repeated until an air bubble-free sample vial is collected.

- Sample numbering, labeling, documentation, and packaging procedures will be followed as described in Worksheets #27 and #29.

DECONTAMINATION PROCEDURES

In the event any non-disposable equipment is used for sampling purposes, the equipment will be decontaminated as follows:

1. **Pre-screening using a hand-held alpha/beta survey meter** — If radioactive contamination exceeds the equipment release limits (identified in the Radiological Work Plan), the equipment and local area will be secured and the RSOR will be notified for further action.
2. **Washing with detergent and water solution** — This step will reduce the amount of gross contamination from the equipment. Use of a container, approximately 75 percent full of solution, is suggested for this step. This detergent solution will be prepared as directed by the manufacturer.
3. **Rinsing with potable water** — This step will rinse all the detergent solution away from equipment. Use of a container, approximately 75 percent full of potable water, is suggested for this step. Periodic changing of this water is required.
4. **Screening of equipment** — When dry, survey the post-decontaminated equipment using a hand-held alpha/beta survey meter. If radioactive contamination exceeds the equipment release limits (identified in the Radiological Work Plan), the equipment and local area will be secured and the RSOR will be notified for further action.
5. **Drumming of wastewater** — Drummed decontamination fluids will be sampled to characterize the waste for disposal as described in the wastewater characterization sampling procedure section above. Drums will be stored in a designated storage area pending receipt of the analytical data.

DATA MANAGEMENT TASKS

Field sampling data, including field logbooks and field forms, will be maintained. The logbooks will be numbered sequentially on the cover by the PQCM and that number will be entered into a logsheet maintained by the PQCM. A copy of all field forms will be maintained in the project file.

SAP Worksheet #14 – Summary of Project Tasks (Continued)

A copy of the laboratory COCs will be faxed/emailed to the Project Chemist on a daily basis for review and communication with the laboratory. The Project Chemist will maintain a copy of the COC form until submitted to the DON Administrative Record along with the hard-copy packages as described in Worksheet #29.

The laboratory will submit data at the turnaround time to TtEC via email. This submittal will include results and basic QC results (method blanks, laboratory control sample [LCS], surrogates, and matrix spike/matrix spike duplicates [MS/MSDs]). Following this submittal, the laboratory will be required to submit an EPA Level III- or IV-equivalent data package within 30 business days of the sample collection date. For this project, 80 percent of the data will be submitted in an EPA Level III-equivalent data package, and 20 percent will be submitted in an EPA Level IV-equivalent data package as listed on the COC and described in Worksheet #29. Each sample will have an EPA Level III or IV designation on the COC. In order to meet the 20 percent requirement for EPA Level IV samples, EPA Level IV will be chosen for every fifth sample collected.

Field data from the laboratory COCs (date and time collected, sample identification, etc.) will be entered into the TtEC database by the Project Chemist. Survey data will be recorded and also entered into the database. All radiological survey locations will be surveyed in accordance with EWI EVR.6, Environmental Data Management and Required Electronic Delivery Standards (SWDIV 2005). Horizontal control information will be captured in the State Plane Coordinate System (North American Datum 83) in feet, and vertical control standards will be in mean sea level (North American Vertical Datum 88) in feet. Any manual entries into the TtEC database will be 100 percent verified by the Project Chemist by checking the manual entry against the hard-copy information.

The laboratory will provide an electronic data deliverable (EDD) that will be compatible with TtEC requirements, and the EDD will be uploaded into the TtEC database. The data will be checked for required values and project-specific requirements by the database. Any discrepancies in the EDD will be corrected by TtEC or the laboratory will be notified to make corrections.

Analytical data generated by the laboratory will be validated by an independent data validation company as required by EWI #1, 3EN2.1, Chemical Data Validation (SWDIV 2001). The validation report will include the data validation findings worksheets as described in Worksheet #29, and the validation qualifiers will be entered electronically in the laboratory EDD.

After receipt of the validated data, the validation qualifiers will be uploaded into the TtEC database and will be checked against the hard-copy validation report for accuracy. Validated analytical data will be submitted to the NIRIS website in NEDD format in accordance with EWI EVR.6, Environmental Data Management and Required Electronic Delivery Standards (SWDIV 2005) as required.

Hard-copy data will be stored until subsequent submittal to the DON Administrative Record as described in Worksheet #29. The TtEC database will be electronically backed up on data storage tapes, and the backup will be stored as an archive file.

Note: Curtis and Tompkins will prepare the sample on-site into a sealed tuna can geometry, which allows for the in-growth of Ra-226 daughter products to approach secular equilibrium leading to analysis of the 609 keV Bi-214 gamma energy peak after in-growth is complete, typically 21 calendar days.

Asbestos	132207-33-1	1	[g]	0.25	0.25	Not applicable [b]

Notes:

* The criteria in this Worksheet #15.1 are applicable to fill material and waste characterization samples. For analytes that have no project action limit (PAL) established, the data will be evaluated to determine if additional screening is warranted in regards to fill material samples. In the event material cannot be used for fill at IR Site 2, it will need to be sent off-site for disposal. Disposal facilities require a standard list of analytes for each analytical method even though each analyte does not have a PAL because the facility may have its own criteria for those analytes. Therefore, fill material samples and waste characterization samples are being analyzed for the same full list of analytes. In addition, the gamma spectroscopy analytes in this Worksheet #15.1 without PALs established are predominantly naturally occurring radioactive materials (NORM). Information collected from these analytes may be used qualitatively to assess a correlation between high gamma scan survey readings with corresponding samples containing no radionuclides above the PALs for the radionuclides of concern.

[a] Project quantitation limits and minimum detectable activities for radiological analyses are calculated per samples per analysis. Therefore, these values are listed as to be determined (TBD) until a project action limit is applicable since these are determined based on instrument background, sample size, and count time. Values listed indicate a minimum MDA that will be achieved for isotopes that have project action limits specified in the ROD (DON 2010). For the laboratory, the MDAs listed are based on a 30-45 minute count time. To achieve lower MDAs, the sample count time would have to increase. The DON or RASO may direct an increase in sample count times to lower MDAs based on a sample-specific basis.

[b] MDLs are not applicable to radiological and asbestos analyses.

[c] Total strontium may be analyzed first due to a quicker turnaround time by the laboratory. If the total strontium result exceeds the project action limit listed, then the sample will be analyzed for ^{90}Sr.

[d] Limit listed is the value at which if exceeded then TCLP analysis must be performed. TCLP results will then be evaluated against CCR Title 22 criteria. If the TCLP results are below the CCR Title 22 criteria, then the material may be suitable as fill material pending evaluation of the rest of the analytical data against criteria in footnote f and/or g below. Otherwise, the material will be disposed of off-site.

[e] CAS number listed is from the NEDD valid value list since a CAS number is not available for this analyte.

SAP Worksheet #15.1 – Reference Limits and Evaluation Table for Soil Samples (Continued)

[f] ROD (DON 2010) criteria for chemical analytes are applicable only to the soil cover material. Subgrade material to be used as fill material is only required to pass the non-hazardous waste criteria for chemical analytes described in footnotes d) and g) herein. (Note that ROD criteria for radioisotopes listed herein are applicable to subgrade and the cover material.)

[g] Limit listed is the Total Threshold Limit Concentration value at which if exceeded the material is automatically considered non-RCRA hazardous and will be evaluated for TCLP analysis. If the value is not exceeded, results will then be evaluated to determine if STLC/TCLP analysis is required in accordance with CCR Title 22. If STLC/TCLP analysis is required, those results will be evaluated against criteria in CCR Title 22. If the STLC/TCLP results are below the CCR Title 22 criteria, then the material may be suitable for use as fill material pending evaluation of the rest of the analytical data against criteria in footnote d and/or f above. Otherwise, the material will be disposed of off-site.

Notes:

* The criteria in this Worksheet #15.2 are applicable to waste characterization samples for water sent off-site for disposal. Only analytes that have a STLC or TCLP criteria are listed in this worksheet. In addition, the gamma spectroscopy analytes in this Worksheet #15.2 without PALs established are predominantly NORM. Information collected from these analytes may be used qualitatively to assess a correlation between high gamma scan survey readings with corresponding samples containing no radionuclides above the PALs for the radionuclides of concern.

[a] Project quantitation limits and minimum detectable activities for radiological analyses are calculated per samples per analysis. Therefore, these values are listed as to be determined (TBD) until a project action limit is applicable since these are determined based on instrument background, sample size, and count time. Values listed indicate a minimum MDA that will be achieved for isotopes that have project action limits defined in the ROD (DON 2010). For the laboratory, the MDAs listed are based on a 30-45 minute count time. To achieve lower MDAs, the sample count time would have to increase. The DON or RASO may direct an increase in sample count times to lower MDAs based on a sample-specific basis.

[b] MDLs are not applicable to listed analyses.

[c] Total strontium is analyzed first due to a quicker turnaround time by the laboratory. If the total strontium result exceeds the waste criteria, then the sample will be analyzed for ^{90}Sr.

[d] CAS number listed is from the NEDD valid value list since a CAS number is not available for this analyte.

SAP Worksheet #16 – Project Schedule / Timeline Table

The project schedule is provided as Figure 1-3 of the Remedial Action Work Plan.

This page intentionally left blank.

SAP Worksheet #17 – Sampling Design and Rationale

RADIOLOGICAL SURVEYS AND SAMPLING

Sections 7.0 through 11.0 of the Radiological Work Plan (Attachment 2 to the Remedial Action Work Plan) describe the formulas and general procedural requirements of the MARSSIM surveys planned as part of the remedial action at IR Site 2. Equipment parameters have not been calculated as site-specific reference background areas have not been sampled and analyzed. As stated in Section 8.3.3, Final Status Surveys: "Although the FSS of IR Site 2 is not intended to provide for radiological release of IR Site 2, the sample density is designed to ensure data commensurate with a Class 1 survey are collected. Derived concentration guideline levels (DCGLs) for each ROC are based on the exposure pathways and parameters presented in the Final Remedial Investigation Report IR Site 2, West Beach Landfill and Wetlands (Battelle and BBL 2006), and limit the maximum annual dose to an individual to 15 mrem and the ELCR to 3×10^{-4} for the critical group." These DCGLs used in conjunction with conservative assumptions of approximate background concentrations of the ROCs result in a minimum of nine samples from the reference area and nine from the survey unit area. In the interest of conservatism, these sample number values are increased to 10 in each respective area.

Ten soil samples will be collected from each survey unit and analyzed for gamma isotopes and one of those samples will be randomly chosen for total strontium and/or ^{90}Sr, and alpha isotope (^{238}U) analysis. (The only analyte of interest to be analyzed by alpha spectroscopy is ^{238}U, because all other radionuclides of concern are easily quantified through gamma spectroscopy.) Additionally, any sample result exceeding the release criterion for ^{137}Cs will also be analyzed for total strontium and/or ^{90}Sr. These sample results will be used to perform dose and risk assessments for the final MARSSIM survey of the cover.

Any soil that is excavated during this time will be placed in 6-inch lifts. The soil will be surveyed again, and soil samples will be collected at a rate of two samples per 40 cubic yards. All samples will be analyzed for gamma isotopes. Ten percent of the samples will be analyzed for total strontium and/or ^{90}Sr, and alpha isotopes (^{238}U). Additionally, any sample result exceeding the release criterion for ^{137}Cs will also be analyzed for total strontium and/or ^{90}Sr. These results will be used to determine if the material is LLRW or non-LLRW. LLRW material will be transported to the waste broker for subsequent disposal. Non-LLRW will be sampled at a minimum of one sample per 500 cubic yards for chemical analyses as listed in Worksheet #18. These chemical results will determine if any of the material can be reused as fill material for IR Site 2 or if off-site disposal of the material is required.

IMPORT FILL MATERIAL SAMPLING

The DON is currently stockpiling soil (and rock) material generated by other projects in the runway areas north and east of IR Site 2. Only materials that have been characterized as non-hazardous have been placed in this area and are envisioned to be placed as part of the subgrade layer at IR Site 2. Previous chemical and radiological analytical results of these soil stockpiles will be reviewed against the criteria in Worksheet #15.1, as applicable, prior to use of the material as subgrade. The material may not have been analyzed for all analytes listed in Worksheet #15.1 because the material may have been sampled based on the contaminants of

SAP Worksheet #17 – Sampling Design and Rationale (Continued)

concern at the site where the material was generated. However, for evaluation of the material to be used as subgrade, at a minimum a) 10 samples of the material will have been collected and analyzed for chemical analyses (even though the analyte lists may not exactly match Worksheet #15.1); b) those 10 samples will also have been analyzed for gamma isotopes as listed in Worksheet #15.1, which includes meeting the MDA criteria; and c) 1 of those 10 samples will also have been analyzed for total strontium and/or ^{90}Sr, and alpha isotope (^{238}U) as listed in Worksheet #15.1, which includes meeting the MDA criteria. If the evaluation of the data indicates that the material is non-hazardous (i.e., meets criteria in Worksheet #15.1), then the material may be used as fill material for the subgrade at IR Site 2.

If other sources of material are identified (Navy or off-site sources) that are not currently stockpiled near IR Site 2 but have analytical results, those results will also be evaluated as described in the paragraph above prior to use of this material for the subgrade at IR Site 2.

In the event that additional soil material sources are needed for the subgrade that do not have analytical results or for the import sand material that is needed for the cover at IR Site 2, a minimum of 10 soil samples will be collected per source and analyzed for gamma isotopes and all chemical analytes listed in Worksheet #15.1. One of those 10 samples will also be analyzed for total strontium and/or ^{90}Sr, and alpha isotope (^{238}U) as listed in Worksheet #15.1. Analytical results for the subgrade or cover material will be evaluated as described in Worksheet #15.1.

WASTEWATER CHARACTERIZATION SAMPLING

Water from decontamination activities will be collected and stored in approved storage containers. A minimum of one wastewater sample per container will be collected and analyzed as described in Worksheet #18.

SAP Worksheet #18 – Sampling Locations and Methods/SOP Requirements Table

Sampling Location / ID Number [a]	Matrix	Depth (feet)	Analytical Group	Number of Samples	Sampling SOP Reference
Excavated area samples	Soil	1 foot	Gamma isotopes [b] (and strontium or alpha isotope analyses as required)	TBD [c]	Worksheet #14
Initial gamma survey samples	Soil	Surface	• Gamma isotopes [b] • Strontium and alpha isotope analyses	• 10 samples per survey unit • 1 random sample per survey unit	Worksheet #14
Excavated soil samples (initial or final gamma screenings)	Soil	Not applicable since soil is laid out in 6-inch lifts	• Gamma isotopes [b] • Strontium and alpha isotope analyses	• 2 samples per 40 cubic yards • Ten percent of samples randomly chosen	Worksheet #14
Fill material samples (subgrade or cover)	Soil	Random	• VOCs, SVOCs, pesticides, PCBs, TPH-purgeable, TPH-extractable, metals including mercury, asbestos, gamma isotopes • Strontium and alpha isotope analyses	• 10 samples per source • 1 random sample per source	Worksheet #14
Excavated soil samples (not radioactive)	Soil	Random	VOCs, SVOCs, pesticides, PCBs, TPH-purgeable, TPH-extractable, metals including mercury, asbestos	Minimum of 1 sample per 500 cubic yards	Worksheet #14
Wastewater samples	Water	Not applicable	VOCs, SVOCs, pesticides, PCBs, herbicides, metals including mercury, gamma isotopes, radium-226, strontium, tritium, and alpha isotope analyses as required	Minimum of 1 sample per container	Worksheet #14

Notes:

[a] The sample IDs will be determined in the field using a sequential numbering system explained in Worksheet #27.

[b] Any sample result exceeding the release criterion for ^{137}Cs will also be analyzed for total strontium and/or ^{90}Sr.

[c] The number of excavated area samples is listed as TBD (to be determined) since it is unknown if and how many excavations may be conducted based on initial survey results above twice background.

This page intentionally left blank.

Water	Mercury (TestAmerica-St. Louis)	EPA 7470A SOP ST-MT-0005	One 500-mL poly bottle	500 mL	pH ≤ 2 w/HNO_3	28 days

SAP Worksheet #19 – Analytical SOP Requirements Table (Continued)

Matrix	Analytical Group	Analytical and Preparation Method / SOP Reference	Containers	Sample Volume	Preservation Requirements (chemical, temperature, light protected)	Maximum Holding Time (preparation/analysis) [a]
Water	Herbicides (TestAmerica-St. Louis)	EPA 3510C/8151A SOP ST-GC-0017	Two 1-L amber bottles	2 L	4±2°C	7 days/40 days

Notes:

The laboratory will meet the analytical requirements in the EPA methods listed above or the requirements in this SAP, whichever is more stringent.

[a] If one time is listed, that is the maximum holding time for the analysis. (Preparation time is included in the analytical method holding time.) If two times are listed, they are listed as the maximum holding time for the preparation/analysis.

[b] If En Core samplers cannot be used due to saturated soil, then only the 8-ounce jar will be used, and VOC analysis will be conducted from the jar sample.

[c] Multiple analyses may be performed from one 8-ounce jar. The laboratory will be contacted to determine the appropriate number of jars based on analyses required.

SAP Worksheet #20 – Field Quality Control Sample Summary Table

Field QC samples are not required for this project since any samples collected are for modeling dose/risk, waste characterization purposes, or for evaluation of fill material. Therefore, measurement performance criteria for field QC sample collection are not applicable. However, MS/MSD samples will be collected for fill material.

Matrix	Analytical Group	No. of Sampling Locations	No. of Field Duplicates	No. of MS/MSDs	No. of Field Blanks	No. of Equipment Blanks	No. of VOA Trip Blanks	No. of PT Samples	Total No. of Samples to Lab
Fill Material Soil Samples									
Soil	Gamma Isotopes	TBD [a]	Not applicable	1 per 20 samples	Not applicable	Not applicable	Not applicable	Not applicable	TBD [a]
Soil	Strontium	TBD [a]	Not applicable	1 per 20 samples	Not applicable	Not applicable	Not applicable	Not applicable	TBD [a]
Soil	Alpha isotopes	TBD [a]	Not applicable	1 per 20 samples	Not applicable	Not applicable	Not applicable	Not applicable	TBD [a]
Soil	VOCs	TBD [a]	Not applicable	1 per 20 samples	Not applicable	Not applicable	Not applicable	Not applicable	TBD [a]
Soil	SVOCs	TBD [a]	Not applicable	1 per 20 samples	Not applicable	Not applicable	Not applicable	Not applicable	TBD [a]

SAP Worksheet #26 – Sample Handling System

Sample Handling System

SAMPLE COLLECTION, PACKAGING, AND SHIPMENT
Sample Collection (Personnel/Organization): Sampler / TtEC
Sample Packaging (Personnel/Organization): Sampler / TtEC
Coordination of Shipment (Personnel/Organization): Sampler / TtEC
Type of Shipment/Carrier: Courier or FedEx®
SAMPLE RECEIPT AND ANALYSIS
Sample Receipt (Personnel/Organization): Sample Custodian / Curtis and Tompkins and TestAmerica-St. Louis
Sample Custody and Storage (Personnel/Organization): Sample Custodian / Curtis and Tompkins and TestAmerica-St. Louis
Sample Preparation (Personnel/Organization): Sample preparation personnel / Curtis and Tompkins and TestAmerica-St. Louis
Sample Determinative Analysis (Personnel/Organization): Analyst / Curtis and Tompkins and TestAmerica-St. Louis
SAMPLE ARCHIVING
Field Sample Storage (No. of days from sample collection): 90 calendar days
Sample Extract/Digestate Storage (No. of days from extraction/digestion): up to 40 calendar days depending on method holding times
Biological Sample Storage (No. of days from sample collection): Not applicable
SAMPLE DISPOSAL/ARCHIVE
Personnel/Organization: Sample Custodian / Curtis and Tompkins and TestAmerica-St. Louis
Number of Days from Analysis: chemical Samples – 90 calendar days; radiological samples may be returned to the site as requested.

This page intentionally left blank.

SAP Worksheet #27 – Sample Custody Requirements Table

An overriding consideration for data resulting from laboratory analyses is the ability to demonstrate that the data are legally defensible, i.e., that the samples were obtained from the locations stated and that they reached the laboratory without alteration. To accomplish this, evidence of collection, shipment, laboratory receipt, and laboratory custody until disposal will be documented through the COC record. A sample is considered to be in custody if the following conditions have been observed:

- In actual possession or in view of the person who collected the samples
- Locked in a secure area
- Placed in an area restricted to authorized personnel
- Placed in a container and secured with an official seal, so that the sample cannot be reached without breaking the seal

Appendix B presents an example of the COC record. The COC record lists each sample and the individuals performing the sample collection, shipment, and receipt. Appendix B presents an example of a custody seal that will seal samples and the cooler during transportation to the laboratory.

The COC record will be the controlling document to ensure that the sample custody is maintained. Each time the sample custody is transferred, the former custodian will sign the COC on the _Relinquished By_ line, and the new custodian will sign the COC on the _Received By_ line. The date, time, and project or company affiliation will accompany each signature. When FedEx is used to ship samples to the laboratory, the waybill number and courier name will be recorded on the COC. The shipping container will be secured with two custody seals, thereby allowing for custody to be maintained by the shipping personnel until receipt by the laboratory.

Sample custody will be the responsibility of sampling personnel from the time of sample collection until the samples are accepted by the laboratory. Thereafter, the laboratory performing the analysis will maintain custody. The sample custodian will sign the COC, inventory each shipment, and note on the original COC record any discrepancy in the sample custody, temperature of the cooler for chemical samples, or broken sample containers. The laboratory will also note any discrepancies and notify the Project Chemist. The laboratory will have a system for tracking samples consistent with Section 5.8 of the Quality Systems Manual (QSM) (DoD 2010). Radiological soil samples submitted for analysis shall be retuned to the project site as requested for archiving and disposition. Chemical samples submitted for analysis shall be held for up to 90 calendar days after sample collection, at which time the samples will be disposed of by the laboratory.

In addition to providing a custody exchange record for the samples, the COC record serves as a formal request for sample analyses. The COC records will be completed, signed, and distributed as follows:

- One copy retained on-site for inclusion in the project files
- A copy faxed/e-mailed to the Project Chemist on a daily basis to allow tracking of samples sent to the laboratory to confirm laboratory receipt of samples

SAP Worksheet #27 – Sample Custody Requirements Table (Continued)

SAMPLE NUMBERING

Samples will be uniquely designated using a numbering system that identifies the Contract Task Order number and a sequential number (e.g., 9-001). The sample number will be recorded in the field logbook, on the labels, and the COC record at the time of sample collection. A complete description of the sample and sampling conditions will be recorded in the field logbook and referenced using the unique sample identification number.

SAMPLE PACKAGING

Radiological soil samples will be collected in containers that are labeled then couriered to Curtis and Tompkins laboratory.

For samples submitted to TestAmerica-St. Louis, immediately after sample labeling, custody seals will be affixed to each sample container. Each container will be placed in double-resealable plastic bags to protect the samples from moisture. For VOA vials and En Core samples, the custody seal will be placed on the outside of the first resealable bag; then the containers will be placed in a second resealable bag. This will prevent any contact with the adhesive from the custody seal and the samples. Glass containers will then be wrapped in bubble wrap. VOA vials will be wrapped with bubble wrap first, thenplaced in a resealable bag, and then placed in another resealable bag following application of a custody seal over the first bag.

Samples to be shipped to TestAmerica-St. Louis will be shipped in coolers. Each cooler will be shipped with a temperature blank as required for chemical analysis only. (A temperature blank is a container filled with tap water and stored in the cooler during sample collection and transportation.) The temperature of the cooler will be recorded by the laboratory on the COC record immediately upon receipt of the samples. Sample cooler drain spouts will be taped from the inside and outside of the cooler to prevent any leakage.

Samples to be shipped by commercial carrier will be packed in a sample cooler lined with a plastic bag. Double-bagged ice will be added inside the plastic bag at the bottom of the cooler, one layer of sample containers will be placed on the ice, and more double-bagged ice will be placed on top of the containers. This will be repeated until the cooler is filled with ice as the top layer in the cooler. (Ice is not required for containers for radiological analysis only.)

The COC record will include the air bill number, and the “Received By” box will be labeled with the commercial courier’s name. The COC record will be sealed in a double-resealable bag and then taped to the inside of the sample cooler lid. The cooler will be taped shut with strapping tape. Two custody seals will be taped across the cooler lid: one seal in the front and one seal in the back. Clear tape will be applied to the custody seals to prevent accidental breakage during shipment. The pouch for the air bill will be placed on the cooler and secured with clear tape. The air bill will be completed for priority overnight delivery and placed in the pouch. If multiple coolers are being shipped, the original air bill will be placed on the cooler with the COC record, and copies of the air bill will be placed on the other coolers. The number of packages should be included on each air bill (1 of 2, 2 of 2). Saturday deliveries, if required, should be coordinated with the laboratory in advance, and field sampling personnel or their designee must ensure that Saturday delivery stickers are placed on each cooler by the commercial courier. “Dangerous goods” declarations will also be completed as applicable.

SAP Worksheet #28.1 – Laboratory QC Samples Table – Soil (Continued)

Notes:

[a] Analytical SOP revision numbers listed are current as of the date this SAP was published.

[b] Any sample associated with a blank that fails the criteria checks will be reprocessed in a subsequent preparation batch, except when the sample analysis resulted in a non-detect. If no sample volume remains for reprocessing, the results will be reported with appropriate data qualifying codes.

[c] Reprep and reanalyze the LCS and all samples in the associated preparatory batch for failed analytes, if sufficient sample material is available.

[d] Reprep and reanalyze the sample and duplicate in the associated preparatory batch for failed analytes if sufficient sample material is available and the sample is homogeneous. If RPD/RER still out of range, report as matrix interference confirmed and write a nonconformance. If reanalysis is in range, re-extract samples in batch.

[e] Truncate carriers/tracers above 100% recovery to eliminate low biased results. Reprep and reanalyze sample if carrier is low (indicating high biased results) if there is activity in the sample above the reporting limit. No reanalysis if matrix interference is nonconformance during sample preparation.

[f] The data will be evaluated to determine the source of difference and to determine if there is a matrix effect or analytical error.

[g] Reprep and reanalyze all failed samples for failed surrogates in the associated preparatory batch, if sufficient sample material is available.

[h] Reprep and reanalyze all failed samples for failed internal standards in the associated preparatory batch, if sufficient sample material is available.

[i] Replace injection port liner and trim or replace column. Reanalyze samples in the associated preparatory batch.

[j] Perform post-digestion spike addition if serial dilution does not meet criteria.

[k] Reanalyze post-digestion spike.

This page intentionally left blank.

SAP Worksheet #28.2 – Laboratory QC Samples Table – Water (Continued)

Notes:

[a] Analytical SOP revision numbers listed are current as of the date this SAP was published.

[b] Any sample associated with a blank that fails the criteria checks will be reprocessed in a subsequent preparation batch, except when the sample analysis resulted in a non-detect. If no sample volume remains for reprocessing, the results will be reported with appropriate data qualifying codes.

[c] Reprep and reanalyze the LCS and all samples in the associated preparatory batch for failed analytes, if sufficient sample material is available.

[d] Reprep and reanalyze the sample and duplicate in the associated preparatory batch for failed analytes if sufficient sample material is available and the sample is homogeneous. If RPD/RER still out of range, report as matrix interference confirmed and write a nonconformance. If reanalysis is in range, re-extract samples in batch.

[e] Truncate carriers/tracers above 100% recovery to eliminate low biased results. Reprep and reanalyze sample if carrier is low (indicating high biased results) if there is activity in the sample above the reporting limit. No reanalysis if matrix interference is nonconformance during sample preparation.

[f] The data will be evaluated to determine the source of difference and to determine if there is a matrix effect or analytical error.

[g] Reprep and reanalyze all failed samples for failed surrogates in the associated preparatory batch, if sufficient sample material is available.

[h] Reprep and reanalyze all failed samples for failed internal standards in the associated preparatory batch, if sufficient sample material is available.

[i] Replace injection port liner and trim or replace column. Reanalyze samples in the associated preparatory batch.

[j] Perform post-digestion spike addition if serial dilution does not meet criteria.

[k] Reanalyze post-digestion spike.

SAP Worksheet #29 – Project Documents and Records Table

Document	Where Maintained
Work Plan and associated plans including SAP and Health and Safety Plan	Project file; NAVFAC SW Administrative Record
Field logbook	Project file
Field forms	Project file; project file copy will subsequently be sent to NAVFAC SW Administrative Record as part of closure report
COC	Laboratory; NAVFAC SW Administrative Record
Shipping records	Project file
Field surveillance reports	Project file
Field Change Requests	Project file; project file copy will subsequently be sent to NAVFAC SW Administrative Record as part of closure report
Laboratory data package including: • Copy of chain of custody • Sample receipt and login • Laboratory internal chain of custody • Instrument calibration information • Chromatograms as applicable • Sample preparation logs • Sample analysis/run logs • Nonconformance Reports including corrective actions • Laboratory signed review page	Laboratory and project file; project file copy will subsequently be sent to NAVFAC SW Administrative Record as part of closure report
Data validation report	Validator and project file; project file copy will subsequently be sent to NAVFAC SW Administrative Record as part of closure report

Project files are maintained at the project site under the oversight of the PQCM until completion of the project. Files are then sent to the TtEC San Diego office for storage. Once the CTO is complete and closed out, the files are sent to an off-site archive for 10 years.

SAP Worksheet #29 – Project Documents and Records Table (Continued)

Field documentation associated with sampling activities includes logbooks, sample labels, COCs, sample shipping records, field surveillance reports, and FCR forms. In addition, laboratory and validator documentation will be generated during this project. These types are described in the following sections.

Field Logbook

A permanently bound field logbook with consecutively numbered pages, used for sampling activities only, will be assigned to this project. All entries will be recorded in indelible black or blue ink. At the end of each work day, the logbook pages will be signed by the responsible sampler, and any unused portions of the logbook pages will be crossed out, signed, and dated. If it is necessary to transfer the logbook to another person, the person relinquishing the logbook will sign and date the last page used, and the person receiving the logbook will sign and date the next page to be used. At a minimum, the logbook will contain the following information:

- Project name and site location
- Date and time
- Personnel in attendance
- General weather information
- Work performed
- Field observations
- Sampling performed, including specifics such as location, type of sample, type of analyses, and sample identification
- Field analyses performed, including results, instrument checks, problems, and calibration records for field instruments
- Descriptions of deviations from this SAP
- Problems encountered and corrective action taken
- Identification of field QC samples
- QC activities
- Verbal or written instructions
- Any other events that may affect the samples

Sample Labels

Sample labels will be filled out in indelible black or blue ink and affixed to sample containers at the time of sample collection. An example sample label is provided in Appendix B. Each sample label will be covered with clear tape. Each sample container will be labeled with the following, at a minimum:

SAP Worksheet #29 – Project Documents and Records Table (Continued)

- Sample identification number
- Sample collection date (month/day/year)
- Time of collection (24-hour clock) from the start of sampling
- Sampler's initials
- Preservative (if any)
- Sample weight (data completed by laboratory)

Chain of Custody

COC information is described in Worksheet #27.

Sample Shipping Records

Samples will be transported to the laboratory via courier or FedEx. For samples shipped via FedEx, the COC will be packaged within the cooler, and the sender's copy of the airbill will serve as custody documentation and will be maintained on-site in the project file. Sample shipping procedures are detailed in Worksheet #27.

Field Surveillance Reports

Field Surveillances will be performed in accordance with the three phases of inspection as required by the QC Program. A Preparatory Inspection will be performed by the PQCM prior to the first sampling activities. This will include a general orientation for health and safety. An Initial Inspection will be conducted at the beginning of field sampling activities for project. Daily field inspections and subsequent surveillances will be performed at the discretion of the PQCM or the QCPM throughout the duration of the project. The PQCM will use the Initial Inspection Checklist during inspection.

Field Change Request

An FCR will be prepared by the Program Chemist, or a designee, if a change to the SAP occurs during sampling activities. These changes will be minor and not result in a change in scope and/or DQOs for this project. The FCR must be approved prior to field implementation. The FCR may include the revised worksheets from this SAP.

Major changes to work scope affecting the original DQOs or meeting criteria described in EWI #2, 3EVR.2, Review, Approval, Revision, and Amendment of Sampling and Analysis Plans (SAPs) (NAVFAC SW 2006) will require preparation of a SAP Addendum. The SAP Addendum must be approved by the NAVFAC SW QAO prior to conducting sampling and analysis.

Laboratory Documentation

Laboratory data packages will include the following at a minimum:

- Sample receipt and login

SAP Worksheet #29 – Project Documents and Records Table (Continued)

- Laboratory internal COC
- Instrument calibration logs
- Sample preparation logs
- Sample analysis/run logs
- Sample results case narrative
- Sample disposal records
- Nonconformance reports including corrective actions

The laboratory will prepare analytical data packages comprising the above documentation for each sample delivery group (SDG) and provide them to TtEC. Laboratory deliverables will include a copy of the hard copy data package, submitted as either EPA Level III- or IV-equivalent packages as specified on the COC. Detailed information on the requirement of hard copy data packages is provided below. The report pages will be sequentially numbered. The report will contain a table of contents referencing individual sections in the data package, the original copy of COC records, a copy of all corrective action reports, and a narrative documenting the resolution of all corrective actions and nonconformances. All samples will be cross-referenced to the associated QC samples. The packages will be assembled in the following sequence:

- Cover page (with laboratory name, address, phone number, contact person, and SDG number, as well as the project name and project number)
- Table of contents
- Case narrative
- Sample management records, including the original, white copy of COC records (including cooler temperature and sample condition), shipping documents, and laboratory sample receipt forms
- Cross-reference table
- Analytical results and QA/QC information by test as follows:
  - Radiological raw data sequence
    a. Sample results forms, including method blanks
    b. Sample raw data (EPA Level IV only)
    c. QC summaries
    d. Initial calibration (ICAL)
    e. Calibration checks, including all related continuing calibration verifications (CCVs)
    f. Instrument run log
    g. Sample preparation log

SAP Worksheet #29 – Project Documents and Records Table (Continued)

– Organic raw data sequence

a. Sample result forms, including method blanks
b. Sample raw data after each result form (EPA Level IV only)
c. Surrogate summaries (surrogate results may appear on the sample result forms)
d. QC summaries
e. Tune data (gas chromatograph/mass spectrometer [GC/MS] only)
f. ICAL
g. Daily calibration checks, including related CCVs
h. Resolution check standards (GC/MS and pesticides), if applicable
i. QC LCS, MS/MSD raw data (EPA Level IV only)
j. Instrument run log
k. Sample preparation log

If manual integration is required for any organic analysis, supporting information for all manual integrations (i.e., chromatograms before and after manual integration as well as a brief explanation for the manual integration) will be included in the data package deliverables and evaluated during data validation.

– Inorganic raw data sequence

a. Sample results forms, including method blanks
b. Sample raw data (EPA Level IV only)
c. QC summaries
d. ICAL
e. Daily calibration checks, including all related CCVs
f. Calibration blanks, including all related continuing calibration blanks
g. Interference check standards A and B for inductively coupled plasma (ICP)-atomic emission spectrometer (AES) only
h. QC raw data (EPA Level IV only)
i. Post-digestion spike results
j. Analytical spike results
k. Method of standard additions
l. ICP-AES serial dilutions
m. Instrument run log
n. Sample preparation log

All relevant laboratory raw data and documentation including, but not limited to, logbook, data sheets, electronic files, and reports, will be maintained by the laboratory for at least 5 years. TtEC must be notified 30 days before disposal of any relevant records.

SAP Worksheet #29 – Project Documents and Records Table (Continued)

In addition to the hard copy data, an EDD will be submitted by the laboratory in a format compatible with TtEC requirements. Both the EDDs and the hard copy report will present results to two or three significant figures. For radiological results, at least three significant figures will be used for all results. For organic results, at least two significant figures will be used for all results. For inorganic results, at least two significant figures will be used for results less than 10, and at least three significant figures will be used for results greater than 10. Results for QC analyses (method blanks, MS/MSD, LCS, and duplicates) will be reported up to three significant figures.

When revisions to laboratory data reports are required, the revised pages (an original and copy) will be stamped with the notation “amended or revised report.” If revisions affect the laboratory EDDs, the revised EDD will then be sent along with the revised hard copy pages. In addition, a hard copy or electronic copy of items submitted to the validator by the laboratory will also be submitted to the Project Chemist.

Data Validation Reports

Analytical data generated by the laboratory will be validated by an independent data validation company as required in EWI #1, 3EN2.1, Chemical Data Validation (SWDIV 2001). The validation report will include the data validation findings worksheets. The reports will be arranged in increasing SDG numbers and grouped by the type of analysis; i.e., a group of reports will consist of SDGs with the same analysis arranged in increasing numerical order. Each SDG will be submitted as a separate data validation report. Reports covering multiple SDGs are <u>not</u> acceptable.

The validation reports will contain the following information:

- Title page that contains project name, sample collection date, validator subcontractor name, report date, type of analysis, laboratory, SDG, sample identifications (including MS/MSD, duplicate, reanalysis, or dilution samples), sample matrix (e.g., soil, water), and validation level (EPA Level III or IV).
- Introduction page that includes the number of samples per matrix, analytical method reference, validation guideline reference, and section references to summary qualification flags, and denotes QC samples. Statements regarding flag classification (protocol/advisory) and whether raw data check was performed will also be included.
- Section headings for each analytical method will include the following:
  - Technical holding times
  - GC/MS instrument performance check (tune) if applicable
  - Calibration
    a. ICAL
    b. Initial calibration verification (second source standard)
    c. CCV

SAP Worksheet #29 – Project Documents and Records Table (Continued)

- Laboratory blanks
- Accuracy and precision data
  a. Surrogate spike recoveries
  b. MS/MSD
  c. LCSs/LCS duplicates (LCSDs)
  d. Internal standards
- Target compound identification
- System performance checks
- Analyte quantitation and QLs
- Field QC samples (if not applicable, report will note)
- Overall assessment of data
- Assessment of compliance with statement of work requirements

* QC deviation summaries, which will include in a tabular format the following:
  - Unique identification of QC run (e.g., date/time)
  - Associated project and sample numbers (not the laboratory internal sample IDs)
  - Associated constituents
  - Actual value for noted deviation
  - Applicable QC criteria
  - Applicable qualifiers
  - Qualifier classifications (advisory or protocol)
* Validation findings worksheets
* Qualifier classification

Any revisions will be submitted within 1 week of receiving the review comments from the Project Chemist. Report revision submittal packages will include a cover page and revised pages.

In addition to a hard-copy report, the validator will receive the EDD and populate the final validation qualifiers in the EDD. The validated EDD will be returned to TtEC for upload into the database.

The data validation subcontractor will maintain validation records for at least 5 years. TtEC will be notified 30 days before disposal of any records.

SAP Worksheet #30 – Analytical Services Table (Continued)

The following sections describe analytical laboratory requirements, including qualifications, sample custody, and QC procedures.

Laboratory Qualifications

Curtis and Tompkins and TestAmerica-St. Louis have been selected to analyze samples for this project. Asbestos analysis will be subcontracted to AmeriSci. Curtis and Tompkins and TestAmerica-St. Louis laboratories have successfully completed the Department of Defense (DoD) Environmental Laboratory Accreditation Program (ELAP) certification for the matrices and methods listed in Worksheet #23 and will maintain current status throughout the duration of this project. Curtis and Tompkins and TestAmerica-St. Louis are also certified by the CDPH under the California National Environmental Laboratory Accreditation Program (NELAP) for all of the analytical methods listed in Worksheet #23. Both laboratories are capable of providing the project QC and data deliverables required by this SAP and the QSM for Environmental Laboratories (DoD 2010). Asbestos testing is a specialty testing and is not part of DoD ELAP or CDPH NELAP accreditations; however, AmerSci does have the National Voluntary Laboratory Accreditation Program certification to perform asbestos analysis.

Curtis and Tompkins' main laboratory which only performs chemical analyses is located in Berkeley, California. However, Curtis and Tompkins has a satellite laboratory located at the TtEC project site at Hunters Point Naval Shipyard. TestAmerica-St. Louis will be used to perform chemical analyses, additional radiological analyses that Curtis and Tompkins does not perform (or is not certified by DoD ELAP and CDPH to perform), and as a back-up laboratory for Curtis and Tompkins.

Definition of Detection and Quantitation Limits

Radiological analyses reports data with detections limits different from chemical analyses. The following definitions are included herein to explain those differences:

- **MDA:** For this project, the minimum detectable activity (MDA) pertains only to radiological analyses as is defined as follows in accordance with the Multi-Agency Radiological Laboratory Analytical Protocols: the MDA is calculated as a sample-specific value and typically these values assumed both a Type I (α) and Type II (β) error of 5 percent.

- **MDL:** The method detection limit (MDL) (associated with chemical analyses only) is an estimate of the measured concentration at which there is 99 percent confidence that a given analyte is present in a given sample matrix. The MDL is the concentration at which a decision is made regarding whether an analyte is detected by a given method. The MDL can be calculated from replicate analyses of a matrix containing the analyte. Results reported above the MDL (and below the QL as defined below) are considered "estimated" concentrations and are qualified by the laboratory with a "J" qualifier.

SAP Worksheet #30 – Analytical Services Table (Continued)

- **QL:** Quantitation limit (QL), associated with chemical analyses only, is defined as the concentration of an analyte in a laboratory sample at which the measurement process gives results within a specified relative standard deviation. Unless otherwise specified in a specific method or SOP, this relative standard deviation is typically 10 percent. In addition, the QL is the lowest value used for the calibration curve for a given method. Results reported above the QLs are considered detected concentrations with no qualifications.

SAP Worksheet #33 – QA Management Reports Table

Type of Report	Frequency (daily, weekly monthly, quarterly, annually, etc.)	Projected Delivery Date(s)	Person(s) Responsible for Report Preparation (Title and Organizational Affiliation)	Report Recipient(s) (Title and Organizational Affiliation)
Field Sampling Surveillance Report	Once at the beginning, once during, and once towards the end of field sampling activities	Determined during the project	PQCM, TtEC	Project Manager and QCPM, TtEC
Management Review Report	Once after management review is completed	Determined during the project	QCPM, TtEC	Project Manager and Program Manager, TtEC

This page intentionally left blank.

SAP Worksheet #34 – Verification (Step I) Process Table

Verification Input	Description	Internal/ External	Responsible for Verification (Title and Organizational Affiliation)
Field logbook	Field logbooks will be reviewed weekly and verified for information accuracy and completeness. The inspection will be documented in daily QC reports.	I	PQCM, TtEC
COC forms	COC forms will be reviewed daily upon their completion and verified for completeness.	I	PQCM, TtEC Project Chemist, TtEC
Sample receipt	For samples shipped via courier or FedEx, the Project Chemist will verify receipt of samples by the laboratory the day following shipment.	I	Project Chemist, TtEC
Sample logins	Sample login information will be reviewed and verified for accuracy and completeness in accordance with the requirements in this SAP.	E	Laboratory Supervisor, Curtis and Tompkins and Laboratory Project Manager, TestAmerica-St. Louis
Laboratory data prior to release	Laboratory data will be reviewed to verify that the requirements in this SAP have been met. Prior to release, data will be verified as follows:	E	Laboratory Supervisor, Curtis and Tompkins and Laboratory Project Manager, TestAmerica-St. Louis
	All data (100 percent) comply with the method- and project-specific requirements and any deviations or failure to meet criteria is documented for the project file.	E	Analyst, Curtis and Tompkins/TestAmerica-St. Louis
	All manual entries (100 percent) are free of transcription errors and manual calculations are accurate; computer calculations are spot-checked to verify program validity; data reported are compliant with method- and project-specific QC requirements; raw data and supporting materials are complete; spectral assignments are confirmed; descriptions of deviations from method or project requirements are documented; significant figures and rounding have been appropriately used; reported values include dilution factors; and results are reasonable.	E	Peer Analyst, Curtis and Tompkins/TestAmerica-St. Louis
	Data reported are compliant with method- and project-specific QC requirements; the reported information is complete; the information in the report narrative is complete and accurate; and results are reasonable.	E	Supervisor, Curtis and Tompkins/TestAmerica-St. Louis

SAP Worksheet #34 – Verification (Step I) Process Table (Continued)

Verification Input	Description	Internal/ External	Responsible for Verification (Title and Organizational Affiliation)
Laboratory data prior to release (Continued)	Data reported are compliant with method- and project-specific QC; analytical methods are performed in compliance with approved SOPs. This review may be conducted after release of data since reviews are done only on 10 percent of the data.	E	Laboratory Supervisor, Curtis and Tompkins and Laboratory Project Manager, TestAmerica-St. Louis
Laboratory data due at turnaround time listed on COC	Laboratory data will be verified for having been obtained following the protocols in this SAP and being of sufficient quality to satisfy DQOs.	I	RSO or designee, TtEC Project Chemist, TtEC
Laboratory data packages	All laboratory data packages will be verified by the laboratory performing the work for completeness and technical accuracy prior to submittal. Data packages will then be reviewed by the Project Chemist for accuracy and completeness in accordance with the data package requirements described in Worksheet #29. Subsequently, data packages will be evaluated externally by undergoing third-party data validation as described in Worksheet #36.	E I I	Laboratory Supervisor, Curtis and Tompkins and Laboratory Project Manager, TestAmerica-St. Louis RSO or designee, TtEC Project Chemist, TtEC
Field and electronic data	One hundred percent of manual entries will be reviewed against the hard-copy information and 10 percent of electronic uploads will be checked against the hard copy.	I I	RSO or designee, TtEC Project Chemist, TtEC

SAP Worksheet #35 – Validation (Steps IIa and IIb) Process Table

Step IIa/IIb	Validation Input	Description	Responsible for Validation (Title and Organizational Affiliation)
IIa	Sample Collection	Ensure that the sampling procedures described in this SAP were used to collect samples and that any deviations to those procedures were documented in a FCR.	PQCM, TtEC Project Chemist, TtEC
IIa	Sample Handling	Ensure that the procedures described in this SAP for sample handling, packaging, and transport to the laboratory were followed.	PQCM, TtEC Project Chemist, TtEC
IIa	Sample Documentation	Ensure that the COC procedures described in this SAP were followed for sample collection and that logbooks or field forms were completed as required.	PQCM, TtEC Project Chemist, TtEC
IIa	Analytical Procedures	Ensure that the analytical methods and deliverable requirements described in this SAP were followed including holding times, analyte lists, and QC criteria.	Laboratory Supervisor, Curtis and Tompkins and Laboratory Project Manager, TestAmerica-St. Louis
IIa	Laboratory data reports	Data reports will be validated by the laboratory performing the work for technical accuracy and requirements listed in Worksheet #29 prior to submittal.	Laboratory Supervisor, Curtis and Tompkins and Laboratory Project Manager, TestAmerica-St. Louis
IIb	Sampling Procedures	Review of sampling procedures to appropriately document if any deviations occurred and if corrective action is required.	PQCM, TtEC
IIb	Analytical Procedures	Review of analytical procedures to appropriately document if any deviations occurred and if corrective action is required.	RSO or designee, TtEC Project Chemist, TtEC
IIb	Project Quantitation Limits and Laboratory QC Criteria	Ensure project quantitation limits and laboratory QC criteria were followed and any deviations documented.	RSO or designee, TtEC Project Chemist, TtEC

This page intentionally left blank.

SAP Worksheet #36 – Analytical Data Validation (Steps IIa and IIb) Summary Table

Step IIa / IIb	Matrix	Analytical Group	Validation Criteria	Data Validator (Title and Organizational Affiliation)
IIa	Soil/Water	All	In accordance with Curtis and Tompkins and TestAmerica-St. Louis SOPs listed in Worksheet #23 and DoD QSM	RSO or designee, TtEC Project Chemist, TtEC
IIb	Soil/Water	All	In accordance with DoD QSM and EPA Level III and IV guidelines (see description below)	Third-party data validator, LDC

The following documents will be used as guidance for validating all data: Contract Laboratory Program National Functional Guidelines for Organic Data Review, EPA 540/R-99-008 (EPA 1999); Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, EPA 540-R-04-004 (EPA 2004); EWI #1, 3EN2.1, Chemical Data Validation (SWDIV 2001); Test Methods for Evaluating Solid Waste, Physical Chemical Methods, SW-846, Third Edition and final updates (EPA 1986); QSM (DOD 2010); and the QC criteria specified in this SAP. Currently, there are no standards for data validation of radiological analyses. Therefore, guidance documents on validation of radiological data and modified functional guidelines will be used by the validator.

Data validation will be performed as required by an independent data validation company. For this project, 80 percent of the data will require EPA Level III-equivalent data validation and 20 percent EPA Level IV-equivalent data validation. EPA Level III-equivalent data validation includes the comparison of QC parameters to the appropriate criteria or limits. (QC parameters include holding times, tune, calibration, blanks, spikes, surrogates, and internal standards, as applicable.) EPA Level IV-equivalent data validation includes not only what is performed in a Level III-equivalent validation but also includes review of raw data and backup documentation (for calibrations, standards, analysis run logs, etc.). This information is used for checking calculations of quantified analytical data during a Level IV-equivalent data validation review. Appendix C includes the data validation checklists used for each method. These checklists provide the criteria used to validate/qualify the results. All samples in a batch will be qualified for associated QC parameters based on these checklists. In addition to the checklists in Appendix C, the following criteria will be evaluated by the validator and flagged as indicated:

- Manual integration will be evaluated during data validation for the organic methods (i.e., volatiles, semivolatiles, pesticides, PCBs and herbicides). If the manual integration is not calculated appropriately, the validator will flag the associated results with a "J" for estimated.

- Second column confirmations for pesticides and herbicides analyses and DDT/Endrin breakdown for pesticides will be evaluated during data validation. If results between primary and second column confirmations have an RPD ≥ 40%, the associated results will be flagged with a "J" for estimated. If the DDT/Endrin breakdown is ≥ 15%, the associated results will be flagged with a "J" for estimated.

SAP Worksheet #36 – Analytical Data Validation (Steps IIa and IIb) Summary Table (Continued)

- For radiological methods, if the calibration criteria listed in Worksheet #24 is not met, the associated results will be flagged with a "J" for estimated.

Analytical results that have been validated may be qualified as protocol or advisory. Protocol violations are when the laboratory deviates from the referenced analytical methods or the project-specific QLs, QC limits, or QC criteria. Advisory violations are when technical validation criteria have not been met. These qualifications will be noted in the validation reports.

SAP Worksheet #37 – Usability Assessment

After the analytical data have been reviewed, verified, and validated in accordance with Worksheets #34 to 36, a data quality assessment (DQA) report may be prepared to assess data quality and usability. The DQA will include review of the following:

- Sample collection and analytical methods to verify that these were performed as discussed in Worksheets #14 and #17
- Project-specific QLs as listed in Worksheet #15 to verify that project-specific remedial goals were met
- DQOs to determine whether they have been achieved by the data collected
- Project-specific data quality indicators for precision, accuracy, representativeness, completeness, and comparability (PARCC) parameters as discussed below

Analytical DQOs as assessed through the PARCC parameters are as follows.

Precision

Precision is the measure of the reproducibility of a set of replicate results or the agreement among repeat observations made under the same conditions. Analytical precision is the measurement of the variability associated with duplicate or replicate analyses. Field duplicate, laboratory duplicate, MSD, and LCSD (if analyzed) samples will be used to assess field and analytical precision. The precision measurement will be determined using the RPD between the duplicate sample results as follows:

$$\text{RPD} = 100 \times 2 \times (\text{result - duplicate result})/(\text{result + duplicate result})$$

$$\text{RER} = (\text{result activity – duplicate activity})/(\text{sample uncertainty + duplicate uncertainty})$$
using 2 sigma propogated uncertainty

The RPD limits for laboratory duplicate, MSD, and LCSD are presented in Worksheet #28, and the field duplicate limits are listed in Worksheet #12. Associated samples that do not meet the criteria will be evaluated by the validator.

Accuracy

Accuracy is defined as the nearness of a result or the mean of a set of results to the true or accepted value. Analytical accuracy is measured by comparing the percent recovery (%R) of analytes spiked into a sample against a control limit. Spiked samples (typically from wet chemical analysis and separation processes) include MS, MSD, and LCS analyzed for every batch of up to 20 samples. They serve as a measure of analytical accuracy and surrogate standards added to all samples, blanks, MS, MSD, and LCS analyzed for organic contaminants to evaluate the method’s accuracy and help to determine matrix interferences. %R is calculated as follows:

SAP Worksheet #37 – Usability Assessment (Continued)

$$\%R = 100 \times (\text{spiked sample result - unspiked sample result})/\text{amount of spike added}$$

The laboratory will review the QC samples and surrogate standard recoveries for each analysis to ensure that the %R lies within the control limits listed in Worksheet #28. Otherwise, data will be flagged.

Representativeness

Unlike precision and accuracy, which can be expressed in quantitative terms, representativeness is a qualitative parameter. Representativeness is the degree to which sample data accurately and precisely represent a characteristic of a population, parameter variations at a sampling point, or an environmental condition. It is a qualitative parameter that depends on proper design of the sampling program.

Field personnel will be responsible for ensuring that samples are representative of field conditions by collecting and handling samples according to the procedures in this SAP. Errors in sample collection, packaging, preservation, or COC procedures may result in samples being judged non-representative and may form a basis for rejecting the data.

Completeness

Completeness is the percentage of measurements made that is judged to be valid. The completeness goal is to generate a sufficient amount of valid data to meet project needs. Completeness is calculated and reported for each method, matrix, and analyte combination. The number of valid results divided by the number of possible individual analyte results, expressed as a percentage, determines the completeness of the data set. For completeness requirements, valid results are all results not qualified with a rejected (R) flag. The requirement of completeness is 95 percent for samples and is determined using the following equation:

$$\%\ \text{completeness} = 100 \times (\text{number of valid analyte results}/\text{number of possible results})$$

Comparability

Comparability is a qualitative parameter expressing the confidence with which one data set can be compared with another, whether it was generated by a single laboratory or during interlaboratory studies. The use of standardized field and analytical procedures ensures comparability of analytical data.

Sample collection and handling procedures will adhere to EPA-approved protocols. Laboratory procedures will follow standard analytical protocols, use standard units and standardized report formats, follow the calculations as referenced in approved analytical methods, and use a standard statistical approach for QC measurements.

Table of Content

Determination of Radium 226 by Gamma-Ray Spectroscopy
(21 day ingrowth) DOE HASL 4.5.2.3/EPA 903.1

SCOPE: This document describes procedures and quality control criteria for the determination of Radium 226 (Ra226) by gamma ray spectroscopy in soil/solid matrices processed by C&T Radiochemistry SOP 3.6 (Preparation of Soil Samples for Gamma Spectroscopy) after a 21 day ingrowth period. Additional isotopes can be determined in the same sample by using appropriate libraries and calibration standards. Ra226 can be determined in other matrices, Biota, Water by matching calibration standards and using appropriate geometries. This procedure describes the analysis, calculations, documentation, data assessment, quality control and acceptance criteria for Ra226 determination by Gamma Spectroscopy.

The Minimum Detectable Activity (MDA) for Ra226 using this procedure is 1.3 pCi/gr. MDA and Uncertainty can be reduced by counting samples for longer periods of time. Measurement uncertainty can be as high as 100% when the measured results are near or below the detection limit. Ra226 is determined by measuring the Ra226 decay daughter; 214Bi at 609 keV after a 21 day incubation The sample must be sealed and stored for 22 days before 214Bi reaches secular equilibrium with 226Ra. This “in growth” measurement provides an efficient determination of Ra226. More direct determinations of Ra226 by Alpha spectrometry may yield more accurate and precise results however, alpha spec procedures are more labor intensive and expensive.

Summary of the Method

Soil samples are dried, ground and sieved to #10 mesh. 300-400 gram samples are counted in 250 mL sealable metal containers. This “Tuna Can” geometry is maintained consistently for calibration and for Laboratory Control Standard (LCS). Samples and calibrations standards are placed in the gamma-ray spectroscopy systems and counted following daughter ingrowth (21+days). Results are reported in activity as pCi (picoCurie) or pCi/g (picoCurie per gram).

Isotopes and Detection Limits

Isotope	**CAS #**	**MDA (pCi/gr)**
Americium-241	86954-36-1	0.9
Cesium-137	10045-97-3	0.07
Cobalt-60	10198-40-0	0.03
Europium-152	14683-23-9	0.1
Europium-154	15585-10-1	0.2
Radium-226	13982-63-3	1.3
Thorium-232	7440-29-1	0.9
Uranium-235	15117-96-1	0.18

SAMPLE STORAGE PRESERVATION & HOLDING TIME
All samples are collected by client field technicians and provided with a chain of custody.
No sample preservation is required for gamma-ray spectroscopy.
Appropriate sample containers: plastic bags or jars, and once prepared, tuna cans
Samples are delivered, shipped, and stored at ambient temperature
There is no maximum holding time for preparation or analysis. When determining 226-Radium using progeny ingrowth, a hold time before counting of 21 days is required.
All samples in process are stored and secured in the sample storage or sample preparation Conex(s). Following analysis, all samples are secured in archive storage at ambient temperature and held until authorization is received from the client for disposal.

QC REQUIREMENTS
Instrument Calibration procedures, specifications and acceptance criteria with corrective actions are established. Method performance is monitored through the use of laboratory control standards (LCS), duplicate sample analysis, and participation in a proficiency sample program. Issues related to low level environmental radiochemical testing as well as waste disposal costs preclude the use of tracers, spikes, and other QC samples.

The following QC samples are required per batch of 20 samples, more samples are allowed in the batch if the samples were prepared and analyzed for the GS186 product and allowed to incubate for the ingrowth period to achieve a more reliable measurement for Ra-226:

a) Prep Blank
b) One LCS
c) One sample duplicate

Prep Blanks

Prep Blanks are reference blank soil processed by Radiochemistry SOP 3.6 Dried, milled/crushed to pass #10 sieves, and canned with other samples in the batch. The can is labeled prep blank and counted under the same conditions and settings as samples. C&T QC Department has access to the source and preparation of blank soil.

Prep Blank results are evaluated against the weekly background measurement and updated as appropriate.

Frequency: One per batch of 20 samples or One daily if sample was prepared and screened by the GS186 product.
Acceptance Criteria: Absolute value less than analyte RL
Corrective Action: Any sample associated with a blank that fails the criteria checks will be reprocessed in a subsequent preparation batch, except when the sample analysis resulted in a non-detect. If no sample volume remains for reprocessing, the results will be reported with appropriate data qualifying codes.

Duplicate Samples

Frequency: 1 per prep batch, max 20 samples per batch or one daily if sample was prepared and screened by the GS186 product.
Acceptance Criteria: Relative percent difference (RPD) ≤40% or relative error ratio (RER) ≤1
Corrective Action: Re-prepare and reanalyze the sample and duplicate in the associated preparatory batch for failed target analytes if sufficient sample material is available and the sample is homogeneous. If RPD/RER still out of range, report as matrix interference confirmed and write a nonconformance. If reanalysis is in range, re-prepare samples in the batch provided sufficient sample exists to do so. Evaluate the data to determine the source of difference and if there is a matrix effect or analytical error.

Laboratory Control Samples (LCS)

Suitable LCS material is not commercially available; an LCS was prepared in November of 2011 at the HPS laboratory containing approximately 10 pCi/gr Ra226. This is the LCS material used to control this analysis. C&T QC Department has access to the source and preparation of the LCS material described in other documents as “Magic Dirt”.

LCS Criteria

Frequency: One per batch or one daily if sample was prepared and screened by the GS186 product.
Acceptance Criteria: Within establish internal control limits: +/- 20% of known activity
Corrective Action: If the LCS fails perform troubleshooting and instrument maintenance as

needed and reanalyze the LCS and all samples affected by the changes made to the instrument.

Minimum Detectable Activity (MDA)/Minimum Detectable Concentration (MDC)/Lower Level of Detection (LLD)

See Isotopes and Detection Limits table above

Sample weight should be 300g to 400g in the Tuna Can. Soil sample counting time is typically 45 Minutes (2700 seconds) to achieve detection limits for all isotopes of concern.

If less than 300g of soil is present in the tuna can, the counting period may change as informed by data quality objectives and approved by the HPS Laboratory Director or Lab supervisor.

The detection limit for remediation is based on a Critical Level Calculation. Ortec GammaVision-32 software, used in this procedure, provides a Critical Level MDA process, sometimes referred to as the Method Detection Limit (MDL). The Critical Level is 2.33 times the square root of the isotope of concern's background level in the spectrum. For purposes of this procedure, the terms MDA and MDL may be utilized interchangeably.

Matrix Spike (MS)
MS/MSD's are not analyzed because no suitable comparable radioactive material or tracer is commercially available at a relevant (low) activity level.

Initial Calibration QC Specifications
Frequency: as needed for detectors being brought back from maintenance or failed CCV's, or once annually per detector.
Acceptance criteria: +/- 10% of the true value of the nuclides used for the calibration.
Corrective actions: 1) Recalibration, 2) Instrument maintenance, 3) Notify Lab Director
All ICAL events must be documented in the instrument maintenance logs

Continuing Calibration Verification (Performance Checks)
CCV checks are performed on each detector daily prior to use using a CCV check source calibration standard
Acceptance criteria: +/- 10% of the true value of the nuclides used for the calibration.
Corrective actions are: 1) Recalibration, 2) Instrument maintenance, 3) Notify Lab Director

Background Measurement
Frequency: Daily
Acceptance Criteria: Absolute value less than analyte RL
Corrective Action: Any sample associated with a prep blank that fails the criteria checks will be reprocessed in a subsequent preparation batch, except when the sample analysis resulted in a

non-detect. If no sample volume remains for reprocessing, the results will be reported with appropriate data qualifying codes.

In addition to the daily background checks, a long background check (14,000sec) is performed at the end of each week for background correction for the following week.

Instrument Contamination Monitoring

Instrument contamination is monitored by background checks see Background Measurement above and Daily Background Check and 6 month Instrumentation Background Check below.

SAFETY

Laboratory safety procedures shall be implemented as required in accordance with the specifications stated in C&T's Health and Safety Manual. At the HPS lab, the procedures and requirements of the Tetra Tech safety manual, "Accident Prevention/Site Safety and Health Plan", Latest Version apply as well and the procedures and specifications stated in, "Hunter's Point Radiation Protection Plan and Attachments", Latest Version.

There is no eating or drinking in the prep or counting labs at either HPS or Berkeley facilities

All work areas shall be kept as clean as possible at all times and the entire work area shall be cleaned at the conclusion of the last shift of the day.

Promptly clean any spills that occur using the guidance contained in the Health and Safety Manuals and support of the Radiation Safety Officer and Health and Safety Officer if necessary.

INTERFERENCES

Electrical noise is a common interference. Line conditioners are used to minimize electrical surges.

Background interference is also a concern, and appropriate corrective action for this interference is to increase counting times.

Precautions

- Keep HpGe (High Purity Germanium) detectors cold. Minimizing the number of times the detectors are allowed to get to room temperature will extend the life of the crystal/detector.
- For Liquid Nitrogen cooled detectors, ensure the detector cold-finger is submerged in liquid nitrogen at least 8 hours before applying any voltage to the crystal.
- For mechanical cooled detectors, check air filter cleanliness at 2 week intervals, clean

with water rinse and/or replace with new as needed

- In cases where the detector is removed from the liquid nitrogen source, or when a detector shutdown signal is triggered due to increasing temperature, the cold finger should be stabilized at room temperature for a minimum of 24 hours prior to re-submerging in liquid nitrogen.
- Never exceed the manufacturer's recommended operating voltage for the detector. Operate detectors using the correct polarity.
- For detectors that do not have the Detector Interface Module (DIM) hardwired to the detector, ensure N-type detectors are connected to a Negative DIM and P-type detectors are connected to a Positive DIM.
- Do not open the detector shielding during counting operations.

Instrument high voltages and gains are established using the procedures described in Ortec Solid-State Photon Detector Operator's Manual GEM Series HpGe (High-Purity Germanium) Coaxial Detector System.

Liquid Nitrogen (LIN) Airgas Industrial Grade

Maintenance Activities

Maintenance procedures for Gamma spectroscopy equipment it is in APPENDIX 4: INSTRUMENT MAINTENANCE of this SOP.

PROCEDURE

Note: This procedure is only valid for the tuna can geometry. If a different geometry is used, separate calibrations must be performed using the different detector-source geometries.

Initial Calibration Procedure

The calibration procedure is specified in the Ortec Gamma Vision-32 A66-B32 Operations Manual, abstracted below.

The energy calibration data is used to define the energies of the peaks in the spectrum. These adjustments allow the calculated energies to correspond to the correct library entry, to correctly identify the peak and attribute it to the corresponding nuclide.

Calibrating the detector efficiency relates the number of gamma rays emitted from a source to the number of gamma rays collected in the full-energy peak by the detector. Efficiency calibration data includes effects from the detector itself, the detector source geometry, the materials surrounding the detector, and the absorption in the source material or matrix. Incorrect efficiency calibrations will cause the nuclide activity to be incorrectly reported.

Calibration Standards see APPENDIX_2: CALIBRATION STANDARDS

Tuna Can Soil Standard (Density: 1.5 g/cc)

23.5 mm Diameter Multi-energy Button Source. Isotope Eu-152

Energy and Efficiency Calibrations

1. Place the Eu-152 multi-energy button source on top of two stacked empty tuna can geometries.
2. Open GammaVision and Click on ACQUIRE then click on MCB PROPERTIES using the menu bar displayed on GammaVision opening screen.
3. Click on the amplifier tab displayed on the MCB PROPERTIES screen, then click on START AUTO in the OPTIMIZE BLOCK to commence peak optimization.
4. Remove the EU-152 button source and replace with the mixed gamma TUNA CAN standard upon completion of peak optimization. Click on GO displayed in the menu bar of the opening screen of Gamma Vision to initiate a count.
5. Set the cursor at channel 10,660 during the accumulation of counts and adjust the 1332.5 keV Co-60 energy peak to center on the cursor using the ALT+SHIFT+ (+ or -) keys. Once the 1332.5 keV peak is centered at channel 10,660, secure the count by clicking on the STOP button in the menu bar.
6. Acquire a tuna can specific geometry calibration spectrum using the opening screen of Gamma Vision by clicking on ANALYZE then SETTINGS in the menu bar to display the Sample Type Settings screen. Click on PRESETS to view the LIVE TIME block to ensure 10,000 seconds is displayed. Close window and return to opening screen. Click on GO to start the spectrum accumulation. A typical calibration spectrum will contain each peak with at least 10,000 net area counts. Pb-210 at 46.54 keV peak energy is considered the most limiting parameter. Once 10,000 net counts have accumulated in the Pb-210 channel, the count can be stopped.

7. Save the calibration spectrum to the path “C\User\Cal\Spetra\DetX\X_GEOMETRY SOURCENUM.spc” where:

   X = Detector Number

   GEOMETRY = Geometry Description

   SOURCENUM = Source number (i.e,

   C\User\Cal\Det1\1_250 ml Bottle U603.clb)

8. Close all Detector Windows returning to Gamma Vision opening window and click on BUFFER in the Detector ID window. Click on FILE then click on RECALL. Scroll thru the “Look in” window to find the USER FOLDER. Click on USER FOLDER to open folder. Click on CAL folder to open the folder, then, click on SPECTRA to locate the saved calibration spectrum. Click on the saved spectrum to load into BUFFER.
9. Click on Analyze then click on Settings then click on Sample Type. Select the Browse button next to “File:” field and open the file “C:\User\SDF\Cal.Sdf”. Click the OK button.
10. If a previously applicable Calibration File exists click on Calibrate then select Recall Calibration. Select the calibration file and Click the Open button. Select CALIBRATE, then, CALIBRATION WIZARD from the BUFFER menu bar.

    Select the option CREATE NEW ENERGY and EFFICIENCY CALIBRATIONS. The TCC Calibration option should remain at the current setting. Select the NEXT button.

    In the ENERGY CALIBRATION WIZARD page, select the library file“C\User\Lib\EfficiencyCalibration.Lib” for mixed gamma using the Browse button. Click on the NEXT button.

    In the EFFICIENY CALIBRATION WIZARD page, select the appropriate CERTIFICATE file in the CERTIFICATE file window. If a certificate file for the applicable source does not exist, then create a Certificate file for the source as follows:

    Click on the Certificate File Browse Button and select the file to edit from the directory “C:\User\Efficiency Tables,” then click on the open button. (Note: If a file for the applicable source does not exist, then any of the existing file may be copied and renamed as necessary to create a logical name for the source using geometry and source identification.)

    Select the Certificate File Edit button to edit/review the source data.

    Verify or modify the source data as applicable. If any changes are made to any peak data, then select UPGRADE to apply those changes to the data grid before moving to another peak in the grid.

    After all changes are made to the data grid, select the SAVE AS button and save the Efficiency Table/Certificate File to the “C:\User\Efficiency Tables” directory with an appropriate name including the geometry and source identification.

Select the OK button to close Certificate File Editor.

Energy, FWHM, and Efficiency Calibrations

1. Click on NEXT to perform the Energy, FWHM, and Efficiency Calibrations.
2. Select the EDIT ENERGY button to review the Energy and FWHM Calibrations.
3. Verify that at least the 46.54 keV peak and the 1836.01 peak are present in the table for a mixed gamma source as these points are at the low and high extremes for measurement and verify that at least 3 points exist between those extremes.
4. Verify that all delta values in the table for the energy calibration are within +/- 0.2%.
5. On the ENERY CALIBRATION sidebar window select FWHM option in the FIT section. Verify that all delta values in the table for the FWHM calibration are within +/- 5%. Delete any points that have a delta > +/- 5%.
6. Close the ENERGY CALIBRATION sidebar.
7. Select the EDIT EFFICIENCY button to review the EFFICIENCY calibration fit.
    a. Verify the FIT TYPE (or MODE) is appropriate for the detector type, i.e., P-type detectors or N-type with Aluminium end cap most commonly use POLYNOMIAL BELOW the knee. N-type detectors without an Aluminium end cap most commonly use QUADRADIC ABOVE and BELOW the KNEE fit with the knee set at 150 keV.
    b. Verify that all delta values in the table for the efficiency calibration are within +/- 5% with the following clarifications:

8. Hg-203 may be deleted from the efficiency table if the calibration spectrum was acquired more than a few months after the assay date. This is due to the increased error associated with the decay correction using a nuclide with a relatively short half-life.

9. Some geometries in close proximity to the detector will experience more coincidence summing of the Y-88 and Co-60 peaks. As a result, the 661.66 keV peak and the 898.01 keV peak may have delta values greater than the 5%. For those two peaks, a maximum delta up to 10% is generally accepted. This results in a conservative activity calculation in samples for Cs-137 and a more accurate assessment of other peaks in this energy range.

10. Peaks with nearby interferences that result in a high delta should be removed from the calibration. For example, the 511 keV peak may interfere with the 514 keV peak

Curtis & Tompkins, Ltd.

depending on the count time and geometry resulting in an erroneous efficiency value for the 514 keV peak in the calibration.

11. The Knee value may need to be adjusted to ensure a smooth curve fit at the transition point. For geometries that are very close proximity to the detector (i.e. Filter Paper), the knee value may provide a better curve fit at approximately 160 kev rather than 150 kev. The user may use trial and error to determine the best fit.

12. When using the Quadratic fit the knee may be adjusted to improve the calibration fit if necessary. Verify that the fitted line is smooth in the transition point near the knee.

13. Close the Efficiency Calibration sidebar window.

14. Select the SAVE CALIBRATION button and save the calibration to "C;\User\Cal\X_GEOMETRY.clb." where X is the detector and GEOMETRY is an appropriate geometry name (i.e., 1_250mlBottle.clb). If the Interpolative Fit was used as a result of the selected spectrum source being used for QC, then the calibration file name must be X_QC.clb where X is the detector number.

(Note: Except for the detector number all calibration names must be consistent for the automation routines to properly select the specified files!Refer to the GVSampleDataSC Software Manual for more detail related to file identification.)

Enter the calibration description in the format "Detector #X GEOMETRY" where X is the detector number and GEOMETRY is appropriate for Tuna Can when prompted.

Select the FINISH button to close calibration wizard.

Print the calibration report from the menu "Calibration\Print Calibration…"

Close the spectrum BUFFER window and save the spectrum when prompted.

Run the efficiency VERIFICATION AUTOMATION routine from the GVQUICKSTART to verify that the calibration is accurate and all related files were updated successfully. (For the QC calibration, an EFFICIENCY VERIFICATION is not necessary. Run the normal QC to verify the calibration accuracy).

Place the Eu-152 multi-energy button source on top of two stacked empty tuna can geometries.

Acquire a QC calibration spectrum using the opening screen of Gamma Vision by clicking on ANALYZE then SETTINGS in the menu bar to display the Sample Type Settings screen. Click on PRESETS to view the LIVE TIME block to ensure 600 seconds is displayed. Close window and return to opening screen. Click on GO to start the spectrum accumulation. Repeat steps 5.1.8 through 5.1.23 to create a QC calibration file.

QC Criteria for Gamma Spectroscopy Calibrations

Total Source Activity

Efficiency and Energy calibrations will be performed annually, and/or following maintenance, power supply anomalies such as power surge spectrum shifts, and failure of control chart parameters 2 sigma warning and 3 sigma control provided by Gamma Vision software.

Energy Calibration

A valid NIST traceable source will be used for all energy calibrations. Two sets of parameters will be accumulated: energy verses channel number and peak shape, i.e., FWHM versus energy. The inputs to this function are a spectrum with isolated peaks distributed over the energy range of interest and a library of peak energies. The formula for energy versus channel number is:

$$E = a_1 + a_2C + a_3C^2$$

Where:
E = energy
a_i = coefficients
C = channel number

The formula for FWHM vs. channels is:

$$F = b_1 + b_2C + b_3C^2$$

Where:
F = FWHM
b_i = coefficients
C = channels

The calculation for FWHM in energy:

$$F(e) = F(c)\,(a_2 + 2a_3 + C)$$

Where:
F(e) = FWHM in energy
F(c) = FWHM in channels at channel C
a_2 = energy calibration slope defined by Eq.1
a_3 = energy calibration quadratic coefficient defined in Eq.1
C = channel number

When the FWHM fit is made, the fit is checked for validity. If the FWHM curve is negative at any part of the spectrum or the curve bends over (has a maximum and then goes down), a warning message, “NON-PHYSICAL FWHM FIT” will be displayed. The FWHM curve can be displayed to see why the fit is incorrect or if the delta between data points and FWHM fit is greater than 25%. The curve may be accepted if the warning is due to the fit outside the energy of interest, or some of the data points need to be deleted. The calibration spectrum should have good resolution peaks with a minimum of 1,000 counts (preferably 10,000 counts), so, counting longer may remedy the poor fit. In the event Pb-210 is utilized for efficiency calibrations, the Pb-210 peak may be less than 1,000 counts and ignored if desired.

Efficiency Calibration
A valid NIST traceable source that contains isolated singlet peaks over the entire energy range of interest is used for efficiency calibrations.

The polynomial efficiency/energy formula is:

$$\epsilon = e^{\{\Sigma a_i E2\text{-}i\}}$$

Where:
ϵ = efficiency at energy E
a_i = fitting coefficients
E = energy in Mev

The result of an efficiency calibration calculation is one or two sets of coefficients (one for the fit above the maximum and one for below) and a set of energy-efficiency pairs. The energy-efficiency pairs are used for the interpolative fit.

Continuing Calibration Verification & Second Source Calibration Verification

1. Continuing Calibration Verifications (CCV) using calibration standards from a different source or lot number from the same source can be considered laboratory control standards (LCS) to verify the efficiency and energy calibrations established in the ICAL and check the general operating parameters of the system.
2. CCV checks are performed on each detector daily prior to use using a CCV check source calibration standard which should be from a different source or lot number from those used to calibrate the ICAL the detector.
3. A second source standard or Laboratory Control Standard (LCS) is used to verify the primary calibration standard following initial detector calibration and weekly thereafter during detector operation. The LCS contains isotopes encompassing the full energy range in the gamma-ray spectrum measurement. The acceptance criteria for LCS is +/- 20% of the known value for isotopes in the LCS. The corrective action for a failing LCS requires re-analysis or an explanation in the narrative portion of the data report.

Efficiency Verification
An Efficiency Verification is performed after the initial calibration. The steps for running an Efficiency Verification are as follows:

1) Place the Mixed Gamma Source on the detector
2) In the Global Value window initiate the Efficiency Verification Job
3) Enter the technician's name and password performing the Job

4) Enter the Source Reference Number when prompted
5) Click OK to start the count
6) At the end of the count an Excel file is automatically populated with results. Using the Source Certificate of Calibration enter the referenced γps for all the radionuclides.
7) If the percent difference is within 20% for all the nuclides listed then the detector is operating normally.

Daily Background Check

1. Perform a daily background check on each Gamma Detector to monitor detector contamination and power supply anomalies.
2. A daily background report is automatically generated after completing this test.
3. The daily background is not subtracted from the reported sample results, and serves as a quality control check for changes in background for an individual detector.

6 month Instrumentation Background Check

1. Perform a system component background check for each detector and shield every six months, and/or after a new detector is installed and/or returned to service after maintenance. Record these checks in the detector maintenance log.
2. Check pre-determined parameters (background counts, background count rate) and verify results are within acceptable limits. If the result is less than two standard deviations from the mean, no action is necessary.
3. If the result is between two and three standard deviations from the mean, note the result in the instrument maintenance log.
4. If the result is greater than three standard deviations from the mean, notify the lab supervisor or Lab Manager and the detector must be taken out of service until corrective action is completed. Note these activities in the detector maintenance log.

Gamma Counting Procedure

1. The following steps are to be followed after completing the Daily Background Check, Daily Quality Control Check, and Weekly Laboratory Control Standard Check have been performed as required in accordance with procedures above.
2. Enter sample information into Global Values as follows.
3. Start the gamma-ray spectroscopy counting routine by opening "GLOBAL VALUE", then "GLOBAL VALUE QUICK START". Ensure the proper detector is selected for counting. From "GLOBAL VALUE QUICK START" "AUTOMATION GROUPS" screen, open "ANALYZE SAMPLES" file, then from "AUTOMATION JOBS" screen, open "COUNT SAMPLE". Scan the barcode attached to the sample.
4. From the "GV SAMPLE DATA TETRA TECH" automated pop-up screen "SAMPLE DATA" section, verify that the "SAMPLE ID", "CONTRACT", "SAMPLE DATE/TIME", "UNIT NUMBER", are properly populated. Enter sample description into the "SAMPLE DESCRIPTION" field (if necessary). Enter the “INGROWTH SEAL DATE”

5. From the "GV SAMPLE DATA TETRA TECH" automated pop-up screen "ANALYSIS DATA" section, verify the following fields:
   a. "ANALYSIS METHOD" is appropriate for the sample.
   b. "GEOMETRY" is appropriate for the sample (i.e., Smear 47 mm Disk, Soil 250ml Plastic Bottle, Soil 250ml Tuna Can) to ensure an appropriate efficiency is used.
   c. "LIBRARY" is appropriate for the sample (i.e., Efficiency Calibration, Efficiency Verification, Generic Analysis No Decay, Null, or QC). Note that the typical library for analysis is "Generic Analysis No Decay".
   d. "ACTIVITY UNITS" is appropriate for the sample (i.e.,pCi, Ci, Bq, or DPM). Note that the activity units are typically "pCi".
   e. "COUNT TIME" is appropriate for the sample. Note that the typical count time is 2700 seconds.
6. From the "GV SAMPLE DATA" automated pop-up screen "ANALYSIS DATA" section, enter the sample quantity in the "SAMPLE QUANTITY" field. Note that for a soil sample this should be in the range of 300 to 400 grams. We're working on a LIMS application to automate this entry based on sample ID and capture weight data.
7. Place sample to be counted onto high purity Germanium crystal (HpGe).
8. Select "CONTINUE" to start the spectral analysis and collection. Notify the Lab Director for guidance if a FAILURE NOTIFICATION" window appears at any point in the sample analysis set up process.
9. Upon completion of the gamma-ray spectroscopy analysis, click on "SAMPLES" on the "GLOBAL VALUE QUICK START" at HPS or equivalent Gamma Vision window at Berkeley. Enter USERNAME and PASSWORD, and select "OK". Select the spectrum for the sample analyzed from the "SPECTRUM" field drop down menu. Review the completed gamma-ray spectroscopy analytical report to ensure that the following report attributes are satisfactory:
   f. Sample description
   g. Live time equals the selected count time
   h. Efficiency selected is appropriate to the sample
   i. Radionuclide Library selected is appropriate for the sample
   j. Minimum Detectable Activity (MDA) for respective radionuclides meets the criteria listed in the Sampling Analysis Plan

<u>Duplicate Sample Analysis</u>

1. One laboratory duplicate sample will be analyzed once per twenty samples utilized for unrestricted release. Samples prepared for the GS186 product at HPS may be batched with more than 20 samples, in these cases SOP is to count selected samples after the 21 day ingrowth process has occurred LIMS will track the preparation batch and if possible the duplicate sample assigned to the larger batch can be counted to related the appropriate prep duplicate to the sample.
2. Samples are to be run on the same detector, preferably not in consecutive order. In the

Curtis & Tompkins, Ltd.

event that the samples are run consecutively, the sample container will be physically removed from the shielding housing, relocated to the sample storage location, prior to replacing the sample on the detector. This process ensures that the likelihood of a sample returning to the same geometry on the detector face is random, as would normally be during sample analysis.

3. The acceptable criterion for the duplicate pairs stated in the HPS SAP is a relative percent difference (RPD) of <40%. Additional requirements may be imposed through other work documents. The formula for RPD is:

   RPD = 100x2(result -duplicate result) / (result + duplicate result)

Blank Sample Analysis

Blanks are performed at the beginning of every workday before a QC sample is run. The steps for running a Blank are as follows:

1) Place the soil prep blank sample on top of the detector
2) In the Global Value (HPS) of Gamma Vision (BRK) window, initiate the Background Check Job. Enter the technician's name and password
3) Click OK to start the count
4) At the end of the count a LIMS file is automatically populated with results for the condition of the detector.
5) Review the conditions and acceptance criteria for the Background check.
6) If the Background check passes then the detector is operating normally and the QC check can be initiated. If the Background check does not pass notify the Supervisor or his/her designee.
7) If no deviation is found then reference 6.3 Troubleshooting in the Ortec Solid-State Photon Detector Operator's Manual for possible causes.
8) When the corrective action is completed perform the QC check again and make an entry in the detector maintenance log.
9) If the detector performance cannot be remedied, the Supervisor or his/her designee will need to determine further corrective action.

LCS Analysis

LCS are not easily performed given the requirements for radioactive materials for these tests. The steps for running an LCS are the same as a Continuing Calibration/Efficiency Verification except the LCS Job is selected in the Global Value (HPS) or Gamma Vision (BRK) Window.

C&T has prepared LCS material at a nominal activity of 10 pCi Ra226 per gram. The material (Magic Dirt) is available for use at both labs and should be employed when the SAP or client specifications require this determination.

Sample Result Review & Evaluation

Samples are counted and reviewed by Lab Technicians and automatically reviewed for compliance to rules for Gamma Spectroscopy determinations by LIMS. (Gamma Spectroscopy Data Review SOP). Samples that are compliant to all the rules are automatically reported by LIMS. Samples that fail to meet one or more to the rules are automatically queued for supervisory review by LIMS. Data reviewed by supervisors or Lab Managers or their designees are “published” after passing corrective action determined as a result of review effort.

The data review procedure is specified in HPS SOP 2.3 Gamma Spectroscopy Data Review.

Once samples are reviewed an email is sent to the TtEC point of contact stating that all samples have been reviewed and published to the C&T LabLine internet portal alternatively, they’re sent to the project manager for project level review and reporting.

DOCUMENTATION

All initial calibrations, any maintenance event, changes to the instrumentation, or changes to associated hardware and software must be documented in the maintenance benchbooks for each detector.

WASTE DISPOSAL

All laboratory activities associated with this procedure will be performed in a fashion designed to generate the least amount of waste possible using ALARA (as low as reasonably acceptable) necessary to achieve the data quality objectives.

Samples in Tuna cans shall be stored in the counting lab at Berkeley and in the sample control Conex at HPS for 30 days after completion of the work. Samples with no detectable radiation above background levels can be disposed of in the dumpster. Samples with detectable radiation require disposal as low level waste or can be returned to the customer using appropriate shipping procedures. HPS has a long term sample storage facility that is used to archive samples until the appropriate disposition has been determined.

Expired sources are stored in secure containment until disposition. Some sources can be returned to their manufacturer for credit against the cost of a new standard, alternatively they can be disposed of as low level radioactive waste using appropriate procedures at each lab facility.

Materials used for preparation of samples (Masslinn, bench diapers etc.) and those used for decontamination should be disposed in labeled radioactive waste bags. These bags are collected weekly and transferred to the waste facilities at each location.

Low level radioactive waste (materials, extracts, byproducts) shall be stored in appropriate containers as directed by the "HPS Waste Management Plan" and the SOP for Lab Waste Disposal at Berkeley.

POLLUTION PREVENTION

All HPS laboratory activities will be performed in accordance with the base wide "Hunter's Point Shipyard Pollution Prevention Plan".

REVISION HISTORY

This SOP is Revision 0 the first version of this SOP

APPENDIX_1:CALCULATIONS

The ***background determination*** calculates the first pass background on the low-energy side of the peak using a 5-point average of the channel contents for the region from the peak-centroid channel to the channel which is 6 times the library match width (normally 0.5) times the calculated FWHM (from the calibration) below the centroid. The 5-point average data at a given point is the sum of the data from two channels below the point to two channels above the point divided by 5. This is equivalent to smoothing the data with a smoothing width of 5 and coefficients of 0.2 for all points. The background value is the minimum value of the moving 5-point average and the background channel number is the center channel of the 5. If the minimum average value is within one sigma (counting statistics) of the actual channel value at the assigned channel point, this 5-point average is the low energy background value for this peak. If the average value is not within one sigma of the actual data, a 3-point average is used instead of the 5-point average to calculate a new minimum value. This 3-point average minimum value is compared with the actual data at the assigned channel and is accepted if it is within 1 sigma of the actual data. If the 3-point average also fails this test, the data value at the assigned channel is used for the background. The same process is repeated for the high-energy side of the peak to calculate the background value above the peak. The background under the peak is the straight line between these two values. The net peak area and background are calculated from this first pass.

The ***peak area calculation***, to obtain the library peak area for a particular energy, is to fit the spectrum region with a background plus peak shape function. This so-called "directed fit" can be applied to peaks and has the ability to produce negative peak areas. The negative peak area will produce a negative activity and this will be replotted. Negative activities are required by some reporting agencies for statistical purposes. The fit is iterated until the reduced chi square for the fit changes by less than 1% from the previous iteration up to a maximum of 10 iterations. Most cases will converge in 3 to 4 iterations. Since these values are derived from a fitting process, it is difficult to redo the calculations manually.

The ***counting statistical uncertainty*** is the uncertainty in the gross area and the uncertainty in the background added in quadrature. The uncertainty in the gross area is the square root of the area. The uncertainty in the background is not as simple because the background is a calculated number. The background area uncertainty is the uncertainty in the channels used to calculate the end points of the background multiplied by the ratio of the number of channels in the peak to the number of channels used to calculate the background. For wide peaks and low counts per channel, there is high uncertainty in the calculated background.

$$bkg\ error = \left(\frac{(background\ area)\,(peakwidth)}{(width\ of\ low\ average + width\ of\ high\ average)}\right)^{1/2}$$

$$gross\ area\ error = \sqrt{gross\ area}$$

$$net\ area\ error = \sqrt{(gross\ area\ error)^2 + (background\ error)^2}$$

The peak width is calculated at the half maximum, tenth maximum, and twenty-fifth maximum for the net peak shape. The peak width points are linearly interpolated between the two channels that bracket the respective height value.

The ***peak centroid channel*** in total summation is the center-of-moment of the peak and is calculated as the weighted channel number of the peak. That is, the peak centroid is the sum of the net channel contents times the channel number divided by the sum of the channel contents. The centroid is calculated as:

Where: *l, h* = the peak low and high channels i= the channel number
Ci = net contents of channel i

For the directed fit method, the centroid can be refined from the fitting process.

Fraction Limit is used to verify the identification of a particular nuclide in a spectrum, the number of located peaks is compared to the number of possible peaks. This value gives more weight to the more intense peaks. It is expressed as follows:

where *BranchingRatio* is the branching ratio for the peak for the given nuclide, *1*is the sum over the located peaks, and *p* is the sum over the possible peaks. This fraction is between 100 for all peaks located and 0 for no peaks located. This value is compared to a limit value to determine whether this nuclide's peaks are present in sufficient measure to say the nuclide is present. The*fraction limit test* is passed if the fraction is above the selected value

The ***uncertainty*** printed on the report can be either counting or total uncertainty. They can be printed at 1,2, or 3 sigma. The counting uncertainty is the uncertainty of the peak area due to statistical uncertainty. For a peak net area, the counting uncertainty can be expressed in percent of the peak area. This same percent is used to express the percent counting uncertainty in the activity values. The total uncertainty estimate (1 sigma) is determined by summing in quadrature

Curtis & Tompkins, Ltd.

the individual uncertainties from the various analysis components.

$$\sigma_t = \sqrt{\sigma_{count}^2 + \sigma_{nor}^2 + \sigma_{rsum}^2 + \sigma_{abs}^2 + \sigma_{nuc}^2 + \sigma_{eff}^2 + \sigma_{geo}^2 + \frac{\sigma_{uni}^2}{3}}$$

Where:
σ_t =total uncertainty estimate
σ_{count} = counting uncertainty estimate
σ_{nor} = additional normally distributed uncertainty estimate
σ_{rsum} = random summing uncertainty estimate
σ_{abs} = absorption uncertainty estimate
σ_{nuc} = nuclide uncertainty estimate
σ_{eff} = efficiency uncertainty estimate
σ_{geo} = geometry uncertainty estimate
σ_{uni} = uniformly distributed uncertainty estimate

All components of uncertainty estimates except are computed at the I-sigma level.
The uncertainty estimate for a uniformly distributed error is used at the full range. If a collection factor is not used, the uncertainty estimate is zero for that component.

The ***nuclide activity*** is calculated for all peaks in the library whose energy is between the energy limits selected for the analysis (in-range). There are several methods of determining if a nuclide is present or not, and if MDA should be reported. The nuclide is reported as present if one of the following is true:

1. The first in-range peak of the nuclide in the library is present in the spectrum, and the counting uncertainty is below the peak cutoff.
2. All of the peaks marked as key lines are present.
3. The fraction limit test is passed.

The nuclide activity (in becquerels), based on the peak at energy, *E,* is given by:

$$A_{Ei} = \frac{N_{Ei}}{\varepsilon_E * t * \gamma_d}$$

Where: A_{Ei} = the activity of nuclide i based on energy *E*
N_{Ei} = the net peak area for peak at energy *E*
ε_E = the detector efficiency at energy *E*
t = the livetime
Y_d = the gamma-rays/disintegration for energy *E* of this nuclide

The gamma-rays/disintegration value is in the library and the efficiency factor is stored in the calibration file.

This "peak activity" is reported in the nuclide peak matrix. If there is more than one peak in the energy analysis range for a nuclide, then an attempt to average the peak activities is made. The result of the average is the average nuclide activity.

APPENDIX_2: CALIBRATION STANDARDS

NIST Traceable Standards: Eckert & Ziegler Part #85624-918 Total Activity 2.0 ųCi in Tuna Can geometry.

Radionuclide	Quantity in Microcuries
Cd-109	0.85
Co-57	0.019
Ce-139	0.029
Hg-203	0.062
Sn-113	0.049
Cs-137	0.024
Y-88	0.082
Co-60	0.038
Am-241	0.061
Sr-85	0.061
Pb-210	0.77

Put the LCS specifications and identity here

APPENDIX_3: INSTRUMENT CONDITIONS

Instrument conditions can vary slightly between instruments. All specific instrument conditions are found with each instrument's method file at each instrument's workstation.

APPENDIX_4: INSTRUMENT MAINTENANCE

As defined by HPS SAP Worksheet #25, page 160

Maintenance Activity	Testing Activity	Inspection Activity	Frequency	Acceptance Criteria	Corrective Action	Responsible Person
Clean cave; fill LNO2	Physical check	Physical check	Weekly	Acceptable background	-Recalibrate -Instrument maintenance -Consult lab manager	HPS Laboratory Manager
Background check/Check deviation	Physical check	Physical check	Prior to use and at minimum daily	Within 3 sigma of measured population	-Recalibrate -Instrument maintenance -Consult lab manager	-Recalibrate -Instrument maintenance -Consult lab manager
Source check/Check deviation	Physical check	Physical check	Prior to use and at minimum daily	Within 3 sigma of measured population	-Recalibrate -Instrument maintenance -Consult lab manager	-Recalibrate -Instrument maintenance -Consult lab manager

Curtis & Tompkins, Ltd.

APPENDIX_5: DEFINITIONS

Calibration Check - is a standard in the mid range of the energy range that is used to verify the calibration on a daily basis. This is equivalent to continuing calibration verification (CCV) per NELAC.

Laboratory Control Sample (LCS) is a NIST traceable standard from a different lot or if available different vendor than the primary calibration standard. The LCS must include the high, middle and low energy ranges of the isotopes being measured. It serves as an independent check of the calibration. It is run when a new curve is generated.

Prep Blank/Method Background Sample -is an empty tuna can allowed to sit open in the sample prep Conex 250ml jar counted for the same time as a sample and used to assess background contamination.

Efficiency -the percent of decay events from a certified standard radioactive source, in a specific reproducible geometry that are seen and measured by a detector.

Traceable Calibration Standard -A certified calibrated radioactive source prepared as or from a standard reference material traceable to the National Institute of Standards & Technology (NIST), Eckert & Ziegler Isotope Products and others.

ADC -analog to digital converter.

Full Width Maximum (FWHM) -the full width of a gamma-ray peak distribution measured at half the maximum peak height measured above the continuum (background).

Dead Time -the time while the pre amplifier is collecting an electrical pulse generated by photon/detector interaction and is unable to collect another pulse.

Geometry -a standard sample or source counting configuration (i.e. 250 ml polypropylene jar) and its relationship to the detector.

In growth-the expected amount of a decay product that will exist at a later time because of ingrowth from a specified ancestor.

Title: GAMMAVISION ANALYSIS

Approvals (Signature/Date):

Chris Hough Radiochemistry Manager	5/18/12 Date	Michael Ridenhower Health & Safety Manager / Coordinator	5/18/12 Date
Marti Ward Quality Assurance Manager	5/18/12 Date	Elaine Wild Laboratory Director	5/18/12 Date

This SOP was previously identified as SOP No. ST-RD-0102 Rev. 8

Facility Distribution No.: 0	**Distributed To:** See Electronic Distribution Sheet

1.0 SCOPE AND APPLICATION

1.1 This procedure applies to all germanium detectors and the computer assisted germanium spectroscopy analysis system.

1.2 Due to the nature of gamma spectroscopy, once the system is calibrated to a particular geometry a similar matrix may be run as long as it is prepared to match a calibrated geometry.

1.3 This SOP is based on EPA Method 901.1 and DOE EML HASL 300 Method GA-01-R.

1.4 The reporting limits, method detectable activities and QC limits are maintained in the Information Management System (QuantIMS. Because of their dynamic nature, they are not specifically listed in this document, but can be retrieved at any time using TraQAr tools. A copy of the SACs are included in this SOP to demonstrate this information.

2.0 SUMMARY OF METHOD

2.1 This procedure provides detailed instructions for energy calibration, efficiency determination, quality control checks, background and sample counting of the germanium spectroscopy system.

3.0 DEFINITIONS

3.1 See the TestAmerica Quality Assurance Manual (QAM) for a glossary of common laboratory terms and data reporting qualifiers.

4.0 INTERFERENCES

4.1 Germanium spectrometry has potential interference. Interferences are usually in the form of radionuclides with unresolved photon emissions. These interferences are limited by the careful design/construction of the gamma spectral identification and interference libraries.

5.0 SAFETY

5.1 Employees must abide by the policies and procedures in the Corporate Environmental Health and Safety Manual (CW-E-M-001), Radiation Safety Manual and this document. This procedure may involve hazardous material, operations and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats and closed-toe, nonabsorbent shoes are a minimum.

6.0 EQUIPMENT AND SUPPLIES

6.1 Germanium spectroscopy system utilizing a computer based data acquisition system.

7.0 REAGENTS AND STANDARDS

7.1 All standards and reagent preparation, documentation and labeling must follow the requirements of SOP ST-QA-0002, current revision.

7.2 Commercially prepared mixed gamma standards in reproducible geometries, with all appropriate NIST Source Certificate information.

8.0 SAMPLE COLLECTION, PRESERVATION AND STORAGE

8.1 TestAmerica St. Louis supplies sample containers and chemical preservatives in accordance with the method. TestAmerica St. Louis does not perform sample collection. Samplers should reference the methods referenced and other applicable sample collection documents for detailed collection procedures. Sample volumes and preservative information is given in ST-PM-0002.

8.2 Samples may be collected in glass or plastic containers.

8.3 Aqueous samples are preserved with nitric acid to a pH of less than 2.

8.4 Sample hold time is 180 days from collection.

9.0 QUALITY CONTROL

9.1 **Batch**

9.1.1 A sample batch is a maximum of 20 environmental samples, which are prepared together using the same process and same lot(s) of reagents.

9.1.2 Instrument conditions must be the same for all standards, samples and QC samples.

9.1.3 For this analysis, batch QC consists of a method blank, a Laboratory Control Sample , and Sample Duplicate.

9.2 **Method Blank (MB)**

9.2.1 A method blank must be counted with every sample batch.

9.2.1.1 For soils, a method blank is sodium sulfate filled in the specified geometry.

9.2.1.2 For waters, a method blank is DI water filled in the specified geometry.

9.2.1.3 For filters, a method blank is a blank petri dish.

9.3 **Laboratory Control Sample (LCS)**

9.3.1 An LCS must be counted with every sample batch.

9.3.1.1 For water, a purchased mixed nuclide source in the specified geometry.

9.3.1.2 For soil, a purchased mixed nuclide source in the specified geometry.

9.3.1.3 For filters, a purchased mixed nuclide source in a petri dish.

9.4 **Sample Duplicate**

9.4.1 A Sample Duplicate is a recounted field sample to demonstrate instrument precision, since there is no sample preparation.

9.4.1.1 If requested, the laboratory may perform a Sample Duplicate which is an additional aliquot of a field sample.

9.5 **Procedural Variations/ Nonconformance and Corrective Action**

9.5.1 Any variation shall be completely documented using a Nonconformance Memo and approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

9.5.2 Any deviations from QC procedures must be documented as a nonconformance, with applicable cause and corrective action approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

10.0 CALIBRATION AND STANDARDIZATION

10.1 Initial Calibration

10.1.1 Prepare a minimum of **8** energy levels.

10.1.1.1 A new calibration curve must be generated after major changes to the system or when the continuing calibration criteria cannot be met. Major changes include significant changes in instrument operating parameters, and major instrument maintenance (e.g. replacing the detector)

10.1.1.2 Except in specific instances, it is NOT acceptable to remove points from a calibration curve for the purpose of meeting criteria. Refer to the TestAmerica Policy CA-T-P-0002, Selection of Calibration Points

10.1.2 Energy calibrations shall be established for the germanium spectroscopy systems **annually**, or when the calibration quality control check indicates an unacceptable change in the energy calibration parameters.

10.1.3 FWHM calibrations shall be established for the germanium spectroscopy systems **annually**, or when the calibration quality control check indicates an unacceptable change in the energy calibration parameters.

10.1.4 Energy Calibration Criteria

10.1.4.1 The curve should have eight calibration points used to determine the energy relationship of the calibration.

10.1.4.2 The calibration source must have radionuclides that "bracket" the intended range of calibration.

10.1.4.3 The energy difference should be within 0.05% for all calibration points or within 0.2keV for the calibration points.

10.1.4.4 The FWHM must be less than 3.0 keV at 1332 keV.

10.1.4.5 FWHM difference should be within 8% for all calibration points.

10.1.5 Efficiency Calibration Criteria

10.1.5.1 The curve should have at least eight points to determine the efficiency

10.1.5.2 A minimum of 10,000 counts will be accumulated for each data point

10.1.5.3 The efficiency difference should be within 8% for each point

10.1.5.4 The calibration verification (a recount of the calibration source) should be within 8% of the known value.

10.2 Initial Calibration Verification (ICV)

10.2.1 An initial calibration verification standard must be a different standard source than the one used for the initial calibration.

10.2.1.1 The ICV check does not include short half nuclides which may exist in the purchased standard. At a minimum, the ICV will always contain Amercium 241, Cesium 137 and Cobalt 60.

10.2.2 An ICV must be performed with every initial calibration.

10.2.3 The ICV percent recovery must be within +/- 10% criteria for each nuclide.

10.2.4 Not meeting this requirement may be indicative of serious system malfunction or inaccuracies in the standards used for the initial calibration curve or ICV standard. Corrective action must be taken (including reanalysis of the ICV, or analysis of a different ICV). Any decision to proceed with analysis of samples when the ICV is out-of-control must be taken with great care and in consultation with the QA department and the laboratory director. Any such action must be documented in an NCM.

10.3 Background

10.3.1 Background subtraction spectrum shall be established for the germanium spectroscopy systems **monthly**, or when the background quality control check indicates an unacceptable change in the daily background parameters, or as needed per client requirements.

10.3.1.1 Background count time is 36 hours.

10.3.1.1.1 If a client project requires a longer count time, then the background must be performed at the longer time before initiating analysis.

10.4 Daily Checks

10.4.1 The energy, resolution and efficiency calibrations for a detector shall be checked with its respective source each day that the germanium spectroscopy system is used.

10.4.2 The detector background shall be checked each day that the germanium spectroscopy system is used.

10.4.3 Calibration and background checks are acceptable if the value on the Analyze Spectrum utility is less than the action (3σ) limit. The routine calibration and background quality control parameters that will be monitored are:

10.4.3.1 Energy for energy alignment (low- and high-energy)

10.4.3.2 Activity check (low-, mid-, and high-energy) difference – limits are set to represent the percent difference between the source activity and the reported activity.

10.4.3.3 Full-Width at the Half Maximum (FWHM) for peak shape monitoring (low-, mid-, and high-energy)

10.4.3.4 Background Count Rate

10.4.3.5 Channel centroid check – (low, high)

10.4.3.6 Calibration (FWHM and background) quality control parameters will be found **acceptable** if the result is within the (3σ) limits.

10.4.3.7 Energy and channel fixed limits are set symetrical around target.

10.4.3.8 Calibration (efficiency, resolution, energy alignment, and background) quality control parameters will be found **not acceptable** if the result is outside the established limits (3σ range) and marked as "OOS" (Out Of Service). In the case of an action, the daily QC check may be counted again or tagged out. The Daily QC check may only be recounted once without corrective action.

10.4.3.8.1 If the out of control parameter is found acceptable for the rerun, the instrument can be used for the analysis of samples. No corrective action is necessary for this situation since the uncertainty can be attributed to the stochastic uncertainty of decay process (statistics), uncertainty of the sources, or a known uncorrected trend.

10.4.3.8.2 If the instrument fails to meet the acceptance criteria for the rerun for peak centroid and activity, the instrument must be declared "Out of Service". The detector/instrument must be "tagged out". (See ST-QA-0036 for NCM details regarding tagging out of service).

10.4.3.8.3 If the QC check fails for a second time, the analyst may want to:

10.4.3.8.3.1 Check the expiration date of the radioactive standard to confirm the material is current, for the isotopes being utilized.

10.4.3.8.3.2 Check source positioning and all instrument settings.

10.4.3.8.3.3 Check all cables for any apparent damage and confirm that all cables are routed to proper connectors and are in good working order.

10.4.3.9 The instrument may be returned to service once the malfunction has been corrected and the above acceptance criteria have been met. Corrective actions must be noted in the instrument maintenance log.

10.4.3.10 If a parameter has two successive values in the warning/investigate limits, the system will be examined for a trend and noted in the maintenance log. Decisions will be based upon the Data Quality Objectives (DQO) and the degree of the bias in relation to the parameter.

10.5 Calibration Software Handling

10.5.1 Gamma Detector System Energy and Shape Calibration

10.5.1.1 Acquire a spectrum from a calibration standard in the manual mode for an appropriate duration. Save the spectrum to the path "C:\User\Cal\Spectra\DetX\OriginalCountfileName.spc" where:

10.5.1.1.1 X = Detector Number
10.5.1.1.2 Analysis method
10.5.1.1.3 Select library
10.5.1.1.4 Enter correct sample data.
10.5.1.1.5 Enter correct conversion time.

10.5.1.2 Close all detectors windows in the current instance of gamma vision, then recall the appropriate calibration spectrum into the buffer window.
10.5.1.3 Select the menu "Analyze\Setting\Sample type…."
10.5.1.4 Select the browse button next to the "File" field and open the file. Click the "OK" button of the window to close it.
10.5.1.5 Recall the application Calibration File from the menu "Calibration \Recall Calibration…"
10.5.1.6 Select the menu "Calibrate\Calibration wizard…"
10.5.1.7 Select the option to create new energy calibrations. Select the next button.
10.5.1.8 On the energy calibration wizard page, select the file "DET_EnergyStandardMix Lib" or appropriate library for mixed gamma used the browser button if desired. Select the next button.
10.5.1.9 Select the next button to perform the energy, FWHM.
10.5.1.10 Select the edit energy button to review the energy.

10.5.1.10.1 Close the energy calibration sidebar window.

10.5.1.11 Select the save calibration button and save the calibration to "Cal\Energy\X_Energy.clb" where X is the detector.
10.5.1.12 Enter the calibration description in the format "X_ENERGY_GEOMETRY" where X is the detector number and Geometry is an appropriate geometry description when prompted. Select the Finish button to close the calibration wizard.
10.5.1.13 Print the calibration report from the menu "Calibrate \print calibration.

10.5.2 Gamma Detector System Efficiency Calibration

10.5.2.1 Acquire a spectrum from a calibration standard in the manual mode for an appropriate duration. Save the spectrum to the path "C:\User\Cal\Spectra\DetX\OriginalCountfileName.spc" where:

10.5.2.1.1 X = Detector Number
10.5.2.1.2 Analysis method
10.5.2.1.3 Select library
10.5.2.1.4 Enter correct sample data.
10.5.2.1.5 Enter correct conversion time.

10.5.2.2 Close all detector windows in the current instance of Gamma Vision, then recall the appropriate calibration spectrum into the buffer window.
10.5.2.3 Select the menu "Analyze\Setting\Sample Type"
10.5.2.4 Select the browse button next to the "File", field and open the file. Click the "OK" button at the bottom of the window to close it.
10.5.2.5 Recall the applicable calibration file from the menu "Calibration\Recall Calibration" (if the geometry file currently exists)
10.5.2.6 Select the menu "Calibrate\Calibration Wizard"
10.5.2.7 Select the option to create new energy and efficiency calibration. Select next button.
10.5.2.8 On the Energy Calibration Wizard page select the file "EnergyStandardMix Lib" or appropriate library for mixed gamma used the browser button if desired. Select the Next button.
10.5.2.9 On the Efficiency Calibration Wizard page, select library file, "DET_EfficiencyCalibration.Lib" for mixed gamma sources.
10.5.2.10 On the Efficiency Calibration Wizard page, select the appropriate Certification file from the directory.

10.5.2.11 Select the next button to perform the energy FWHM and efficiency calibration.

10.5.2.12 Select the Edit Energy button to review the energy and FWHM Calibration.

10.5.2.12.1 Close the Efficiency Calibration side window.

10.5.2.13 Select the save calibration button and save the calibration to Cal\X_Geometry.clb" where X is the detector and geometry is an appropriate geometry name.

10.5.2.14 Enter the calibration description in the format "x_Geometry_Source number_date counted" where X is the detector number and geometry is an appropriate geometry description when prompted. Select the finish button to close the calibration wizard.

10.5.2.15 Print calibration report from the menu "Calibrate\Print Calibration"

10.5.2.16 Select "Analyze", select "Entire spectrum in memory" and file point.

10.5.2.17 Close the spectrum Buffer window and save the spectrum when prompted.

10.5.3 Detector Long Background Counting

10.5.3.1 Remove any samples from the detector, clean the detector, close the shield lid and start acquisition.

10.5.3.2 Select detector 1 in Global Value Quick Start

10.5.3.3 Select Monthly Background PBC under Automation Groups

10.5.3.4 Select Background PBC Long Count under Automation Jobs.

10.5.3.5 Login using name and password.

10.5.3.6 Select "OK", ensure detector cave is empty.

10.5.3.7 Repeat for each detector which background you would like to start.

10.5.3.8 After the background is complete it will save as a PBC file.

11.0 PROCEDURE

11.1 Calibration Quality Control (Daily Check)

11.1.1 Place the calibration quality control sample on the detector, and start acquisition.

11.1.2 Select detector from Global Value Quick Start.

11.1.3 Select Quality Control under Automation Groups.

11.1.4 Select Daily Quality Control Check under Automation Jobs.

11.1.5 Login with user name and password.

11.1.6 Select "OK", ensure source is on detector.

11.1.7 Repeat for each detector.

11.1.8 Record in the instrument run log.

11.2 Background Quality Control (Daily Background)

11.2.1 Remove any samples from the detector, and start acquisition

11.2.2 Select detector global value quick start.

11.2.3 Select quality control under automation groups.

11.2.4 Select daily background check under automation jobs.

11.2.5 Login with username and password.

11.2.6 Select "OK", ensure detector cave is empty.

11.2.7 Repeat for each detector.

11.2.8 Record in the instrument run log.

11.3 Sample Counting

11.3.1 Remove any samples from the detector and start acquisition.

11.3.2 Place the sample on the detector.

11.3.3 Select detector from global value quick start.

11.3.4 Select analyze samples under automation groups

11.3.5 Select count sample under automation jobs.

11.3.6 Login with username and password.

11.3.7 Scan sample description from barcode report.
11.3.8 Select analysis method, sample type, geometry, library, correct date, count time, continue
11.3.9 Select "OK", ensure sample is on detector.
11.3.10 Record in the instrument run log.

12.0 DATA ANALYSIS AND CALCULATIONS

12.1 Commonly used calculations (e.g. % recovery and RPD) and standard instrument software calculations are given in the TestAmerica St. Louis QAM.

12.2 All calculations are performed in GammaVision; conversions are performed in RadCapture. Calculations are found in QAM.

13.0 DATA ASSESSMENT AND ACCEPTANCE CRITERIA; CORRECTIVE ACTIONS FOR OUT OF CONTROL DATA

13.1 The data assessment and corrective action process is detailed through the Clouseau Nonconformance Memorandum (NCM) process. The NCM process is described in SOP: ST-QA-0036. Below is a subset of the data assessment and QC excursion types within Clouseau; the text in underline is the exact "type" line in Clouseau. For a complete and current listing, please access the software program.

13.2 Method Blank
13.2.1 Acceptance Criteria:
13.2.1.1 No target analytes may be present in the method blank above the reporting limit.
13.2.1.2 Project specific requirements if more stringent than our routine procedure (e.g. no target anlaytes present above ½ RL), will be noted on the client requirements sheet.
13.2.2 Corrective Action for Method Blanks not meeting acceptance criteria:
13.2.2.1 Method Blank Contamination – See Clouseau NCM for corrective action (e.g. reprep/reanalysis, narration). Note certain analytes are common laboratory contaminants which require special narrative comment. These compounds are so designated in Clouseau.

13.3 Laboratory Control Sample (LCS)
13.3.1 Acceptance Criteria:
13.3.1.1 All control analytes must be within the specified control limits for accuracy (%Recovery) and precision (RPD).
13.3.2 Corrective Action for LCS not meeting acceptance criteria:
13.3.2.1 LCS Spike Recovery excursion (high) – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).
13.3.2.2 LCS Spike Recovery excursion (low) – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).
13.3.2.3 RPD/RER Duplicate excursion – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).

13.4 Duplicate
13.4.1 Acceptance Criteria:
13.4.1.1 All control analytes must be within the specified control limits for precision (RPD), max. 40% RPD, RER < 1.
13.4.2 Corrective Action for LCS not meeting acceptance criteria:

13.4.2.1 RPD/RER Duplicate excursion – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).

13.5 Insufficient Sample

13.5.1 For any prescribed re-preparation corrective action, if there is insufficient sample to repeat the analysis and narrative comment stating such is included in the report narrative. The insufficient sample description is included in the the Clouseau NCM within the type defining the excursion.

14.0 METHOD PERFORMANCE AND DEMONSTRATION OF CAPABILITY

14.1 Method performance data, Reporting Limits, and QC acceptance limits, are given in the appendix of this SOP.

14.2 Demonstration of Capability

14.2.1 Initial and continuing demonstrations of capability requirements are established in the QAM.

14.3 Training Qualification

14.3.1 The manager/supervisor has the responsibility to ensure that this procedure is performed by an analyst who has been properly trained in its use and has the required experience.

14.3.2 The analyst must have successfully completed the initial demonstration capability requirements prior to working independently. See requirements in the QAM.

14.4 Annually, the analyst must successfully demonstrate proficiency to continue to perform this analysis. See requirements in the QAM.

15.0 VALIDATION

15.1 Laboratory SOPs are based on standard reference EPA and DOE Methods that have been validated by the EPA and the lab is not required to perform validation for these methods. The requirements for lab demonstration of capability are included in QAM. Lab validation data would be appropriate for performance based measurement systems or non-standard methods. St. St. Louis will include this information in the SOP when accreditation is sought for a performance based measurement system or non-standard method

16.0 WASTE MANAGEMENT AND POLLUTION PREVENTION

16.1 All waste will be disposed of in accordance with Federal, State and Local regulations. Where reasonably feasible, technological changes have been implemented to minimize the potential for pollution of the environment. Employees will abide by this method and the policies in section 13 of the Corporate Environmental Health and Safety Manual for “Waste Management and Pollution Prevention.”

18.0 CLARIFICATIONS, MODIFICATIONS TO THE REFERENCE METHOD

18.1 None.

19.0 CHANGES FROM PREVIOUS REVISION

19.1 Annual Review, No Changes.
19.2 Rev. 8:
19.2.1 Increased background count times from 12 to 36 hours in section 10.3.1.1.
19.2.2 Updated the procedure for detector long background counting in section 10.5 to reflect new software.
19.2.3 Updated daily calibration checks, daily background and sample counting procedures in section 11.0 to reflect new software.
19.3 Rev. 9:
19.3.1 Replaced quartz sand with sodium sulfate to be used for soil method blanks in section 9.2.
19.3.2 Updated section 10.4 regarding instrument daily checks.
19.3.3 Updated data assessment and acceptance criteria in section 13.0
19.3.4 Updated section 9.0 regarding batch, method blank and laboratory control samples.
19.3.5 Updated the calibation points for an internal calibation in section 10.1.
19.3.6 Updated the percent recovery regarding the ICV in section 10.2.
19.3.7 Updated software storage file name throughout section 10.5.

Title: LOW BACKGROUND GAS FLOW PROPORTIONAL COUNTING (GFPC) SYSTEM ANALYSIS

Approvals (Signature/Date):

Chris Hough 6/14/12 Date Radiochemistry Department Manager	Michael Ridenhower 6/14/12 Date Health & Safety Manager / Coordinator
Marti Ward 6.14.12 Date Quality Assurance Manager	for Elaine Wild 6/15/12 Date Laboratory Director

This SOP was previously identified as SOP No. ST-RD-0403 Rev. 12

Facility Distribution No.: __0__ **Distributed To:** __See Electronic Distribution Sheet__

1.0 SCOPE AND APPLICATION

1.1 This SOP is applicable to all Low Background Proportional Counting instruments. TestAmerica St. Louis performs Radium 226, 228, Strontium 89, 90, gross alpha/beta, Neptunium and Chlorine 36.

1.2 This SOP is based on SW846 method 9310, 9315 and 9320; EPA methods 900.0, 903.0, 904.0, 905.0; and DOE EML HASL 300 method, Ba-01-R, Sr-02 and Sr-03-RC.

1.3 The SOP applies to GFPC analysis of liquid and solid matrices.

1.4 The laboratory target analytes supported by this method, the reporting limits, method detection limits and QC limits are maintained in the Information Management System (QuantIMS). A copy of the Structure and Analysis Code (SAC), which lists this information, is included in the appendix of this SOP.

2.0 SUMMARY OF METHOD

2.1 This procedure provides instructions for the daily calibration and maintenance of the Low Background Proportional Counting instrumentation.

3.0 DEFINITIONS

3.1 See the TestAmerica St. Louis Quality Assurance Manual (QAM) for a glossary of common terms and data qualifiers.

3.2 IQC - a computerized Quality Control Program where the counting results of Daily Radioactive check sources and Daily Background checks are entered and compared to statistical average data. A measurement within ± 3 standard deviations indicates the detector is operating within acceptable parameters.

3.3 αLL - discriminator setting indicating the alpha lower voltage limit.

3.4 Alpha Voltage Only - detector voltage capable of collecting ions created by alpha radiation only. Ion pairs created by beta radiation are not collected.

3.5 αUL - discriminator setting indicating the instruments alpha upper voltage limit.

3.6 βLL - discriminator setting indicating the beta lower voltage limit.

3.7 βUL - discriminator setting indicating the beta upper voltage limit.

3.8 Crosstalk - a measure of the amount of beta radiation that is collected in the alpha radiation channel; it is also a measure of alpha radiation collected in the beta channel.

3.9 Plateau - a point on a graph of count rate vs. detector bias voltage where further increases in bias will not result in an increase in measured counting rate.

3.10 LB4100 – LBPC (Low background Gas Flow Proportional Counting instrument).

4.0 INTERFERENCES

4.1 A detector contaminated with radioactive material will result in a high background and interfere with the correct measurement of a sample.

4.1.1 If a sample “times out” reaching 10000 counts before the allotted time, and the sample count rate is 60 cpm or greater, then another daily background check is performed on that detector. If the detector background check is unacceptable, the detector is taken Out Of Service until action is taken to bring the background check within acceptable limits. If the chamber requires action to remove contamination and a new background check is acceptable, then a 30 minute empty chamber count should be performed to determine if a new long background needs to be performed on that detector.

4.2 The actual counting efficiency for alpha radiation decreases greatly with a density > 6.0 mg/cm2. Therefore, the maximum acceptable mass density is typically 5 mg/cm 2 or less that 100 mg for a 2" planchet.

4.3 For beta radiation, reliable data may be obtained counting samples with a density as high as 10 mg/cm 2 or greater.

4.4 Sample thickness as well as moisture content may impact the alpha and/or beta results.

5.0 SAFETY

5.1 Employees must abide by the policies and procedures in the Corporate Environmental Health and Safety Manual (CW-E-M-001), Radiation Safety Manual and this document. This procedure may involve hazardous material, operations and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats and closed-toe, nonabsorbent shoes are a minimum

5.2 SPECIFIC SAFETY CONCERNS OR REQUIREMENTS

5.2.1.1 None.

5.3 PRIMARY MATERIALS USED

5.3.1 The following is a list of the materials used in this method, which have a serious or significant hazard rating. **NOTE: This list does not include all materials used in the method. The table contains a summary of the primary hazards listed in the MSDS for each of the materials listed in the table.** A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the MSDS for each material before using it for the first time or when there are major changes to the MSDS.

6.0 EQUIPMENT AND SUPPLIES

6.1 Low Background Proportional Counter, equivalent to the Canberra/Oxford/Tennelec LB4100, or Protean MPC9604.

6.2 Gas mixture, 90% argon, 10% Methane

6.3 Blank planchets

6.4 PC based data acquisition system, OSUM software, IQC software

7.0 STANDARDS AND REAGENTS

7.1 All standards and reagent preparation, documentation and labeling must follow the requirements of SOP ST-QA-0002, current revision

7.2 Radioactive sources to measure beta radiation,: Sr-90 and Ra-228 sources.

7.3 Radioactive sources to measure alpha radiation: Am-241, Th-230 and Ra-226

8.0 SAMPLE COLLECTION, PRESERVATION AND STORAGE

8.1 TestAmerica St. Louis supplies sample containers and chemical preservatives in accordance with the method. TestAmerica St. Louis does not perform sample collection. Samplers should reference the methods referenced and other applicable sample collection documents for detailed collection procedures. Sample volumes and preservative information is given in ST-PM-0002.

8.2 See associated sample preparation SOPs ST-RC-0020, ST-RC -0021, ST-RC -0036, ST-RC -0040, ST-RC -0041and ST-RC -0050, for more detailed information.

9.0 QUALITY CONTROL

9.1 **Batch**

9.1.1 A sample batch is a maximum of 20 environmental samples, which are prepared together using the same process and same lot(s) of reagents.

9.1.2 Instrument conditions must be the same for all standards, samples and QC samples.

9.1.3 For this analysis, batch QC consists of a method blank, a Laboratory Control Sample (LCS), and Matrix Spike (MS)/ Sample Duplicate (Dup). In the event that there is insufficient sample to analyze a sample duplicate, an LCS Duplicate (LCSD) is prepared and analyzed.

9.1.3.1 Matrix Spike (MS) and Matrix Spike Duplicate (MSD) may be performed upon client request, and are noted in the Client Requirement Sheets and Log-in.

9.2 **Method Blank (MB)**

9.2.1 A method blank is a blank matrix processed simultaneously with, and under the same conditions as, samples through all steps of the procedure.

9.2.2 A method blank must be prepared with every sample batch.

9.3 **Laboratory Control Sample (LCS)**

9.3.1 An LCS is a blank matrix spiked with a known amount of analyte(s), processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.3.2 An LCS must be prepared with every sample batch.

9.4 **Matrix Spike**

9.4.1 A Matrix Spike is an aliquot of a field sample to which a known amount of target analyte(s) is added, and is processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.5 **Sample Duplicate**

9.5.1 A Sample Duplicate is an additional aliquot of a field sample taken through the entire analytical process to demonstrate precision.

9.6 **Procedural Variations/ Nonconformance and Corrective Action**

9.6.1 Any variation shall be completely documented using a Nonconformance Memo and approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

9.6.2 Any deviations from QC procedures must be documented as a nonconformance, with applicable cause and corrective action approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

10.0 CALIBRATION AND STANDARDIZATION

10.1 Voltage Plateau Determination

10.1.1 **Frequency**:

10.1.1.1 Performed as a part of the Intial Calibration.

10.1.2 **Voltage Plateau Determination on LB4110 Red**

10.1.2.1 Place the Am-241 sources in Drawers A and B.

10.1.2.2 Select the auto-sequence file “Plateau”

10.1.2.3 Highlight the detectors in Drawers A and B
10.1.2.4 Click on ‘Run”
10.1.2.5 Type ‘Alpha’ for the sample ID for the detectors with the alpha source
10.1.2.6 Click ‘Done’. The voltage plateau will begin automatically.
10.1.2.7 When the alpha counts are complete, the highlighted detectors will flash. Click ‘Unit status’ and highlight the voltage plateau file name. Click on ‘Re-load’. Enter ‘Beta” as the sample ID.
10.1.2.8 Place the Sr^{90} beta source on the detector.
10.1.2.9 Click ‘Done’. The voltage plateau will complete automatically.
10.1.2.10 When the plateau is complete click on ‘Data Output’. Select the plateau file. Print the graphs and data for calibration packages. Archive the data file.
10.1.2.11 Repeat the steps above for drawers C and D.

10.1.3 **<u>Criteria for Plateaus for LB4110 Red</u>**
10.1.3.1 Voltage range used to determine the plateau is 300-1500V
10.1.3.2 Voltage increase per step is **<**50V per step

10.1.4 **<u>Voltage Plateau Determination on Protean MPC 9604</u>**
10.1.4.1 The manufacturer has counted plateaus and permanently set the discriminator voltages. The manufacturer does not recommend recounting plateaus. The detectors are manufactured to have a high dead time. However, a cross talk test may be performed using different nuclide sources to indicate acceptable discriminator settings. This procedure is outlined in the discriminator setting section of this SOP.

10.1.5 **<u>Criteria for Plateaus for Protean MPC 9604</u>**
10.1.5.1 Plateaus are permanently set for this instrument from the manufactuer.

10.2 **Discriminator Settings**

10.2.1 **<u>Frequency:</u>**
10.2.1.1 Performed as a part of the Intial Calibration.

10.2.2 **<u>Discrimator Settings on LB4110 Red</u>**
10.2.2.1 From the unit menu, select ‘Change ROI’
10.2.2.2 Place a beta source in each detector
10.2.2.3 Highligh a detector with a beta source
10.2.2.4 The alpha upper limit should be set at 100% and the beta lower limit should be set a 0%. The alpha lower limit and the beta upperlimit should both be set at 50%.
10.2.2.5 Select ‘Count’. Accumulate at least 100,000 beta counts
10.2.2.6 Reduce the beta upper limit/alpha lower limit until there is 3.5% beta into alpha crosstalk.
10.2.2.7 Raise the alpha lower limit until there is 0.10% beta into alpha crosstalk.
10.2.2.8 Raise the beta upper limit until it is 5% less than the alpha lower limit.
10.2.2.9 Select ‘Halt’.
10.2.2.10 Repeat steps above until all detectors have been set.
10.2.2.11 Select ‘Close’. Discriminator settings are updated automatically.

10.2.3 **<u>Discrimator Settings on Protean MPC 9604</u>**
10.2.3.1 Collect a minimum of 10,000 counts for each of Am-241, Th-230 and Po-210 sources
10.2.3.2 Calculate the percentage of crosstalk and compare the results to historical and expected values. Consult the Technical director if the values fall out of range.

10.3 **Initial Calibration**:

10.3.1 **<u>Frequency</u>**:

10.3.1.1 The Gas Flow Proportional Counter (GFPC) is calibrated initially and each year thereafter. Recalibration may be required if indicated during the operation of the instrument.

10.3.2 The specific calibration source preparations can be found in the file containing the previous calibration.

10.3.3 All nuclide sources shall be NIST traceable.

10.3.4 The efficiency calibration shall consist of at least seven single or dual sets of mass attenuated calibration standards, unless a single point source efficiency is to be determined.

10.3.5 The standards shall have enough activity to generate at least 10000 counts in 90 minutes of count time for the most highly attenuated source. The count rate shall not exceed 5000 counts per second.

10.3.5.1 For alpha and beta analysis, separate sets of calibration sources shall be prepared.

10.3.6 The mass attenuation is accomplished by utilization of a salt solution with comparable make up to the majority of samples seen in the laboratory.

10.3.6.1 Alternatively, the mass attenuation may be accomplished by using the same carrier solution used in a specific analysis.

10.3.7 Each standard shall be counted in every detector to be calibrated.

10.3.8 **<u>Criteria for a Single or Dual Set Calibration</u>**

10.3.8.1 The efficiency of the detector (the dependent variable) shall be plotted on a single graph against the masses (the independent variable) for all data points.

10.3.8.2 The equation of the calibration curve shall be determined using polynomial functions and be included on the plot of the curve. The curve shall be continuous and smooth.

10.3.8.3 The degree of the polynomial shall not exceed three. The number of discreet source pairs shall be two more than the degree of the polynomial.

10.3.8.4 The percent difference of the measured efficiency and theoretical efficiency shall be calculated for all data points.

10.3.8.5 Points that are visual outliers or demonstrate less than 15 percent difference between the measured efficiency and theoretical efficiency may be removed at the analyst's discretion. Low residual mass sources and samples are difficult to plate with acceptable duplicate precision. Therefore, high outliers may not necessarily be removed from the calibration if they mimic live sample masses. In any case outliers above 15 percent shall be removed from the calibration curve. No more than 20 percent of the data points may be removed. Reasons for removal or inclusion of outliers shall be documented in the calibration narrative. Once outliers are removed, the percent difference between the measured efficiency and theoretical efficiency must be recalculated using the new polynomial coefficients generated from removal of data points. If outliers over 15 percent difference remain between the measured efficiency and theoretical efficiency the Radiochemistry Manager/QA must be consulted before calibration may continue.

10.3.8.6 The coefficient of determination (r^2) shall be calculated and displayed on the plot with the equation of the trend line. An r^2 greater than or equal to 0.9 is required to proceed to counting of verification sources.

10.3.8.7 If the coefficient of determination (r^2) is not greater than or equal to 0.9 on the plot of all data points (with or without outliers removed), the data may be plotted using the mean of the paired values for both the efficiencies and the masses. This action is acceptable to reduce the variability caused when plating low mass sources. Calculate the percent difference of each datum value from the mean of the paired points. If the percent difference for any datum value is greater than 10 percent for alpha or 7.5 percent for beta delete the data pair and perform another statistical fit to the data. More than 20 percent of all data points may not be removed from the curve. The coefficient of determination (r^2) shall be calculated and displayed on the plot with the equation of the trend line. An r^2 greater than or equal to 0.9 is required to proceed to counting of verification sources.

10.4 **Independent Calibration Verification (ICV)**

10.4.1 **Frequency**:

10.4.1.1 Performed with every intial calibration

10.4.2 GFPC initial calibrations must be verified by a second source standard.

10.4.3 The ICV standard is NIST traceable.

10.4.4 The ICV is counted to accumulate at least 5,000 counts.

10.4.5 **ICV for Dual Set Calibrations**:

10.4.5.1 Prepare at least one set of calibration verification sources consisting of a low, medium and high residual mass within the calibration range of the curve.

10.4.5.2 Prepare a blank at the same time.

10.4.5.3 The sources shall contain radionuclide from a second source. Second sources may include a second dilution from the same primary source used for the calibration curve.

10.4.5.3.1 Alternatively, verification source nuclides may consist of different nuclides than the calibration curve if it is customary to do so.

10.4.5.4 Count each secondary source and the blank in all detectors that were calibrated.

10.4.5.5 Calculate the results in terms of percentage recovery.

10.4.5.6 Calculate the mean results of all masses across each detector.

10.4.5.7 Criteria:

10.4.5.7.1 Individual points are within 30 percent of the true value

10.4.5.7.2 The mean result of all masses across all detectors is less than 10 percent.

10.4.5.7.3 If any detector fails the validation tests the Technical Director must be consulted to provide corrective action.

10.4.6 **ICV for Single Set Calibrations**:

10.4.6.1 Prepare at least one set of verification sources varying in expected mass within the calibration range of the curve.

10.4.6.2 Prepare a blank at the same time.

10.4.6.3 The sources shall contain radionuclide from a second source. Second sources may include a second dilution from the same primary source used for the calibration curve.

10.4.6.3.1 Alternatively, verification source nuclides may consist of different nuclides than the calibration curve if it is customary to do so.

10.4.6.4 Count the secondary source and the blank in all detectors that were calibrated.

10.4.6.5 Calculate the results in terms of percentage recovery.

10.4.6.6 Calculate the mean results of all masses across each detector.

10.4.6.7 Criteria:

10.4.6.7.1 Individual points are within 30 percent of the true value

10.4.6.7.2 The mean result of all masses across all detectors is less than 10 percent.

10.4.6.7.3 If any detector fails the validation tests the Technical Director must be consulted to provide corrective action.

10.5 **Setting Performance Check Criteria After Calibration**

10.5.1 Twenty background check samples are counted and used to establish quality control limits for the daily background checks.

10.5.2 Twenty alpha/beta check sources are counted after calibration and used to establish quality control limits for the daily source checks.

10.5.3 The limits will be a running average of the four months post calibration.

10.5.3.1 The limits are to be documented.

10.5.3.2 The limits will be re-established monthly at the following frequency

10.5.3.2.1 1st month – take first five data points from the new month and fifteen data points from the initial calibration.

10.5.3.2.2 2nd month – take first five points from new month, five from prior month and ten from initial calibration.

10.5.3.2.3 3rd month – take first five points from new month, five points each from the previous two months and five from the initial calibration.

10.5.3.2.4 4th month – take first five data points from new month and five points each from the previous three months.

10.5.3.3 Limits are set.

10.6 Alpha to Beta Crosstalk Determination

10.6.1 The mean mass is determined for each data point used to calculate the mass attenuation curve.

10.6.1.1 These curves are calculated and plotted and the percent of alpha into beta crosstalk is determined. This is done by dividing the beta counts per minute as observed in the beta channel from the alpha calibration source counts by the sum of the alpha and beta counts per minute.

10.6.1.2 The mean percent of alpha into beta is determined for each mass point by using the count data accumulated for two sets of alpha sources.

10.6.1.3 The crosstalk curve is plotted as mean crosstalk values relative to the mean mass for the two sets of data.

10.6.1.3.1 In this manner the crosstalk factor can be determined for any given mass.

10.6.1.4 The equation of the curve shall be determined using polynomial functions.

10.6.1.5 The coefficient of determination (R^2) shall be calculated and displayed on the plot as well as the equation for the trendline.

10.7 Beta to Alpha Crosstalk Determination

10.7.1 Since beta to alpha crosstalk does not vary across mass, a mean beta to alpha crosstalk correction factor is calculated.

10.7.2 The percent of beta into alpha is determined by dividing the alpha counts per minute as observed in the alpha channel from the beta calibration source counts by the sum of the alpha and beta counts per minute.

10.7.3 The mean percent of beta into alpha is determined for all mass points. The mean percent is insignificant in calculating results, therefore is not applied to the result calculation.

10.8 Long Background

10.8.1 **Frequency**:

10.8.1.1 Monthly or whenever instrument conditions have significantly changed since the previous background was performed (e.g. detector replaced, etc.)

10.8.1.2 Minimum count time: 1000 minutes.

10.8.2 Wash the planchet holder and clean the drawers with a 20% radiac wash or ethyl alcohol.

10.8.2.1 Do not spray cleaner directly onto the drawers. Spray cleaner on a Kimwipe, a cotton ball, or paper towel and wipe out the drawers.

10.8.3 Check that instrument settings are as specified in 11.1.

10.8.4 **<u>Red Long Background Count Set Up</u>**

10.8.4.1 Place the cursor on the red box in the upper left hand corner of the screen and <u>right click</u> on the mouse.

10.8.4.2 Select 'edit parameters'. Verify the count time on the screen is set to 1000 minutes and the iterations is set to 1. If they are different than 1000 min and 1iteration, change them to 1000 min and 1 iteration. Then select 'close' to exit this window.

10.8.4.3 Place clean empty planchets in instruments.

10.8.4.4 Place the cursor on the red box in the upper left hand corner of the screen and <u>right click</u> on the mouse.

10.8.4.5 Select 'create batch' from the instrument menu.

10.8.4.6 Select 'background'

10.8.4.7 Select the detectors that are to be counted by double clicking the mouse on the drawer desired which selects all detectors in that drawer or on each individual detector in the display.

10.8.4.8 Select 'run'

10.8.4.9 Select 'done'

10.8.4.10 When backgrounds are complete, review the printouts for acceptance.

10.8.5 **<u>Protean Long Background Count Set Up</u>**

10.8.5.1 Create Manual batch in RadCapture

10.8.5.2 Export Manual batch from RadCapture

10.8.5.3 At Protean instrument:

10.8.5.4 Select 'Detector'

10.8.5.5 Select 'Sample Log'

10.8.5.6 Select appropriate Long Background (ex: Sept_Lng_Bkg_00) you want to start under sample ID

10.8.5.7 Change count time to 1000min

10.8.5.8 Select 'Start'

10.8.5.9 Continue these steps with detectors 1-23.

10.8.5.10 Review the data for acceptance when the backgrounds are complete.

10.8.6 **<u>Printing Protean Long Backgrounds</u>**

10.8.6.1 Select 'Print Protean data icon' on the desk top

10.8.6.2 Select OK

10.8.6.3 Enter Batch #

10.8.6.4 Print

10.8.7 **<u>Protean Long Background Entry into Protean</u>**

10.8.7.1 Select Input data

10.8.7.2 Select Definitions

10.8.7.3 Select Calibrations

10.8.7.4 Select Properties

10.8.7.5 Select References 0-7 for Detectors 0 thru 7 and 8-15 for Detectors 8 thru 15

10.8.7.6 Enter Background CPM's for Alpha and Beta from printed data sheet

10.8.8 **<u>Orange and Purple Long Background Count Set-Up</u>**

10.8.8.1 Select detector 0

10.8.8.2 Select 'source log'

10.8.8.3 Select 'monthly long background' by clicking on the file list arrow.

10.8.8.4 Ensure count time is set to 1000 minutes.

10.8.8.5 Select 'start'

10.8.8.6 Continue these steps with detectors 1-23.

10.8.8.7 Review the data for acceptance when the backgrounds are complete.

10.8.9 **Printing Orange and Purple Long Backgrounds**

10.8.9.1 Select 'Data
10.8.9.2 Select 'Source Count Data'
10.8.9.3 Select 'Source Name' Monthly Long BKG
10.8.9.4 Select 'This Range' enter your date range that Long Backgrounds were performed.
10.8.9.5 Select 'Refresh'
10.8.9.6 Select 'Source Count Summary' under Reports
10.8.9.7 Select 'Print'
10.8.9.8 Select 'Landscape' under Orientation
10.8.9.9 Select 'OK'

10.8.10 **Long Background Criteria:**

10.8.10.1 The CPM for the alpha are <0.2 and the beta < 2.0, the detector may be used.

10.8.10.1.1 The data printout must include initials and date to indicate that has been reviewed.
10.8.10.1.2 If a detector is above this limit, discard planchet.
10.8.10.1.3 Clean the planchet holder with radiac wash, ethyl alcohol or a detergent spray cleaner and dry thoroughly.
10.8.10.1.4 Place a clean planchet in the holder and repeat steps for that detector (s) only.
10.8.10.1.5 Perform a new background.

10.8.10.1.5.1 Note: the detector is tagged out of service until a successful background has been achieved.

11.0 PROCEDURES

11.1 Initial Setup

11.1.1 Check the normal instrument settings for all controls as described below:

11.1.1.1 Tank Flow 8 psi
11.1.1.2 Flow Cells >/= 0.3 SCFH, the flow will vary, the target range is 0.15 to 0.20 SCFH.

11.1.2 The High Voltage is set as indicated in the Manuals for the LB4000/LB4100 located in the count room file cabinet. The Protean remains as set by the manufacturer and does not require adjustment.

11.1.3 If counting gas has just been changed or turned on, allow a minimum purge time of 30 minutes prior to operation. Record gas tank changes on document on separate sheet.

11.2 Record date of Daily Background and Check Source Data in runlog logbook.

11.3 Maintenance

11.3.1 Change out the counting gas when the gauge reads under 500 psi. This usually occurs every 1 to 2 weeks. Record in the instrument maintanence logbook.

11.3.2 Allow gas to purge a minimum of 30 minutes prior to operation.

11.4 Data Acquisition: Daily Background Check and Source Check

11.4.1 **Daily Background Check**:

11.4.1.1 **Red Instrument**:
11.4.1.2 Open the drawer by rotating the knob at the front of the drawer to the ‘DOWN’ position and pull the sample drawer out slowly. Place clean empty planchets in the sample holders.

11.4.1.3 **Before inserting the drawer, confirm that none of the planchets extend above the sample holder. Failure to observe this note can result in damage to the detector.**
11.4.1.4 Slowly insert sample drawer into the instrument and slowly rotate the positioning knob into the 'UP' position.
11.4.1.5 Place the cursor on the red box in the upper left hand corner of the screen and right click on the mouse.
11.4.1.6 Select 'create batch'
11.4.1.7 Select 'daily background check'
11.4.1.8 Select the detectors that are to be loaded by double clicking the mouse on the drawer desired or on each individual detector in the display.
11.4.1.9 Select 'run'
11.4.1.10 Select 'done'
11.4.1.11 Measure the detector background for 200 minutes. The count time is predetermined by the protocol selected. i.e. 'daily background check'.
11.4.1.12 The detector display will be yellow when the detector is counting. The detector display will turn green when the count is complete.
11.4.1.13 When counting is complete, place the cursor on the red box in the upper left hand corner of the screen and right click on the mouse. Select 'data output' and select the data file generated by your background counts for that instrument, "DAY- ###". Select 'ok' to print data.
11.4.1.14 On any work station, i.e. "PC computer in the count room", double click on the IQC icon.
11.4.1.15 Select 'import data'
11.4.1.16 Select 'Red'. Enter the current date. Click on the file list arrow.
11.4.1.17 From the file list select each file generated above individually, and then select import data. i.e. import each "Day" or "DQC" file for that instrument individually.
11.4.1.18 Select 'close'
11.4.1.19 Select 'reporting'. Verfiy the current date in both the 'start' and 'end' date fields. Select 'print' to generate the report.

11.4.2 **Protean Instrument**:

11.4.2.1 Open each detector drawer. Place clean empty planchets into each sample holder and slowly insert each sample drawer into the instrument.
11.4.2.2 Double click detector 0 on the Protean computer screen.
11.4.2.3 Select 'source log'
11.4.2.4 Set the time for 200 minutes.
11.4.2.5 Type 'DB0' in the sample id box. (D for daily. B for background. 0 for detector.)
11.4.2.6 Select 'start'
11.4.2.7 Double click detector 1 on the computer screen. Repeat steps 11.4.2.3 through 11.4.2.5 for each detector, making sure to change the number to coincide with the detector the background is counting for.
11.4.2.8 Remove planchets from detector drawers when counting is complete.
11.4.2.9 On any work station, i.e. "PC computer in the count room", double click on the IQC icon.
11.4.2.10 Select 'import data'
11.4.2.11 Select 'Protean'. Enter the current date. Click on the file list arrow.
11.4.2.12 Select 'close'
11.4.2.13 Select 'reporting'. Verfiy the current date in both the 'start' and 'end' date fields. Select 'print' to generate the report.

11.4.3 **Orange and Purple Instrument**:

11.4.3.1 Open each detector drawer. Place clean empty planchets into each sample holder and slowly insert each sample drawer into the instrument.
11.4.3.2 Select detector 0.
11.4.3.3 Select ‘source log’.
11.4.3.4 Select ‘DB’ by clicking on the file list arrows for orange.
11.4.3.5 Select ‘Daily BKG’ by clicking on the file list arrows for purple.
11.4.3.6 Select ‘start’
11.4.3.7 Repeat these steps with detectors 1-23.

11.4.4 **Daily Background Criteria:**

11.4.4.1 Review the IQC printouts for each detector.
11.4.4.1.1 If a detector fails background criteria (3 sigma), clean the detector with radiac wash or ethyl alcohol and re-run.
11.4.4.1.2 If the detector fails a second time, but the CPM for the alpha are <0.2 and the beta < 2.0, the detector may be used. The data printout must include initials and date to indicate that it was checked.
11.4.4.1.3 Circle any failed detector on the printout.
11.4.4.1.4 Place a planchet upside down in the planchet holder to indicate that the detector is out of service for that day.

11.5 **Daily Source Check**

11.5.1 **Red Instrument**:

11.5.1.1 Open the drawer by rotating the knob at the front of the drawer to the ‘DOWN’ position and pull the sample drawer out slowly.
11.5.1.2 Place alpha sources in the sample holders of the A and B drawer. Place beta sources in the sample holders of the C and D drawer.
11.5.1.3 Place the cursor on the red box in the upper left hand corner of the screen and right click on the mouse.
11.5.1.4 Select ‘create batch’
11.5.1.5 Select ‘daily source check’
11.5.1.6 Select the detectors that are loaded by double clicking the mouse on the desired drawer or on each individual detector in the display.
11.5.1.7 Select ‘run’
11.5.1.8 Select ‘done’
11.5.1.9 Measure the detector source for 2 min. The count time is predetermined by the protocol selected. i.e. ‘daily source check’
11.5.1.10 The detector display will be yellow when the detector is counting. The detector display will turn green when the count is complete.
11.5.1.11 When counting is complete, place the cursor on the red box in the upper left hand corner of the screen and right click on the mouse. Select ‘data output’ and select the data file generated by your background counts for that instrument, “DQC- ###”. Select ‘ok’ to print data.
11.5.1.12 Open the drawer by rotating the knob at the front of the drawer to the ‘DOWN’ position and pull the sample drawer out slowly. Place beta sources in the sample holders of the A and B drawer. Place alpha sources in the sample holders of the C and D drawer.
11.5.1.13 Repeat steps 11.5.1.3 to 11.5.1.11.
11.5.1.14 On any work station, i.e. “PC computer in the count room”, double click on the IQC icon.
11.5.1.15 Select ‘import data’

11.5.1.16 Select ‘Red’. Enter the current date. Click on the file list arrow.

11.5.1.17 From the file list select <u>each</u> file generated above <u>individually</u>, and then select import data. i.e. import each “Day” or “DQC” file for that instrument individually.

11.5.1.18 Select ‘close’

11.5.1.19 Select ‘reporting button’. Verify the current date in both the ‘start’ and ‘end’ date fields. Select ‘print’to generate the report

11.5.2 **Protean Instrument:**

11.5.2.1 Slowly open each detector drawer. Place alpha sources in sample holders of detectors 0-7. Place beta sources in sample holders of detectors 8-15 and slowly insert each drawer into the instrument.

11.5.2.2 Double click detector 0 on the Protean computer screen.

11.5.2.3 Select ‘source log’.

11.5.2.4 Set the time for 2 minutes.

11.5.2.5 Type “SA0” in the sample id box. (S for source. A for alpha. 0 for detector.)

11.5.2.6 Select ‘start’

11.5.2.7 Double click detector 1 on the computer screen. Repeat steps 11.5.2.3 to 11.5.2.6 for each detector, making sure to change A to B when starting the beta sources on detectors 8-15 and changing the number to coincide with the detector the source is on.

11.5.2.8 When the counting is complete, slowly open each detector drawer. Place beta sources in detectors 1-7. Place alpha sources in detectors 8-15.

11.5.2.9 Double click detector 0 on the Protean computer screen.

11.5.2.10 Type “SB0” in the sample id box. (S for source. B for beta. 0 for the detector.)

11.5.2.11 Double click detector 1 on the computer screen. Repeat steps 11.5.2.10 for each detector, making sure B to A when starting the alpha sources on detectors 8-15.

11.5.3 Remove sources from detector drawers when counting is complete.

11.5.4 **Orange and Purple Instrument**:

11.5.4.1 Slowly open each detector drawer. Place alpha sources in sample holders of detectors 0-7. Place beta sources in sample holders of detectors 8-15. Slowly insert each drawer into the instrument.

11.5.4.2 Select detector 0.

11.5.4.3 Select ‘source log’.

11.5.4.4 Select ‘SA0’.

11.5.4.5 Select ‘start’

11.5.4.6 Repeat these steps for detectors 1-7 using the correlating detector number. For detectors 8-15 select ‘SB8’, ‘SB9’, and so on for each correlating detector number.

11.5.4.7 Slowly open each detector drawer when counting is complete. Place beta sources in detectors 1-7 and place alpha sources in detectors 8-15.

11.5.4.8 Select detector 0.

11.5.4.9 Select ‘SB0’.

11.5.4.10 Select ‘start’.

11.5.4.11 Repeat these steps for detectors 1-7 using the correlating detector number. For detectors 8-15, select ‘SB8’, ‘SB9’ and so on for each correlating detector number.

11.5.4.12 Repeat steps 11.5.4.1 to 11.5.4.11 for detectors 16-23.

11.5.4.13 Remove sources from detector drawers when counting is complete.

12.0 DATA ANALYSIS AND CALCULATIONS

12.1 Commonly used calculations (e.g. % recovery and RPD) and standard instrument software calculations are given in the TestAmerica St. Louis QAM.

12.2 Result calculations are performed by TestAmerica St. Louis' Rad Capture software program. These calculations are found in the TestAmerica St. Louis QAM.

13.0 DATA ASSESSMENT AND ACCEPTANCE CRITERIA; CORRECTIVE ACTIONS FOR OUT OF CONTROL DATA

13.1 The data assessment and corrective action process is detailed through the Clouseau Nonconformance Memorandum (NCM) process. The NCM process is described in SOP: ST-QA-0036. Below is a subset of the data assessment and QC excursion types within Clouseau; the text in underline is the exact "type" line in Clouseau. For a complete and current listing, please access the software program.

13.2 Method Blank
- 13.2.1 Acceptance Criteria:
  - 13.2.1.1 No target analytes may be present in the method blank above the reporting limit.
  - 13.2.1.2 Project specific requirements if more stringent than our routine procedure (e.g. no target anlaytes present above ½ RL), will be noted on the client requirements sheet.
- 13.2.2 Corrective Action for Method Blanks not meeting acceptance criteria:
  - 13.2.2.1 <u>Method Blank Contamination</u> – See Clouseau NCM for corrective action (e.g. reprep/reanalysis, narration). Note certain analytes are common laboratory contaminants which require special narrative comment. These compounds are so designated in Clouseau.

13.3 Laboratory Control Sample (LCS)
- 13.3.1 Acceptance Criteria:
  - 13.3.1.1 All control analytes must be within the specified control limits for accuracy (%Recovery) and precision (RPD).
- 13.3.2 Corrective Action for LCS not meeting acceptance criteria:
  - 13.3.2.1 <u>LCS Spike Recovery excursion (high)</u> – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).
  - 13.3.2.2 <u>LCS Spike Recovery excursion (low)</u> – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).
- 13.3.2.3 <u>RPD/RER Duplicate excursion</u> – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).

13.4 Matrix Spike/Matrix Spike Duplicate (MS/MSD)
- 13.4.1 Analytes should be within control limits for accuracy (%Recovery) and precision (RPD).
- 13.4.2 Corrective Action for MS/MSD not meeting acceptance criteria:
  - 13.4.2.1 <u>MS/MSD Spike Rec. excursion</u> may not necessarily warrant corrective action other than narration. See Clouseau NCM to determine if re-preparation re-analysis is required.

13.5 Sample result evaluation
- 13.5.1 Tracer/Carrier recovery must be within specified limits.
- 13.5.2 <u>Tracer/Carrier recovery low</u>– See Clouseau NCM for corrective action.
- 13.5.3 <u>Tracer/Carrier recovery high</u>– See Clouseau NCM for corrective action.

13.5.3.1 A sample tracer recovery outside QC limits may be accepted if the sample results are determined valid:
13.5.3.2 minimum number of tracer counts
13.5.3.3 level of uncertainty
13.5.3.4 client project requirements/approval

13.5.4 These expections will be documented using the NCM process. The NCM will narrate the conditions upon which the sample results were accepted with tracer recovery excursions.

13.6 Insufficient Sample

13.6.1 For any prescribed re-preparation corrective action, if there is insufficient sample to repeat the analysis and narrative comment stating such is included in the report narrative. The insufficient sample description is included in the the Clouseau NCM within the type defining the excursion.

14.0 METHOD PERFORMANCE AND DEMONSTRATION OF CAPABILITY

14.1 Method performance data, Reporting Limits, and QC acceptance limits, are given in the appendix of this SOP.

14.2 Demonstration of Capability

14.2.1 Initial and continuing demonstrations of capability requirements are established in the QAM.

14.3 Training Qualification

14.3.1 The manager/supervisor has the responsibility to ensure that this procedure is performed by an analyst who has been properly trained in its use and has the required experience.

14.3.2 The analyst must have successfully completed the initial demonstration capability requirements prior to working independently. See requirements in the QAM.

14.4 Annually, the analyst must successfully demonstrate proficiency to continue to perform this analysis. See requirements in the QAM.

15.0 VALIDATION

15.1 Laboratory SOPs are based on standard reference EPA and DOE methods that have been validated by the EPA and the lab is not required to perform validation for these methods. The requirements for lab demonstration of capability are included in LQM. Lab validation data would be appropriate for performance based measurement systems or non-standard methods. TestAmerica ST Louis will include this information in the SOP when accreditation is sought for a performance based measurement system or non-standard method.

16.0 WASTE MANAGEMENT AND POLLUTION CONTROL

16.1 All waste will be disposed of in accordance with Federal, State and Local regulations. Where reasonably feasible, technological changes have been implemented to minimize the potential for pollution of the environment. Employees will abide by this method and the policies in section 13 of the Corporate Safety Manual for “Waste Management and Pollution Prevention.”

16.2 Waste Streams Produced by the Method

16.2.1 The following waste streams are produced when this method is carried out.

16.2.1.1 Contaminated disposable glass or plastic materials utilized in the analysis are disposed of in the sanitary trash. If the lab ware was used for the analysis of radioactive samples and contains radioactivity at a level of 100 cpm over background as determined by a GM meter, the lab ware will be collected in waste barrels designated for solid rad waste for disposal by the EH&S Coordinator.

18.0 MODIFICATIONS TO THE REFERENCE METHOD

18.1 TestAmerica St. Louis uses Thorium-230 to calibrate the GFPC system for Ra-226. Th-230 has similar alpha energies and a sufficiently long half life to eliminate the need for purification. The laboratory has historically performed well on PE programs for Ra-226, demonstrating the laboratory’s ability to accurately calibrate for this isotope. Calibrating with a Ra-226 source presents a severe bias in the quantitated result. Ra-226 can be purified and separated from all other alpha emitting isotopes, but the moment after separation, alpha emitting daughters begin to grow (i.e. Radon-222, Polonium-28 and Polonium-214). As the daughter’s in-growth alpha activity changes and due to the higher alpha energies of these daughters, the measured efficiency of the GFPC changes as well. After three weeks the alpha activity from purified Ra-226 increases by a factor of four. Due to their short half lives, these daughters can not be isolated long enough to mathematically correct for the bias brought on by them. Calibrating the GFPC with Ra-226 is actually calibrating with a mix of the four isotopes and not a legitimate calibration under the cited regulation.

18.2 Strontium 89's short half life makes it impractical to use as a calibration standard for both Radium 228 analysis, as stated in EPA method 904 and SW method 9310, and Strontium 89 analysis, as stated in EPA method 905. TestAmerica St. Louis uses a mixed Strontium 90/Yittrium 90 standard for its' GFPC beta calibration used in Gross Beta, Strontium 90, Strontium 89, and Radium 228 analyses. TestAmerica St. Louis has selected the Strontium 90/Yittrium 90 standard because it produces a stable beta emission which can be reliably used for initial and continuing calibration. By using this standard mix, we have beta emissions at the lower and upper energetic spectrum whose average is in the middle of the beta range.

18.3 For Radium 228 analysis, TestAmerica St. Louis uses chemical separation techniques to eliminate other potential beta emitters.

18.4 TestAmerica St. Louis does not perform a direct Strontium 89 analysis. TestAmerica St. Louis provides calculated results based on the difference between Total Strontium and Strontium 90.

19.0 CHANGES FROM PREVIOUS REVISION

19.1 Updated Section 10 to address voltage increase per step, plateau slope and QC check count requirements (5000 counts)

19.2 Rev. 11;
- 19.2.1 Added instument Purple throughout section 10 and 11.
- 19.2.2 Adjusted procedure steps throughout section 11.

19.3 Rev. 12,
- 19.3.1 Added Sr-02-RC and Sr-03-RC to sections 1.0 and 17.0.

19.4 Rev. 13:
- 19.4.1 Added Neptunium to scope in section 1.0.
- 19.4.2 Updated the Quality Control Program for counting daily rad checks and daily background checks in section 3.0.
- 19.4.3 Updated background count set-up, printing and entering protean data in section 10.8.

Title: ALPHA SPECTROSCOPY ANALYSIS

Approvals (Signature/Date):

Chris Hough 3/19/12	Date	Michael Ridenhower 3/19/12	Date
Radiochemistry Manager		Health & Safety Manager / Coordinator	
Marti Ward 3.19.12	Date	Elaine Wild 3/19/12	Date
Quality Assurance Manager		Laboratory Director	

This SOP was previously identified as SOP No. ST-RD-0210 Rev. 9

.

Facility Distribution No.: 0 **Distributed To: See Electronic Distribution Sheet**

1.0 SCOPE AND APPLICATION

1.1 This procedure applies to alpha spectroscopy detectors and the computer assisted alpha spectroscopy analysis systems, using AlphaVision software.

1.2 This SOP is based on DOE method A-01-R

1.3 This SOP is applicable to both liquid and solid matrices.

1.4 The laboratory target analytes supported by this method, the reporting limits, method detection limits and QC limits are maintained in the Information Management System (QuantIMS). A copy of the Structure and Analysis Code (SAC), which lists this information, is included in the Appendix of this SOP.

2.0 SUMMARY OF METHOD

2.1 This SOP provides detailed instructions for energy calibration, efficiency determination, quality control checks, background and sample counting of the alpha spectroscopy system.

3.0 DEFINITIONS

3.1 See the TestAmerica St. Louis Quality Assurance Manual (QAM) for glossary of common terms and data qualifiers.

3.2 Tracer - A known amount of 232U, 242Pu or 236Pu, 243Am, 209Po or 229Th (depending on analyte(s) required) added to each sample to determine chemical yield. The tracer serves as an internal standard, which is used to calculate the activity of the target isotopes.

3.3 Region of Intrest (ROI): The KeV range through which the target isotope peak signal responds.

3.4 Tailing: Tailing is a delayed return of a peak to chromatographic baseline or continuation of response beyond its normal response window (RT window, ROI) due to high concentration of the analyte or a matrix interference.

3.5 Alpha Vision – the Alpha Spectrometer data collection and processing software.

4.0 INTERFERENCES

4.1 Alpha spectrometry has many potential interferences. These are usually in the form of radionuclides with unresolved alpha emissions. Poorly resolved alpha peaks are often due to high alpha activity rates or attenuation of the alpha emissions.

4.2 Isotope peak responses, when sufficiently high, may tail into other isotope ROIs. Th229 tailing into the Th230 region of interest is a recognized example. This interference is minimized by maintaining low activities of the Th229 tracer and monitoring of the separation of the ROIs for Th229 and Th230. The use of manual integration may be required.

4.3 Some isotopic elements are not distinguishable and are reported as an isotopic pair, unless specifically directed by the client not to do so. These pairs may be reported separately depending on the client's DQOs and the use-ability of the data. When reported separately, the narrative must describe the technical aspects of how the isotopic pair was divided.

4.3.1 Recognized Isotopic Pairs:

4.3.1.1 Plutonium 239/240

4.3.1.2 Uranium 235/236
4.3.1.3 Uranium 233/234
4.3.1.4 Curium 245/246
4.3.1.5 Curium 247/248

5.0 SAFETY

5.1 Employees must abide by the policies and procedures in the Corporate Environmental Health and Safety Manual (CW-E-M-001), Radiation Safety Manual and this document. This procedure may involve hazardous material, operations and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats and closed-toe, nonabsorbent shoes are a minimum.

5.2 SPECIFIC SAFETY CONCERNS OR REQUIREMENTS
None.

5.3 PRIMARY MATERIALS USED
None.

6.0 EQUIPMENT AND SUPPLIES

6.1 Alpha spectroscopy system utilizing a computer based data acquisition system.

7.0 REAGENTS AND STANDARDS

7.1 All standards and reagent preparation, documentation and labeling must follow the requirements of SOP ST-QA-0002, current revision.

7.2 Commercially prepared alpha standards for the isotopes Th230, Pu239 and Am243.

8.0 SAMPLE COLLECTION, PRESERVATION AND STORAGE

8.1 TestAmerica St. Louis supplies sample containers and chemical preservatives in accordance with the method. TestAmerica St. Louis does not perform sample collection. Samplers should reference the methods referenced and other applicable sample collection documents for detailed collection procedures. Sample volumes and preservative information is given in ST-PM-0002.

9.0 QUALITY CONTROL

9.1 See actinide preparation SOPs for additional information regarding QC types, frequency and preparation

9.2 **Batch**

9.2.1 A sample batch is a maximum of 20 environmental samples, which are prepared together using the same process and same lot(s) of reagents.

9.2.2 Instrument conditions must be the same for all standards, samples and QC samples.

9.2.3 For this analysis, batch QC consists of a method blank, a Laboratory Control Sample (LCS), and Sample Duplicate (Dup). In the event that there is insufficient sample to analyze a sample duplicate, an LCS Duplicate (LCSD) is prepared and analyzed.

9.2.3.1 Matrix Spike (MS) and Matrix Spike Duplicate (MSD) may be performed upon client request, and are noted in the Client Requirement Sheets and Log-in.

9.3 **Method Blank (MB)**

9.3.1 A method blank is a blank matrix processed simultaneously with, and under the same conditions as, samples through all steps of the procedure.

9.3.2 A method blank must be prepared with every sample batch.

9.4 **Laboratory Control Sample (LCS)**

9.4.1 An LCS is a blank matrix spiked with a known amount of analyte(s), processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.4.2 An LCS must be prepared with every sample batch.

9.5 **Matrix Spike**

9.5.1 A Matrix Spike is an aliquot of a field sample to which a known amount of target analyte(s) is added, and is processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.6 **Sample Duplicate**

9.6.1 A Sample Duplicate is an additional aliquot of a field sample taken through the entire analytical process to demonstrate precision.

9.7 **Procedural Variations/ Nonconformance and Corrective Action**

9.7.1 Any variation shall be completely documented using a Nonconformance Memo and approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

9.7.2 Any deviations from QC procedures must be documented as a nonconformance, with applicable cause and corrective action approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

10.0 INSTRUMENT SETUP, CALIBRATION, AND STANDARDIZATION

10.1 Initial instrument setup is performed when instrument is first installed, when a detector or chamber is changed/replaced, when a chamber is returned from the manufacturer after servicing, or other such circumstances. The following steps should be taken to ensure proper setup. Steps may be accomplished either through hardware knobs/potentiometers or through software settings (depending upon the system hardware/software). See the hardware and/or software manual to determine further detailed instructions:

10.1.1 Set the conversion gain to 1024 channels.

10.1.2 Adjust the coarse and fine gain as well as the offset to adjust the location of the three peaks of the alpha source such that the lower energy peak (Th-230 at 4688 keV) falls into channel 176, the mid-energy peak (Pu-239 at 5155 keV) falls into channel 239, and the higher energy peak (Am-241 at 5486 keV) falls into channel 283. Note that this results in 107 channels between the low energy and high energy peaks (about 7.46 keV/channel with offset of approximately 3375 keV). Ensure each peak is within 2 channels of the desired channel before beginning energy and efficiency calibrations.

10.1.2.1 Gain adjustment:

10.1.2.1.1 Turning the knob counter-clockwise decreases the gain (decrease the value in the fine gain for software adjustment), causing the spectrum peaks to move closer to each other (smaller keV/channel slope) and toward the lower energy.

10.1.2.1.2 Turning the knob clockwise increases the gain (increase the value in the fine gain for software adjustment), causing the spectrum peaks to spread apart (larger keV/channel slope) and toward higher energy.

10.1.2.2 Offset adjustment:

10.1.2.2.1 Increasing the offset moves the peak/spectra toward the the left (lower channel number) without altering the keV/channel (slope).

10.1.2.2.2 Decreasing the offset moves the peak/spectra toward the right (higher channel number) without altering the keV/channel (slope).

10.1.3 Adjust the pulser setting such that the pulser peak is centered at about channel 222 (approximately 5 MeV).

10.2 Initial calibrations are performed according to the following schedule

10.2.1 Initial energy calibrations shall be performed for the alpha spectroscopy systems <u>yearly</u>, or when a calibration quality control check indicates an unacceptable change in the energy calibration parameters.

10.1.1.1 Energy Calibrations shall be performed using at least three isotopes within the energy range of 3-6 MeV. Typical isotopes used are Th-230, Pu-239, and Am-241. Final peak energy positions of all observed isotopes shall be within +/- 5 channels (~40 keV) of expected channel/energy (see 10.1.2). The actual energy vs. channel and the equation with the slope is not calculated. Setting the peaks to within 5 channels of expected will ensure calculations utilizing fixed Regions of Interest (ROI) for each isotope will provide accurate results with minimal need for manual adjustment of ROI. Routine pulser checks and continuing calibration verifications (see below) will help control/monitor for drift.

10.2.2 Initial efficiency calibrations shall be established for the alpha spectroscopy systems <u>yearly</u>, or when a calibration quality control check indicates an unacceptable change in the efficiency calibration parameters.

10.2.2.1 Calibrated efficiency should fall between 20% and 32%. Values outside this range do not constitute a failure. However, if the calibrated efficiency does fall outside this range, an evaluation of the suitability of the detector for use should be performed and documented.

10.2.3 Initial calibration verifications (ICV) shall be performed utilizing an independent second source following the initial calibration.

10.2.3.1 The efficiency of the ICV must fall withing 95%-105% of the initial calibration efficiency value.

10.2.3.2 A second level review will be perfomed before detectors are placed into service and will be noted as acceptable in the electronic monthly maintenance log.

10.3 Calibration Quality Control Check (Continuing Calibration Verification/CCV)

10.3.1 A continuing calibration verification shall be performed on a <u>monthly</u> basis.

10.3.1.1 The Final peak energy positions for the isotopes should fall within +/- 5 channels of the expected channel/energy.

10.3.1.2 The efficiency should fall within 95%-105% of the calibrated efficiency.

10.3.1.3 A second level review will be performed before detectors are placed into service and will be noted as accepable in the electronic monthly maintenance log.

10.4 Background subtraction spectrum shall be established for the alpha spectroscopy systems <u>monthly</u>, or when the background quality control check indicates an unacceptable change in the daily background parameters.

10.5 Daily Checks

10.5.1 Routine pulser quality control verifications are performed each day of use.

10.5.1.1 The pulser energy, peak centroid, peak resolution, peak area quality control for a detector shall be checked each day that the alpha spectroscopy system is used.

The limits for pulser centroid and pulser energy will be as below:

10.5.1.1.1 Gross counts must be within 5% of the average (20-point minimum) for each detector.

10.5.1.1.2 The peak resolution (FWHM) must fall within 10-20 keV.

10.5.1.1.3 The pulser centroid must fall within +/- 5 channels of the average (20-point minimum) for each detector.

10.5.1.1.4 The pulser energy must fall within +/- 40 keV of the average (20-point minimum) for each detector.

10.5.2 Routine calibration, background and pulser quality control parameters using the “Boundry” out-of-range test will be found unacceptable if the value is outside parameter tolerance.

10.5.2.1 The routine quality control check should be rerun to determine the statistical significance of the out of control parameter.

10.5.2.2 If the out of control parameter is found acceptable in the rerun, the investigation will be noted in the instrument maintenance log.

10.5.2.3 Check the integrity of the radioactive standard.

10.5.2.4 Check source positioning and all instrument settings.

10.5.2.5 Check all cables for any apparent damage and to confirm that all cables are routed to proper connectors and are in good working order.

10.5.3 If the instrument fails to meet the acceptance criteria, and the corrective actions above do not resolve the problem, the instrument must be “tagged” out of service for the day.

10.5.3.1 This is noted on the Alpa Spec Daily report by marking the report (The report will display FAIL for criteria not met). The detector will be marked out of service with the date and initials of the analyst performing the daily check.

10.5.3.2 If a detector fails three consecutive days for the same criteria, the detector will be taken out of service until the problem is resolved. This is done by clicking on the detector in Alphavision. Right click on the the detector, select detector properties, check the “out of service” box and fill in the description field briefly explaining the problem. Mark the detector with an OOS tag as a visual indicator of its status.

10.5.3.3 The instrument may be returned to service once the malfunction has been corrected and the above acceptance criteria have been met. Note any repairs in the maintenance log.

10.6 Calibration process in the Software

10.6.1 Alpha Detector System Energy and Efficiency Calibration

10.6.1.1 Place the correct source into the detector.

10.6.1.2 In the Alphavision software, click on Calibration Icon.

10.6.1.3 Click on detector to be calibrated.

10.6.1.4 Select Calibration from the Tool Bar.

10.6.1.5 Select Process

10.6.1.5.1 The Calibration Explorer Window will appear.

10.6.1.6 In the General Window, name the Calibration with the month, year_detector format. (JAN2001_AV1)

10.6.1.7 Choose correct template for source to count

10.6.1.8 Click next

10.6.1.9 In the Acquisition window, confirm count time of 140 minutes

10.6.1.10 Click next

10.6.1.11 In the Energy/Efficiency Calibration Window, confirm the correct source is used, and select which shelf the source is on. (This will either be 1 or 2)

10.6.1.12 Click next

10.6.1.13 In the Report Window, select print on completion

10.6.1.14 Click finish

10.6.1.15 When count is complete, the Manual Energy and Efficiency Calibration Window will appear. In this window, select Calibration ROI, select Calibrate, and Save.

10.6.1.16 Repeat for each detector

10.6.1.17 Record the calibration in the Alpha Maintenance Log Book.

10.6.2 **Detector Background Counting**

10.6.2.1 Select the Batch Icon

10.6.2.2 Select backgrounds from the Tool Bar

10.6.2.3 Select Process.

10.6.2.3.1 This will open the General Window in Batch Wizard

10.6.2.4 Name the background with month_year format. (JAN_04)

10.6.2.5 Select correct template (provided by analyst)

10.6.2.6 Click next.

10.6.2.7 In the Sample Window, add all detector names.

10.6.2.8 Click next

10.6.2.9 In the Acquisition Window, confirm count time is set at 960 minutes or 1200 minutes for special projects (or as long as the longest sample count time)

10.6.2.10 Click next

10.6.2.11 In the Analysis Set Up Page, select Background Library and Background ROI, check the Use ROI box.

10.6.2.12 Click next

10.6.2.13 In the Report Window, select print on completion

10.6.2.14 Click finish

10.6.2.15 The Detector Assignment worksheet will appear, assign detectors, and select start now.

10.6.2.16 Record the backgrounds in the instrument maintenance log.

10.6.2.17 The background spectrum will be processed by the software

10.6.2.18 The detectors shall be "categorized" after each monthly background. The detectors will be labelled as follows:

<u>Counts in Region of Interest (i.e. Th230, Th232, U234, U238, Pu238, Pu239</u>):

- 0-2 counts – Blue – Ultra Low Level
- 0-4 counts – Yellow – Intermediate Low Level
- 4-20 counts – Green – Low Level
- Detectors 1-8 –Red – Always designated for Routine analysis when the RL=1 or the activity is from a known radioactive site. Upper count limit of 40 counts
- 20 hour background (Th & U only) – White – Upper limit of 40 counts
- 20 hour background – No Color – Upper count limit of 20 chounds

See Attachment 1 Detector Color Key

10.6.2.19 Detectors with backgrounds above the counts listed above are taken out of service for cleaning.

10.6.2.20 Detectors may also be removed from service when there is a visible peak present or at analyst judgment.

10.6.2.21 Backgrounds will be 2nd reviewed before placing into service and a notation of acceptable will be listed in the electronic monthly maintenance log.

10.6.2.22 Detector Cleaning

10.6.2.22.1 Clean detector surface with ethanol and a clean cotton ball.

10.6.2.22.2 Clean the sample tray and place a clean background planchette on the tray.

10.6.2.22.3 A passing background cont is required before returning the detector to service.

11.0 PROCEDURE

11.1 For sample preparation reference the applicable actinide SOPs: ST-RC-0040, ST-RC-0210, ST-RC-0232, ST-RC-0238, ST-RC-0241, ST-RC-0242 and ST-RC-0246.

11.2 Initial Setup

11.2.1 Establish the normal instrument settings for all controls.

11.2.1.1 Detector specific high voltage settings and required polarity are listed in the method software settings.

11.2.2 Pulser quality controls shall be checked before each use of the instrument.

11.3 Counting Samples

11.3.1 In Radcapture, go to Utilities,export, Alphavision batch data, enter batch #, and ok export to Alphavision.

11.3.2 In Alphavision, go to Process, select Batch to open the Batch Wizard.

11.3.3 Choose Load from LIMS, and pick the batch.

11.3.4 Choose test by clicking on the correct isotope test

11.3.5 Select Next

11.3.6 Click on blank, and then pick blank type (Uu blank, Pu Blank, ect)

11.3.7 Click on LCS, and then pick LCS type with correct spike number. For amount, use the spike aliquot amount (0.1, 0.2mL, 0.1326g, etc).

11.3.8 Select Next

11.3.9 Live time is count time. Enter correct count time for the batch, select next,

11.3.10 Select Nuclide Library, choose correct ROI and tracer

11.3.11 Select next

11.3.12 Change TPU Sigma to 2 (unless otherwise noted in client requirements), select correct activity units (DPM, pCi, etc), select Activity concentration.

11.3.13 Select Next, two times

11.3.14 Select Print on Completion

11.3.15 Select Finish

11.3.16 Click and drag correct detectors to the correct sample id and select Start Now.

11.3.17 The spectrum will be processed by the software.

11.3.18 For DOE: the FWHM of each tracer peak shall be <= 100keV; the tracer peak energy for each sample shall be within +/-50keV of the expected energy.

11.3.19 Backgrounds are checked after high activity samples

11.4 Samples with a count rate of greater than 1 CPS should be removed from the alpha counting system to prevent contamination of detector(s).

11.4.1 Alpha detectors exposed to samples with count rates greater than 1 CPS should be tagged out-of-service until an empty chamber check can be performed. To perform an empty chamber check, place a clean stainless steel disc in the chamber, establish vacuum, turn on bias and start acquisition for the pre-set time (180 minutes). Note this in the instrument and maintenance log.

12.0 DATA ANALYSIS AND CALCULATIONS

12.1 Commonly used calculations (e.g. % recovery, RPD, uncertainty, MDC, tracer recovery) and standard instrument software calculations are given in the TestAmerica St. Louis LQM.

12.1 Isotope ROIs and libraries are derived from the PCNudat master nuclide library in this SOP.

12.1.1 http://www.nndc.bnl.gov/nudat2/indx_dec.jsp

12.2 Any manual integration of a peak or group of peaks must be documented. In all instances where the data system report has been edited or where manual integration has been performed, the operator must clearly identify such edits or manual procedures. Reference SOP ST-QA-0040 for details.

13.0 DATA ASSESSMENT AND ACCEPTANCE CRITERIA; CORRECTIVE ACTIONS FOR OUT OF CONTROL DATA

13.1 The data assessment and corrective action process is detailed through the Clouseau Nonconformance Memorandum (NCM) process. The NCM process is described in SOP: ST-QA-0036. Below is a subset of the data assessment and QC excursion types within Clouseau; the text in underline is the exact "type" line in Clouseau. For a complete and current listing, please access the software program.

13.2 Method Blank

13.2.1 Acceptance Criteria:

13.2.1.1 No target analytes may be present in the method blank above the reporting limit.

13.2.1.2 Project specific requirements if more stringent than our routine procedure (e.g. no target anlaytes present above ½ RL), will be noted on the client requirements sheet.

13.2.2 Corrective Action for Method Blanks not meeting acceptance criteria:

13.2.2.1 <u>Method Blank Contamination</u> – See Clouseau NCM for corrective action (e.g. reprep/reanalysis, narration). Note certain analytes are common laboratory contaminants which require special narrative comment. These compounds are also designated in Clouseau.

13.3 Laboratory Control Sample (LCS)

13.3.1 Acceptance Criteria:

13.3.1.1 All control analytes must be within the specified control limits for accuracy (%Recovery) and precision (RPD).

13.3.2 Corrective Action for LCS not meeting acceptance criteria:

13.3.2.1 <u>LCS Spike Recovery excursion (high)</u> – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).

13.3.2.2 <u>LCS Spike Recovery excursion (low)</u> – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).

13.3.2.3 <u>RPD/RER Duplicate excursion</u> – See Clouseau NCM for corrective action (e.g. reanalysis, narration).

13.4 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

13.4.1 Analytes should be within control limits for accuracy (%Recovery) and precision (RPD).

13.4.2 Corrective Action for MS/MSD not meeting acceptance criteria:

13.4.2.1 <u>MS/MSD Spike Rec. excursion</u> may not necessarily warrant corrective action other than narration. See Clouseau NCM to determine if re-preparation re-analysis is required.

13.5 Sample result evaluation

13.5.1 Tracer recovery must be within specified limits.

13.5.2 <u>Tracer/Carrier recovery low</u>– See Clouseau NCM for corrective action.

13.5.3 <u>Tracer/Carrier recovery high</u>– See Clouseau NCM for corrective action.

13.5.3.1 A sample tracer recovery outside QC limits may be accepted if the sample results are determined valid:

13.5.3.2 minimum number of tracer counts

13.5.3.3 level of uncertainty

13.5.3.4 client project requirements/approval

13.5.4 These expections will be documented using the NCM process. The NCM will narrate the conditions upon which the sample results were accepted with tracer recovery excursions.

13.5.5 The following occurances require a dilution to be performed:

13.5.5.1 A peak is significantly tailing out side its region of interest

13.5.5.2 The tracer recovery is low due the high activity of the sample
13.5.5.3 A Peak is observed which is identified as an interference
13.5.5.4 Dilution level is determined by taking the highest gross counts divided by the count time multiplied by a factor of 2. (ie: 3580/180*2=1:40)

13.6 Insufficient Sample

13.6.1 For any prescribed re-preparation corrective action, if there is insufficient sample to repeat the analysis and narrative comment stating such is included in the report narrative. The insufficient sample description is included in the the Clouseau NCM within the type defining the excursion.

14.0 METHOD PERFORMANCE AND DEMONSTRATION OF CAPABILITY

14.1 Method performance data, Reporting Limits, and QC acceptance limits, are given in the appendix of this SOP.

14.2 Demonstration of Capability

14.2.1 Initial and continuing demonstrations of capability requirements are established in QAM

14.3 Training Qualification

14.3.1 The manager/supervisor has the responsibility to ensure that this procedure is performed by an analyst who has been properly trained in its use and has the required experience.

14.3.2 The analyst must have successfully completed the initial demonstration capability requirements prior to working independently. See requirements in QAM.

14.1 Annually, the analyst must successfully demonstrate proficiency to continue to perform this analysis. See requirements in QAM.

15.0 VALIDATION

15.1 Laboratory SOPs are based on standard reference HASL 300 28th Edition Methods that have been validated by the DOE and the lab is not required to perform validation for these methods. The requirements for lab demonstration of capability are included in LQM. Lab validation data would be appropriate for performance based measurement systems or non-standard methods. TestAmerica St. Louis will include this information in the SOP when accreditation is sought for a performance based measurement system or non-standard method

16.0 WASTE MANAGEMENT AND POLLUTION PREVENTION

16.1 All waste will be disposed of in accordance with Federal, State and Local regulations. Where reasonably feasible, technological changes have been implemented to minimize the potential for pollution of the environment. Employees will abide by this method and the policies in section 13 of the Corporate Safety Manual for “Waste Management and Pollution Prevention.”

16.2 Waste Streams Produced by the Method

16.2.1 The following waste streams are produced when this method is carried out.

16.2.1.1 Contaminated disposable glass or plastic materials utilized in the analysis are disposed of in the sanitary trash. If the lab ware was used for the analysis of radioactive samples and contains radioactivity at a level of 100 cpm over background as determined by a GM meter, the lab ware will be collected in waste barrels designated for solid rad waste for disposal by the EH&S Coordinator.

18.0 MODIFICATIONS TO REFERENCE METHOD

18.1 Energy calibrations checks are performed monthly. Daily pulsar checks are performed in place of the weekly energy calibration checks.

19.0 CHANGES TO PREVIOUS REVISION

19.1 No Changes- Annual Review
19.2 Rev. 8
19.2.1 Section 10 additions
19.2.1.1 Addition of Instrument setup as §10.1
19.2.1.2 Addition of Calibration Quality Control Check as §10.3
19.2.1.3 Addition of calibration acceptance criteria
19.3 Rev. 9
19.3.1 Section 10.5, addition of limits for pulser centroid and pulser energy
19.4 Rev. 10
19.4.1 Section 10:
19.4.1.1 2nd level review for ICV and CCV added to section 10
19.4.1.2 1200 minute setting for acquisition window for special projects
19.4.1.3 Upper control limits for long backgrounds
19.4.1.4 Detector cleaning
19.4.2 Section 12: addition of ROI and library reference
19.4.3 Section 13: Occurances that require dilution
19.4.4 Addition of Attachement 1

Attachment 1

AlphaVision Detector Key

Red – Routine only (AV1-AV8)

Green – Low Level 4+ counts (varies by month)

Yellow – Intermediate Low Level 0 – 4 counts (varies by month)
Special Projects Only

Blue – Ultra Low Level (for Pu/Am/Np)
Special Projects Only

OOS Tag – Out of Service (OOS)

White – 20 Hour background (Th and U only)

No Color – 20 Hour background

Title: LIQUID SCINTILLATION COUNTER ANALYSIS

Approvals (Signature/Date):

3/5/12	3/5/12
Chris Hough Date	Michael Ridenhower Date
Radiochemistry Manager	Health & Safety Manager / Coordinator
3.5.12	3/5/12
Marti Ward Date	Elaine Wild Date
Quality Assurance Manager	Laboratory Director

This SOP was previously identified as SOP No. ST-RD-0302 Rev. 12

Facility Distribution No.: 0 Distributed To: See Electronic Distribution Sheet

1.0 SCOPE AND APPLICATION

1.1 This procedure provides instruction for the operation of the Packard Tri-Carb series3170, Packard Tri-Carb series 3180, and Packard Tri-Carb 2550 CA/LL Liquid Scintillation Analyzer.

1.2 This procedure applies to all samples that are analyzed using the liquid scintillation counter, namely:

- Carbon 14
- Iodine 129
- Iron 55
- Lead 210
- Nickel 59 and 63
- Plutonium 241
- Technetium 99
- Tritium
- Iodine 131
- Total Activity

1.3 The reporting limits, method detectable activities and QC limits are maintained in the Information Management System (QuantIMS). A copy of the Structure and Analysis Code (SAC), which lists this information, is included in the appendix of this SOP.

2.0 SUMMARY OF METHOD

2.1 The liquid scintillation counter is calibrated with standards containing a known quantity of H^3, Iodine 131, C-14, Fe-55, I-129, Ni-59/63, Pb-210, Pu-241, and Tc-99. Not every instrument is calibrated for every nuclide. However, any instrument used to analyze a given method is calibrated for the nuclide requested.

2.2 Prepared samples are loaded into the sample tray and counted.

3.0 DEFINITIONS

3.1 See the TestAmerica Quality Assurance Manual (QAM) for a glossary of common terms and data reporting qualifiers.

3.2 Quenching - The interference with the conversion of decay energy to electronic signal in the photo multiplier tubes resulting in a reduction in counting efficiency. This can be caused by materials present in the scintillation solution that interfere with the process leading to the production of light as well as materials present that absorb the light before it reaches the photo multiplier tubes.

4.0 INTERFERENCES

4.1 See individual sample preparation SOPs.

5.0 SAFETY

5.1 Employees must abide by the policies and procedures in the Corporate Environmental Health and Safety Manual (CW-E-M-001), Radiation Safety Manual and this document. This procedure may involve hazardous material, operations and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats and closed-toe, nonabsorbent shoes are a minimum.

5.2 SPECIFIC SAFETY CONCERNS OR REQUIREMENTS
None.

5.3 PRIMARY MATERIALS USED
The following is a list of the materials used in this method, which have a serious or significant hazard rating. **NOTE: This list does not include all materials used in the method. The table contains a summary of the primary hazards listed in the MSDS for each of the materials listed in the table.** A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the MSDS for each material before using it for the first time or when there are major changes to the MSDS.

6.0 EQUIPMENT AND SUPPLIES

6.1 Packard Tri-Carb Series 3170, Packard 3180, Packard Tri-Carb 2550 CA/LL Liquid Scintillation Analyzers.

6.2 Liquid Scintillation Counter vials

7.0 REAGENTS AND STANDARDS

7.1 All standards and reagent preparation, documentation and labeling must follow the requirements of SOP ST-QA-0002, current revision.

7.2 DI Water Type obtained from the Milli-Q unit.

7.3 Unquenched standards:
- 7.3.1 Background Standard
- 7.3.2 Unquenched C -14 standard
- 7.3.3 Unquenched I-131 standard
- 7.3.4 Unquenched Fe-55 standard
- 7.3.5 Unquenched I-129 standard
- 7.3.6 Unquenched Ni-59/63 standard
- 7.3.7 Unquenched Pb-210 standard
- 7.3.8 Unquenched Pu-241 standard
- 7.3.9 Unquenched Tc-99 standard
- 7.3.10 Unquenched Tc-99 for Total Activity standard
- 7.3.11 Unquenched H3 standard
- 7.3.11 Unquenched Pm-147 standard

7.4 For Quench curves:
- 7.4.1 Quenched C-14 standard
- 7.4.2 Quenched I-131 standard
- 7.4.3 Quenched Fe-55 standard
- 7.4.4 Quenched I-129 standard
- 7.4.5 Quenched Ni-59/63 standard
- 7.4.6 Quenched Pb-210 standard
- 7.4.7 Quenched Pu-241 standard
- 7.4.8 Quenched Tc-99 standard
- 7.4.9 Quenched Tc-99 for Total Activity standard
- 7.4.10 Quenched H3 standard
- 7.4.11 Quenched Pm-147 standard

7.5 Standards may contain varying activities depending on the supplier and concentration availability of the nuclide of interest. However, all standards in a quench curve are counted until a minimum of 10,000 counts are collected.

7.6 Sample to cocktail ratios: See Attachment 1 of this SOP.

8.0 SAMPLE COLLECTION, PRESERVATION AND STORAGE

8.1 TestAmerica St. Louis supplies sample containers and chemical preservatives in accordance with the method. TestAmerica St. Louis does not perform sample collection. Samplers should reference the methods referenced and other applicable sample collection documents for detailed collection procedures. Sample volumes and preservative information is given in ST-PM-0002.

8.2 See individual sample preparation SOP for specific sample handling and storage requirements.

9.0 QUALITY CONTROL

9.1 **Batch**

9.1.1 A sample batch is a maximum of 20 environmental samples, which are prepared together using the same process and same lot(s) of reagents.

9.1.2 Instrument conditions must be the same for all standards, samples and QC samples.

9.1.3 For this analysis, batch QC consists of a method blank, a Laboratory Control Sample (LCS), Matrix Spike (MS) and a sample duplicate (SD). In the event that there is insufficient sample to analyze a sample duplicate, an LCS Duplicate (LCSD) is prepared and analyzed.

9.1.3.1 Matrix Spike (MS) and Matrix Spike Duplicate (MSD) may be performed upon client request, and are noted in the Client Requirement Sheets and Log-in.

9.2 **Method Blank**

9.2.1 A method blank is a blank matrix processed simultaneously with, and under the same conditions as, samples through all steps of the procedure.

9.2.2 A method blank must be prepared with every sample batch.

9.3 **Laboratory Control Sample**

9.3.1 An LCS is a blank matrix spiked with a known amount of analyte(s), processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.3.2 An LCS must be prepared with every sample batch.

9.4 **Matrix Spike**

9.4.1 A Matrix Spike is an aliquot of a field sample to which a known amount of target analyte(s) is added, and is processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.5 **Sample Duplicate**

9.5.1 A Sample Duplicate is an additional aliquot of a field sample taken through the entire analytical process to demonstrate precision.

9.6 **Procedural Variations/ Nonconformance and Corrective Action**

9.6.1 Any variation shall be completely documented using a Nonconformance Memo and approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

9.6.2 Any deviations from QC procedures must be documented as a nonconformance, with applicable cause and corrective action approved by the Supervisor and QA Manager.

See SOP ST-QA-0036 for details regarding the NCM process.

10.0 CALIBRATION AND STANDARDIZATION

10.1 Initial Calibration:

10.1.1 Prepare a quench curve for the nuclide of interest.

10.1.1.1 The process for quench curve preparation can be found on the print out of the previous calibration file.

10.1.2 Frequency:

10.1.2.1 Quench curves are performed minimally on an annual basis.

10.1.2.1.1 A new calibration curve is generated after major changes to the system or when the continuing calibration criteria cannot be met. Major changes include any significant changes in instrument operating parameters, and major instrument maintenance.

10.1.3 Acceptance Criteria:

10.1.3.1 A minimum of 10,000 counts must be obtained for each data point

10.1.3.2 Correlation Coefficient (r^2) > 0.995 or each data point less than 7.5% relative to the calibrated value calculated from the fitted curve.

10.1.3.3 Except in specific instances, it is NOT acceptable to remove points from a calibration curve for meeting criteria. Refer to the TestAmerica Policy CA-T-P-0002, Selection of Calibration Points

10.2 Initial Calibration Verification (ICV)

10.2.1 The initial calibration verification standard is a different standard source than the one used for the initial calibration.

10.2.2 Validate the quench curve by counting at least three second source standards.

10.2.2.1 The process of preparing validation standards is found on the print out of the previous calibration file. The verification standards should contain an unquenched standard as well as quenched standards that represent the quench range of live samples.

10.2.3 Frequency:

10.2.3.1 An ICV is performed with every initial calibration.

10.2.4 Acceptance Criteria:

10.2.4.1 Mean Recovery +/- 10% of the known value.

10.2.4.1.1 Not meeting this requirement may be indicative of serious system malfunction or inaccuracies in the standards used for the initial calibration curve or ICV standard.

10.2.4.1.2 Corrective action must be taken (including reanalysis of the ICV or analysis of a different ICV).

10.3 Continuing Calibration:

10.3.1 Load standards and use the appropriate protocol flag as listed on the status page “Daily QC”. The instrument will perform the required tests and the results are printed and saved to the Quality Control Table.

10.3.2 Frequency:

10.3.2.1 Quality control checks are performed for each day of use for the nuclides which measurements are being performed.

10.3.3 Acceptance Criteria:

10.3.3.1 The instruments are set at 2 sigma for a warning and 3 sigma for out of control limits.

10.3.3.2 If a Continuing Check fails and the analyst can document the reason for failure (e.g. carryover from the previous sample, etc.) then a second check may be analyzed without any adjustments to the instrument. If this check meets criteria then sample analysis may continue.

10.3.3.3 If this second check does not meet criteria, the analysis run is terminated. Instrument maintenance is performed and the instrument may require calibration.

11.0 PROCEDURE

11.1 Confirm the following:

11.1.1 Computer software is loaded and operational.

11.1.2 Printer is on-line.

11.2 Load sample vials by lifting the instrument cover and placing samples in tray with flag facing towards the left.

11.3 Samples are counted from left to right. QC checks are run daily. Prior to starting samples, make sure the daily QC has run and is acceptable.

11.4 Position 1 in the sample tray is reserved for the background vial.

11.5 Log the following information into the Run Log:

11.5.1 Date

11.5.2 Batch number

11.5.3 Sample I.D.

11.5.4 Protocol No.

11.5.5 Count length

11.5.6 Type of analysis

11.5.7 Operator's initials

11.6 Close instrument cover and allow sample vials to dark-adapt per the cocktail manufacturer's instructions, typically 30 minutes.

11.7 Spectrum are assessed for interferences, peak shape, etc. against a known source either the LCS or the instruments reference manual.

11.8 For the Packard 2550 LSC:

11.8.1 Press F1 key until Status Page is displayed on monitor. Enter the protocol number and press Enter.

11.8.2 Press F3 Key and verify the desired count time is entered. If needed, use the arrow keys to go to the count time parameter and type in the correct count time. Then press the enter key. Press F1 key to return to the Status Page.

11.8.3 Verify sample tray is in the correct order, starting with the background, blank, LCS, followed by the samples. Label the prep sheet with the correct counting order.

11.8.4 Press F10 key to go to the Worklist page.

11.8.4 Use the arrow keys to go to the beginning of the Worklist. Place the cursor on the second line of the Worklist. Press F3 key repeatedly until all the lot numbers from the previous analysis have been deleted.

11.8.5 Scan current batch in correct sample order. Press enter twice between each sample ID Press F1 to exit worklist. Press F2 to confirm exit.

11.8.6 Press F11 key to start the analysis.

11.8.7 Data is sent to the printer

11.8.8 When the batch is done counting, save the data file and transfer to a disk.

11.8.8.1 To save the data file, select F5 (DOS Exit).

11.8.8.2 Place disk in drive and change directory and save data as follows: Type command *CD\spectrum* (this will change to the spectrum directory where the data is retrieved)

11.8.8.3 Type command *copy s.data X.XXX a:* (X.XXX will be found on the first page of the data printout). (This will copy the data to the disk)

11.8.8.4 Type command rename sdata.X.XXX batch number i.e. *rename sdata1.123 875413.* (this will rename the file in the spectrum directory)

11.8.8.5 Type command *exit* which will return to the status page. (The data is now saved to the disk)

11.8.8.6 Transfer the file the Upload folder, 2550 on SLSVR01.

11.9 For the Packard 3170 LSC and 3180 LSC:

11.9.1 Maximize the instrument window. Double click on the flag icon which has the protocol number that needs to be run. Click on the count conditions tab at the top of the analysis window. Enter the correct count time in the count time field.

11.9.2 Click on the Worklist tab at the top of the analysis window. Scan the samples from the Rad Capture paperwork.

11.9.3 Verify sample tray is in the correct order, starting with the background, blank, LCS, followed by the samples. Check tray order with the order appearing on the screen version of the worklist.

11.9.4 Click on the green start flag in the upper left corner of the instrument window.

11.9.5 Upon completion of counting, results will be sent to printer. The data is sent to the appropriate instrument folder.

12.0 DATA ANALYSIS AND CALCULATIONS

12.1 Calculations are performed in RadCapture (TestAmerica St. Louis custom software). These calculations are printed directly from the software and are included the TestAmerica St. Louis QAM.

12.2 Commonly used calculations (e.g. % recovery, RPD, uncertainty, MDC, tracer recovery) and standard instrument software calculations are given in the TestAmerica St. Louis QAM.

13.0 DATA ASSESSMENT AND ACCEPTANCE CRITERIA; CORRECTIVE ACTIONS FOR OUT OF CONTROL DATA

13.1 The data assessment and corrective action process is detailed through the Clouseau Nonconformance Memorandum (NCM) process. The NCM process is described in SOP: ST-QA-0036. Below is a subset of the data assessment and QC excursion types within Clouseau; the text in underline is the exact "type" line in Clouseau. For a complete and current listing, please access the software program.

13.2 Method Blank

13.2.1 Acceptance Criteria:

13.2.1.1 No target analytes may be present in the method blank above the reporting limit.

13.2.1.2 Project specific requirements if more stringent than our routine procedure (e.g. no target anlaytes present above ½ RL), will be noted on the client requirements sheet.

13.2.2 Corrective Action for Method Blanks not meeting acceptance criteria:

13.2.2.1 Method Blank Contamination – See Clouseau NCM for corrective action (e.g. reprep/reanalysis, narration). Note certain analytes are common laboratory contaminants which require special narrative comment. These compounds are so designated in Clouseau.

13.3 Laboratory Control Sample (LCS)

13.3.1 Acceptance Criteria:

13.3.1.1 All control analytes must be within the specified control limits for accuracy (%Recovery) and precision (RPD).

13.3.2 Corrective Action for LCS not meeting acceptance criteria:

13.3.2.1 LCS Spike Recovery excursion (high) – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).

13.3.2.2 LCS Spike Recovery excursion (low) – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).

13.3.2.3 RPD/RER Duplicate excursion – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).

13.4 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

13.4.1 Analytes should be within control limits for accuracy (%Recovery) and precision (RPD).

13.4.2 Corrective Action for MS/MSD not meeting acceptance criteria:

13.4.2.1 MS/MSD Spike Rec. excursion may not necessarily warrant corrective action other than narration. See Clouseau NCM to determine if re-preparation re-analysis is required.

13.5 Sample result evaluation

13.5.1 Tracer recovery must be within specified limits.
Tracer/Carrier recovery low– See Clouseau NCM for corrective action.

13.5.2 Tracer/Carrier recovery high– See Clouseau NCM for corrective action.

13.5.2.1 A sample tracer recovery outside QC limits may be accepted if the sample results are determined valid:

13.5.2.2 Minimum number of tracer counts

13.5.2.3 Level of uncertainty

13.5.2.4 Client project requirements/approval

13.5.3 These expectations will be documented using the NCM process. The NCM will narrate the conditions upon which the sample results were accepted with tracer recovery excursions.

13.6 Insufficient Sample

13.6.1 For any prescribed re-preparation corrective action, if there is insufficient sample to repeat the analysis and narrative comment stating such is included in the report narrative. The insufficient sample description is included in the Clouseau NCM within the type defining the excursion.

14.0 METHOD PERFORMANCE AND DEMONSTRATION OF CAPABILITY

14.1 Method performance data, Reporting Limits, and QC acceptance limits, are given in the appendix of this SOP.

14.2 Demonstration of Capability

14.2.1 Initial and continuing demonstrations of capability requirements are established in the QAM.

14.3 Training Qualification

14.3.1 The manager/supervisor has the responsibility to ensure that this procedure is performed by an analyst who has been properly trained in its use and has the required experience.

14.3.2 The analyst must have successfully completed the initial demonstration capability requirements prior to working independently. See requirements in the QAM.

14.4 Annually, the analyst must successfully demonstrate proficiency to continue to perform this analysis. See requirements in the QAM.

15.0 VALIDATION

15.1 Laboratory SOPs are based on standard reference EPA, DOE, and ASTM methodologies that have been validated by the EPA and the lab is not required to perform validation for these methods. The requirements for lab demonstration of capability are included in QAM. Lab validation data would be appropriate for performance based measurement systems or non-standard methods. TestAmerica St. Louis will include this information in the SOP when accreditation is sought for a performance based measurement system or non-standard method

16.0 WASTE MANAGEMENT

16.1 All waste will be disposed of in accordance with Federal, State and Local regulations. Where reasonably feasible, technological changes have been implemented to minimize the potential for pollution of the environment. Employees will abide by this method and the policies in section 13 of the Corporate Environmental Health and Safety Manual for "Waste Management and Pollution Prevention."

16.2 Waste Streams Produced by the Method

16.2.1 The following waste streams are produced when this method is carried out.

16.2.1.1 Acidic sample waste generated. All acidic waste will be accumulated in the appropriate waste accumulation container, labeled as Drum Type "A" or "B."

16.2.1.2 Contaminated disposable glass or plastic materials utilized in the analysis are disposed of in the sanitary trash. If the lab ware was used for the analysis of radioactive samples and contains radioactivity at a level of 100 cpm over background as determined by a GM meter, the lab ware will be collected in waste barrels designated for solid rad waste for disposal by the EH&S Coordinator."

18.0 CLARIFICATIONS, MODIFICATIONS TO THE REFERENCE METHOD

18.1 EPA method 906 is a drinking water method, and as such formulated its' Tritium calculation to reflect counts per minute (CPM) rather than disintegrations per minute (dpm). In true drinking water samples, it is acceptable to use CPM since drinking water samples should have little effect on efficiencies. However, EPA method 906 is commonly referenced for wastewater samples, and even silica gels and soil matrices. For these matrices, there can be a significant difference in efficiency and thus using dpm provides a more accurate result.

19.0 CHANGES TO PREVIOUS REVISION

19.1 Added Promethium back to the list of standards in section 7.3.11 and 7.3.10.
19.2 Rev 13:
19.2.1 Added Iodine-131 and Total Activity to section 1.2.
19.2.2 Added Iodine-131 to section 2.1.
19.2.3 Added section 7.6 and attachment 1 to document sample to cocktail ratios
19.2.4 Removed redundant section 18.2.

Attachment 1

LIQUID SCINT. SAMPLE TO COCKTAIL RATIOS

ST-RC-0015	Total Activity	
Solid and Semi-solid Samples		
	0.25 - 3 mL	Sample
	15 - 17 mL	Cocktail
	18 mL	Final
Aqueous Samples		
	0.25 - 3 mL	Sample
	15 - 17 mL	Cocktail
	18 mL	Final
Oil Samples		
	3 mL	Sample
	15 mL	Cocktail
	18 mL	Final

ST-RC-0030	Tritium	
Steam Distillation (Water); Silica Gel; Solids (soil, filters/swipes); Direct Method - Water		
	10 mL	Sample
	10 mL	Cocktail
	20 mL	Final
Direct Method - Oil		
	1 - 2 mL	Sample
	18 - 19 mL	Cocktail
	20 mL	Final

ST-RC-0031	Tritium Cryo	
	10 mL	Sample must dilute to 10 mL total if 10 mL of sample not present
	10 mL	Cocktail
	20 mL	Final

ST-RC-0042	I-129	
Carrier Determination by ICP-MS		
	4.9 mL	Sample
	15 mL	Cocktail
	19.9 mL	Final
gravimetric carrier		
	5 mL	Sample
	15 mL	Cocktail
	20 mL	Final

ST-RC-0055	I-55 & Ni-59/63	
Iron		
	4.9 mL	Sample
	15 mL	Cocktail
	19.9 mL	Final
Nickel		
	3.9 mL	Sample
	16 mL	Cocktail
	19.9 mL	Final

This SOP was previously identified as SOP No. ST-MS-0002 Rev. 17

Facility Distribution No.: 0 Distributed To: See Electronic Distribution Sheet

1.0 SCOPE AND APPLICATION

1.1 This SOP is applicable to the determination of Volatile Organic Compounds in waters, wastewater, soils, sludges and other solid matrices.

1.2 This SOP is applicable to SW-846 method 8000B, 8000C, 8260B, 8260C, Drinking water method 524.2, and EPA 624.

1.3 This method can be used to quantify most volatile organic compounds that have boiling points below 200°C and are insoluble or slightly soluble in water. Volatile water soluble compounds can be included in this analytical technique; however, for more soluble compounds, quantitation limits are approximately ten times higher because of poor purging efficiency.

1.4 The method is based upon a purge and trap, gas chromatograph/mass spectrometric (GC/MS) procedure. The approximate working range is 1 to 200 μg/L for 5 mL waters, 0.5 to 40 μg/L for 25 mL purge waters, 5 to 200 μg/kg for low-level soils, and 250 to 25,000 μg/kg for high-level soils.

1.5 The laboratory target analytes supported by this method, the reporting limits, method detection limits and QC limits are maintained in the Information Management System (QuantIMS). A copy of the Structure and Analysis Code (SAC), which lists this information, is included in the appendix of this SOP.

1.5.1 Additional compounds may be amenable to this method. The minimum requirement for non-standard analytes is that the reporting limit be set at the lowest required concentration that can actually be detected by the instrument, and when an MDL study can not be conducted, the MDL be set equal to the reporting limit.

2.0 SUMMARY OF METHOD

2.1 Volatile compounds are introduced into the gas chromatograph by the purge and trap method. The components are separated via the chromatograph and detected using a mass spectrometer, which is used to provide both qualitative and quantitative information.

2.2 In the purge and trap process, an inert gas is bubbled through the solution at ambient temperature or at 40^oC (40^oC required for low level soils) and the volatile components are efficiently transferred from the aqueous phase to the vapor phase. The vapor is swept through a sorbant column where the volatile components are trapped. After purging is completed, the sorbant column (trap) is heated and flushed with inert gas to desorb the components onto a gas chromatographic column. The gas chromatographic column is then heated to elute the components that are detected with a mass spectrometer.

2.3 Qualitative identification of the parameters in the extract is performed using the retention time and the relative abundance of characteristic ions. Quantitative analysis is performed using the internal standard technique with a single characteristic ion.

2.4 The use of selected ion monitoring (SIM) is acceptable for applications requiring quantitation limits below the normal range of electro impact mass spectrometry. However, SIM may provide a lesser degree of confidence in the compound identification, since less mass spectral information is available. Instead of scanning everything in a retention time range, SIM looks for specific ions (qualitative and quantitative) that are placed in retention time groups. The ions used for qualitative and quantitative purposes are the same for scan and SIM analysis. The laboratory currently only runs a SIM method for 1,4 dioxane. Details are available in Appendix 1 of this SOP.

3.0 DEFINITIONS

3.1 See the TestAmerica St. Louis Quality Assurance Manual (QAM) for a glossary of common laboratory terms and data reporting qualifiers.

3.2 SIM – Single Ion Monitoring

4.0 INTERFERENCES

4.1 Method interferences may be caused by contaminants in solvents, reagents, glassware, and other processing apparatus that lead to discrete artifacts. All of these materials must be routinely demonstrated to be free from interferences under conditions of the analysis by running laboratory method blanks as described in the Quality Control section. The use of ultra high purity gases, pre-purged purified reagent water or purchased HPLC water, and approved lots of purge and trap grade methanol will greatly reduce introduction of contaminants.

4.2 Samples can be contaminated by diffusion of volatile organics (particularly methylene chloride and fluorocarbons) into the sample through the septum seal during shipment and storage. A field blank prepared from reagent water and carried through the sampling and handling protocol can serve as a check on such contamination. Trip Blanks, prepared from reagent water, can serve as a check on conditions during transportation from the field to the laboratory.

4.3 Matrix interferences may be caused by non-target contaminants that are coextracted from the sample. The extent of matrix interferences will vary considerably from source to source depending upon the nature and diversity of the site being sampled.

4.4 Cross-contamination can occur whenever high-level and low-level samples are analyzed sequentially or in the same purge position on an autosampler. Whenever an unusually concentrated sample is analyzed, it should be followed by one or more blanks to check for cross-contamination. The purge and trap system may require extensive bake-out and cleaning after a high-level sample.

4.5 Some samples may foam when purged due to surfactants present in the sample. When this kind of sample is encountered an antifoaming agent can be used. A blank spiked with this agent must be analyzed with the sample because of the non-target interferences associated with the agent.

5.0 SAFETY

5.1 Employees must abide by the policies and procedures in the Corporate Environmental Health and Safety Manual (CW-E-M-001), Radiation Safety Manual and this document. This procedure may involve hazardous material, operations and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats and closed-toe, nonabsorbent shoes are a minimum.

5.2 **SPECIFIC SAFETY CONCERNS OR REQUIREMENTS**

5.2.1 The gas chromatograph and mass spectrometer contain zones that have elevated temperatures. The analyst needs to be aware of the locations of those zones, and must cool them to room temperature prior to working on them.

5.2.2 The mass spectrometer is under deep vacuum. The mass spectrometer must be brought to atmospheric pressure prior to working on the source.

5.2.3 There are areas of high voltage in both the gas chromatograph and the mass spectrometer. Depending on the type of work involved, either turn the power to the instrument off, or disconnect it from its source of power.

5.3 **PRIMARY MATERIALS USED**

5.3.1 The following is a list of the materials used in this method, which have a serious or significant hazard rating. NOTE: This list does not include all materials used in the method. The table contains a summary of the primary hazards listed in the MSDS for each of the materials listed in the table. A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the MSDS for each material before using it for the first time or when there are major changes to the MSDS.

Material (1)	Hazards	Exposure Limit (2)	Signs and symptoms of exposure
Methanol	Flammable Poison Irritant	200 ppm (TWA)	A slight irritant to the mucous membranes. Toxic effects exerted upon nervous system, particularly the optic nerve. Symptoms of overexposure may include headache, drowsiness and dizziness. Methyl alcohol is a defatting agent and may cause skin to become dry and cracked. Skin absorption can occur; symptoms may parallel inhalation exposure. Irritant to the eyes.
1 – Always add acid to water to prevent violent reactions.			
2 – Exposure limit refers to the OSHA regulatory exposure limit.			
TWA – Time Weighted Average			

6.0 EQUIPMENT AND SUPPLIES

6.1 Micro syringes- 1.0 µL, 10µL, 25 µL, 50µL, 100 µL, 250µL, 500µL, 1000µL. Hamilton 1700 series

6.2 Volumetric flasks, Class A

6.3 Analytical Balance, capable of weighing ± 0.001 grams

6.4 Syringe: 5 or 25 mL glass with Luerlok tip, if applicable to the purging device.

6.5 Vials: 20 and 40 mL with Teflon lined screw caps

6.6 Spatula: Disposable wooden tongue depressors

6.7 Disposable pipettes

6.8 pH paper: Wide range & 0.3 to 2.3

6.9 Glass beads: Store in a drying oven.

6.10 Gas Chromatograph/Mass Spectrometer System:

6.10.1 Gas Chromatograph: Hewlett Packard GC 5890 and Agilent 6890 system with temperature programming.

6.10.2 Purge and Trap Device: The purge and trap device consists of the sample purger, the trap, and the desorb heater.

6.10.3 Gas Chromatographic Capillary Columns:

6.10.3.1 Mass Spectrometer: Hewlett Packard 5970, 5972 and 5973 mass spectrometers capable of scanning 35-300 AMU every two seconds or less, using 70 volts electron energy in the electron impact mode.

6.10.4 GC/MS interface: In general split/splitless injector are used but any interface (including direct introduction to the mass spectrometer) that achieves all acceptance criteria may be used.

6.10.5 Data System:

6.10.5.1 ChemStation software system that allows the continuous acquisition and storage on machine-readable media of all mass spectra obtained throughout the duration of the chromatographic program.

6.10.5.2 Target software system allows searching any GC/MS data file for ions of a specified mass and plotting such ion abundances versus time or scan number. This type of plot is defined as an Extracted Ion Current Profile (EICP). Software allows integrating the abundances in any EICP between for a specified time or scan-number limit. Also, for the non-target compounds, software a mass spectrum that meets the required criteria when 50ng of 4-Bromofluorobenzene (BFB) are must be available that allows for the comparison of sample spectra against reference library spectra. The most recent release of the NIST/EPA mass spectral library should be used as the reference library.

6.10.5.2.1 Data Library: NIST 98

6.11 Carrier gas: Ultra high purity helium

6.12 Make up gas: Ultra high purity helium

7.0 REAGENTS AND STANDARDS

7.1 All standards and reagent preparation, documentation and labeling must follow the requirements of SOP ST-QA-0002, current revision.

7.2 Methanol: Purge and Trap Grade

7.3 Water: HPLC grade or equivalent.

7.4 See recipes for standards and QC samples in the Standards Log program.

7.5 Calibration Standards and Surrogates

7.5.1 Stock Solutions: Stock solutions may be purchased as certified solutions from commercial sources or prepared from pure standard materials as appropriate. These standards are prepared in methanol and stored in Teflon-sealed screw-cap bottles with minimal headspace at 0° to -20°C.

7.5.2 Working standards: A working solution containing the compounds of interest prepared from the stock solution(s) in methanol. These standards are stored in the freezer or as recommended by the manufacturer.

7.5.2.1 See SOP: ST-QA-0002 for expiration date criteria.

7.6 Initial calibration verification (ICV) standards are similar to calibration standards, but are from a completely different source.

7.7 Internal Standards: Internal standards are added to all samples, standards, and blank analyses.

7.8 Tuning Standard: A 25ng/ul 4-Bromofluorobenzene standard is made up that will deliver 50ng (or 25 ng) on column upon injection.

7.9 Sodium Bisulfate, crystal

7.10 Ascorbic Acid, ACS Reagent Grade, granular

7.11 Sodium Thiosulfate, ACS Reagent Grade, granular

8.0 SAMPLE COLLECTION, PRESERVATION AND STORAGE

8.1 TestAmerica St. Louis supplies sample containers and chemical preservatives in accordance with the method. TestAmerica St. Louis does not perform sample collection. Samplers should reference the methods referenced and other applicable sample collection documents for detailed collection procedures. Sample volumes and preservative information is given in ST-PM-0002.

8.2 Aromatic volatiles water samples are preserved with 1:1 HCl and stored at 4 ± 2 °C. Analysis hold time is 14 days from collection.

8.3 Aqueous samples are stored in glass containers with Teflon lined septa at 4^{o}C +/- 2^{o}C, with minimum headspace.

8.4 Soil samples are refrigerated at 4 ± 2 °C. Analysis hold time is 14 days from collection.

8.4.1 Medium level solid extracts are aliquoted into 2 - 5 mL glass vials with Teflon lined caps and stored at 4^{o}C +/- 2^{o}C. The extracts are stored with minimum headspace.

8.5 For 5035 analysis

8.5.1 Solid samples, for low level analysis, may be field preserved with sodium bisulfate solution, or collected unpreserved using the Encore (or equivalent)™ sampler and shipped to the laboratory within 48 hours of sampling.

8.5.1.1 Following shipment back to the lab the soil is preserved with sodium bisulfate or the sample is extruded into an empty, clean sealed vial and frozen within 48 hours of sampling.

8.5.1.2 It is recommended that two Encore (or equivalent) samplers be used for each field sample position, to allow for any reruns than may be necessary.

8.5.2 Solid samples, for medium level analysis, may be field extracted with methanol, or collected unpreserved using the Encore (or equivalent)™ sampler and shipped to the laboratory within 48 hours of sampling.

8.5.2.1 It is recommended that two Encore (or equivalent) samplers be used for each field sample position, to allow for any reruns than may be necessary.

8.5.2.2 Solid samples – field extracted with methanol

8.5.2.2.1. Prepare a 2 oz sample container by adding 25 mL purge and trap grade methanol. (If a 5 g sample is to be used, add 5 mL methanol to a 2 oz container or VOA vial).

8.5.2.2.2. Seal the bottle and attach a label.

8.5.2.2.3. Weigh the bottle to the nearest 0.01g and note the weight on the label.

8.5.2.2.4. Ship with appropriate sampling instructions.

8.5.2.2.4.1. At client request, the methanol addition and weighing may also be performed in the field.

8.5.2.2.4.2. When the samples are returned to the lab, obtain the weight of the soil added to the vial and note on the label.

8.5.2.3 Solid samples – field extracted with methanol

8.5.2.3.1. When the samples are returned to the lab, extrude the (nominal) 5g (or 25g) sample into a pre-weighed VOA vial containing 5mL methanol (25mL methanol for the 25g sampler). Obtain the weight of the soil added to the vial and note on the label.

8.6 An additional sample is collected for percent moisture determination.

8.7 EPA 524.2 Sample Dechlorination and Preservation

8.7.1 If specified by the client that actual drinking water samples containing residual chlorine are to be analyzed by the laboratory, the following procedure shall be used:

8.7.1.1 Finished drinking water samples suspected of containing residual chlorine shall have 25 mg of ascorbic acid added to each 40 ml VOA vial prior to filling. If the requested target analytes are not gases at room temperature or are not listed in Table 7 of EPA Method 524.2, sodium thiosulfate is recommended to reduce residual chlorine (3 mg sodium thiosulfate for each 40 ml VOA vial).

8.7.1.2 If the sample containers are prepared by the laboratory for filling by the sample collector, the ascorbic acid or sodium thiosulfate will be placed into unpreserved VOA vials (do not mix the ascorbic acid or sodium thiosulfate with the HCl used for preservation).

8.7.1.3 It will be the sample collector's responsibility to add additional ascorbic acid or sodium thiosulfate if a diethyl-p-phenylenediamine (DPD) test kit indicates residual chlorine in excess of 5 mg/L (25 mg ascorbic acid or 3 mg sodium thiosulfate per each 5 mg/L of residual chlorine).

8.7.1.4 After filling the VOA vial, the sample collector should adjust the sample to pH<2 by carefully adding two drops of 1:1 HCl for each 40 ml of sample. Samples should be sealed and mixed for one minute. (Note: If the sample is to be analyzed for trihalomethanes (THMs) only, the HCl preservation step may be omitted if sodium thiosulfate was used for dechlorination.)

8.7.1.5 If a sample foams vigorously when HCl is added, the sample should be discarded. Fill fresh VOA vials containing ascorbic acid or sodium thiosulfate, but do not acidify. A note should be placed on the chain-of-custody that is submitted with the samples that they were "not acidified". These samples have a 24 hold time if target analytes other than THMs are to be analyzed.

8.7.1.6 Samples should be maintained at $4^oC \pm 2^oC$ until analysis.

8.8 At specific client request, unpreserved soils packed into glass jars or brass tubes may be accepted and sub-sampled in the lab.

8.8.1 This is an older procedure based on method 5030.

9.0 QUALITY CONTROL

9.1 Batch

9.1.1 A sample batch is a maximum of 20 environmental samples, which are prepared together using the same process and same lot(s) of reagents. A preparation batch is composed of one to 20 environmental samples of a similar matrix, meeting the above mentioned criteria. Where no preparation method exists (example, volatile organics, water) the batch is defined as environmental samples that are analyzed together with the same process and personnel, using the same lots of reagents, not to exceed 20 environmental samples. An analytical batch is composed of prepared environmental samples, extracts, digestates or concentrates that are analyzed together as a group. An analytical batch can include prepared samples originating from various environmental matrices and can exceed 20 samples.

9.1.2 Instrument conditions must be the same for all standards, samples and QC samples.

9.1.3 For this analysis, batch QC consists of a method blank, a Laboratory Control Sample (LCS), Matrix Spike (MS) and Matrix Spike Duplicate (MSD). In the event that there is insufficient sample to analyze a MS/MSD, an LCS Duplicate (LCSD) is prepared and analyzed.

9.1.4 Samples having different QC codes, due to non-standard client specific QC requirements, must be batched separately in the LIMS. A method blank and LCS may be shared across QC codes provided the actual "sample batch" does not exceed 20 environmental samples. MS/MSD must be performed for each separate QC code.

9.1.5 Unless medium level (i.e. an extraction batch) the blank, LCS and MS/MSD MUST run in the same 12 hour clock. The definition of a non-extraction batch is a maximum of 20 samples run in a 12 hr clock.

9.2 **Method Blank**

9.2.1 A method blank is a blank matrix processed simultaneously with, and under the same conditions as, samples through all steps of the procedure.

9.2.2 For Water analyses, the method blank is comprised of HPLC water.

9.2.3 For Soil analyses, the method blank is comprised of glass beads.

9.2.4 **For water and low soil method 8260 and 524.2 analyses**

9.2.4.1 A method blank must be analyzed with every 12 hour analytical clock and/or with each batch of 20 samples, whichever occurs first.

9.2.5 **For water method 624 analyses**

9.2.5.1 A method blank must be analyzed with every 24 hour analytical clock and with each batch of 20 samples, whichever occurs first..

9.2.6 **For medium level soil method 8260 analyses**

9.2.6.1 A method blank must be prepared with every medium level soil batch (20 or fewer samples of the same matrix). The medium level method blank is tied to an extraction and does not require repeated analysis with each sample analysis batch.

9.2.7 Method blank population studies shall be performed periodically. The data from such studies shall be used to identify systemic contamination issues.

9.3 **Laboratory Control Sample**

9.3.1 An LCS is a blank matrix spiked with a known amount of analyte(s), processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.3.2 For Water analyses, the LCS is comprised of HPLC water fortified with Volatiles.

9.3.2.1 For water analyses, the LCS and ICV are the identical. If an ICV was already run in the 12 hour analysis clock, the analyst may chose to omit running a second LCS. The ICV is uploaded as the LCS.

9.3.3 For Soil analyses, the LCS is comprised of glass beads fortified with Volatiles.

9.3.4 **For method 8260 and 524.2 analyses**

9.3.4.1 A LCS must be analyzed with every 12 hour analytical clock and with each batch of 20 samples, whichever occurs first..

9.3.5 **For method 624 analyses**

9.3.5.1 A LCS must be analyzed with every 24 hour analytical clock and with each batch of 20 samples.

9.3.5.2 A LCS must be prepared with every high level soil batch (20 or fewer samples of the same matrix).

9.3.6 **For medium level soil method 8260 analyses**

9.3.7 An LCS must be prepared with every medium level soil batch (20 or fewer samples of the same matrix).

9.3.7.1 The medium level LCS is tied to an extraction and does not require repeated analysis with each sample analysis batch.

9.4 **Matrix Spike/Matrix Spike Duplicate**

9.4.1 A Matrix Spike is an aliquot of a field sample to which a known amount of target analyte(s) is added, and is processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.4.2 **8260** - A MS/MSD must be analyzed with every 12 hour analytical clock and with each batch of 20 samples, whichever occurs first..

9.4.3 **524.2** - Method 524.2 does not require a MS/MSD be performed though it may be requested by the client. In the absence of client QC criteria for this MS/MSD, the laboratory will use 70%-130% recovery limits, and RPD of 20%, as advisory criteria.

9.4.4 **624** - A MS/MSD must be analyzed with every 24 hour analytical clock and with each batch of 20 samples, whichever occurs first..

9.5 **Surrogate**

9.5.1 A surrogate is a non-target analyte similar in chemical composition and behavior, which mimics the target analytes during preparation, extraction and analysis.

9.5.2 Surrogate(s) is added to every field sample, method blank, LCS and MS/MSD for analysis at the beginning of the sample preparation process.

9.6 **Procedural Variations/ Nonconformance and Corrective Action**

9.6.1 Any variation shall be completely documented using a Nonconformance Memo and approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

9.6.2 Any deviations from QC procedures must be documented as a nonconformance, with applicable cause and corrective action approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

10.0 CALIBRATION AND STANDARDIZATION

10.1 Internal standard calibration is used.

10.1.1 Internal standard calibration is used. The internal standards are listed in this SOP. Target compounds should reference the nearest internal standard. Each calibration standard is analyzed and the response factor (RF) for each compound is calculated using the area response of the characteristic ions against the concentration for each compound and internal standard.

10.2 **Instrument Tuning**

10.2.1 Each GC/MS system must be hardware-tuned to meet the abundance criteria, listed in this SOP, for a maximum of a 50 ng (8260 and 624) and 25ng (524.2) injection or purging of BFB. These criteria must be met

10.2.1.1 **8260** - for each 12-hour time period

10.2.1.2 **524.2** – for each 12-hour time period

10.2.1.3 **624** – for each 24-hour time period

10.2.1.3.1. The time period begins at the moment of injection of BFB.

10.2.2 Inject the method appropriate amount of GC/MS tuning standard into the GC/MS system. Obtain a background-corrected mass spectra of BFB and confirm that all the key m/z criteria in Table 2 are achieved. If all the criteria are not achieved, the analyst must retune the mass spectrometer and repeat the test until all criteria are achieved. The performance criteria must be achieved before any samples, blanks, or standards are analyzed.

10.3 **Initial Calibration**

10.3.1 Prepare a multi-point calibration curve by fortifying 5ml of HPLC water with incrementing concentrations of Volatiles standard.

10.3.2 The initial calibration contains a minimum of 5points, for each target analyte (6 points are required for a quadratic fit.) The low level standard must be at or below the reporting limit. The other standards define the working range of the detector, with the highest level standard establishing the linear range of the instrument.

10.3.2.1 Note 624 requires a minimum 3 point calibration. The low level standard must be at or below the reporting limit. The other standards define the working range of the detector, with the highest level standard establishing the linear range of the instrument.

10.3.3 A new calibration curve must be generated after major changes to the system or when the continuing calibration criteria cannot be met. Major changes include new columns, any significant changes in instrument operating parameters, and major instrument maintenance.

10.3.4 Except in specific instances, it is NOT acceptable to remove points from a calibration curve for the purpose of meeting criteria. Refer to the TestAmerica Policy CA-T-P-0002, Selection of Calibration Points

10.3.5 Sample peak areas are compared to peak areas of the standards. The ratio of the detector response to the amount concentration of analyte in the calibration standard is defined as the response factor (RF) or calibration factor (CF).

10.3.6 **Initial Calibration Criteria (SW 8000B/8260B)**:

10.3.6.1 The % RSD of the calibration check compounds (CCC) must be less than 30%. CCC are as follows:

Vinyl Chloride

1,1-Dichloroethene

Chloroform

1,2-Dichloropropane

Toluene

Ethylbenzene

10.3.6.2 If none of the CCCs are required analytes, project specific calibration specifications must be agreed with the client.

10.3.6.3 The average RF must be calculated for each compound. A system performance check is made prior to using the calibration curve. The five system performance check compounds (SPCC) are checked for a minimum average response factor.

10.3.6.3.1. A **minimum response factor of 0.01** must be achieved for all other volatile target analytes.

Compound	Min. RF
Chloromethane	0.100
1,1-Dichloroethane	0.100
Bromoform	>0.100
1,1,2,2-Tetrachloroethane	0.300
Chlorobenzene	0.300

10.3.6.4 If all %RSDs in the initial calibration are ≤ 15%, then all analytes may use average response factor for calibration.

10.3.6.5 The analyst should evaluate analytes with %RSD > 15%.

10.3.6.5.1. Evaluate whether the problem is related to the analytical range. The low standard or the high standard having a response that is out of line with the others typically expresses this. For criteria regarding the removing calibration points from the curve, refer to STL policy P-T-001, Selection of Calibration Points.

10.3.6.6 For SW846 Method 8000B

10.3.6.6.1. If the average of all %RSDs in the calibration is > 15%, the analyst should consider instrument maintenance to improve the linearity of response.

10.3.6.6.2. When a linear regression curve is used, the intercept of the curve at zero response must be less than + or – the reporting limit for the analyte. Client requirements may be tighter. (see Section 10.3.7.6.1)

10.3.6.6.3. If a linear regression curve is used, r must be ≥ 0.995.

10.3.6.6.4. When a linear model is employed use of 1/Concentration^2 weighting is recommended to improve the accuracy of quantitation at the low end of the curve and to better control the intercept at zero response.

10.3.6.6.5. The regression may be forced through zero when using a linear model. See specific client requirements to determine if this technique is allowed for specific sample groups.

10.3.7 **Initial Calibration criteria (8000C/8260C and 524.2)**:

10.3.7.1 Minimum Response Factors (SW 8260C only)

10.3.7.1.1. See Table 4 in this SOP for recommended minimum response factors prescribed by method 8260. For analytes not given a minimum response factor by the method, TestAmerica St. Louis has established a default of 0.01 and 0.001 depending on the nature of the compound.

10.3.7.2 SW-846 8260C and 524.2 chromatographic methods allow the use of both linear and non-linear models for the calibration data.

10.3.7.3 The first way is to begin with the simplest approach, the linear model through the origin, and then progress through other options until the calibration acceptance criteria are met. The second way is to use technical knowledge of the detector response to the target compound to choose the calibration model.

10.3.7.4 The option for non-linear calibration may be necessary to address specific instrumental techniques. However, it is not EPA's intent to allow non-linear calibration to be used to compensate for detector saturation or to avoid proper instrument maintenance.

10.3.7.5 **Linear calibration using the average response factor**

10.3.7.5.1. The Relative Standard Deviation (RSD) of the calibration points from the curve used must be ≤ 20% for each target analyte.

10.3.7.5.2. If the %RSDs in the initial calibration is > 20%, then calibration using a linear regression may be employed.

10.3.7.6 **Linear calibration using a least squares regression**

10.3.7.6.1. The intercept of a linear calibration at zero response (i.e. the y-intercept) must have an absolute value less than the reporting limit for each analyte. Client requirements may be tighter, please check Client Requirement Memorandum (CRM) if identified in comments. Note, for analyses utilizing an internal standard the Target variable "b" does NOT equal the y-intercept. For analyses utilizing an internal standard, the Target variable "b" must be multiplied by the associated internal standard concentration to derive the concentration at the y-intercept.

10.3.7.6.2. r (correlation coefficient) must be ≥ 0.995 OR r^2 (coefficient of difference) must be ≥ 0.990.

10.3.7.6.3. When calculating the calibration curves using the linear regression model, a minimum quantitation check on the viability of the lowest calibration point should be performed by re-fitting the response from the low concentration calibration standard back into the curve.

10.3.7.6.4. It is not necessary to re-analyze a low concentration standard, rather the data system can recalculate the concentrations.

10.3.7.6.5. The recalculated concentration of the low calibration point should be within ± 30% of the standard's true concentration.

10.3.7.6.5.1. Analytes which do not meet the minimum quantitation calibration re-fitting criteria should be considered "out of control" and corrective action should be taken.

10.3.7.7 **Linear calibration using a least squares regression, forcing thru zero**

10.3.7.7.1. Forcing the curve through zero is not the same as including the origin as a fictitious point in the calibration. In essence, if the curve is forced through zero, the intercept is set to 0 *before* the regression is calculated, thereby setting the bias to favor the low end of the calibration range by "pivoting" the function around the origin to find the best fit and resulting in one less degree of freedom. It may be appropriate to force the regression though zero for some calibrations.

10.3.7.7.2. Curve must still meet criteria in 10.3.7.6.1 and 10.3.7.6.2

10.3.7.8 **Linear calibration using a least squares regression, weighting of data points**

10.3.7.8.1. In a linear model, the points at the lower end of the calibration curve have less absolute variance than points at the high concentration end of the curve. This can cause severe errors in quantitation at the low end of the calibration. For this reason it may preferable to increase the weighting of the lower concentration points. $1/\text{Concentration}^2$ weighting (often called $1/X^2$ weighting) to improve accuracy at the low end of the curve.

10.3.7.8.2. Curve must still meet criteria in 10.3.7.6.1 and 10.3.7.6.2.

10.3.7.9 **Non-linear calibration**

10.3.7.9.1. In situations where the analyst knows that the instrument response does not follow a linear model over a sufficiently wide working range, or when the other approaches have not met the acceptance criteria, a quadratic model may be employed. All quadratic curves require a minimum of 6 pts.

10.3.7.9.2. It is not EPA's intent to allow non-linear calibration to be used to compensate for detector saturation or to avoid proper instrument maintenance. Thus, non-linear calibrations are not be employed for analytes shown to consistently exhibit linear calibration for the analytes of interest.

10.3.7.9.3. The intercept of the curve at zero response must be less than + or – the reporting limit for the analyte. (Some clients may have tighter criteria; check Client Requirement Memos)

10.3.7.9.4. r (correlation coefficient) must be ≥ 0.995 OR r^2 (coefficient of difference) must be ≥ 0.990.

10.3.8 **624 Criteria**

10.3.8.1 Method 624 only requires a 3 point calibration. We routinely perform a 5 point calibration; however, 2 points may be removed from the curve if necessary to meet 624 calibration criteria. Refer to the TestAmerica Policy CA-T-P-0002, Selection of Calibration Points

10.3.8.2 The Relative Standard Deviation (RSD) of the calibration points from the curve used must be $\leq 35\%$.

10.3.8.3 If the %RSDs in the initial calibration is > 35%, then calibration using a linear regression may be employed.

10.3.8.3.1. If a linear regression curve is used, the intercept of the curve at small zero response must be less than + or – the reporting limit for the analyte. It is recommended that for linear regression curves the line be set through the origin.

10.3.8.4 Use of $1/\text{Concentration}^2$ weighting is recommended to improve the accuracy of quantitation at the low end of the curve. The analyst should consider instrument maintenance to improve the linearity of response.

10.3.8.4.1. Weighting of data points

10.3.8.4.2. The points at the lower end of the calibration curve have less weight in determining the curve generated than points at the high concentration end of the curve. However, in environmental analysis, accuracy at the low end of the curve is very important. For this reason it is preferable to increase the weighting of the lower concentration points. 1/Concentration^2 weighting (often called $1/X^2$ weighting) will improve accuracy at the low end of the curve and should be used if the data system has this capability.

10.4 **Initial Calibration Verification (ICV)**

10.4.1 The initial calibration verification standard is a different standard source than the one used for the initial calibration

10.4.2 An ICV must be performed with each initial calibration.

10.4.3 The ICV performance must be within +/- 30% D criteria for each analyte.

10.4.3.1 Not meeting this requirement may be indicative of serious system malfunction or inaccuracies in the standards used for the initial calibration curve or ICV standard.

10.4.4 Corrective action must be taken (including reanalysis of the ICV or analysis of a different ICV).

10.4.4.1 Any decision to proceed with analysis of samples when the ICV is out-of-control must be taken with great care and in consultation with the QA department and the laboratory director. Any such action must be documented in an NCM.

10.4.4.2 Variance among vendor supplied standards for a few compounds is not atypical for long analyte lists. All ICV failures that cannot be associated to laboratory error will require the immediate analysis of a third standard in an attempt to characterize the bias. If a third standard is not in the laboratory it must be ordered immediately.

10.5 **Continuing Calibration Verification.(CCV)**

10.5.1 At the start of each 12-hour period (8260) or 24-hour period (624) the GC/MS tuning standard must be analyzed. A 50ng injection of BFB must result in a mass spectrum for BFB which meets the criteria. See Table 2 in this SOP.

10.5.2 Following a successful BFB analysis, the continuing calibration standard(s) are analyzed. The standards must contain all volatile analytes, including all required surrogates. A mid level calibration standard is used for the continuing calibration

10.5.3 A CCV standard is analyzed every analysis tune clock immediately following the BFB tune.

10.5.3.1 **8260 and 524.2** - for each 12-hour tune time period

10.5.3.2 **624** – for each 24-hour tune time period

10.5.4 The CCV can be the same source or a second source from the calibration.

10.5.5 The internal standard response must be within -50% to 100% of the response in the mid level of the initial calibration. The internal standard retention times must be within 30 seconds of the retention times in the mid-level of the initial calibration.

10.5.6 8000B/8260B criteria:

10.5.6.1 The SPCC compounds must have a minimum response factor (see Initial Calibration SPCC criteria)

10.5.6.2 The percent difference of the CCC compounds from the initial calibration must be $\leq$ 20%.

10.5.6.3 In addition, the percent difference or drift of all analytes must be $\leq$ 60%, with allowance being made for up to six target compounds to have percent drift greater than 20%. Due to poor responses, the following compounds are allowed to have a %D > 60%, but less than 100%: Cyclohexane, 2-Chloroethyl vinyl ether, 2-Nitropropane, 1,4-Dioxane, Tetrahydrofuran, n-butanol and Isobutanol.

10.5.6.4 In addition, if any target analyte's %D is > 20%, the entire target analyte list must be averaged. The average %D must be ≤ 20%.

10.5.6.5 If none of the identified CCCs are in the special calibration, the project specific target analytes %D must be < 20% or a maximum %D as agreed with the client. If there is a special project/client %D criteria it is noted on the client requirement sheet; otherwise a maximum 20% D is applied.

10.5.6.6 There are instances where a small subset of the routinely calibrated analytes are needed for analysis (e.g. dilutions or project with abbreviated target analyte lists). In cases where the target analytes for analysis constitutes less than half of the total number of analytes in the calibration standard, apply the following:

10.5.6.6.1. The SPCC compounds must have a response factor (see initial calibration SPCC criteria) if the SPCC is a target of interest.

10.5.6.6.2. The percent difference of the CCC compounds from the initial calibration must be $\leq$ 20%, if the CCC is a target of interest. In addition, the percent difference or drift of all analytes of concern must be $\leq$ 60%, with allowance being made for, Cyclohexane, 2-Chloroethyl vinyl ether, 2-Nitropropane, 1,4-Dioxan, Tetrahydrofuran, n-butanol and Isobutanol. These compounds are allowed to have a %D > 60% but less than 100%.

10.5.6.6.3. For target analyte lists with more than 20 compounds: if any target analyte's %D is > 15%, the entire target analyte list must be averaged. The average %D must be ≤ 15%.

10.5.6.6.4. For target analyte lists with less than 20 compounds: each target analyte %D must be < 15% or a maximum %D as agreed with the client.

10.5.7 **8260C criteria:**

10.5.7.1 The CCV performance must be with +/- 20% D criteria.

10.5.7.2 If a CCV has failed and the analyst can document the reason for failure (e.g. broken vial, carryover from the previous sample etc.) then a second CCV may be analyzed without any adjustments to the instrument. If this CCV meets criteria then sample analysis may continue. If this second CCV does not meet criteria, the analysis run is terminated. Instrument maintenance is performed and the instrument may require re-calibration (i.e. initial calibration)

10.5.8 **624 criteria**

10.5.8.1 Continuing calibration %D criteria is given in Table 5 of the Method. The column "Range for Q" is used to determine if CCV target analytes meet acceptance.

10.5.8.2 All target analytes must be within the limits prescribed.

10.5.9 **524.2 criteria**

10.5.9.1 For each target analyte %D must be less than or equal to 30%.

10.5.10 Calibration excursions are to be documented via a NCM.

10.6 Retention Time (RT) windows

10.6.1 Relative Retention Time (RRT)

10.6.1.1 In addition to normalizing the response (peak area) of the target compound to the response of the internal standard in that sample or extract for that injection, the retention times of the target compound and the internal standard may be used to calculate the relative retention time (RRT) of the target compound.

10.6.1.2 The RRT is expressed as a unit-less quantity:

$$RRT = \frac{\text{Retention time of the analyte}}{\text{Retention time of the internal standard}}$$

10.6.1.3 The RRT of each target analyte in each calibration standard should agree within ± 0.06 RRT units.

10.6.1.4 It is recognized here that with increasing retention times of the internal standard, target analytes will be able to more easily meet this criterion. Thus, care should be exercised when selecting the appropriate internal standards by retention times. The process of selecting internal standards to quantify target analytes should also include consideration of retention times as they should be similar.

10.6.1.5 If this criterion is not met and unless there are no other indicators of a component's identification such as a very unique but a high probability mass spectral match then that component may not be considered as identified by relative retention time.

10.6.1.6 The RRT evaluation allows the analyst to compensate for modest shifts in the chromatographic conditions that can occur due to interferences and simple day-to-day instrument variability. Many methods that employ internal standard calibration use more than one internal standard, and the target compounds are related to the internal standards on the basis of the similarity of their respective chromatographic retention times.

10.6.2 Retention Time Windows

10.6.2.1 The maximum retention time window is +/- 0.45 minutes from the established retention time of the target analyte in the initial calibration.

10.6.2.1.1. Establishing this maximum retention time window, ensures that the RRT criteria of RRT +/- 0.06 is achieved.

10.6.3 Internal standard retention time

10.6.3.1 The retention times of the internal standards in the calibration verification standard must be evaluated immediately after or during data acquisition. If the retention time for any internal standard changes by more than 30 sec from that in the mid-point standard level of the most recent initial calibration sequence, then the chromatographic system must be inspected for malfunctions and corrections must be made, as required. When corrections are made, reanalysis of samples analyzed while the system was malfunctioning is required.

10.6.4 Retention Time Criteria

10.6.4.1 The retention times of all compounds in each continuing calibration must be within the retention time windows established.

11.0 PROCEDURE

11.1 Screening

11.1.1 Screening samples is a semi-quantitative determination and is not intended to be use as a reportable analytical result.

11.1.2 Screening may be performed on either a GC-FID or GC/MS instrument. The instrument should be capable of detecting the compounds of concern but does not adhere to any method calibration criteria or analysis tune clock times, nor are there any batch QC (eg method blanks, LCS) requirements for screening samples.

11.1.3 Water samples are screened using a minimum 0.5ml of samples and diluting with target analyte free water to a final volume of 5ml. Greater dilutions may be taken if the sample is suspected to have significantly high concentration of target analytes or interferents.

11.1.4 For soil samples, 1g of sample is place in a 40ml VOA vial with 5ml of target analyte free water. Greater dilutions may be taken if the sample is suspected to have significantly high concentration of target analytes or interferents.

11.1.5 Sample screening may be performed utilizing a heated or non-heated purging vessel.

11.2 Allow standards, samples and sample extracts to reach ambient temperature before analysis.

11.3 All analysis conditions and injection volumes for samples must be the same for the calibration standards. (including purge time and flow, desorb time and temperature, column temperatures, multiplier setting etc.).

11.3.1 Water, soil and medium level extract analyses are routinely performed by heated purge.

11.3.1.1 If desired, water, TCLP and methanol extracts may be performed using a non-heated purge.

11.3.1.2 If non-heated purge is desired, the calibration and all QC samples must also be performed utilizing a non-heated purge.

11.4 **<u>Water Sample Preparation (5030B method)</u>**

11.4.1 Transfer 5ml or 25ml sample to a VOA vial.

11.4.2 Transfer the 5ml sample into an empty labeled 40ml VOA vial.

11.4.3 Add 250 ng of each internal and surrogate standard (10 µL of a 25 µg/mL solution)

11.4.3.1 For routine TCLP samples use 0.5 mL of TCLP sample leachate with 4.5 mL reagent water and spike with surrogate and internal standards.

11.4.3.1.1.1 Note that TCLP reporting limits will be 10 times higher than the corresponding aqueous limits)

11.4.3.2 For low level TCLP samples, use 5ml of TCLP sample leachate and spike with surrogate and internal standard.

11.4.4 Prepare a method blank with 5ml or 25 mlof HPLC water. Add 250 ng of each internal and surrogate standard (10 µL of a 25 µg/mL solution)

11.4.5 Prepare a LCS with 5mlor 25 ml of HPLC water. Add 250 ng of each internal and surrogate standard (10 µL of a 25 µg/mL solution). Add 10µL of 25µg/ml spiking solution

11.4.5.1 For samples designated for MS/MSD analysis, add 10µL of 25µg/ml of spiking solution.

11.4.6 Check and document the pH the remaining sample.

11.4.6.1 Do not check pH prior to taking aliquot for analysis.

11.5 **<u>Low-Level Soil Preparation (5035A method)</u>**

11.5.1 If samples arrive unpreserved, the laboratory must, within 48 hours of collection, preserve samples with sodium bisulfate or extrude sample into a clean, empty, sealed VOA vial and freeze.

11.5.1.1 Check the preparation method code of the SAC to determine preservation.

11.5.1.1.1 Sodium bisulfate code: 4D

11.5.1.1.2 Freezing code: 4P

11.5.2 <u>If samples arrive in the Encore (or equivalent) sampler and require Sodium bisulfate preservation</u>:

11.5.2.1 Pre-weigh a labeled 40ml VOA vial.

11.5.2.1.1 Label with an indelible marker rather than a paper label, since paper labels may cause the autosampler to bind and malfunction.

11.5.2.2 Extrude the soil sample from the Encore (or equivalent) sampler into the VOA vial.

11.5.2.3 Weigh the vial to the nearest 0.01g.

11.5.2.4 Record weight on the label and runlog.

11.5.2.5 Add a magnetic stir bar, approximately 1g of sodium bisulfate and 5 mL of HPLC water.

11.5.2.5.1 Soils containing carbonates may effervesce when adding the sodium bisulfate solution. If this is the case, retrieve a second Encore sample plug, add 5 mL of water instead, and freeze at <10^{o}C until analysis.

11.5.2.6 Seal the vial.

11.5.2.7 Add 10 ul of surrogate through the septum to each sample and QC.

11.5.2.7.1 For samples designated for MS/MSD analysis, add 10µL of spiking solution to the vials.

11.5.2.7.2 Prepare a Method Blank using 5.0g of glass beads and 5mL of HPLC grade water. Add 10µL of surrogate to the vial.

11.5.2.7.3 Prepare a LCS using 5.0g glass beads, and 5ml HPLC water. Add 10µL of surrogate and 10µL of spiking solution.

11.5.3 <u>If samples arrive 40ml VOA vial already preserved with Sodium bisulfate</u>:

11.5.3.1 Add 5 ul of surrogate through the septum to each sample and QC.

11.5.3.1.1 For samples designated for MS/MSD analysis, add 10µL of spiking solution to the vials.

11.5.3.1.2 Prepare a Method Blank using 5.0g of glass beads and 5mL of HPLC grade water. Add 5µL of surrogate to the vial.

11.5.3.1.3 Prepare a LCS using 5.0g glass beads, and 5ml HPLC water. Add 10µL of surrogate and 10µL of spiking solution.

11.5.4 <u>If samples arrive in the Encore (or equivalent) sampler and require freezing as preservation:</u>

11.5.4.1 Pre-weigh a labeled 40ml VOA vial.

11.5.4.1.1 Label with an indelible marker rather than a paper label, since paper labels may cause the autosampler to bind and malfunction.

11.5.4.2 Extrude the soil sample from the Encore (or equivalent) sampler into the VOA vial.

11.5.4.3 Weigh the vial to the nearest 0.01g

11.5.4.4 Record weight on the label and runlog.

11.5.4.5 Freeze sample until time of analysis.

11.5.4.6 Seal the vial.

11.5.4.7 Add 10 ul of surrogate through the septum to each sample and QC.

11.5.4.7.1 For samples designated for MS/MSD analysis, add 10µL of spiking solution to the vials.

11.5.4.7.2 Prepare a Method Blank using 5.0g of glass beads and 5mL of HPLC grade water. Add 10µL of surrogate to the vial.

11.5.4.7.3 Prepare a LCS using 5.0g glass beads, and 5ml HPLC water. Add 10µL of surrogate and 10µL of spiking solution.

11.5.5 <u>If samples arrive in 40ml VOA vial and require freezing as preservation</u>:

11.5.5.1 Freeze sample until time of analysis.

11.5.5.2 Add 5mL of HPLC water

11.5.5.3 Seal the vial.

11.5.5.4 Add 10 ul of surrogate through the septum to each sample and QC.

11.5.5.4.1 For samples designated for MS/MSD analysis, add 10µL of spiking solution to the vials.

11.5.5.4.2 Prepare a Method Blank using 5.0g of glass beads and 5mL of HPLC grade water. Add 10µL of surrogate to the vial.

11.5.5.4.3 Prepare a LCS using 5.0g glass beads, and 5ml HPLC water. Add 5µL of surrogate and 10µL of spiking solution.

11.6 <u>Low-Level Soil Preparation (superceded 5030 method)</u>

11.6.1 See SOP ST-QA-0038 for the procedure for sub sampling.

11.6.2 Weigh 5 g +/- 0.05 of the sample into a pre-weighed 40mL glass labeled vial.

11.6.2.1 If the sample is suspected or known to have high concentrations of analytes, reduce the sample aliquot to 1.0 g

11.6.3 Record the weight.

11.6.4 Add 5ml HPLC water

11.6.5 Seal the vial.

11.6.6 The above steps should be performed rapidly and without interruption to avoid loss of volatile organics.

11.6.7 Add 10µL of surrogate standard through the septum.

11.6.7.1 Prepare a Method Blank using 5.0g of glass beads and 5mL of HPLC grade water. Add 10µL of surrogate to the vial.

11.6.7.2 Prepare a LCS using 5.0g glass beads, 10µL of surrogate and 10µL of spiking solution.

11.6.7.3 For samples designated as for MS/MSD, add 10µL of spiking solution.

11.7 <u>Methanol Extraction of Soils (5035A method)</u>

11.7.1 Extrude the (nominal) 5g sample into a pre-weighed VOA vial containing 5mL methanol (25mL methanol for the 25g sampler).

11.7.2 Obtain the weight of the soil added to the vial and note in preplog (Attachment 1).

11.7.3 Add 5 ul medium level surrogate to each sample and QC samples.

11.7.3.1 Prepare a Method Blank using 5.0g of glass beads and 5 mL methanol. Add 5 µL of parent surrogate to the vial.

11.7.3.2 Prepare a LCS using 5.0g glass beads, 5 mL of methanol , 5 µL of parent surrogate and 10µL of spiking solution.

11.7.3.3 For the LCS and MS/MSD, add 100 µL medium level spike mix.

11.7.4 Using a vortex mixer, agitate sample for at least half a minute.

11.8 **<u>Methanol Extraction of Soils (superceded 5030 method)</u>**

11.8.1 See SOP ST-QA-0038 for the procedure for sub sampling.

11.8.2 Weigh 5 g +/- 0.05 of the sample into a pre-weighed 40mL glass labeled vial.

11.8.2.1 If the sample is suspected or known to have high concentrations of analytes, reduce the sample aliquot to 1.0 g

11.8.3 Record the weight in prep log (Attachment 1).

11.8.4 Seal the vial.

11.8.5 Add 5 mL of purge and trap methanol.

11.8.6 Add 5 µL medium level surrogate to each sample and QC samples.

11.8.6.1 Prepare a Method Blank using 5.0g of glass beads and 5 mL methanol. Add 5µL of surrogate to the vial.

11.8.6.2 Prepare a LCS using 5.0g glass beads, 5 mL methanol , 5µL of surrogate and 20µL of spiking solution.

11.8.6.3 For the MS/MSD, add 100 µL medium level spike mix.

11.8.7 Using a vortex mixer, agitate sample for at least half a minute.

11.9 **<u>Volatile Analysis</u>**:

11.9.1 Load each 40ml VOA sample vial (and QC) in the purge and trap autosampler.

11.9.1.1 Medium Level Analysis

11.9.1.1.1 Rinse a glass-tight syringe with organic free water and fill the syringe with water. Bring volume to 5 mL add 5 µL of internal standards.

11.9.1.1.2 Add sample methanol extract to the syringe (no more than 100µL for a 5 mL purge).

11.9.1.1.3 If less than 1µL of methanol extract is to be added to the water, dilute the methanol extract using a serial dilution.

11.9.1.1.4 Transfer methanol extract/HPLC water in syringe to a labeled 40ml VOA vial.

11.9.2 Record autosampler sample analysis sequence in logbook.

11.9.3 Start analysis.

11.9.4 After purging is complete, desorb the sample, start the GC temperature program, and begin data acquisition.

11.9.4.1 For method 524.2 the desorb time should be a minimum of 2 minutes.

11.9.5 After desorption, bake the trap for 5-10 minutes to condition it for the next analysis. When the trap is cool, it is ready for the next sample.

11.9.6 When the standards and extracts are not being used, refrigerate them at 4 $\pm$ 2^{o}C, protected from light in screw cap vials equipped with unpierced Teflon lined septa.

12.0 DATA ANALYSIS AND CALCULATIONS

12.1 Commonly used calculations (e.g. % recovery and RPD) and standard instrument software calculations are given in the TestAmerica QAM.

12.2 Internal Standards

12.2.1 Samples that exhibit low IS recoveries <50% or high IS recoveries >100% are reanalyzed once to confirm matrix effect.

12.3 Manual Integrations

12.3.1 Identified compounds are reviewed for proper integration. Integrations are performed automatically by the data system. If necessary, manual integrations are performed and are documented by the analyst. Manual integrations are denoted with a "M" flag on the Target quantitation report. See TestAmerica Policy CA-Q-S-001, Acceptable Manual Integration Practices

12.4 Qualitative identification

12.4.1 An analyte is identified by retention time and by comparison of the sample mass spectrum with the mass spectrum of a standard of the suspected compound (standard reference spectrum). Mass spectra for standard reference may be obtained on the user's GC/MS by analysis of the calibration standards or from the NIST Library. Two criteria must be satisfied to verify identification: (1) elution of sample component at the same GC retention time as the standard component; and (2) correspondence of the sample component and the standard component characteristic ions.

12.4.1.1 Note: Care must be taken to ensure that spectral distortion due to co-elution is evaluated.

12.4.2 The sample component retention time must compare to within ± 0.2 min. of the retention time of the standard component. For reference, the standard must be run within the same twelve hours as the sample.

12.4.3 All ions present in the standard mass spectra at a relative intensity greater than 10% (most abundant ion in the spectrum equals 100%) should be present in the sample spectrum.

12.4.4 The relative intensities of ions should agree to within ±30% between the standard and sample spectra. (Example: For an ion with an abundance of 50% in the standard spectra, the corresponding sample abundance should be between 20 and 80 percent.)

12.4.5 If a compound cannot be verified by all the above criteria, but in the technical judgment of the analyst, the identification is correct, then the analyst shall report that identification and proceed with quantitation.

12.5 Retention time criteria for samples

12.5.1 If the retention time for any internal standard changes by more than 0.5 minutes from the last continuing calibration standard, the chromatographic system must be inspected for malfunctions and corrected. Reanalysis of samples analyzed while the system was malfunctioning is required.

12.5.2 If the retention time of any internal standard in any sample varies by more than 0.1 minute from the preceding continuing calibration standard, the data must be carefully evaluated to ensure that no analytes have shifted outside their retention time windows.

12.6 Tentatively Identified Compounds (TICs)

12.6.1 If the client requests components not associated with the calibration standards, a search of the NIST library may be made for the purpose of tentative identification. Guidelines are:

12.6.1.1 Relative intensities of major ions in the reference spectrum (ions > 10% of the most abundant ion) should be present in the sample spectrum.

12.6.1.2 The relative intensities of the major ions should agree to within 20%. (Example: If an ion shows an abundance of 50% in the standard spectrum, the corresponding sample ion abundance should be between 30% and 70%).

12.6.1.3 Molecular ions present in the reference spectrum should be present in the sample spectrum.

12.6.1.4 Ions present in the sample spectrum but not in the reference spectrum should be reviewed for possible background contamination or presence of co-eluting compounds.

12.6.1.5 Ions present in the reference spectrum but not in the sample spectrum should be reviewed for possible subtraction from the spectrum because of background contamination or co-eluting peaks. (Data system reduction programs can sometimes create these discrepancies.)

12.6.1.6 Computer-generated library search routines should not use normalization routines that would misrepresent the library or unknown spectra when compared to each other. Only after visual inspection of the sample with the nearest library searches should the analyst assign a tentative identification. Library searches of peaks present in the chromatogram that are not target compounds (Tentatively Identified Compounds, TIC) may be performed if required by the client.

12.6.1.7 The first 20 TICs will be identified in a sample, unless a different number is specified by the client. See client requirement sheet.

12.7 Dilutions

12.7.1 If the concentrations of any analytes exceed the working range as defined by the calibration standards, then the sample must be diluted and reanalyzed.

12.7.1.1 TestAmerica St. Louis has adopted the CLP allowance to report results that are within 10% of the upper level standard without dilution.

12.7.2 A dilution should target the most concentrated analyte in the upper half (over 50% of the high level standard) of the client specific project requirements.

12.7.2.1 Aqueous samples requiring less than a 1:1000 dilution can be diluted directly using a 5-ml syringe

12.7.2.2 Aqueous samples requiring less than a 1:5000 dilution can be diluted directly using a 25-ml syringe

12.7.2.3 Low level soil samples may re-analyzed using a 1g sample aliquot or utilizing the methanol extraction technique.

12.8 Carryover

12.8.1 When a sample has a high response for a compound, there is a real possibility that some of the sample may carry over into the sample analyzed immediately afterward.

12.8.1.1 If a sample analyzed after a sample with high concentrations has negative results, carryover did not occur.

12.8.1.2 If a sample analyzed after a sample with high concentrations has positive results for the same analyses, carryover may have occurred.

12.8.1.2.1 This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred

12.8.1.3 If the chromatographic profile resembles the previous sample, the results are questionable.

12.8.1.3.1 This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred.

13.0 DATA ASSESSMENT AND ACCEPTANCE CRITERIA; CORRECTIVE ACTIONS FOR OUT OF CONTROL DATA

13.1 The data assessment and corrective action process is detailed through the Clouseau Nonconformance Memorandum (NCM) process. The NCM process is described in SOP: ST-QA-0036. A hardcopy of all the data assessment types and descriptions along with their associated corrective actions is included in the SOP. Below is a subset of the data assessment and QC excursion types within Clouseau; the text in underline is the exact “type” line in Clouseau. For a complete and current listing, please access the software program.

13.2 Method Blank

13.2.1 Acceptance Criteria:

13.2.1.1 No target analytes may be present in the method blank above the reporting limit.

13.2.1.2 The method blank must have acceptable surrogate recoveries.

13.2.2 Corrective Action for Method Blanks not meeting acceptance criteria:

13.2.2.1 Method Blank Contamination – See Clouseau NCM for corrective action. Note certain analytes are common laboratory contaminants which require special narrative comment. These compounds are so designated in Clouseau.

13.2.2.2 Method Blank Surrogate excursion – See Clouseau NCM for corrective action.

13.3 Laboratory Control Sample (LCS)

13.3.1 Acceptance Criteria:

13.3.1.1 All control analytes should be within established control limits for accuracy (%Recovery) and precision (RPD).

13.3.1.1.1 For long analyte spike list, marginal exceedances (ME) are allowed as follows:

13.3.1.1.2 < 11 analytes in LCS, no analytes allowed in ME of the LCS control limit.

13.3.1.1.3 11-30 analytes in LCS, 1 analytes allowed in ME of the LCS control limit.

13.3.1.1.4 31-50 analytes in LCS, 2 analytes allowed in ME of the LCS control limit.

13.3.1.1.5 51-70 analytes in LCS, 3 analytes allowed in ME of the LCS control limit.

13.3.1.1.6 71-90 analytes in LCS, 4 analytes allowed in ME of the LCS control limit.

13.3.1.1.7 > 90 analytes in LCS, 5 analytes allowed in ME of the LCS control limit.

13.3.1.1.8 No LCS recoveries may be outside the Marginal Exceedance limit.

13.3.1.1.9 Marginal exceedances must be random. If the same LCS analyte exceeds the control limit repeatedly, it is an indication of a systemic problem. The source of the error must be located and corrective action taken.

13.3.1.2 The LCS should have acceptable surrogate recoveries.

13.3.2 Corrective Action for LCS not meeting acceptance criteria:

13.3.2.1 LCS Spike Recovery excursion (high) – See Clouseau NCM for corrective action.

13.3.2.2 LCS Spike Recovery excursion (low) – See Clouseau NCM for corrective action.

13.3.2.3 LCS Surrogate Recovery excursion – See Clouseau NCM for corrective action.

13.3.2.4 RPD excursion for MS/MSD or LCS/LCSD – See Clouseau NCM for corrective action.

13.4 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

13.4.1 All analytes should be within established control limits for accuracy (%Recovery) and precision (RPD).

13.4.2 Corrective Action for MS/MSD not meeting acceptance criteria:

13.4.2.1 MS/MSD Spike Rec. excursion may not necessarily warrant corrective action other than narration. See Clouseau NCM to determine if re-preparation re-analysis is required.

13.5 Surrogate

13.5.1 All surrogates should be within established control limits for accuracy (% Recovery).

13.5.2 Corrective Action for Surrogates not meeting acceptance criteria:

13.5.2.1 Surrogate Spike Rec. excursion may not necessarily warrant corrective action other than narration. See Clouseau NCM to determine if re-preparation re-analysis is required.

13.6 Sample result evaluation

13.6.1 Internal Standards

13.6.1.1 Acceptance Criteria:

13.6.1.1.1 See the GC/MS analytical SOPs for acceptance criteria

13.6.1.2 Corrective Action for Internal Standards not meeting acceptance criteria:

13.6.1.2.1 Internal Standard excursion – high– See Clouseau NCM for corrective action.

13.6.1.2.2 Internal Standard excursion - low– See Clouseau NCM for corrective action.

13.6.2 Dilutions

13.6.2.1 If the response for any compound exceeds the working range of the analytical system, a dilution of the extract is prepared and analyzed. An appropriate dilution should be in the upper half of the calibration range.

13.6.2.2 Dilution: Sample– See Clouseau NCM for corrective action.

13.6.2.3 Dilution: Surrogate(s) diluted out– See Clouseau NCM for corrective action.

13.6.2.4 Dilution: Surrogates(s) and/or Spike(s) diluted out– See Clouseau NCM for corrective action.

13.6.3 Carryover

13.6.3.1 When a sample has a high response for a compound, there is a real possibility that some of the sample may carry over into the sample analyzed immediately afterward.

13.6.3.2 If a sample analyzed after a sample with high concentrations has negative results, carryover did not occur.

13.6.3.3 If a sample analyzed after a sample with high concentrations has positive results for the same analytes, or if the chromatographic profile resembles the previous sample, the results are questionable. This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred.

13.7 Insufficient Sample

13.7.1 For any prescribed re-preparation corrective action, if there is insufficient sample to repeat the analysis a narrative comment stating such is included in the report narrative. The insufficient sample description is included in the Clouseau NCM within the type defining the excursion.

14.0 METHOD PERFORMANCE AND DEMONSTRATION OF CAPABILITY

14.1 Method performance data, Reporting Limits, and QC acceptance limits, are given in the appendix of this SOP.

14.2 Demonstration of Capability

14.2.1 Initial and continuing demonstrations of capability requirements are established in the QAM.

14.3 Training Qualification

14.3.1 The manager/supervisor has the responsibility to ensure that this procedure is performed by an analyst who has been properly trained in its use and has the required experience.

14.3.2 The analyst must have successfully completed the initial demonstration capability requirements prior to working independently. See requirements in the QAM.

14.4 Annually, the analyst must successfully demonstrate proficiency to continue to perform this analysis. See requirements in the QAM.

15.0 VALIDATION

15.1 Laboratory SOPs are based on standard reference EPA Methods that have been validated by the EPA and the lab is not required to perform validation for these methods. The requirements for lab demonstration of capability are included in LQM. Lab validation data would be appropriate for performance based measurement systems or non-standard methods. TestAmerica St. Louis will include this information in the SOP when accreditation is sought for a performance based measurement system or non-standard method

16.0 POLLUTION PREVENTION AND WASTE MANAGEMENT

16.1 All waste will be disposed of in accordance with Federal, State and Local regulations. Where reasonably feasible, technological changes have been implemented to minimize the potential for pollution of the environment. Employees will abide by this method and the policies in section 13 of the Corporate Safety Manual for "Waste Management and Pollution Prevention."

16.2 Waste Streams Produced by the Method

16.2.1 The following waste streams are produced when this method is carried out.

16.2.1.1 Acidic sample waste generated. All acidic waste will be accumulated in the appropriate waste accumulation container, labeled as Drum Type "A" or "B".

16.2.1.2 Solvent waste generated. Solvent waste must be accumulated in the appropriate waste accumulation container, labeled as Drum Type "D".

16.2.1.3 Contaminated disposable glass or plastic materials utilized in the analysis are disposed of in the sanitary trash. If the labware was used for the analysis of radioactive samples and contains radioactivity at a level of 100 cpm over background as determined by a GM meter, the labware will be collected in waste barrels designated for solid rad waste for disposal by the EH&S Coordinator.

18.0 CLARIFICATIONS, MODIFICATIONS OF PREVIOUS REFERENCE METHOD

18.1 Modification to Reference Method 624

18.1.1 Ion 119 is used as the quantitation ion for chlorobenzene-d5 for 25 mL purge tests.

18.1.2 A retention time window of 0.2 minutes is used for all components, since some data systems do not have the capability of using the relative retention time units specified in the reference method.

18.1.3 The quantitation and qualifier ions for some compounds have been changed from those recommended in SW-846 in order to improve the reliability of qualitative identification.

18.1.4 Method 624 Section 5.2.2 of the source method describes the trap packing materials as Tenax GC, Methyl silicone, silica gel and coconut charcoal. TestAmerica routinely employs the Supelco K trap.

18.2 Modifications required for drinking water analysis by method 524.2

18.2.1 Only one internal standard -- Fluorobenzene -- is required for this method. The lab uses 3 ISTDs.

18.2.2 The same analysis run may be used to satisfy the requirements for an LCS (also known as a laboratory fortified blank, LFB) and a continuing calibration verification sample. The LCS/CCV does not need to be a second source standard.

18.2.3 524.2 Section 7.1 of the source method requires that the trap packing materials be Tenax GC, Methyl silicone, silica gel and coconut charcoal. TestAmerica routinely uses Supleco K trap

18.2.4 524.2 Section 7.8.2 of the source method requires that each calibration standard be prepared by diluting the appropriate volume of the working standard with organic-free water adjusted to pH < 2 in a volumetric flask. TestAmerica prepares calibration standards by diluting the appropriate volume of the working standard with organic-free water at neutral pH.

19.0 CHANGES FROM PREVIOUS REVISION

19.1 Section 9.1.5: Blank, LCS & MS/MSD must be run in same clock for non-medium level samples

19.2 Section 10.3.2: The number of calibration points required for curves is clarified

19.3 Section 10.3.6.6: notes added to address client requirements and y-intercept

19.4 Section 10.3.7.9.1: added six point requirement for all quadratic curves

19.5 Section 10.4.4.2: Added corrective action for ICV failure (use of third standard)

19.6 Section 10.3.7.9.3: added note addressing client specific requirements

19.7 Section 12.7.1.1: added CLP allowance for reporting data within 10% of upper standard without dilution

19.8 Table Two: added allowance of other published BFB Tune criteria (i.e. EPA CLP)

19.9 Added Attachment 1 – example page from VOA Medium Level Extraction log.

19.10 Revision 17:

19.10.1 Fixed grammatical errors throughout SOP.

19.10.2 Updated section 9.1 regarding MS/MSD duplicates being performed for separate QC codes.

19.10.3 Updated section 10.5.7 regarding CCV criteria testing.

19.10.4 Removed section 10.5.8.3 regarding passing CCV percentage calibration points in the initial calibration curve.

19.10.5 Updated section 11.7 and 11.8 regarding volumes of medium level surrogate and medium level spike mix used.

19.11 Rev 18:

19.11.1 Added information for Select Ion Monitoring Procedure to Sections 2, 3 and Appendix 1

Table 1
Internal Standards

	Standard Concentration µg/mL	Quantitation ion (5 mL purge)	Quantitation ion (25 mL purge)
Fluorobenzene	25	96	96
Chlorobenzene-d5	25	117	117
1,4-Dichlorobenzene-d4	25	152	152

Notes:
1) 10 µL of the internal standard is added to the sample. This results in a concentration of each internal in the sample of 50µg/L for a 5 mL purge or 10 µg/L for a 25 mL purge.
2) Surrogate and internal standards may be combined in one solution.

Surrogate and Spike concentrations are listed on the Structure and Analysis Codes, which are in the attachment to this SOP.

Table 2
BFB Key Ion Abundance Criteria

Mass	Ion Abundance Criteria
50	15% to 40% of Mass 95
75	30% to 60% of Mass 95
95	Base Peak, 100% Relative Abundance
96	5% to 9% of Mass 95
173	Less Than 2% of Mass 174
174	Greater Than 50% of Mass 95
175	5% to 9% of Mass 174
176	Greater Than 95%, But Less Than 101% of Mass 174
177	5% to 9% of Mass 176

- BFB tuning criteria for mass 75 are 30-80% of mass 95 for method 524.2
- Alternatively, other documented tuning criteria (e.g. EPA CLP) may be used provided method performance is not aversely affected

Table 3
Characteristic ions

Compound	Primary*	Secondary	Tertiary
1,2-Dichloroethane-d_4 (Surrogate)	67*	102*	65
Dichlorodifluoromethane	85	87	50, 101,103
Chloromethane	50	52	49
Vinyl chloride	62	64	61
Bromomethane	94	96	79
Chloroethane	64	66	49
Trichlorofluoromethane	101*	103*	66
1,1-Dichloroethene	96	61	63, 98

Characteristic ions

Nonanol	57	98	41
t-Butyl alcohol	59	41	
1-Chlorohexane	91	55	43
Ethanol	45	46	
TAME	73	87	43
ETBE	59	87	41
DIPE (Diisopropyl ether)	45	87	59
2,2-Dimethylpentane	45	46	
2,4-Dimethylpentane	57	85	43
2,2,3-Trimethylbutane	57	43	85
3,3-Dimethylpentane	43	71	85
2-Methylhexane	43	57	85
2,3-Dimethylpentane	56	71	43

Characteristic ions

Compound	Primary*	Secondary	Tertiary
3-Methylhexane	43	57	71
3-Ethylpentane	43	71	55
Heptane	43	57	71
Dimethylsulfide	94	79	45
1,3,5-Trichlorbenzene	180	182	145

The primary ion should be used for quantitation unless interferences are present, in which case a secondary ion may be used.
*****Primary/secondary and/or tertiary ions are switched from order in Method based on signal intensity and co-elutions.

TABLE 4

RECOMMENDED MINIMUM RELATIVE RESPONSE FACTOR CRITERIA FOR INITIAL AND CONTINUING CALIBRATION VERIFICATION

Volatile Compounds	Minimum Response Factor
Dichlorodifluoromethane	0.100
Chloromethane	0.100
Vinyl chloride	0.100
Bromomethane	0.100
Chloroethane	0.100
Trichlorofluoromethane	0.100
1,1-Dichloroethene	0.100
1,1,2-Trichloro-1,2,2-trifluoroethane	0.100
Acetone	0.100
Carbon disulfide	0.100
Methyl Acetate	0.100
Methylene chloride	0.100
trans-1,2-Dichloroethene	0.100
cis-1,2-Dichloroethene	0.100
Methyl tert-Butyl Ether	0.100
1,1-Dichloroethane	0.200
2-Butanone	0.100
Chloroform	0.200
1,1,1-Trichloroethane	0.100
Cyclohexane	0.100
Carbon tetrachloride	0.100
Benzene	0.500
1,2-Dichloroethane	0.100
Trichloroethene	0.200
Methylcyclohexane	0.100
1,2-Dichloropropane	0.100
Bromodichloromethane	0.200
cis-1,3-Dichloropropene	0.200
trans-1,3-Dichloropropene	0.100
4-Methyl-2-pentanone	0.100
Toluene	0.400
1,1,2-Trichloroethane	0.100
Tetrachloroethene	0.200
2-Hexanone	0.100
Dibromochloromethane	0.100
1,2-Dibromoethane	0.100
Chlorobenzene	0.500
Ethylbenzene	0.100
meta-/para-Xylene	0.100
ortho-Xylene	0.300
Styrene	0.300
Bromoform	0.100
Isopropylbenzene	0.100
1,1,2,2-Tetrachloroethane	0.300
1,3-Dichlorobenzene	0.600
1,4-Dichlorobenzene	0.500
1,2-Dichlorobenzene	0.400
1,2-Dibromo-3-chloropropane	0.050
1,2,4-Trichlorobenzene	0.200

TestAmerica St. Louis has established a default minimum response factor of 0.01 for compounds not identified in this table, except for Acrolein, Acetonitrile, Isobutanol, Tetrahydrofuran, Propionitrile, n-butanol, 1,4-Dioxane, 2-chloroethyl vinyl ether, Cyclohexanone, nonanol (25ml purge) and Acrolein, Acetonitrile, Tetrahydrofuran, Propionitrile, Isobutanoln-butanol, 1,4-Dioxane, Cyclohexanone (5ml purge), which have a minimum response factor of 0.001.

TAL Reference Data Summary

Structured Analysis Code: I-4B-QK-01-06

Target Analyte List: All Analytes

Matrix: WATER
Extraction: PURGE AND TRAP - Lab MEOH Ext. (Solids or Wastes)
Method: Volatile Organics, GC/MS (8260B)
QC Program: STANDARD TEST SET
Location: TestAmerica St. Louis

TAL Reference Data Summary

Structured Analysis Code: A-4B-QK-01-06

Target Analyte List: All Analytes

Matrix: SOLID
Extraction: PURGE AND TRAP - Lab MEOH Ext. (Solids or Wastes)
Method: Volatile Organics, GC/MS (8260B)
QC Program: STANDARD TEST SET
Location: TestAmerica St. Louis

Title: GC/MS SEMIVOLATILES ANALYSIS [SW-846 8270D; EPA 625]

Approvals (Signature/Date):

Ben Hicks 12/31/12 Ben Hicks — Date Organics Manager	Michael Ridenhower 12/31/12 Michael Ridenhower — Date Health & Safety Manager / Coordinator
Marti Ward 12-31-12 Marti Ward — Date Quality Assurance Manager	Elaine Wild 12/31/12 Elaine Wild — Date Laboratory Director

This SOP was previously identified as SOP No. ST-MS-0001 Rev. 13

Facility Distribution No.: 0 **Distributed To:** See Electronic Distribution Sheet

1.0 SCOPE AND APPLICATION

1.1 This SOP is applicable to the determination of the concentration of semivolatile organic compounds in extracts prepared from solid and aqueous matrices

1.2 This SOP is based on SW-846 Method 8000B, 8000C and 8270D and EPA method 625.

1.3 The following compounds are documented in the method as problematic:

1.3.1 Benzidine can be subject to oxidative losses during solvent concentration and exhibits poor chromatography. Neutral extraction should be performed if this compound is expected.

1.3.2 Hexachlorocyclopentadiene is subject to thermal decomposition in the inlet of the gas chromatograph, chemical reaction in acetone solution, and photochemical decomposition.

1.3.3 Pentachlorophenol, 2,4-dinitrophenol, 4-nitrophenol, 4,6-dinitro-2-methylphenol, 4-chloro-3-methylphenol, benzoic acid, 2-nitroaniline, 3-nitroaniline, 4-chloroaniline, and benzyl alcohol are subject to erratic chromatographic behavior, especially if the GC system is contaminated with high boiling material.

1.3.4 Hexachlorophene may not be amenable to analysis by this method.

1.4 N-Nitrosodiphenylamine decomposes in the gas chromatographic inlet and cannot be distinguished from Diphenylamine.

1.5 3-Methylphenol cannot be separated from 4-Methylphenol by the conditions specified in this method.

1.6 Phthalic acid decomposes in the gas chromatographic inlet and cannot be distinguished from Phthalic anhydride.

1.7 Azobenzene is formed by decomposition of 1,2-diphenlyhydrazine. If 1,2-diphenylhydrazine is requested, it will be reported as Azobenzene.

1.8 The laboratory target analytes supported by this method, the reporting limits, method detection limits and QC limits are maintained in the Laboratory Information Management System (LIMS).

1.8.1 Additional compounds may be amendable to this method. The minimum requirement for non-standard analytes is that the reporting limit be set at the lowest required concentration that can actually be detected by the instrument, and when an MDL study can not be conducted, the MDL be set equal to the reporting limit.

2.0 SUMMARY OF METHOD

2.1 Aqueous samples are extracted with methylene chloride using a separatory funnel. Solid samples are extracted with methylene chloride / acetone using sonication. Waste dilution is used for organic or unusual matrix samples. The sample extract is concentrated to a volume of 1 mL or 10 mL, and analyzed by GC/MS. Qualitative identification of the parameters in the extract is performed using the retention time and the relative abundance of characteristic ions. Quantitative analysis is performed using the internal standard technique with a single characteristic ion.

2.2 The use of selected ion monitoring (SIM) is acceptable for applications requiring quantitation limits below the normal range of electro impact mass spectrometry. However, SIM may provide a lesser degree of confidence in the compound identification, since less mass spectral information is available. Instead of scanning everything in a retention time range, SIM looks for specific ions (qualitative and quantitative) that are placed in retention time groups. The ions used for qualitative and quantitative purposes are the same for scan and SIM analysis.

3.0 DEFINITIONS

3.1 See the TestAmerica St. Louis Quality Assurance Manual (QAM) for a glossary of common laboratory terms and data reporting qualifiers.

3.2 SIM – Single Ion Monitoring

4.0 INTERFERENCES

4.1 Method interferences may be caused by contaminants in solvents, reagents, glassware, and other processing apparatus that lead to discrete artifacts. All of these materials must be routinely demonstrated to be free from interferences under conditions of the analysis by running laboratory method blanks as described in the Quality Control section. Raw GC/MS data from all blanks, samples, and spikes must be evaluated for interferences. If an interference is detected it is necessary to determine if the source of interference is in the preparation and/or cleanup of the samples; then take corrective action to eliminate the problem.

4.2 Matrix interferences may be caused by contaminants that are co-extracted from the sample. The extent of matrix interferences will vary considerably from source to source, depending upon the nature of the sample.

4.3 Contamination by carryover can occur whenever high-level and low-level samples are sequentially analyzed. To reduce carryover, the sample syringe must be rinsed with solvent between samples. Whenever an unusually concentrated sample is encountered, it should be followed by the analysis of solvent to check for cross contamination.

4.4 Phthalate contamination is commonly observed in this analysis and its occurrence should be carefully evaluated as an indicator of a contamination problem in the sample preparation step of the analysis.

5.0 SAFETY

5.1 Employees must abide by the policies and procedures in the Corporate Environmental Health and Safety Manual (CW-E-M-001), Radiation Safety Manual and this document. This procedure may involve hazardous material, operations and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats and closed-toe, nonabsorbent shoes are a minimum.

5.2 **SPECIFIC SAFETY CONCERNS OR REQUIREMENTS**

5.2.1 Latex and vinyl gloves provide no protection against the organic solvents used in this method. Nitrile, Silver Shield, or similar gloves must be used.

5.2.2 The gas chromatograph and mass spectrometer contain zones that have elevated temperatures. The analyst needs to be aware of the locations of those zones, and must cool them to room temperature prior to working on them.

5.2.3 The mass spectrometer is under deep vacuum. The mass spectrometer must be brought to atmospheric pressure prior to working on the source.

5.2.4 There are areas of high voltage in both the gas chromatograph and the mass spectrometer. Depending on the type of work involved, either turn the power to the instrument off, or disconnect it from its source of power.

5.3 PRIMARY MATERIALS USED

5.3.1 The following is a list of the materials used in this method, which have a serious or significant hazard rating. NOTE: This list does not include all materials used in the method. The table contains a summary of the primary hazards listed in the MSDS for each of the materials listed in the table. A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the MSDS for each material before using it for the first time or when there are major changes to the MSDS.

Material	Hazards	Exposure Limit (2)	Signs and symptoms of exposure
Methylene Chloride	Carcinogen Irritant	25 ppm (TWA) 125 ppm (STEL)	Causes irritation to respiratory tract. Has a strong narcotic effect with symptoms of mental confusion, light-headedness, fatigue, nausea, vomiting and headache. Causes irritation, redness and pain to the skin and eyes. Prolonged contact can cause burns. Liquid degreases the skin. May be absorbed through skin.
1 – Always add acid to water to prevent violent reactions.			
2 – Exposure limit refers to the OSHA regulatory exposure limit.			
TWA – Time Weighted Average			
STEL – Short Term Exposure Limit			

6.0 EQUIPMENT AND SUPPLIES

6.1 Gas Chromatograph/Mass Spectrometer System: HP 6890/5973 - An analytical system complete with a temperature-programmable gas chromatograph suitable for split/splitless injection and all required accessories, including syringes, analytical columns, and gases. The capillary column should be directly coupled to the source. Capable of scanning from 35 to 500 AMU every one second or less, using 70 volts (nominal) electron energy in the electron impact ionization mode. The mass spectrometer must be capable of producing a mass spectrum for decafluorotriphenylphosphine (DFTPP) which meets all of the criteria in Table 1 when 50 ng of the GC/MS tuning standard is injected through the GC.

6.2 Data System:

6.2.1 ChemStation software system that allows the continuous acquisition and storage on machine-readable media of all mass spectra obtained throughout the length of the chromatographic program.

6.2.2 Target software system allows the searching of any GC/MS data file for ions of a specified mass and plots such ion abundances versus time or scan number. This type of plot is defined as an Extracted Ion Current Profile (EICP). The software allows integrating the abundances in any EICP for a specified time or scan-number limit. Also, for the non-target compounds with a mass spectrum that meets the required criteria, software must be available that allows for the comparison of sample spectra against the reference library spectra.

6.2.3 Data Library: NIST05

6.3 Carrier gas: Ultra high purity helium

6.4 Instrument columns and run conditions are posted in the instrument area.

6.5 Amber vials. Crimp top seals

6.6 Disposal pipettes

6.7 Micro syringes- 10µL, 250µL, 500µL, 1000µL. Hamilton 1700 series

6.8 Volumetric flasks, Class A

6.9 Analytical Balance, capable of weighing ± 0.01 grams.

7.0 REAGENTS AND STANDARDS

7.1 All standards and reagent preparation, documentation and labeling must follow the requirements of SOP ST-QA-0002, current revision.

7.2 See recipes for standards and QC samples in the Reagent Log program.

7.3 At a minimum, a five point calibration curve is prepared. The low point should be at or below the reporting limit. Refer to Table 3 for typical calibration levels for all analytes. Other calibration levels may be used, depending on instrument capability, but the low standard must support the reporting limit and the high standard defines the range of the calibration.

7.4 An Internal Standard (IS) solution is prepared. Compounds in the I.S. Mix are: acenaphthene-d10, chrysene-d12, 1,4-dichlorobenzene-d4, naphthalene-d8, perylene-d12, and phenanthrene-d10.

7.5 Internal Standards are added to all standards and extracts to result in 40ng injected onto the column.

7.6 GC/MS Tuning Standard: A methylene chloride solution containing 50 µg/mL of decafluorotriphenylphosphine (DFTPP) is prepared.

7.7 ICV standards, NIST traceable:
- 7.7.1 The Semivolatile ICV standard is a second source from the calibration standard.
- 7.7.2 ICV standard is prepared and stored in the same way as calibration standards.

7.8 Standards are to be refrigerated at $\leq 6^oC$ when not in use. Refrigeration at -10^oC to -20^oC may be used if it can be demonstrated that analytes do not fall out of solution at this temperature. The standards must be replaced at least 6 months after opening.

8.0 SAMPLE COLLECTION, PRESERVATION AND STORAGE

8.1 TestAmerica St. Louis supplies sample containers and chemical preservatives in accordance with the method. TestAmerica St. Louis does not perform sample collection. Samplers should reference the methods referenced and other applicable sample collection documents for detailed collection procedures. Sample volumes and preservative information is given in ST-PM-0002.

8.2 Water samples are collected in amber glass, unpreserved and stored at 4 ± 2°C.

8.3 Soil samples are refrigerated at 4 ± 2°C.

8.4 The extraction holding time for Semivolatiles analysis in waters is 7 days.

8.5 The extraction holding time for Semivolatiles in soil/solid matrix is 14 days.

8.6 Extracts must be refrigerated at $\leq 6^oC$ and analyzed within 40 days of the beginning of the extraction.

9.0 QUALITY CONTROL

9.1 Batch
- 9.1.1 A sample batch is a maximum of 20 environmental samples, which are prepared together using the same process and same lot(s) of reagents.
- 9.1.2 Instrument conditions must be the same for all standards, samples and QC samples.
- 9.1.3 For this analysis, batch QC consists of a method blank, a Laboratory Control Sample (LCS), and Matrix Spike (MS)/ Matrix Spike Duplicate (MSD). In the event that there is insufficient sample to analyze a MS/MSD, an LCS Duplicate (LCSD) is prepared and analyzed.

9.2 **Method Blank (MB)**
- 9.2.1 A method blank is a blank matrix processed simultaneously with, and under the same conditions as, samples through all steps of the procedure.
- 9.2.2 A method blank must be prepared with every sample batch.

9.2.3 DI water is used for the Method Blank.

9.3 **Laboratory Control Sample (LCS)**

9.3.1 An LCS is a blank matrix spiked with a known amount of analyte(s), processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.3.2 An LCS must be prepared with every sample batch.

9.3.3 The LCS is comprised of sodium sulfate fortified with the target analyte(s).

9.4 **Matrix Spike (MS) /Matrix Spike Duplicate (MSD)**

9.4.1 A Matrix Spike is an aliquot of a field sample to which a known amount of target analyte(s) is added, and is processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.5 **Surrogate**

9.5.1 A surrogate is a non-target analyte similar in chemical composition and behavior, which mimics the target analytes during preparation, extraction and analysis.

9.5.2 Surrogate(s) is added to every field sample, method blank, LCS and MS/MSD for analysis at the beginning of the sample preparation process.

9.6 **Procedural Variations/ Nonconformance and Corrective Action**

9.6.1 Any variation shall be completely documented using a Nonconformance Memo and approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

9.6.2 Any deviations from QC procedures must be documented as a nonconformance, with applicable cause and corrective action approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

10.0 CALIBRATION AND STANDARDIZATION

10.1 Internal standard calibration is used.

10.1.1 Internal Standard Calibration Procedure: Internal standards are listed in Table 2. Use the base peak m/z as the primary m/z for quantitation of the standards. If interferences are noted, use one of the next two most intense masses for quantitation.

10.1.1.1 Compounds are assigned to the IS, generally with the closest retention time. See Table 2.

10.2 **Instrument Tuning**

10.2.1 The GC/MS system must be checked to see if acceptable performance criteria are achieved for DFTPP (decafluorotriphenylphosphine). See Table 1 in this SOP.

10.2.1.1 The DFTPP and calibration verification standard may be combined into a single standard as long as both tuning and calibration verification acceptance criteria for the project can be met without interferences.

10.2.1.2 **8270** - At the beginning of every twelve hour shift

10.2.1.3 **625** - At the beginning of every 24 hour shift.

10.2.1.3.1 The time period begins at the moment of injection of DFTPP.

10.2.2 Inject 50 ng of the GC/MS tuning standard into the GC/MS system. Obtain a background-corrected mass spectrum of DFTPP and confirm that all the key m/z criteria in Table 1 are achieved. If all the criteria are not achieved, the analyst must retune the mass spectrometer and repeat the test until all criteria are achieved. The performance criteria must be achieved before any samples, blanks, or standards are analyzed.

10.2.3 Degradation of DDT to DDE and DDD should not exceed 20%. (See SOP: ST-GC-0016 for the percent breakdown calculation.) Benzidine and pentachlorophenol should be present at their normal responses, and should not exceed a tailing factor of 2 given by the following equation:

Tailing Factor = BC/AB

Where the peak is defined as follows:

AC is the width at 10% height; DE is the height of peak and B is the height at 10% of DE. This equation compares the width of the back half of the peak to the width of the front half of the peak at 10% of the height.

10.3 **Initial Calibration**

10.3.1 Prepare calibration standards at a minimum of five concentration levels, six points for a quadratic fit, (see Table 3 for suggested concentrations) for each parameter of interest. It may be useful to analyze six calibration levels and use the lower five for most analytes and the upper five for analytes that have poor response. The low level standard should be at or below the reporting limit. The other standards define the working range of the detector.

10.3.2 Add the internal standard mixture to result in 40 ng on column. The concentrations of all analytes are listed in Table 3. Add the internal standard mixture to result in 4ng on column for SIM analysis.

10.3.3 Analyze each calibration standard and tabulate the area of the primary characteristic m/z against concentration for each compound and internal standard. The low level standard must be at or below the reporting limit.

10.3.4 Except in specific instances, it is NOT acceptable to remove points from a calibration curve for the purpose of meeting criteria. Refer to the TestAmerica corporate policy, "Calibration Curves."

10.3.5 It may be necessary to analyze more than one set of calibration standards to encompass all of the analytes required for some tests.

10.3.6 A new calibration curve must be generated after major changes to the system or when the continuing calibration criteria cannot be met. Major changes include new columns, any significant changes in instrument operating parameters, and major instrument maintenance (e.g., cleaning the ion source).

10.3.7 Sample peak areas are compared to peak areas of the standards. The ratio of the detector response to the amount concentration of analyte in the calibration standard is defined as the response factor (RF) or calibration factor (CF).

10.3.8 **Initial Calibration Criteria (8270D)**

10.3.8.1 Minimum Response Factors

10.3.8.2 See Table 4 in this SOP for the minimum response factors. These minimum response factors are prescribed by SW method 8270D. For analytes not given a minimum response factor by the method, St. Louis has established a default minimum response factor of 0.01 for compound, except for Famphur, Hexachlorophene, Kepone, Phthalic Anhydride which have a minimum response factor of 0.001.

10.3.8.2.1 SW-846 chromatographic methods allow the use of both linear and non-linear models for the calibration data.

10.3.8.3 The first way is to begin with the simplest approach, the linear model through the origin, and then progress through other options until the calibration acceptance criteria are met. The second way is to use technical knowledge of the detector response to the target compound to choose the calibration model.

10.3.8.4 The option for non-linear calibration may be necessary to address specific instrumental techniques. However, it is not EPA's intent to allow non-linear calibration to be used to compensate for detector saturation or to avoid proper instrument maintenance.

10.3.8.5 **Linear calibration using the average response factor**

10.3.8.5.1 The Relative Standard Deviation (RSD) of the calibration points from the curve used must be $\leq$ 20% for each target analyte.

10.3.8.5.2 If the %RSD in the initial calibration is > 20%, then calibration using a linear regression may be employed.

10.3.8.6 **Linear calibration using a least squares regression**

.

The intercept of a linear calibration at zero response (i.e. the y-intercept) must have an absolute value less than the reporting limit for each analyte. Client requirements may be tighter, please check Client Requirement Memorandum (CRM) if identified in comments.

Note, for analyses utilizing an internal standard the Target variable "b" does NOT equal the y-intercept. For analyses utilizing an internal standard, the Target variable "b" must be multiplied by the associated internal standard concentration to derive the concentration at the y-intercept.

10.3.8.6.1 r (correlation coefficient) must be ≥ 0.995 OR r^2 (coefficient of difference) must be ≥ 0.990.

10.3.8.6.2 When calculating the calibration curves using the linear regression model, a minimum quantitation check on the viability of the lowest calibration point should be performed by re-fitting the response from the low concentration calibration standard back into the curve.

10.3.8.6.3 It is not necessary to re-analyze a low concentration standard; rather the data system can recalculate the concentrations.

10.3.8.6.4 The recalculated concentration of the low calibration point should be within ± 30% of the standard's true concentration.

10.3.8.6.4.1 Analytes which do not meet the minimum quantitation calibration re-fitting criteria should be considered "out of control" and corrective action should be taken.

10.3.8.7 **Linear calibration using a least squares regression, forcing thru zero**

10.3.8.7.1 Forcing the curve through zero is not the same as including the origin as a fictitious point in the calibration. In essence, if the curve is forced through zero, the intercept is set to 0 *before* the regression is calculated, thereby setting the bias to favor the low end of the calibration range by "pivoting" the function around the origin to find the best fit and resulting in one less degree of freedom. It may be appropriate to force the regression though zero for some calibrations.

10.3.8.7.2 Curve must still meet criteria in 10.3.8.6.1 and 10.3.8.6.2

10.3.8.7.3 For samples requiring adherence to method 8000B, forcing through zero is ***NOT*** allowed.

10.3.8.8 **Linear calibration using a least squares regression, weighting of data points**

10.3.8.8.1 In linear, the points at the lower end of the calibration curve have less absolute variance than points at the high concentration end of the curve. This can cause severe errors in quantitation at the low end of the calibration; for this reason it may be preferable to increase the weighting of the lower concentration points, $1/\text{Concentration}^2$ weighting (often called $1/X^2$ weighting), to improve accuracy at the low end of the curve.

10.3.8.8.2 Curve must still meet criteria in 10.3.8.6.1 and 10.3.8.6.2

10.3.8.9 **Non-linear calibration**

10.3.8.9.1 In situations where the analyst knows that the instrument response does not follow a linear model over a sufficiently wide working range, or when the other approaches have not met the acceptance criteria, a non-linear calibration model may be employed.

10.3.8.9.2 It is not EPA's intent to allow non-linear calibration to be used to compensate for detector saturation or to avoid proper instrument maintenance. Thus, non-linear calibrations are not to be employed for analytes shown to consistently exhibit linear calibration for the analytes of interest.

10.3.8.9.2.1 These compounds are not to use non-linear calibrations: 1,4-Dioxane; Pyridine; n-Nitrosodimethylamine;

2-Fluorophenol; Aniline; Bis(2-chloroethyl)ether; Phenol-d5; Phenol; 2-Chlorophenol; 1,3-Dichlorobenzene; 1,4-Dichlorobenzene; 1,2-Dichlorobenzene; Benzyl Alcohol; 2-Methylphenol; N-nitrosodinpropylamine; Hexachloroethane; 3 and 4-Methylphenol; Nitrobenzene-d5; Nitrobenzene; Isophorone; 2-Nitrophenol;
2,4-Dimethylphenol; Bis(2-chloroethoxy) methane;
2,4- Dichlorophenol; 1,2,4-Trichlorobenzene; Naphthalene; Hexachlorobutadiene; 4-Chloro-3-Methylphenol;
2-Methylnaphthalene; 2,4,6-Trichlorophenol;
2-Fluorobiphenyl; 2,4,5-Trichlorophenol; 2-Chloronaphthalene; Dimethylphathalate; Acenaphthylene; Acenaphthene; Dibenzofuran; Diethylphthalate; Fluorene; 4-Chlorophenyl-phenylether; N-Nitrosodiphenylamine; Azobenzene; 4-Bromophenyl-phenylether; Hexachlorobenzene; Phenanthrene; Anthracene; Carbazole; Di-n-Butylphthalate; Fluoranthene; Pyrene; Terphenyl-d14; Butylbenzylphthalate; Benzo(a)Anthracene; Chrysene; bis(2-ethylhexyl)Phthalate; 2-Picoline;
n-Nitrosomethylethylamine; Methyl methanesulfonate;
n-Nitrosodiethylamine; Ethyl Methanesulfonate; Pentachloroethane; Acetophenone; n-Nitrosopyrrolidine;
n-Nitrosomorpholine; O-Toluidine; n-Nitrosopiperidine; o,o,o-Triethyl-Phosphorothioate; 2,6-Dichlorophenol; Hexachloropropene; Benzothiazole;
n-Nitrosodi-n-butylamine; Safrole;
1,2,4,5-Tetrachlorobenzene; cis-Isosafrole; trans-Isosafrole; 1,4-Dinitrobenzene; 1,3-Dinitrobenzene; Pentachlorobenzene; 1-Naphthylamine; 2-Naphthylamine; Thionazin; 5-Nitro-o-toluidine; Tri-n-butylphosphate; Sulfotepp; Diallate; Phorate; Phenacetin; Tris (2-chloroethyl) phosphate; 4-Aminobiphenyl; Pronamide; Pentachloronitrobenzene; Disulfoton; Parathion; Isodrin; Aramite; p- (Dimethylamino) azobenzene; Chlorobenzilate; 2-Acetylaminofluorene; 4,4'-Methylenebis (2)-Chloroaniline; 7,12-Dimethylbenz (a) anthracene;
3-Methylcholanthrene; Isosafrole; Benzenethiol;
4-Chlorobenzenethiol; p-Chlorophenyl methyl sulfide; Phenyl sulfide; Phenyl disulfide; Phenyl sulfone; Octachlorostyrene; 2,2'Dichlorobenzil;
4-Chlorophenyl sulfone; Methyl methacrylate;
Ethyl methacrylate; Benzaldehyde; Caprolactam;
1-Methylnaphthalene; Biphenyl; Atrazine.

10.3.8.9.2.2 EPA Method 8000C suggests a 20% RSD limit be used when evaluating a calibration. The above compound list was constructed based on the 20% RSD criteria. TestAmerica St. Louis reserves the right to employ different calibration models when client mandated criteria are less than the 20% criteria found in method 8000C.

10.3.8.9.3 The intercept of the curve at zero response must be less than + or – the reporting limit for the analyte.

10.3.8.9.4 r (correlation coefficient) must be ≥ 0.995 OR r^2 (coefficient of difference) must be ≥ 0.990.

10.3.8.9.5 Due to the nature of SIM analysis, non-linear calibrations may be used.

10.3.9 **625 criteria**

10.3.9.1 Method 625 only requires a 3 point calibration. We routinely perform a 6 point calibration; however, 3 points may be removed from the curve if necessary to meet 625 calibration criteria.

10.3.9.1.1 Refer to the TestAmerica corporate policy, "Calibration Curves."

10.3.9.2 The Relative Standard Deviation (RSD) of the calibration points from the curve used must be < 35%.

10.3.9.3 If the %RSD in the initial calibration is > 35%, then calibration using a linear regression may be employed.

10.3.9.4 If a linear regression curve is used, the intercept of the curve at zero response must be less than ± the reporting limit for the analyte. It is recommended that for linear regression curves the line be set through the origin.

10.3.9.5 Use of $1/\text{Concentration}^2$ weighting is recommended to improve the accuracy of quantitation at the low end of the curve. The analyst should consider instrument maintenance to improve the linearity of response.

10.3.9.6 Weighting of data points

10.3.9.6.1 The points at the lower end of the calibration curve have less weight in determining the curve generated than points at the high concentration end of the curve. However, in environmental analysis, accuracy at the low end of the curve is very important. For this reason it is preferable to increase the weighting of the lower concentration points. $1/\text{Concentration}^2$ weighting (often called $1/X^2$ weighting) will improve accuracy at the low end of the curve and should be used if the data system has this capability.

10.4 **Initial Calibration Verification (ICV)**

10.4.1 An initial calibration verification standard is a different standard source than the one used for the initial calibration.

10.4.2 An ICV must be performed with every initial calibration.

10.4.3 The ICV performance must be within ± 30% D criteria.

10.4.3.1 Not meeting this requirement may be indicative of serious system malfunction or inaccuracies in the standards used for the initial calibration curve or ICV standard. Corrective action must be taken (including reanalysis of the ICV or analysis of a different ICV). Any decision to proceed with analysis of samples when the ICV is out-of-control must be taken with great care and in consultation with the QA department and the laboratory director. Any such action must be documented in an NCM.

10.5 **Continuing Calibration Verification (CCV)**

10.5.1 At the start of each 12 hour period (8270) or 24 hour period (EPA 625) the GC/MS tuning standard must be analyzed. A 50 ng injection of DFTPP must result in a mass spectrum for DFTPP which meets the criteria. See Table 1 in this SOP.

10.5.2 Following a successful DFTPP analysis the continuing calibration standard(s) are analyzed. The standards must contain all semivolatile analytes, including all required surrogates. A mid level calibration standard is used for the continuing calibration

10.5.3 A CCV standard is analyzed every analysis tune clock immediately following the DFTPP tune.

10.5.3.1 **EPA 8270 –** for each 12 hour tune time period

10.5.3.2 **EPA 625 –** for each 24 hour tune time period

10.5.4 The CCV can be the same source or a second source from the calibration.

10.5.5 The internal standard response must be within 50-200 area counts (-50% to 100%) of the response in the mid level of the initial calibration. The internal standard retention times must be within 30 seconds of the retention times in the mid-level of the initial calibration.

10.5.6 **EPA 8270 Criteria**

10.5.6.1 Minimum Response Factors

10.5.6.2 See Table 4 in this SOP for the minimum response factors. These minimum response factors are prescribed by SW-846 method 8270D. For analytes not given a minimum response factor by the method, St. Louis has established a default minimum response factor of 0.01 per compound, except for Famphur, Hexachlorophene, Kepone, Phthalic Anhydride which have a minimum response factor of 0.001.

10.5.6.3 The CCV performance must be with ± 20% D criteria.

10.5.6.4 If a CCV has failed and the analyst can document the reason for failure (e.g. broken vial, carryover from the previous sample etc.) then a second CCV may be analyzed without any adjustments to the instrument. If this CCV meets criteria then sample analysis may continue; however the preceding samples must be reanalyzed. If this second CCV does not meet criteria, the analysis run is terminated. Instrument maintenance is performed and the instrument may require re-calibration (i.e. initial calibration).

10.5.7 **EPA 625 Criteria**

10.5.7.1 For each target analyte %D must be < 20%.

10.5.8 Calibration excursions are to be documented via a NCM.

10.6 Retention Time (RT) windows

10.6.1 Relative Retention Time (RRT)

10.6.1.1 In addition to normalizing the response (peak area) of the target compound to the response of the internal standard in that sample or extract for that injection, the retention times of the target compound and the internal standard may be used to calculate the relative retention time (RRT) of the target compound.

10.6.1.2 The RRT is expressed as a unit-less quantity:

$$\text{RRT} = \frac{\text{Retention time of the analyte}}{\text{Retention time of the internal standard}}$$

10.6.1.3 The RRT of each target analyte in each calibration standard should agree within ± 0.06 RRT units.

10.6.1.4 It is recognized here that with increasing retention times of the internal standard, target analytes will be able to more easily meet this criterion. Thus, care should be exercised when selecting the appropriate internal standards by retention times. The process of selecting internal standards to quantify target analytes should also include consideration of retention times as they should be similar.

10.6.1.5 If this criterion is not met and unless there are no other indicators of a component's identification such as a very unique but a high probability mass spectral match then that component may not be considered as identified by relative retention time.

10.6.1.6 The RRT evaluation allows the analyst to compensate for modest shifts in the chromatographic conditions that can occur due to interferences and simple day-to-day instrument variability. Many methods that employ internal standard calibration use more than one internal standard and the target compounds are related to the internal standards on the basis of the similarity of their respective chromatographic retention times (see Table 5).

10.6.2 Internal standard retention time

10.6.2.1 The retention times of the internal standards in the calibration verification standard must be evaluated immediately after or during data acquisition. If the retention time for any internal standard changes by more than 30 seconds from that in the mid-point standard level of the most recent initial calibration sequence, then the chromatographic system must be inspected for malfunctions and corrections must be made, as required. When corrections are made, reanalysis of samples analyzed while the system was malfunctioning is required.

10.6.3 Retention Time Criteria

10.6.3.1 The retention times of all compounds in each continuing calibration must be within the retention time windows established.

11.0 PROCEDURE

11.1 Samples are prepared following ST-OP-0002.

11.2 All standards and extracts are allowed to warm to room temperature before injecting.

11.3 All samples must be analyzed using the same instrument conditions as the initial calibration.

11.4 Add internal standard to the extract to result in 40ng injected on column. Mix thoroughly before injection into the instrument.

11.4.1 Add internal standard to the extract to result in 4ng injected on column for SIM analysis.

11.5 Inject the sample extract into the GC/MS system using the same injection technique as used for the standards.

11.6 The data system will determine the concentration of each analyte in the extract using calculations equivalent to those in section 12. Quantitation is based on the initial calibration, not the continuing calibration.

11.7 Perform all qualitative and quantitative measurements. When the extracts are not being used for analyses, refrigerate at -10^{o}C to -20^{o}C (if it can be demonstrated that analytes do not fall out of solution at this temperature), protected from light in screw cap vials equipped with un-pierced Teflon lined septa.

12.0 DATA ANALYSIS AND CALCULATIONS

12.1 External Standard Calculations
12.1.1 See Target software for calculations.

12.2 Manual Integrations
12.2.1 Identified compounds are reviewed for proper integration. Integrations are performed automatically by the data system. If necessary, manual integrations are performed and are documented by the analyst. Manual integrations are denoted with "M" flag on the Target quantitation report. See TestAmerica Policy CA-Q-S-001, Acceptable Manual Integration Practices

12.3 Qualitative identification
12.3.1 An analyte is identified by retention time and by comparison of the sample mass spectrum with the mass spectrum of a standard of the suspected compound (standard reference spectrum). Mass spectra for standard reference may be obtained on the user's GC/MS by analysis of the calibration standards or from the NIST Library. Two criteria must be satisfied to verify identification: (1) elution of sample component at the same GC retention time as the standard component; and (2) correspondence of the sample component and the standard component characteristic ions.
12.3.1.1 Note: Care must be taken to ensure that spectral distortion due to co-elution is evaluated. The following analytes should be carefully reviewed:

1,4-Dichlorobenzene-d4	Aniline	Bis (2-Chloroethyl) ether
1,3-Dichlorobenzene	1,4-Dichlorobenzene	1,2-Dichlorobenzene
Benzyl alcohol	2-Methylphenol	3,4-Methylphenol
2,4-Dichlorophenol	2,4,6-Trichlorophenol	2,4,5-Trichlorophenol
Phenanthrene	Anthracene	Benz (a) anthracene
Bis (2-ethylhexyl) phthalate	Chrysene	Di-n-octyl phthalate
Benzo (b) fluoranthene	Benzo (k) fluoranthene	Indeno (1,2,3-cd) pyrene

Benzo (g,h,i) perylene	p-Phenylenediamine	Safrole
Cis-Isosafrole	Trans-isosafrole	1,4-Dinitrobenzene
1,3-Dinitrobenzene	1-Naphthylamine	2-Naphthylamine
2,3,4,6-Tetrachlorophenol	Dinoseb	Sulfotepp
Diallate 1 & 2	Methapyrilene	Aramite 1 & 2

12.3.2 The sample component retention time must compare to within ± 0.2 min. of the retention time of the standard component. For reference, the standard must be run within the same twelve hours as the sample.

12.3.3 All ions present in the standard mass spectra at a relative intensity greater than 10% (most abundant ion in the spectrum equals 100%) should be present in the sample spectrum.

12.3.4 The relative intensities of ions should agree to within ±30% between the standard and sample spectra. (Example: For an ion with an abundance of 50% in the standard spectra, the corresponding sample abundance should be between 20 and 80 percent.)

12.3.4.1 See Table 2 for primary, secondary and tertiary ion assignments.

12.3.5 If a compound cannot be verified by all the above criteria, but in the technical judgment of the analyst, the identification is correct, then the analyst shall report that identification and proceed with quantitation.

12.3.6 Retention time criteria for samples

12.3.6.1 If the retention time for any internal standard changes by more than 0.5 minutes from the last continuing calibration standard, the chromatographic system must be inspected for malfunctions and corrected. Reanalysis of samples analyzed while the system was malfunctioning is required.

12.3.6.2 If the retention time of any internal standard in any sample varies by more than 0.1 minute from the preceding continuing calibration standard, the data must be carefully evaluated to ensure that no analytes have shifted outside their retention time windows.

12.4 Library searches of peaks present in the chromatogram that are not target compounds (Tentatively Identified Compounds, TIC) may be performed if required by the client.

12.4.1 TICs are done as follows:

12.4.1.1 The computer will give quality matches in order from most likely to least likely. In order for us to call a TIC a certain compound, the quality match must be at least 90%. However, if the next two quality matches are within (around) 10% quality match of the first choice, the compound will be identified as an unknown because it is too close to call. Unknowns are put into a group if possible (such as Unknown alkanes) but if a group is not available it will be called Unknown. A compound will be also called unknown if the top three matches are all different groups of compounds and the quality match is < 90% (ex. If the top choice is an alkane, the second choice is an alcohol, the third choice is an acid).

12.4.1.2 The first 30 TICs, based on abundance, will be identified in a sample, unless a different number is specified by the client. See client requirement sheet.

12.5 Dilutions

12.3.7 If the concentrations of any analytes exceed the working range as defined by the calibration standards, then the sample must be diluted and reanalyzed.

12.5.1 A dilution should target the most concentrated analyte in the upper half (over 50% of the high level standard) of the client specific project requirements.

12.5.2 Samples may be diluted initially if the project reporting limits are above the laboratory's routine calibration lower limit, if there is physical evidence of matrix, or historical knowledge of the site.

12.6 Carryover

12.6.1 When a sample has a high response for a compound, there is a real possibility that some of the sample may carry over into the sample analyzed immediately afterward.

12.6.1.1 If a sample analyzed after a sample with high concentrations has negative results or is non-detect, carryover did not occur.

12.6.1.2 If a sample analyzed after a sample with high concentrations has positive results for the same analytes, carryover may have occurred.

12.6.1.2.1 This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred.

12.6.1.3 If the chromatographic profile resembles the previous sample, the results are questionable. This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred.

13.0 DATA ASSESSMENT AND ACCEPTANCE CRITERIA; CORRECTIVE ACTIONS FOR OUT OF CONTROL DATA

13.1 This SOP lists requirements for the standard Quality Assurance criteria followed at TestAmerica St. Louis. If a client or program requires stricter quality controls (i.e. DoD, DOE) the analyst is directed to the Client Requirement Memo for that client/project for limits.

13.2 The data assessment and corrective action process is detailed through the LIMS Nonconformance Memorandum (NCM) process. The NCM process is described in SOP: ST-QA-0036.

13.3 Method Blank

13.3.1 Acceptance Criteria:

13.3.1.1 No target analytes may be present in the method blank above the reporting limit.

13.3.1.2 The method blank must have acceptable surrogate recoveries.

13.3.1.3 Corrective Action for Method Blanks not meeting acceptance criteria:

13.3.1.3.1 <u>Method Blank Contamination</u> – Blank contamination above the RL (>1/2 RL for some programs – see specific Client Requirement Memos for details) requires re-prep of batch unless all associated samples are < RL or greater than 10 times the amount detected in the method blank.

13.3.1.3.2 <u>Method Blank Surrogate excursion</u> – If excursion is limited to the blank, data may be reported with an NCM. If surrogates are also outside criteria in samples, re-prep and re-anlaysis is required. In cases where the surrogate recovery is high and the samples are non-detect, the data may be reported with an NCM.

13.4 Laboratory Control Sample (LCS)

13.4.1 Acceptance Criteria: All control analytes must be within established control limits for accuracy (%Recovery) and precision (RPD).

13.4.1.1 For long analyte spike list, marginal exceedances (ME) are allowed as follows:

13.4.1.2 less than 11 analytes in LCS, no analytes allowed in ME of the LCS control limit.

13.4.1.3 11-30 analytes in LCS, 1 analytes allowed in ME of the LCS control limit.

13.4.1.4 31-50 analytes in LCS, 2 analytes allowed in ME of the LCS control limit.

13.4.1.5 51-70 analytes in LCS, 3 analytes allowed in ME of the LCS control limit.

13.4.1.6 71-90 analytes in LCS, 4 analytes allowed in ME of the LCS control limit.

13.4.1.7 More than 90 analytes in LCS, 5 analytes allowed in ME of the LCS control limit.

13.4.1.8 No LCS recoveries may be outside the Marginal Exceedance limit.

13.4.1.9 Marginal exceedances must be random. If the same LCS analyte exceeds the control limit repeatedly, it is an indication of a systemic problem. The source of the error must be located and corrective action taken.

13.4.2 The LCS should have acceptable surrogate recoveries.

13.4.3 Corrective Action for LCS not meeting acceptance criteria:

13.4.3.1 <u>LCS Spike Recovery excursion (high)</u> – Samples that are non-detect may be reported with an NCM (unless prohibited by client requirements). Samples with detects for the analyte recovered high in the LCS are re-prepped and re-analyzed. . In cases where the surrogate recovery is high and the samples are non-detect, the data may be reported with an NCM

13.4.3.2 <u>LCS Spike Recovery excursion (low)</u> – batch is re-prepped and re-analyzed.

13.4.3.3 LCS Surrogate Recovery excursion – If excursion is limited to the LCS, data may be reported with an NCM. If target analytes are in control in the LCS, data may be reported with an NCM. If surrogates are also outside criteria in samples, re-prep and re-analysis is required.

13.4.3.4 RPD excursion for LCS/LCSD – If target analytes recoveries are in control, data may be reported with an NCM

13.5 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

13.5.1 All analytes should be within established control limits for accuracy (%Recovery) and precision (RPD).

13.5.2 Corrective Action for MS/MSD not meeting acceptance criteria:

13.5.2.1 MS/MSD Spike Rec. excursion may not necessarily warrant corrective action other than narration. If affected analyte concentration in the original sample is greater than four times the amount spiked, percent recovery information is ineffective. Data is reported with an NCM. If the excursion is due to a physically evident matrix interference, the data is reported with an NCM (the physical interference must be described in the NCM). If there is no evidence of interference and the RPD as well as spike recoveries out outside limits out, sample re-prep and re-analysis are required.

13.6 Sample result evaluation

13.6.1 Dilutions

13.6.1.1 If the response for any compound exceeds the working range of the analytical system, a dilution of the extract is prepared and analyzed. An appropriate dilution should be in the upper half of the calibration range.

13.6.1.2 Dilution: Sample– An NCM is created when dilutions are required.

13.6.1.3 Dilution: Surrogate(s)/spikes diluted out– An NCM is generated to document the surrogates/spikes being diluted out.

13.6.2 Carryover

13.6.2.1 When a sample has a high response for a compound, there is a real possibility that some of the sample may carry over into the sample analyzed immediately afterward.

13.6.2.2 If a sample analyzed after a sample with high concentrations is non-detect for the high concentration analyte, carryover did not occur.

13.6.2.3 If a sample analyzed after a sample with high concentrations has positive results for the same analytes, or if the chromatographic profile resembles the previous sample, the results are questionable. This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred.

13.6.3 Internal Standards

13.6.3.1 Acceptance Criteria:

13.6.3.1.1 If the EICP area for any of the internal standards in the calibration verification standard changes by a factor of two (-50% to +100%) from that in the mid-point standard level of the most recent initial calibration sequence.

13.6.3.1.2 If the EICP area for any of the internal standards in samples, spikes and blanks changes by a factor of two (-50% to +100%) from the areas determined in the continuing calibration analyzed that day, corrective action must be taken. The samples, spikes or blanks should be reanalyzed or the data should be qualified. (Some programs may require that the midpoint of the initial calibration be used for ISTD monitoring. See the project CRM for specifics.)

13.6.3.2 Corrective Action for Internal Standards not meeting acceptance criteria:

13.6.3.2.1 Internal Standard excursion – high – High ISTD recovery indicates a potential low bias to analytical results. Instrument maintenance, if required, is done and affected samples are reanalyzed. If ISTDs are outside criteria on the re-analysis, a matrix interference is suspected and data reported with an NCM.

13.6.3.2.2 Internal Standard excursion – low – Low ISTD recovery indicates the potential for a high bias to analytical results. Samples that are non-detect for affected analytes may be reported with an NCM. Samples with positive hits above the RL for analytes associated with the poor ISTD recovery require re-analysis. Instrument maintenance, if required, is done. If ISTDs are outside criteria on the re-analysis, a matrix interference is suspected and data reported with an NCM.

13.7 Insufficient Sample

13.7.1 For each prescribed re-preparation corrective action, if there is insufficient sample to repeat the analysis, an NCM is created and a narrative comment stating such is included in the report's Case Narrative.

14.0 METHOD PERFORMANCE AND DEMONSTRATION OF CAPABILITY

14.1 Method performance data, Reporting Limits, and QC acceptance limits, are given in the LIMS.

14.2 Demonstration of Capability

14.2.1 Initial and continuing demonstrations of capability requirements are established in the QAM.

14.3 Training Qualification

14.3.1 The manager/supervisor has the responsibility to ensure that this procedure is performed by an analyst who has been properly trained in its use and has the required experience.

14.3.2 The analyst must have successfully completed the initial demonstration capability requirements prior to working independently. See requirements in the QAM.

14.4 Annually, the analyst must successfully demonstrate proficiency to continue to perform this analysis. See requirements in the QAM.

15.0 VALIDATION

15.1 Laboratory SOPs are based on standard reference EPA Methods that have been validated by the EPA and the lab is not required to perform validation for these methods. The requirements for lab demonstration of capability are included in LQM. Lab validation data would be appropriate for performance based measurement systems or non-standard methods. TestAmerica St. Louis will include this information in the SOP when accreditation is sought for a performance based measurement system or non-standard method.

16.0 WASTE MANAGEMENT AND POLLUTION PREVENTION

16.1 All waste will be disposed of in accordance with Federal, State and Local regulations. Where reasonably feasible, technological changes have been implemented to minimize the potential for pollution of the environment. Employees will abide by this method and the policies in section 13 of the Corporate Safety Manual for "Waste Management and Pollution Prevention."

16.2 Waste Streams Produced by the Method

16.2.1 The following waste streams are produced when this method is carried out.

16.2.1.1 Auto-sample vials containing Methylene Chloride are to be disposed of in the appropriate solvent vial waste accumulation container located within the GC/MS lab, for temporary storage. Once this temporary container is full or once it reaches a one-year collection time, this container must be dumped into the permanent solvent vial waste container located in the 90-day storage area, which is marked as a Type "C" waste accumulation container.

16.2.1.2 Waste Methylene Chloride rinses are to be collected and disposed of within the solvent waste accumulation container located in the Organic Prep. Lab. This temporary storage container shall be dumped on a daily basis into the permanent waste accumulation container located in the 90-day storage area which is marked as a Type "D" waste drum.

18.0 CLARIFICATIONS, MODIFICATIONS TO THE REFERENCE METHOD

18.1 The quantitation and qualifier ions for some compounds have been changed from those recommended in SW-846 in order to improve the reliability of qualitative identification.

19.0 CHANGES TO PREVISION SOP REVISION

19.1 Table reference in Section 6.1 was corrected.
19.2 Y-intercept requirements added to Section 10.
19.3 Added requirement for 6 levels for a quadratic curve to Section 10
19.4 Added CLP allowance for reporting data within 10% of upper standard without dilution to Section 12
19.5 Clarification of criteria for TIC reporting added to Section 12.4.
19.6 Table 1: clarified Tune criteria and added allowance of other published DFTPP Tune criteria (i.e. EPA CLP)
19.7 Added Table 5, a listing of internal standards and associated analytes
19.8 Revision 13:
- 19.8.1 Grammatical /spelling corrections
- 19.8.2 Added SIM analysis to section 11

19.9 Revision 14:
- 19.9.1 Removed QuantIMS and Clouseau references – replaced with LIMs
- 19.9.2 Created hyperlinks to tables

19.9.3 Appended LVI Calibration Levels to Table 3
19.9.4 Combined fragmented Table 5 into one table
19.9.5 Added table of potentially mis-identifiable analytes to Section 12.3.
19.9.6 Removed CLP allowance for reporting data within 10% of upper standard without dilution from Section 12.
19.9.7 Revised Section 13 to remove Clouseau corrective action references and to provide specific corrective actions for non-conformances.

Table 1
DFTPP Key Ions and Ion Abundance Criteria*

Mass	Ion Abundance Criteria
51	30 - 60% of mass 198
68	<2% of mass 69
70	<2% of mass 69
127	40 - 60% of mass 198
197	<1% of mass 198
198	Base peak, 100% relative abundance
199	5 - 9% of mass 198
275	10 - 30% of mass 198
365	>1% of mass 198
441	Present, but less than mass 443
442	>40% of mass 198
443	17 - 23% of mass 442

* Tune criteria in use is a combination of 8270C and 8270D which is more stringent than either method. Alternatively, other documented tuning criteria (e.g. EPA CLP) may be used provided method performance is not aversely affected.

Marti Ward Quality Assurance Manager	Date	Elaine Wild Laboratory Director	Date

This SOP was previously identified as SOP No. ST-GC-0016 Rev. 12

Facility Distribution No.: 0 **Distributed To:** See Electronic Distribution Sheet

1.0 SCOPE AND APPLICATION

1.1 This SOP describes procedures to be used for the analysis of Pesticides by GC/ECD.

1.2 Sample preparation techniques are described in SOP ST-OP-0002.

1.3 This SOP is based on SW-846 Methods 8000B, 8000C and 8081B and EPA Method 608.

1.4 The laboratory target analytes supported by this method, the reporting limits, method detection limits and QC limits are maintained in the Information Management System (QuantIMS). A copy of the Structure and Analysis Code (SAC), which lists this information, is included in the appendix of this SOP.

1.4.1 Additional compounds may be amendable to this method. The minimum requirement for non-standard analytes is that the reporting limit be set at the lowest required concentration that can actually be detected by the instrument, and when an MDL study can not be conducted, the MDL be set equal to the reporting limit.

2.0 SUMMARY OF METHOD

2.1 Aqueous samples are prepared for analysis using continuous or separatory funnel liquid / liquid extraction. Solid samples are prepared using sonication. Waste dilution and wipes are extracted by autoshaker.

2.2 After the initial preparation step, the sample is introduced to the GC, equipped with capillary columns and dual Electron Capture Detectors (ECD). Concentrations of target analytes are measured by the detector response within a defined retention time window, relative to the response to standard concentrations. The external standardization procedure is used.

3.0 DEFINITIONS

3.1 See the TestAmerica St. Louis Quality Assurance Manual (QAM) for a glossary of common laboratory terms and data reporting qualifiers.

4.0 INTERFERENCES

4.1 Interferences in the GC analysis arise from many compounds amenable to gas chromatography that give a measurable response on the electron capture detector. Phthalate esters, which are common plasticizers, can pose a major problem in the determinations. Interferences from phthalates are minimized by avoiding contact with any plastic materials.

4.2 Interferences co-extracted from samples will vary considerably from source to source. The presence of interferences may raise quantitation limits for individual samples. Specific cleanups may be performed on the sample extracts, including florisil cleanup (Method 3620).

4.3 Contamination by carryover can occur when a low concentration sample is analyzed after a high concentration sample. Co-elution of target analytes with non-targets can occur, resulting in false positives or biased high results.

4.4 Solvents, reagents, glassware, and other sample processing hardware may yield artifacts and interferences to sample extracts. Strict attention to glassware cleaning and handling and demonstration of solvent purity will lead minimization of these interferences.

5.0 SAFETY

5.1 Employees must abide by the policies and procedures in the Corporate Environmental Health and Safety Manual, Radiation Safety Manual and this document. This procedure may involve hazardous material, operations and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats and closed-toe, nonabsorbent shoes are a minimum.

5.2 SPECIFIC SAFETY CONCERNS OR REQUIREMENTS

5.2.1 The gas chromatograph contains zones that have elevated temperatures. The analyst needs to be aware of the locations of those zones, and must cool them to room temperature prior to working on them.

5.2.2 There are areas of high voltage in the gas chromatograph. Depending on the type of work involved, either turn the power to the instrument off, or disconnect it from its source of power.

5.3 PRIMARY MATERIALS USED

5.3.1 The following is a list of the materials used in this method, which have a serious or significant hazard rating. **NOTE: This list does not include all materials used in the method. The table contains a summary of the primary hazards listed in the MSDS for each of the materials listed in the table.** A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the MSDS for each material before using it for the first time or when there are major changes to the MSDS.

Material (1)	**Hazards**	**Exposure Limit (2)**	**Signs and symptoms of exposure**
Hexane	Flammable Irritant	500 ppm (TWA)	Inhalation of vapors irritates the respiratory tract. Overexposure may cause lightheadedness, nausea, headache, and blurred vision. Vapors may cause irritation to the skin and eyes.
Methanol	Flammable Poison Irritant	200 ppm (TWA)	A slight irritant to the mucous membranes. Toxic effects exerted upon nervous system, particularly the optic nerve. Symptoms of overexposure may include headache, drowsiness and dizziness. Methyl alcohol is a defatting agent and may cause skin to become dry and cracked. Skin absorption can occur; symptoms may parallel inhalation exposure. Irritant to the eyes.
1 – Always add acid to water to prevent violent reactions.			
2 – Exposure limit refers to the OSHA regulatory exposure limit.			
TWA – Time Weighted Average			

6.0 EQUIPMENT AND SUPPLIES

6.1 GC/ECD system: The lab utilizes an Agilent GC 6890 dual micro ECD system with autosampler.

6.1.1 GC column type, and instrument run conditions are posted on the individual GC instruments.

6.2 Disposable pipettes

6.3 Amber vials: Crimp top seals

6.4 Clear vials and silicon crimp seals

6.5 Micro syringes- 10µL, 250µL, 500µL, 1000µL. Hamilton 1700 series.

6.6 Volumetric flasks, Class A

6.7 Analytical Balance, capable of weighing ± 0.01 grams.

7.0 REAGENTS AND STANDARDS

7.1 All standards and reagent preparation, documentation and labeling must follow the requirements of SOP ST-QA-0002, current revision.

7.2 Pesticide stock standard solutions must be replaced after 6 months, once opened, or manufacturer's expiration date whichever is shorter. Pesticide calibration solutions must be refrigerated at $\leq 6^{o}$C and protected from light. Intermediate and working standards must be replaced at least every six months, or the stock solutions expiration date, whichever is sooner. Additionally standards are discarded if comparison with check standards indicates a problem.

7.3 See reagent log for specific information regarding standards and reagents.

7.4 ICV standards, NIST traceable:

7.4.1 The Pesticide ICV standard is a second source from the calibration standard.

7.4.2 ICV standard is prepared and stored in the same way as calibration standards.

7.5 Surrogate Standards

7.5.1 Tetrachloro-m-xylene and decachlorobiphenyl are the surrogate standards.

7.6 Column Degradation Evaluation Mix (PEM Standard)

7.6.1 A standard containing 4,4'-DDT and Endrin and not containing any of their breakdown products must be prepared for evaluation of degradation of these compounds by the GC column and injection port. This mix must be replaced after 6 months, or whenever corrective action to columns fails to eliminate the breakdown of the compounds, whichever is shorter. This solution also contains the surrogates. Refer to Table 2 for details of the column degradation evaluation mix.

7.7 Gases for carrier and make-up: Hydrogen carrier, Nitrogen make-up

8.0 SAMPLE PRESERVATION AND STORAGE

8.1 TestAmerica St. Louis supplies sample containers and chemical preservatives in accordance with the method. TestAmerica St. Louis does not perform sample collection. Samplers should reference the methods referenced and other applicable sample collection documents for detailed collection procedures. Sample volumes and preservative information is given in ST-PM-0002.

8.2 Water samples are unpreserved and stored at 4 ± 2˚C.

8.3 Soil samples are refrigerated at 4 ± 2˚C.

8.4 The extraction holding time for Pesticides analysis in waters is 7 days.

8.5 The extraction holding time for Pesticides analysis in soil/solid matrix is 14 days.

8.6 Extracts must be refrigerated at $\leq 6^{o}$C and analyzed within 40 days of the end of the extraction.

9.0 QUALITY CONTROL

9.1 **Batch**

9.1.1 A sample batch is a maximum of 20 environmental samples, which are prepared together using the same process and same lot(s) of reagents.

9.1.2 Instrument conditions must be the same for all standards, samples and QC samples.
