9.1.3 For this analysis, batch QC consists of a method blank, a Laboratory Control Sample (LCS), and Matrix Spike (MS)/ Matrix Spike Duplicate (MSD). In the event that there is insufficient sample to analyze a MS/MSD an LCS Duplicate (LCSD) is prepared and analyzed.

9.2 **Method Blank (MB)**

9.2.1 A method blank is a blank matrix processed simultaneously with, and under the same conditions as, samples through all steps of the procedure.

9.2.2 A method blank must be prepared with every sample batch.

9.3 **Laboratory Control Sample (LCS)**

9.3.1 An LCS is a blank matrix spiked with a known amount of analyte(s), processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.3.2 An LCS must be prepared with every sample batch.

9.4 **Matrix Spike (MS) /Matrix Spike Duplicate (MSD)**

9.4.1 A Matrix Spike is an aliquot of a field sample to which a known amount of target analyte(s) is added, and is processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.4.2 For Method 608 a matrix spike must be performed at a frequency of one per ten samples.

9.5 **Surrogate**

9.5.1 A surrogate is a non-target analyte similar in chemical composition and behavior, which mimics the target analytes during preparation, extraction and analysis.

9.5.2 Surrogate(s) is added to every field sample, method blank, LCS and MS/MSD for analysis at the beginning of the sample preparation process.

9.6 **Procedural Variations/ Nonconformance and Corrective Action**

9.6.1 Any variation shall be completely documented using a Nonconformance Memo and approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

9.6.2 Any deviations from QC procedures must be documented as a nonconformance, with applicable cause and corrective action approved by the Supervisor and QA Manager. See SOP STL-QA-0036 for details regarding the NCM process.

10.0 CALIBRATION AND STANDARDIZATION

10.1 External standard calibration is used.

10.2 Column Degradation Evaluation (PEM)

10.2.1 The column evaluation mix must be injected before each initial calibration, the beginning of an analytical sequence and every subsequent 12 hours of continuous analysis.

10.2.2 The degradation of DDT and Endrin must be calculated (see equations Section 12) and each shown to be less than 15% before calibration can proceed.

10.2.3 If the breakdown of DDT and/or Endrin exceeds the limits given above, corrective action must be taken. This action may include:

10.2.3.1 Replacement of the injection port liner or the glass wool.

10.2.3.2 Cutting off a portion of the injection end of a capillary column.

10.2.3.3 Replacing the GC column.

10.3 Initial Calibration

10.3.1 Prepare a Pesticide standard at a minimum of five concentration levels. The low level standard should be at or below the reporting limit. The other standards define the working range of the detector. Six points are required for 2nd order curves or higher.

10.3.2 A single point calibration for Technical Chlordane and Toxaphene is performed with every initial calibration for pattern recognition.

10.3.2.1 Select 3-5 major peaks in the mulit-component analyte pattern. Calculate the response using the total area of these peaks.

10.3.2.2 If Toxaphene or Technical Chlordane is detected, sample will require re-analysis under a five point calibration for the analyte found. See Client Requirements Sheet to determine if this is needed.

10.3.3 The analyst may include a full 5 point calibration for any of the multi-component analytes with the initial calibration.

10.3.4 A new calibration curve must be generated after major changes to the system or when the continuing calibration criteria cannot be met. Major changes include new columns, any significant changes in instrument operating parameters, and major instrument maintenance (e.g., ECD replacement).

10.3.5 Except in specific instances, it is NOT acceptable to remove points from a calibration curve for the purpose of meeting criteria. Refer to the STL corporate policy, “Selection of Calibration Points”, P-T-001.

10.3.6 Sample peak areas are compared to peak areas of the standards. The ratio of the detector response to the amount concentration of analyte in the calibration standard is defined as the response factor (RF) or calibration factor (CF).

10.4 SW 8081 criteria

10.4.1 SW-846 chromatographic methods allow the use of both linear and non-linear models for the calibration data.

10.4.1.1 The first way is to begin with the simplest approach, the linear model through the origin, and then progress through other options until the calibration acceptance criteria are met. The second way is to use technical knowledge of the detector response to the target compound to choose the calibration model.

10.4.1.2 The option for non-linear calibration may be necessary to address specific instrumental techniques. However, it is not EPA's intent to allow non-linear calibration to be used to compensate for detector saturation or to avoid proper instrument maintenance.

10.4.2 Linear calibration using the average response factor

10.4.2.1 The Relative Standard Deviation (RSD) of the calibration points from the curve used must be $\leq$ 20% for each target analyte.

10.4.2.2 If the %RSDs in the initial calibration is > 20%, then calibration using a linear regression may be employed.

10.4.3 Linear calibration using a least squares regression

10.4.3.1 The intercept of the curve at zero response must be less than + or – the reporting limit for the analyte.

10.4.3.2 r (correlation coefficient) must be $\geq$ 0.995 OR r^2 (coefficient of difference) must be $\geq$ 0.990.

10.4.3.3 Linear calibration using a least squares regression, forcing thru zero

10.4.3.3.1 Forcing the curve through zero is not the same as including the origin as a fictitious point in the calibration. In essence, if the curve is forced through zero, the intercept is set to 0 *before* the regression is calculated, thereby setting the bias to favor the low end of the calibration range by “pivoting” the function around the origin to find the best fit and resulting in one less degree of freedom. It may be appropriate to force the regression though zero for some calibrations.

10.4.3.3.2 Curve must still meet criteria in 10.4.3.1 and 10.4.3.2.

10.4.3.3.3 For samples requiring adherence to SW846 Method 8000B, forcing through zero is NOT allowed.

10.4.3.4 Linear calibration using a least squares regression, weighting of data points

10.4.3.4.1 In linear, the points at the lower end of the calibration curve have less absolute variance than points at the high concentration end of the curve. This can cause severe errors in quantitation at the low end of the calibration. For this reason it may preferable to increase the weighting of the lower concentration points. 1/Concentration^2 weighting (often called $1/X^2$ weighting) to improve accuracy at the low end of the curve.

10.4.3.4.2 Curve must still meet criteria in 10.4.3.1 and 10.4.3.2.

10.4.4 Non-linear calibration

10.4.4.1 In situations where the analyst knows that the instrument response does not follow a linear model over a sufficiently wide working range, or when the other approaches have not met the acceptance criteria, a non-linear calibration model may be employed. Non linear calibration requires 6 points.

10.4.4.1.1 It is not EPA's intent to allow non-linear calibration to be used to compensate for detector saturation or to avoid proper instrument maintenance. Thus, non-linear calibrations are not be employed for analytes shown to consistently exhibit linear calibration for the analytes of interest.

10.4.4.2 The intercept of the curve at zero response must be less than + or – the reporting limit for the analyte.

10.4.4.3 r (correlation coefficient) must be ≥ 0.995 OR r^2 (coefficient of difference) must be ≥ 0.990.

10.5 608 Criteria

10.5.1 Method 608 only requires a 3-point calibration.

10.5.1.1 We routinely perform a 5-point calibration; however, 2 points may be removed from the curve if necessary to meet 608 calibration criteria.

10.5.1.2 Refer to the STL corporate policy, “Selection of Calibration Points”, P-T-0001.

10.5.2 The Relative Standard Deviation (RSD) of the calibration points from the curve used must be ≤ 10%.

10.5.3 If the %RSDs in the initial calibration is > 10%, then calibration using a linear regression may be employed. See section 10.4.3 for criteria.

10.6 Initial Calibration Verification (ICV)

10.6.1 An initial calibration verification standard must be a different standard source than the one used for the initial calibration.

10.6.2 An ICV must be performed with every initial calibration.

10.6.3 The ICV performance must be within +/- 20% D criteria.

10.6.3.1 Not meeting this requirement may be indicative of serious system malfunction or inaccuracies in the standards used for the initial calibration curve or ICV standard. Corrective action must be taken (including reanalysis of the ICV, or analysis of a different ICV). Any decision to proceed with analysis of samples when the ICV is out-of-control must be taken with great care and in consultation with the QA department and the laboratory director. Any such action must be documented in an NCM.

10.7 Continuing Calibration Verification (CCV)

10.7.1 A CCV may be the same source or second source as the calibration.

10.7.2 Analyte response factors must be verified at the beginning of each analytical run (by either an ICV or a CCV), after every 10 samples and at the end of the analysis run through the analysis of a mid-level calibration standard.

10.7.3 SW 8081 criteria

10.7.3.1 The calibration verification is acceptable if the %D for each single component pesticide is ≤ 20%.

10.7.3.2 The same criteria will be used if Technical Chlordane or Toxaphene verifications are performed.

10.7.3.3 If a CCV has failed and the analyst can document the reason for failure (e.g. broken vial, carryover from the previous sample etc.) then a second CCV may be analyzed without any adjustments to the instrument. If this CCV meets criteria then sample analysis may continue; however the preceding samples must be reanalyzed. If this second CCV does not meet criteria, the analysis run is terminated. Instrument maintenance is performed and the instrument may require re-calibration (ie initial calibration).

10.7.4 608 criteria

10.7.4.1 At the beginning of each 24-hour long (or less) analytical sequence, demonstrate that the instrument calibration is still within the linear range established by the initial calibration through the analysis of mid-level standards of each compound of interest.

10.7.4.2 If the analyzed concentration of each analyte is within ± 15% of the true value, the daily calibration check is successful, and samples may be analyzed until 24-hours have elapsed from the injection of the first daily calibration standard.

10.8 Retention Time (RT) Windows

10.8.1 Retention Time (RT) windows must be determined for all analytes.

10.8.1.1 Establishing RT windows:

10.8.1.1.1 Make an injection of all analytes of interest each day over a three day period. Calculate the mean and the standard deviation of the three retention times for each analyte.

10.8.1.1.2 The width of the retention time window for each analyte, surrogate, and major constituent in multi-component analytes is defined as ± 3 times the standard deviation of the mean absolute retention time established during the 72-hour period or 0.03 minutes, whichever is greater. Historically, calibrations RT windows have not been greater than 0.03 minutes. Windows larger than 0.03 minutes are indicative of equipment issues.

10.8.1.1.3 The center of the retention time window is the retention time from the CCV performed at the beginning of the analytical run. For samples run during the same shift as the initial calibration, use the retention time of the mid-point standard from the initial calibration. Some clients may have specific requirements regarding the updating of RT windows. Review the Client Requirement Memo for instructions.

10.8.1.1.4 A new retention time windows is performed annually or when the analytical column from a new vendor or different stationary phase is used.

10.8.1.1.4.1 Until these standards have been run on the new column, the retention time windows from the old column may be used, updated with the retention times from the new initial calibration.

10.8.2 Retention Time Criteria

10.8.2.1 The retention times of all compounds in each continuing calibration must be within the retention time windows established.

11.0 PROCEDURE

11.1 Allow standards, samples and sample extracts to reach ambient temperature before analysis.

11.2 All analysis conditions and injection volumes for samples must be the same as for the calibration standards.

11.3 Sample Introduction

11.3.1 Semivolatile analytes are introduced by direct injection of the extract. Samples, standards, and QC must be introduced using the same procedure.

11.4 Perform all qualitative and quantitative measurements. When the standards and extracts are not being used, refrigerate them at 4 $\pm$ 2^{o}C, protected from light in screw cap vials equipped with unpierced Teflon lined septa.

12.0 DATA ANALYSIS AND CALCULATIONS

12.1 Commonly used calculations (e.g. % recovery and RPD) and standard instrument software calculations are given in the TestAmerica St. Louis QAM.

12.2 External Standard Calculations

12.2.1 See Target software for calculations.

12.3 Manual Integrations

12.3.1 Identified compounds are reviewed for proper integration. Manual integrations are performed if necessary and are documented by the analyst or automatically by the data system. See TestAmerica Policy CA-Q-S-001, Acceptable Manual Integration Practices. Manual integrations are denoted with a “M” flag on the Target quantitation report.

12.4 Dilutions

12.4.1 If the concentrations of any analytes exceed the working range as defined by the calibration standards, then the sample must be diluted and reanalyzed.

12.4.2 A dilution should target the most concentrated analyte in the upper half (over 50% of the high level standard) of the client specific project requirements.

12.5 Carryover

12.5.1 When a sample has a high response for a compound, there is a real possibility that some of the sample may carry over into the sample analyzed immediately afterward.

12.5.1.1 If a sample analyzed after a sample with high concentrations has negative results, carryover did not occur.

12.5.1.2 If a sample analyzed after a sample with high concentrations has positive results for the same analytes, carryover may have occurred.

12.5.1.2.1 This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred.

12.5.1.3 If the chromatographic profile resembles the previous sample, the results are questionable.

12.5.1.3.1 This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred.

12.6 Dual column quantitation

12.6.1 As per 8000C, report the lower result of the two columns, unless the Client SOW requires that the higher result be reported. See Client Requirements Sheet for determination.

12.6.1.1 For non-detect (ND) results, report from the A channel, unless there is evidence of chromatographic interference in the A channel’s performance.

12.6.1.2 If one result is significantly higher (e.g., >40%), check the chromatograms to see if an obviously overlapping peak is causing an erroneously high result. If no overlapping peaks are noted, examine the baseline parameters established by the instrument data system (or operator) during peak integration. If no anomalies are noted, review the chromatographic conditions. If there is no evidence of chromatographic problems, report the lower result. The data user should be advised of the disparity between the results on the two columns.

12.6.1.3 Use the higher result if there is obvious chromatographic interference on the column with the lower result.

12.6.1.4 If the CCV performance on one of the two channels is outside acceptance criteria due to confirmed matrix interference, report sample data from the column with acceptable performance, irrespective of it being the higher or lower result.

12.6.1.4.1 See Clouseau for data assessment and narration.

12.6.2 The QC should be reported from the column that reflects the column used for the majority of the samples associated with the QC.

12.6.3 The surrogate should be reported from the column that reflects the column used for the majority of the analytes associated with a sample.

13.0 DATA ASSESSMENT AND ACCEPTANCE CRITERIA; CORRECTIVE ACTIONS FOR OUT OF CONTROL DATA

13.1 The data assessment and corrective action process is detailed through the Clouseau Nonconformance Memorandum (NCM) process. The NCM process is described in SOP: STL-QA-0036. Below is a subset of the data assessment and QC excursion types within Clouseau; the text in underline is the exact "type" line in Clouseau. For a complete and current listing, please access the software program.

13.2 Method Blank

13.2.1 Acceptance Criteria:

13.2.1.1 No target analytes may be present in the method blank above the reporting limit.

13.2.1.2 Project specific requirements if more stringent than our routine procedure (e.g. no target analytes present above ½ RL), will be noted on the client requirements sheet.

13.2.2 Corrective Action for Method Blanks not meeting acceptance criteria:

13.2.2.1 <u>Method Blank Contamination</u> – See Clouseau NCM for corrective action (e.g. reprep/reanalysis, narration). Note certain analytes are common laboratory contaminants which require special narrative comment. These compounds are so designated in Clouseau.

13.3 Laboratory Control Sample (LCS)

13.3.1 Acceptance Criteria:

13.3.1.1 All control analytes should be within established control limits for accuracy (%Recovery) and precision (RPD).

13.3.1.1.1 For long analyte spike list, marginal exceedances (ME) are allowed as follows:

13.3.1.1.2 < 11 analytes in LCS, no analytes allowed in ME of the LCS control limit.

13.3.1.1.3 11-30 analytes in LCS, 1 analytes allowed in ME of the LCS control limit.

13.3.1.1.4 31-50 analytes in LCS, 2 analytes allowed in ME of the LCS control limit.

13.3.1.1.5 51-70 analytes in LCS, 3 analytes allowed in ME of the LCS control limit.

13.3.1.1.6 71-90 analytes in LCS, 4 analytes allowed in ME of the LCS control limit.

13.3.1.1.7 > 90 analytes in LCS, 5 analytes allowed in ME of the LCS control limit.

13.3.1.1.8 No LCS recoveries may be outside the Marginal Exceedance limit.

13.3.1.1.9 Marginal exceedances must be random. If the same LCS analyte exceeds the control limit repeatedly, it is an indication of a systemic problem. The source of the error must be located and corrective action taken.

13.3.1.1.10 The LCS should have acceptable surrogate recoveries.

13.3.2 Corrective Action for LCS not meeting acceptance criteria:

13.3.2.1 LCS Spike Recovery excursion (high) – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).

13.3.2.2 LCS Spike Recovery excursion (low) – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).

13.3.2.3 RPD Duplicate excursion – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).

13.4 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

13.4.1 Analytes should be within control limits for accuracy (%Recovery) and precision (RPD).

13.4.2 Corrective Action for MS/MSD not meeting acceptance criteria:

13.4.2.1 MS/MSD Spike Rec. excursion may not necessarily warrant corrective action other than narration. See Clouseau NCM to determine if re-preparation re-analysis is required.

13.5 Surrogate

13.5.1 All Surrogates should be within established control limits for accuracy (%Recovery).

13.5.2 Corrective Action for Surrogate not meeting acceptance criteria:

13.5.2.1 Surrogate Spike Rec. excursion may not necessarily warrant corrective action other than narration. See Clouseau NCM to determine if re-preparation re-analysis is required.

13.6 Sample result evaluation

13.6.1 Dilutions

13.6.1.1 If the response for any compound exceeds the working range of the analytical system, a dilution of the extract is prepared and analyzed. An appropriate dilution should be in the upper half of the calibration range.

13.6.1.2 Dilution: Sample– See Clouseau NCM for corrective action.

13.6.1.3 Dilution: Surrogate(s) diluted out– See Clouseau NCM for corrective action.

13.6.1.4 Dilution: Surrogates(s) and/or Spike(s) diluted out– See Clouseau NCM for corrective action.

13.6.2 Carryover

13.6.2.1 If a sample analyzed after a sample with high concentrations has positive results for the same analytes, or if the chromatographic profile resembles the previous sample, the results are questionable. This sample must be reanalyzed under conditions in which carryover can be demonstrated to not have occurred.

13.6.2.1.1 The carryover affected analyses are not reported, unless specifically requested by the client or there was insufficient extract/sample remaining to reanalyze. – See Clouseau NCM for narrative.

13.6.3 Insufficient Sample

13.6.3.1 For any prescribed re-preparation corrective action, if there is insufficient sample to repeat the analysis and narrative comment stating such is included in the report narrative. The insufficient sample description is included in the Clouseau NCM within the type defining the excursion.

14.0 METHOD PERFORMANCE AND DEMONSTRATION OF CAPABILITY

14.1 Method performance data, Reporting Limits, and QC acceptance limits, are given in the appendix of this SOP.

14.2 Demonstration of Capability

14.2.1 Initial and continuing demonstrations of capability requirements are established in QAM section 18.3.

14.3 Training Qualification

14.3.1 The manager/supervisor has the responsibility to ensure that this procedure is performed by an analyst who has been properly trained in its use and has the required experience.

14.3.2 The analyst must have successfully completed the initial demonstration capability requirements prior to working independently. See requirements in QAM section 18.3.

14.4 Annually, the analyst must successfully demonstrate proficiency to continue to perform this analysis. See requirements in QAM section 18.3.

15.0 VALIDATION

15.1 Laboratory SOPs are based on standard reference EPA Methods that have been validated by the EPA and the lab is not required to perform validation for these methods. The requirements for lab demonstration of capability are included in QAM. Lab validation data would be appropriate for performance based measurement systems or non-standard methods. TestAmerica St. Louis will include this information in the SOP when accreditation is sought for a performance based measurement system or non-standard method.

16.0 WASTE MANAGEMENT AND POLLUTION PREVENTION

16.1 All waste will be disposed of in accordance with Federal, State and Local regulations. Where reasonably feasible, technological changes have been implemented to minimize the potential for pollution of the environment. Employees will abide by this method and the policies in section 13 of the Corporate Environmental Health and Safety Manual for “Waste Management and Pollution Prevention.”

16.2 Waste Streams Produced by the Method

16.2.1 The following waste streams are produced when this method is carried out.

16.2.1.1 Solvent waste generated. Solvent waste must be accumulated in the appropriate waste accumulation container, labeled as Drum Type “D”.

16.2.1.2 Vials containing sample extract will be accumulated in the appropriate waste accumulation container, labeled as Drum Type “C”.

18.0 CLARIFICATIONS, MODIFICATIONS TO THE REFERENCE METHOD

18.1 Chapter 1 of SW-846 states that the method blank should not contain any analyte of interest at or above the Method Detection Limit. This SOP states that the Method Blank must not contain any analyte of interest at or above the reporting limit. Common lab contaminants are allowed to be up to 5 times the reporting limit in the blank following consultation with the client.

18.2 The surrogate calibration curve is calculated from the Pesticide mix standard. Surrogates are not included in the Technical Chlordane and Toxaphene standards.

18.3 SW846 requires that new retention time windows be established if a GC column has been shortened during maintenance. Given the matrices of the sample the laboratory receives, and the number of times the GC column may require clipping, TestAmerica St. Louis does not perform a RT study after clipping a column. RT studies done by the laboratory show that, historically, RT windows have not been greater than the method allowed 0.03 minutes. The lab defaults to a 0.03 minute RT window as allowed by the method.

18.4 Method 608 only requires a 3 point calibration. We routinely perform a 5 point calibration.

19.0 CHANGES TO PREVIOUS REVISION

19.1 Updated section 4.2 by removing Gel Permeation Chromatography (Method 3640) and Sulfur cleanup (Method 3660).

19.2 Rev 11:

19.2.1 Annual Review, No Changes.

19.3 Rev 12:

19.3.1 Annual Review, No Changes.

19.4 Rev 13:

19.4.1 Added new equipment and supplies to section 6.0.

19.4.2 Updated information regarding reagent log in section 7.0.

19.4.3 Updated instructions for initial calibrations in section 10.3.

19.4.4 Updated non-linear calibration point requirements in section 10.4.

19.4.5 Updated requirements for performing RT window studies.

Table 2	
Column Degradation Evaluation Mix	
Component	Concentration (ug/L)
4,4'-DDT	100.000
Alpha-BHC	10.000
Beta-BHC	10.000
Endrin	50.000
Gamma-BHC	10.000
Methoxychlor	250.000
Tetrachloro-m-xylene (Surrogate)	20.000
Decachlorobiphenyl (Surrogate)	20.000

Title: PCB GC ANALYSIS [SW-846 8000C/8082A; EPA 608]

Approvals (Signature/Date):

Ben Hicks 2/12/13 Date Organics Department Manager	Michael Ridenhower 2/14/13 Date Health & Safety Manager / Coordinator
Marti Ward 2.12.13 Date Quality Assurance Manager	Elaine Wild 2/12/13 Date Laboratory Director

This SOP was previously identified as SOP No. ST-GC-0015 Rev. 10

Facility Distribution No.: 0 **Distributed To: See Electronic Distribution Sheet**

1.0 SCOPE AND APPLICATION

1.1 This SOP describes procedures to be used for the analysis of polychlorinated biphenyls (PCB) by GC/ECD. The PCBs are determined and quantitated as multi-component Aroclor mixes.

1.2 Sample preparation techniques are described in SOP ST-OP-0002.

1.3 This SOP is based on EPA SW-846 Methods 8000C and 8082A, and EPA Method 608.

1.4 The laboratory target analytes supported by this method, the reporting limits, method detection limits and QC limits are maintained in the Laboratory Information Management System (LIMS).

1.4.1 Additional compounds may be amendable to this method. The minimum requirement for non-standard analytes is that the reporting limit be set at the lowest required concentration that can actually be detected by the instrument, and when an MDL study can not be conducted, the MDL be set equal to the reporting limit.

2.0 SUMMARY OF METHOD

2.1 Aqueous samples are prepared for analysis using continuous or separatory funnel liquid / liquid extraction. Solid samples are prepared using sonication. Wipes are extracted by autoshaker.

2.2 After the initial preparation step, the sample is introduced to the GC and concentrations of target analytes are measured by the detector response within a defined retention time window, relative to the response to standard concentrations. The external standardization procedure is used.

3.0 DEFINITIONS

3.1 See the TestAmerica St. Louis Quality Assurance Manual (ST-QAM) for a glossary of common laboratory terms and data reporting qualifiers.

4.0 INTERFERENCES

4.1 Interferences in GC analysis arise from many compounds amenable to gas chromatography that give a measurable response on the electron capture detector. Phthalate esters, which are common plasticizers, can pose a major problem in the determinations. Interferences from phthalates are minimized by avoiding contact with any plastic materials.

4.2 Interferences co-extracted from samples will vary considerably from source to source. The presence of interferences may raise quantitation limits for individual samples. Specific cleanups may be performed on the sample extracts, including florisil cleanup (Method 3620), Gel Permeation Chromatography (Method 3640), and Sulfur cleanup (Method 3660). For PCBs the most common cleanup procedure is the Sulfuric Acid cleanup (Method 3665A).

4.3 Contamination by carryover can occur when a low concentration sample is analyzed after a high concentration sample. Co-elution of target analytes with non-targets can occur, resulting in false positives or high biased results.

4.4 Solvents, reagents, glassware, and other sample processing hardware may yield artifacts and interferences to sample extracts. Strict attention to glassware cleaning and handling and demonstration of solvent purity will lead to minimization of these interferences.

5.0 SAFETY

5.1 Employees must abide by the policies and procedures in the Corporate Environmental Health and Safety Manual (CW-E-M-001), Radiation Safety Manual and this document. This procedure may involve hazardous material, operations and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats and closed-toe, nonabsorbent shoes are a minimum.

5.2 SPECIFIC SAFETY CONCERNS OR REQUIREMENTS

5.2.1 The gas chromatograph contains zones that have elevated temperatures. The analyst needs to be aware of the locations of those zones, and must cool them to room temperature prior to working on them.

5.2.2 There are areas of high voltage in the gas chromatograph. Depending on the type of work involved, either turn the power to the instrument off, or disconnect it from its source of power.

5.3 PRIMARY MATERIALS USED

5.3.1 The following is a list of the materials used in this method, which have a serious or significant hazard rating. **NOTE: This list does not include all materials used in the method. The table contains a summary of the primary hazards listed in the MSDS for each of the materials listed in the table.** A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the MSDS for each material before using it for the first time or when there are major changes to the MSDS.

Material (1)	Hazards	OSHA Exposure Limit (2)	Signs and symptoms of exposure/Unusual Hazards
Hexane	Flammable Irritant	500 ppm-(TWA)	Inhalation of vapors irritates the respiratory tract. Overexposure may cause lightheadedness, nausea, headache, and blurred vision. Vapors may cause irritation to the skin and eyes.
Methanol	Flammable Poison Irritant	200 ppm (TWA)	A slight irritant to the mucous membranes. Toxic effects exerted upon nervous system, particularly the optic nerve. Symptoms of overexposure may include headache, drowsiness and dizziness. Methyl alcohol is a defatting agent and may cause skin to become dry and cracked. Skin absorption can occur; symptoms may parallel inhalation exposure. Irritant to the eyes.
1 – Always add acid to water to prevent violent reactions.			
2 – Exposure limits refer to the OSHA regulatory exposure limit.			
TWA – Time Weighted Average			

6.0 EQUIPMENT AND SUPPLIES

6.1 GC/ECD system: The lab utilizes a Hewlett Packard GC 5890 dual ECD system and an Agilent GC 6890 dual micro ECD system with autosampler.

6.1.1 GC column types, and instrument run conditions are posted on the individual GC instruments.

6.2 Data System – Chemstation for acquisition and Target™ for data processing.

6.3 Amber and/or clear glass vials. Crimp top seals.

6.4 Disposal pipettes.

6.5 Micro syringes- 10µL, 250µL, 500µL, 1000µL. Hamilton 1700 series.

6.6 Volumetric flasks, Class A

7.0 REAGENTS AND STANDARDS

7.1 All standards and reagent preparation, documentation and labeling must follow the requirements of SOP ST-QA-0002, current revision.

7.2 PCB primary standard solutions:

7.2.1 Primary standards are prepared by dilution of neat liquid Aroclor mix 1016/1260, and from single aroclor mixes in hexane. Primary standards must be replaced after 6 months or the manufacturer's expiration date whichever is shorter. Standards must be stored in refrigerator or freezer at $\leq 6^{\circ}$C.

7.3 Working standards:

7.3.1 The working standards are prepared in hexane from the primary standard solution for a minimum of five concentration levels of the Aroclor mix 1016/1260 and one level of the single aroclors. Working standards must be replaced after 6 months or manufacturer's expiration date whichever is shorter. All working standards expire after six months or at the expiration date of their stock standards, whichever comes sooner.

7.4 Gases for carrier and make-up: Hydrogen carrier, Nitrogen make-up.

7.5 Decachlorobiphenyl (surrogate)

7.6 Copper powder

7.6.1 Remove oxides (if powder is dark) by treating with dilute nitric acid, rinse with organic-free reagent water to remove all traces of acid, rinse with acetone, and dry under a stream of nitrogen.

7.7 Initial Calibration Verification (ICV) spiking standard is similar to calibration standards, but are from a different source or vendor and are prepared and stored in the same way as calibration standards.

8.0 SAMPLE COLLECTION, PRESERVATION AND STORAGE

8.1 TestAmerica St. Louis supplies sample containers and chemical preservatives in accordance with the method. TestAmerica St. Louis does not perform sample collection. Samplers should reference the methods referenced and other applicable sample collection documents for detailed collection procedures. Sample volumes and preservative information is given in ST-PM-0002.

8.2 Water samples are unpreserved and stored at $4 \pm 2^{\circ}$ C.

8.3 Soil samples are refrigerated at $4 \pm 2^{\circ}$ C.

8.4 Extracts must be refrigerated at $\leq 6^{o}$C.

8.5 Sample extracts need to be isolated from all potential contaminants and all standards.

9.0 QUALITY CONTROL

9.1 **Batch**

9.1.1 A sample batch is a maximum of 20 environmental samples, which are prepared together using the same process and same lot(s) of reagents.

9.1.2 A preparation batch is composed of one to 20 environmental samples of a similar matrix, meeting the above mentioned criteria. Where no preparation method exists (example, volatile organics, water) the batch is defined as environmental samples that are analyzed together with the same process and personnel, using the same lots of reagents, not to exceed 20 environmental samples, and/or 24 hours (12 hours for GC/MS).

9.1.3 An analytical batch is composed of prepared environmental samples, extracts, digestates or concentrates that are analyzed together as a group. An analytical batch can include prepared samples originating from various environmental matrices and can exceed 20 samples.

9.1.4 Instrument conditions must be the same for all standards, samples and QC samples.

9.1.5 Each analytical batch may contain up to 20 environmental samples, a Method Blank (MB), a single Laboratory Control Sample (LCS) and a Matrix Spike/Matrix Spike Duplicate (MS/MSD) pair. In the event that there is insufficient sample to analyze an MS/MSD, an LCS Duplicate (LCSD) is prepared and analyzed.

9.1.6 Samples having different QC codes, due to non-standard client specific QC requirements, must be batched separately in the LIMS. A method blank and LCS may be shared across QC codes provided the actual “sample batch” does not exceed 20 environmental samples. Duplicates (and MS/MSD if applicable) must be performed for each separate QC code.

9.2 **Method Blank (MB)**

9.2.1 A method blank is a blank matrix processed simultaneously with, and under the same conditions as, samples through all steps of the procedure.

9.2.2 A method blank must be prepared with every batch (20 or fewer samples of the same matrix).

9.2.3 DI water is used as the blank matrix for water batches.

9.2.4 Sodium sulfate is used as the blank matrix for solid batches.

9.3 **Laboratory Control Sample (LCS)**

9.3.1 An LCS is a blank matrix spiked with a known amount of analyte(s), processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.3.2 An LCS must be prepared with every batch.

9.3.3 DI water, spiked with the analytes of interest is used as the LCS for water batches.

9.3.4 Sodium sulfate, spiked with the analytes of interest is used as the LCS for solid batches

9.4 **Matrix Spike/Matrix Spike Duplicate (MS/MSD)**

9.4.1 A Matrix Spike is an aliquot of a field sample to which a known amount of target analyte(s) is added, and is processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.4.2 Additional MS/MSDs do not count towards the 20 samples in an analytical batch.

9.4.3 An MS/MSD can be prepared with every batch, although it is not a method requirement. If there is insufficient sample to perform an MS/MSD, a duplicate LCS is analyzed.

9.5 **Procedural Variations/Nonconformance and Corrective Action**

9.5.1 Any variation shall be completely documented using a Nonconformance Memo and approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

9.5.2 Any deviations from QC procedures must be documented as a nonconformance, with applicable cause and corrective action approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

10.0 CALIBRATION AND STANDARDIZATION

10.1 External standard calibration is used.

10.2 Initial Calibration

10.2.1 Prepare an Aroclor 1016/1260 and Decachlorobiphenyl (surrogate) standard at a minimum of five concentration levels. (Six points are required if a quadratic (second order) curve is used.) The low level standard should be at or below the reporting limit. The other standards define the working range of the detector. Recommended calibration levels are given in Table 1.

10.2.1.1 If a specific Aroclor is of interest for a particular project, that Aroclor may be used for the five point calibration rather than the 1016 / 1260 mix. See Client Requirements Sheet or Memo.

10.2.1.2 A single point calibration for Aroclor 1221, 1232, 1242, 1248, 1254, 1262, and 1268 is performed with every initial calibration for pattern recognition.

10.2.1.2.1 If any of the above single point Aroclors are detected, samples may be required to be re-analyzed under a five point calibration for the aroclor found. See Client Requirement Sheet to determine if this is needed.

10.2.1.3 Select 3-5 major peaks in the analyte pattern. Calculate the response using the area of these individual peaks.

10.2.1.3.1 Aroclor 1221 uses only 3 peaks due to the limited amount of peaks available to choose from.

10.2.2 A new calibration curve must be generated after major changes to the system or when the continuing calibration criteria cannot be met. Major changes include new columns, any significant changes in instrument operating parameters, and major instrument maintenance (e.g., ECD replacement).

10.2.3 Except in specific instances, it is NOT acceptable to remove points from a calibration curve for the purpose of meeting criteria. Refer to the TestAmerica Corporate policy, “Calibration Point Selection”, CA-Q-T-002.

10.3 SW 8082 criteria

10.3.1 The Relative Standard Deviation (RSD) of the calibration points from the curve used must be $\leq$ 20%.

10.3.2 If the %RSDs in the initial calibration is > 20%, then calibration using a linear regression may be employed.

10.3.2.1 If a linear regression curve is used, the intercept of the curve at zero response must be less than + or – the reporting limit for the analyte. It is recommended that for linear regression curves the line be set through the origin.

10.3.2.2 If a linear regression curve is used, r must be $\geq$ 0.99

10.3.2.3 Weighting of data points

10.3.2.3.1 In linear, the points at the lower end of the calibration curve have less absolute variance than points at the high concentration end of the curve. This can cause severe errors in quantitation at the low end of the calibration. However, in environmental analysis, accuracy at the low end of the curve is very important. For this reason it may preferable to increase the weighting of the lower concentration points. 1/Concentration^2 weighting (often called 1/X^2 weighting) will improve accuracy at the low end of the curve and should be used if the data system has this capability.

10.4 608 Criteria

10.4.1 Method 608 only requires a 3 point calibration. We routinely perform a 5 point calibration; however, 2 points may be removed from a curve if necessary to meet 608 calibration criteria. The lowest level of the curve must be at or below the reporting limit. The other standards define the working range of the detector.

10.4.1.1 Refer to the TestAmerica Corporate policy, “Calibration Point Selection”, CA-Q-T-002.

10.4.2 The Relative Standard Deviation (RSD) of the calibration points from the curve used must be $\leq$ 10%.

10.4.3 If the %RSDs in the initial calibration is > 10%, then calibration using a linear regression may be employed.

10.4.3.1 If a linear regression curve is used, the intercept of the curve at zero response must be less than + or – the reporting limit for the analyte. It is recommended that for linear regression curves the line be set through the origin.

10.4.3.2 If a linear regression curve is used, r must be $\geq$ 0.995

10.4.3.3 Use of 1/Concentration^2 weighting is recommended to improve the accuracy of quantitation at the low end of the curve. The analyst should consider instrument maintenance to improve the linearity of response.

10.4.3.3.1 Weighting of data points

10.4.3.3.2 The points at the lower end of the calibration curve have less weight in determining the curve generated than points at the high concentration end of the curve. However, in environmental analysis, accuracy at the low end of the curve is very important. For this reason it is preferable to increase the weighting of the lower concentration points. 1/Concentration^2 weighting (often called 1/X^2 weighting) will improve accuracy at the low end of the curve and should be used if the data system has this capability.

10.5 Initial Calibration Verification (ICV)

10.5.1 An initial calibration verification standard must be a different standard source than the one used for the initial calibration.

10.5.1.1 The ICV is not performed for the single point aroclors.

10.5.2 An ICV must be performed with every initial calibration.

10.5.2.1 A passing ICV may be used as the opening CCV for a set of samples run following the ICV.

10.5.3 The ICV performance must be within +/- 20% D criteria.

10.5.3.1 Only the analytes present in the ICAL are evaluated for the 20% criteria.

10.5.3.2 Not meeting this requirement may be indicative of serious system malfunction or inaccuracies in the standards used for the initial calibration curve or ICV standard. Corrective action must be taken (including reanalysis of the ICV or analysis of a different ICV).

10.5.3.3 Any decision to proceed with analysis of samples when the ICV is out-of-control must be taken with great care and in consultation with the QA department and the laboratory director. Any such action must be documented in an NCM.

10.6 Continuing Calibration Verification (CCV)

10.6.1 A CCV may be a second source or the same source as the initial calibration standards and should be made to represent the midpoint of the curve.

10.6.2 Analyte response factors must be verified at the beginning of each analytical run (by either an ICV or a CCV), after every 10 samples and at the end of the analysis run through the analysis of a CCV.

10.6.3 It is adequate to verify calibration with a single mixture of Aroclors 1016 and 1260.

10.6.3.1 For projects with specific Aroclor requirements, a specific Aroclor may be included in the daily calibration check.

10.6.4 The calibration verification is acceptable if the %D for both 1016/1260 and the surrogate (DCB) is $\leq$ 20%.

10.6.4.1 The same criterion is used if other Aroclor verifications are performed.

10.6.4.2 If a CCV has failed and the analyst can document the reason for failure (e.g. broken vial, carryover from the previous sample etc.) then a second CCV may be analyzed without any adjustments to the instrument.

10.6.4.3 If this CCV meets criteria then sample analysis may continue; however the preceding samples must be reanalyzed.

10.6.4.4 If this second CCV does not meet criteria, the analysis run is terminated. Instrument maintenance is performed and the instrument may require re-calibration (i.e. initial calibration).

10.7 Retention Time (RT) Windows

10.7.1 Retention Time (RT) windows must be determined for all analytes.

10.7.2 Establishing RT windows:

10.7.2.1 Make an injection of all analytes of interest each day over a three day period. Calculate the standard deviation of the three retention times for each analyte (relative retention times may also be used).

10.7.2.2 The width of the retention time window for each analyte, surrogate, and major constituent in multi-component analytes is defined as ± 3 times the standard deviation of the mean absolute retention time established during the 72-hour period or 0.03 minutes, whichever is greater.

10.7.2.3 The center of the retention time window is the retention time from the average of three standards used to calculate the RT window.

10.7.2.4 The center of the window is updated with the midpoint standard of the initial calibration.

10.7.2.5 A new retention time window is established annually or each time a new column is installed.

10.7.2.5.1The new windows must be generated within one week of the installation of the new column.

10.7.2.5.2Until these standards have been run on the new column, the retention time windows from the old column may be used, updated with the retention times from the new initial calibration.

10.7.3 Retention Time Criteria

10.7.3.1 The retention times of AR 1016/1260 (and other aroclors if applicable) in each continuing calibration must be within the retention time windows established.

11.0 PROCEDURE

11.1 Allow standards, samples and sample extracts to reach ambient temperature before analysis.

11.2 Sulfur Removal

11.2.1 Sulfur Removal with Copper Powder

11.2.1.1 Transfer 1.0 mL of sample extract, and associated QC, into labeled vials.

11.2.1.2 Add approximately 2g cleaned copper powder to the vial.

11.2.1.3 Mix for one minute on a mechanical shaker.

11.2.1.4 Allow phases to separate.

11.2.1.5 Separate extract from copper by drawing the extract off with a disposable pipette.

11.2.1.6 Transfer the supernate to a clean, labeled vial.

11.3 All analysis conditions and injection volumes for samples must be the same as for the calibration standards.

11.4 Sample Introduction

11.4.1 Semivolatile analytes are introduced by direct injection of the extract. Samples, standards, and QC must be introduced using the same procedure.

11.5 Perform all qualitative and quantitative measurements. When the standards and extracts are not being used, refrigerate them at $\leq 6^{o}C$, protected from light in screw cap vials equipped with unpierced Teflon lined septa.

12.0 DATA ANALYSIS AND CALCULATIONS

12.1 Commonly used calculations (e.g. % recovery and RPD) and standard instrument software calculations are given in the TestAmerica St. Louis ST-QAM.

12.2 External Standard Calculations

12.2.1 *Analyte Concentration (µg/L) in sample*

Concentration (µg/L):

$$[C] = \frac{A_x * V_t * D}{\overline{\overline{CF}} * V_i * V_s}$$

Where:

$[C]$	=	*Analyte Concentration in sample (µg/L)*
A_x	=	*Area of peak (response)*
V_t	=	*Total volume of extract (µL)*
D	=	*Dilution factor*
$\overline{CF}$	=	*Calibration factor (* $\overline{RF}$ *in target) – Response factor*
V_i	=	*Volume of extract injected (µL)*
V_s	=	*Volume of sample extracted*

12.2.2 *On column concentration*

On Column Concentration (µg/mL):

$$[OC] = \frac{A_x}{\overline{\overline{CF}}}$$

Where:

$[OC]$ = *On Column Concentration [typically expressed in µg/mL (ppm)]*

Then substitute/derive

$$[C] = [OC]\left(\frac{V_t * D}{V_i * V_s}\right)$$

When *on column concentration* $[OC]$ is equal to the *CAL-AMT (calibration amount)* of the low level standard needed to support the *reporting limit (µg/L)* and we solve the equation for *concentration (µg/L)*

Then

$$[C] \equiv RL \equiv [OC]\left(\frac{V_t * D}{V_i * V_s}\right)$$

Where:

RL = Reporting Limit

12.2.3 See Target software for additional calculations.

12.3 Manual Integrations

12.3.1 Identified compounds are reviewed for proper integration. Manual integrations are performed if necessary and are documented by the analyst or automatically by the data system. See TestAmerica policy: CA-Q-S-002, "Manual Integrations". Manual integrations are denoted with an "M" flag on the Target quantitation report.

12.4 Identification of Aroclors

12.4.1 Tentative identification of an Aroclor occurs when multi-component peaks are found within their respective retention time window for an analyte, at a concentration above the reporting limit, or above the MDL if J flags are required.

12.4.2 Definitive Aroclor identification is based primarily on pattern recognition. Retention times and retention time windows are used to tentatively identify Aroclors, but the fingerprint produced by major peaks of those analytes in the standard is used in tandem with the retention times for identification. The ratios of the areas of the major peaks are also taken into consideration. Identification may be made even if the retention times of the peaks in the sample fall outside of the retention time windows of the standard, if in the analyst's judgment the fingerprint (retention time and peak ratios) resembles the standard chromatogram.

12.4.3 When samples are analyzed from a source known to contain specific Aroclors, the results from a single-column analysis may be confirmed on the basis of a clearly recognizable Aroclor pattern. Source-specific information, such as historical data, indicating the anticipation of Aroclors must be documented. The pattern of peaks can serve as confirmation depending of the client specific project requirements.

12.5 Quantitation of Aroclors

12.5.1 Use three to five major peaks when calibrating Aroclors. Choose peaks distinctive of the individual Aroclor. Any manual integration made in the ICAL levels must be noted and be made in any subsequent samples to maintain consistency with the initial calibration. These same three to five peaks are then used to calculate the response/concentration of the Aroclor(s) when present in a sample.

12.5.1.1 For Aroclor 1221 only three peaks are used due to the limited number of peaks available.

12.5.1.2 In instances where less than five peaks are used those peaks that are not used are said to be "dropped" and an NCM must be written. When quantitating Aroclors 1016/1260 in an LCS/D and/or MS/MSD, all five peaks must be used. In samples, less than the standard five peaks may be used to quantitate target analytes if there is demonstrated matrix interferences and/or if multiple, overlapping Aroclors are present. If there is a predominance of one Aroclor that elutes next to and shares peaks with another Aroclor and it is apparent to the analyst that the lesser Aroclor's concentration is elevated significantly by the more dominant Aroclor, then three peaks may be dropped and an NCM written. It is never allowable to quantitate an Aroclor using only one peak.

12.5.2 If well distinguishable Aroclor patterns are present, then multiple Aroclors are quantitated and reported.

12.5.2.1 Aroclor elution times may overlap and one or more Aroclor peaks may be "shared" with another Aroclor. When this occurs, only the predominant Aroclor is quantitated and reported. Aroclors sharing elution time and peaks include: 1016, 1232, 1242, 1248 – these cannot be identified together (unless quantitating an MS/D where Aroclor 1016 is known to be present). Aroclors 1260 and 1262 also share peaks; only one of these can be reported (unless quantitating and MS/D where 1260 is known to be present).

12.5.3 Dual Column Quantitation

12.5.3.1 Dual column confirmation is required for positive Aroclor identification. A secondary column using an alternate phase is employed and the sample is injected simultaneously into both a primary and secondary column. Elution times often differ, as does overall pattern/fingerprint of Aroclors between the two columns. Determination of target analytes on the secondary column is made in the same way as on the primary column. Target analytes may be reported from either column.

12.5.3.2 Report the lower result of the two columns, unless the Client SOW requires that the higher result be reported. See Client Requirement Sheet for determination.

12.5.3.2.1 For non-detect (ND) results, report from the primary channel if all QC and CCVs are acceptable. If the QC and CCVs are only acceptable on the secondary column, report the non-detects from this column.

12.5.3.2.2 If the %D between the two columns is greater than 40%, report the higher result if there are obvious chromatographic interferences on the column with the lower result.

12.5.3.2.3 If one result is significantly higher (e.g., >40%), check the chromatograms to see if an obviously overlapping peak is causing an erroneously high result. If no overlapping peaks are noted, examine the baseline parameters established by the instrument data system (or operator) during peak integration. If no anomalies are noted, review the chromatographic conditions.

12.5.3.2.3.1 If there is no evidence of chromatographic problems, report the lower result. The data user should be advised of the disparity between the results on the two columns.

12.5.3.2.3.2 Use the higher result if there is obvious chromatographic interference on the column with the lower result.

12.5.3.3 The QC should be reported from the column that reflects the column used for the majority of the samples associated with the QC.

12.5.3.4 The surrogate should be reported from the column used for the reporting of the sample results.

12.6 Dilutions

12.6.1 If concentrations of any analytes exceed the working range as defined by the calibration standards, then the sample data is “E” flagged and the sample must be diluted and reanalyzed. Dilutions should target the most concentrated analyte in the upper half (over 50% of the high level standard) of the calibration range. Target analytes with resulting concentrations lower than the dilution adjusted RL should be flagged with a “J” qualifier.

12.6.2 It may be necessary to dilute samples due to matrix.

12.7 Carryover

12.7.1 When a sample has a high response for a compound, there is a real possibility that some of the sample may carry over into the sample analyzed immediately afterward.

12.7.1.1 If a sample analyzed after a sample with high concentrations has negative results, carryover did not occur.

12.7.1.2 If a sample analyzed after a sample with high concentrations has positive results for the same analytes, or if the chromatographic profile resembles the previous sample, the results are questionable. This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred.

13.0 DATA ASSESSMENT AND ACCEPTANCE CRITERIA; CORRECTIVE ACTIONS FOR OUT OF CONTROL DATA

13.1 The data assessment and corrective action process is detailed through the LIMS Nonconformance Memorandum (NCM) process. The NCM process is described in SOP: ST-QA-0036.

13.2 Method Blank (MB)

13.2.1 Acceptance Criteria:

13.2.1.1 No target analytes may be present in the method blank above the reporting limit.

13.2.1.2 Project specific requirements if more stringent than our routine procedure (e.g. no target analytes present above ½ RL), will be noted on the client requirements sheet.

13.2.1.3 The Method Blank must have acceptable surrogate recoveries.

13.2.2 Corrective Action for Method Blanks not meeting acceptance criteria:

13.2.2.1 Method Blank Contamination – Blank contamination above the RL (>1/2 RL for some programs – see specific Client Requirement Memos for details) requires re-prep of batch unless all associated samples are < RL or greater than 10 times the amount detected in the method blank.

13.2.2.2 Method Blank Surrogate excursion – If excursion is limited to the blank, data may be reported with an NCM. If surrogates are also outside criteria in samples, re-prep and re-analysis is required. In cases where the surrogate recovery is high and the samples are non-detect, the data may be reported with an NCM.

13.3 Laboratory Control Sample (LCS)

13.3.1 Acceptance Criteria:

13.3.1.1 All control analytes must be within established control limits for accuracy (%Recovery) and precision (RPD).

13.3.1.2 The LCS must have acceptable surrogate recoveries.

13.3.2 Corrective Action for LCS not meeting acceptance criteria:

13.3.2.1 LCS Spike Recovery excursion (high) – Samples that are non-detect may be reported with an NCM (unless prohibited by client requirements). Samples with detects for the analyte recovered high in the LCS are re-prepped and re-analyzed. In cases where the surrogate recovery is high and the samples are non-detect, the data may be reported with an NCM

13.3.2.2 LCS Spike Recovery excursion (low) – batch is re-prepped and re-analyzed.

13.3.2.3 LCS Surrogate Recovery excursion – If excursion is limited to the LCS, data may be reported with an NCM. If target analytes are in control in the LCS, data may be reported with an NCM. If surrogates are also outside criteria in samples, re-prep and re-analysis is required.

13.3.2.4 RPD excursion for LCS/LCSD – If target analytes recoveries are in control, data may be reported with an NCM.

13.4 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

13.4.1 All analytes should be within established control limits for accuracy (%Recovery) and precision (RPD).

13.4.2 Corrective Action for MS/MSD not meeting acceptance criteria:

13.4.2.1 MS/MSD Spike Rec. excursion may not necessarily warrant corrective action other than narration. If affected analyte concentration in the original sample is greater than four times the amount spiked, percent recovery information is ineffective. Data is reported with an NCM. If the excursion is due to a physically evident matrix interference, the data is reported with an NCM (the physical interference must be described in the NCM). If there is no evidence of interference and the RPD as well as spike recoveries out outside limits out, sample re-prep and re-analysis are required.

13.5 Surrogate

13.5.1 All Surrogates should be within established control limits for accuracy (%Recovery).

13.5.2 Corrective Action for Surrogate not meeting acceptance criteria:

13.5.2.1 Surrogate Spike Rec. excursion may not necessarily warrant corrective action other than narration.

13.6 Sample Result Evaluation

13.6.1 Dilutions

13.6.2 If the response for any compound exceeds the working range of the analytical system, a dilution of the extract is prepared and analyzed. An appropriate dilution should be in the upper half of the calibration range.

13.1.1.1 Dilution: Sample– An NCM is written to document the reason for the dilution

13.1.1.2 Dilution: Surrogate(s) and/or spikes diluted out– Dilution: Surrogate(s) and/or spike(s) diluted out– An NCM is written to document the reason for the dilution.

13.6.3 Carryover

13.6.3.1 When a sample has a high response for a compound, there is a real possibility that some of the sample may carry over into the sample analyzed immediately afterward.

13.6.3.2 If a sample analyzed after a sample with high concentrations has negative results, carryover did not occur.

13.6.3.3 If a sample analyzed after a sample with high concentrations has positive results for the same analytes, or if the chromatographic profile resembles the previous sample, the results are questionable. This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred.

13.7 Insufficient Sample

13.7.1 For each prescribed re-preparation corrective action, if there is insufficient sample to repeat the analysis a narrative comment stating such is included in the report case narrative.

14.0 METHOD PERFORMANCE AND DEMONSTRATION OF CAPABILITY

14.1 Method performance data, Reporting Limits, and QC acceptance limits, are maintained in the LIMS.

14.2 Demonstration of Capability

14.2.1 Initial and continuing demonstrations of capability requirements are established in the ST-QAM.

14.3 Training Qualification

14.3.1 The manager/supervisor has the responsibility to ensure that this procedure is performed by an analyst who has been properly trained in its use and has the required experience.

14.3.2 The analyst must have successfully completed the initial demonstration capability requirements prior to working independently. See requirements in the ST-QAM.

14.1 Annually, the analyst must successfully demonstrate proficiency to continue to perform this analysis. See requirements in the ST-QAM.

15.0 VALIDATION

15.1 Laboratory SOPs are based on published methods (EPA, DOE, ASTM, Eichrom, Standard Methods) and do not require validation by the laboratory. The requirements for laboratory demonstration of capability are included in the ST-QAM. Laboratory validation data would be appropriate for performance based measurement systems, non-standard methods and significant modifications to published methods. Data from said validations is held in the QA department.

16.0 WASTE MANAGEMENT AND POLLUTION PREVENTION

16.1 All waste will be disposed of in accordance with Federal, State and Local regulations. Where reasonably feasible, technological changes have been implemented to minimize the potential for pollution of the environment. Employees will abide by this method and the policies in section 13 of the Corporate Safety Manual for "Waste Management and Pollution Prevention."

16.2 Waste Streams Produced by the Method

16.2.1 The following waste streams are produced when this method is carried out.

16.2.1.1 Acidic sample waste generated. All acidic waste will be accumulated in the appropriate waste accumulation container, labeled as Drum Type "A" or "B".

16.2.1.2 Solvent waste generated. Solvent waste must be accumulated in the appropriate waste accumulation container, labeled as Drum Type "D".

16.2.1.3 Contaminated disposable glass or plastic materials utilized in the analysis are disposed of in the sanitary trash. If the lab ware was used for the analysis of radioactive samples and contains radioactivity at a level of 100 cpm over background as determined by a GM meter, the lab ware will be collected in waste barrels designated for solid rad waste for disposal by the EH&S Coordinator.

16.2.1.4 Expired primary and working PCB standards shall be segregated and placed into the proper satellite accumulation container specifically for PCB waste which is located within the GC lab.

18.0 MODIFICATIONS FROM REFERENCE METHOD

18.1 Chapter 1 of SW-846 states that the method blank should not contain any analyte of interest at or above the Method Detection Limit. This SOP states that the Method Blank must not contain any analyte of interest at or above the reporting limit. Common lab contaminants are allowed to be up to 5 times the reporting limit in the blank following consultation with the client.

18.2 The surrogate calibration curve is calculated from the Aroclor 1016/1260 mix. Surrogates in the other calibration standards are used only as retention time markers.

18.3 Method 608 only requires a 3 point calibration. We routinely perform a 5 point calibration; however, 2 points may be removed from a curve if necessary to meet 608 calibration criteria. The lowest level of the curve must be at or below the reporting limit.

19.0 CHANGES FROM PREVIOUS REVISION

19.1 Updated the table one regarding the levels of calibration of Aroclor 1016/1260 and the amount of the surrogate used, Decachlorobipenyl.

19.2 Rev 10:

19.2.1 Removing holding times for PCB's in section 8.0

19.3 Revision 11:

19.3.1 Removed references to QuantIMS and Clouseau – replaced with LIMS.

19.3.2 Added software information to Section 6.

19.3.3 Added composition of Method Blank and LCS to Section 9.

19.3.4 Added requirement for 6 points for non-linear curves to Section 10.

19.3.5 Added Reporting limit calculations to Section 12

19.3.6 Added specific corrective actions to Section 13

19.3.7 Updated text in Section 15 to include methods beyond those approved by EPA.

Table 1								
Calibration Levels ng/ml								
	Level 1	Level 2	Level 3	Level 4	Level 5	Level 6	Level 7	
Aroclor 1016/1260	50	100 Reporting Limit	250	500	1000 ICV/CCV	2000	4000	
The surrogate is included with all calibration mixes at the following levels								
Decachlorobiphenyl	2.5	5	12.5	25	50	100	200	

* Level 1 is optional.
Aroclors 1232, 1221, 1242, 1248, 1254, 1262 and 1268 may be quantitated within the range 100 to 4000 ng/mL

This SOP was previously identified as SOP No. ST-GC-0014 Rev 10

Facility Distribution No.: 0   Distributed To: See Electronic Distribution Sheet

1.0 SCOPE AND APPLICATION

1.1 This SOP describes sample preparation and analysis of volatile petroleum hydrocarbons, including Benzene, Toluene, Ethylbenzene, Xylenes, MTBE and Gasoline, by a purge and trap GC-PID/FID procedure, following method OA-1.

1.2 This SOP describes sample preparation and analysis of aromatic volatile organics by a purge and trap GC PID procedure, following SW-846 methods 8000C and 8021B.

1.2.1 TestAmerica St. Louis does not perform the halogenated volatile organics portion of method 8021B.

1.3 This SOP describes sample preparation and analysis of volatile petroleum hydrocarbons. Gasoline Range Organics (GRO) correspond to the range of alkanes from C6 to C10 and cover a boiling point range of approximately 60^{o}C-170^{o}C. This procedure follows SW-846 methods 8000C and 8015B.

1.4 Water samples and soil samples with low levels of contamination may be analyzed directly by purge-and-trap extraction and gas chromatography. Higher concentrations of the analytes in soil may be determined by a methanol extraction procedure.

1.5 Water samples are prepared in accordance with SW-846 method 5030A. Soil samples are prepared in accordance with SW-846 method 5035. For specific client projects, the superceded SW-846 method 5030 may be used for soil analyses.

1.6 The laboratory target analytes supported by this method, the reporting limits, method detection limits and QC limits are maintained in the Information Management System (QuantIMS). A copy of the Structure and Analysis Code (SAC), which lists this information, is included in the appendix of this SOP.

2.0 SUMMARY OF METHOD

2.1 Helium gas is bubbled through the sample heated at 40^{o}C, and the volatile components are transferred from the aqueous phase to the vapor phase. The vapor is swept through a column where the volatile components are absorbed. After purging is completed, the column is heated and flushed with inert gas to desorb the components onto a gas chromatographic column. Hydrogen gas carries the analytes onto the GC column, where they are separated and finally detected by a Photo Ionization Detector (PID) and Flame Ionization Detector (FID) in tandem.

2.1.1 The GC is hooked up to two detectors that work in tandem. Analytes leave the column and enter the photo ionization detector (PID). The OA-1 compounds are analyzed using the PID. Compounds vent from the PID and go into the FID for further analysis by EPA Method 8015M.

2.2 If an aqueous or solid sample exhibits high level contamination, a portion of the sample is dispersed in methanol to dissolve the volatile organic constituents. An aliquot is extracted with methanol and combined with water in a purging chamber, and analyzed by purge-and-trap GC following the standard procedure for water samples.

3.0 DEFINITIONS

3.1 See the TestAmerica St. Louis Quality Assurance Manual for a glossary of common laboratory terms and data reporting qualifiers.

3.2 For the Method 8015, Gasoline is defined as hydrocarbon peaks eluting in the carbon range C6-C10.

3.3 For the OA-1 Method, Gasoline is defined by its elution pattern.

4.0 INTERFERENCES

4.1 Impurities in the purge gas, and organic compounds out-gassing from the plumbing ahead of the trap, account for the majority of contamination problems. The analytical system must be demonstrated to be free from contamination under the conditions of the analysis by running laboratory reagent blanks. The use of non-TFE plastic tubing, non-TFE thread sealants, or flow controllers with rubber components in the purging device should be avoided.

4.2 Samples can be contaminated by diffusion of volatile organics (particularly methylene chloride and fluorocarbons) through the septum seal of the sample vial during shipment and storage. A trip blank prepared from organic-free reagent water and carried through sampling and handling protocols serves as a check on such contamination.

4.3 Contamination by carryover can occur whenever high-concentration and low-concentration samples are analyzed sequentially. The determination of carryover is mad by checking for trap contamination, and examining the positive hits in each sample against those is the sample run just before it.

4.4 The method is non-specific and all co-extracted compounds will be detected. Any GC chromatographable compound, organic or inorganic, which gives a flame detector response in the retention time window selected will be included in the quantification of total petroleum hydrocarbons.

5.0 SAFETY

5.1 Employees must abide by the policies and procedures in the Corporate Environmental Health and Safety Manual (CW-E-M-001), Radiation Safety Manual and this document. This procedure may involve hazardous material, operations and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats and closed-toe, nonabsorbent shoes are a minimum.

5.2 SPECIFIC SAFETY CONCERNS OR REQUIREMENTS
The gas chromatograph contains zones that have elevated temperatures. The analyst needs to be aware of the locations of those zones, and must cool them to room temperature prior to working on them. There are areas of high voltage in both the gas chromatograph. Depending on the type of work involved, the analyst need to either turn off the power to the instrument, or disconnect it from its source of power.

5.3 PRIMARY MATERIALS USED
The following is a list of the materials used in this method, which have a serious or significant hazard rating. **NOTE: This list does not include all materials used in the method. The table contains a summary of the primary hazards listed in the MSDS for each of the materials listed in the table.** A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the MSDS for each material before using it for the first time or when there are major changes to the MSDS.

Material (1)	Hazards	Exposure Limit (2)	Signs and symptoms of exposure
Methanol	Flammable Poison Irritant	200 ppm (TWA)	A slight irritant to the mucous membranes. Toxic effects exerted upon nervous system, particularly the optic nerve. Symptoms of overexposure may include headache, drowsiness and dizziness. Methyl alcohol is a de-fatting agent and may cause skin to become dry and cracked. Skin absorption can occur; symptoms may parallel inhalation exposure. Irritant to the eyes.
1 – Always add acid to water to prevent violent reactions.			
2 – Exposure limit refers to the OSHA regulatory exposure limit.			
TWA – Time Weight Average			

6.0 EQUIPMENT AND SUPPLIES

6.1 Gas Chromatograph (GC), Agilent 5890 with a Photo Ionization Detector (PID) and Flame Ionization Detector (FID) system with Archon autosampler, purge and trap concentrator.

6.2 GC column type, trap, and instrument run conditions are posted on the individual GC instruments.

6.3 Micro syringes – 10µL, 25µL, 100µL, 250µL, 500µL, and 1000µL. These should be equipped with a 20 gauge (0.006” ID) needle.

6.4 Gas tight syringes – 5 mL and 25 mL.

6.5 Volumetric flasks, Class A

6.6 pH paper

6.7 Vortex mixer

6.8 Analytical Balance, capable of weighing ± 0.01 grams

6.9 Glass beads: Store in a drying oven.

7.0 REAGENTS AND STANDARDS

7.1 All standards and reagent preparation, documentation and labeling must follow the requirements of SOP STL-QA-0002, current revision.

7.2 Methanol: purge and trap grade.

7.3 Water: HPLC grade or equivalent.

7.4 Surrogate Spike Mix: a,a,a-Trifluorotoluene in methanol.

7.4.1 This standard has a maximum lifetime of six months.

7.5 Calibration standards, NIST traceable:

7.5.1 The Gasoline standard in methanol at a concentration of 1000 ug/mL.

7.5.2 The aromatic volatiles standard contains the following compounds 20 ug/mL MTBE, toluene, ethylbenzene, benzene, o-xylene, and m,p-xylene. (resulting in 60 ug/mL for Xylenes, total)

7.5.3 Working standards are good for 6 months from the date made, unless the parent expires first. If component breakdown occurs, (MTBE breakdown is common) replace the standard.

7.5.4 Gases for carrier and make- up: Hydrogen- carrier, Air – makeup.

7.6 ICV standards, NIST traceable:

7.6.1 Gasoline in methanol at a concentration 2500-µg/mL.

7.6.1.1 Due to manufacturer differences in hydrocarbon types, the ICV is from the same vendor but a separate standard lot from the calibration standard.

7.7 Marker Standards 2-methylpentane and 1,2,4-trimethylbenzene

7.8 The aromatic volatiles ICV standard is a second source from the calibration standard.

8.0 SAMPLE COLLECTION, PRESERVATION AND STORAGE

8.1 TestAmerica St. Louis supplies sample containers and chemical preservatives in accordance with the method. TestAmerica St. Louis does not perform sample collection. Samplers should reference the methods referenced and other applicable sample collection documents for detailed collection procedures. Sample volumes and preservative information is given in ST-PM-0002.

8.2 Aromatic volatiles water samples are preserved with 1:1 HCl and stored at 4 ± 2 °C. Analysis hold time is 14 days from collection.

8.3 GRO water samples may or may not be chemically preserved with HCl and stored at 4 ± 2 °C. Analysis hold time is 14 days from collection with or with chemical preservation.

8.4 Aqueous samples are stored in glass containers with Teflon lined septa at $4^{o}C$ +/- $2^{o}C$, with minimum headspace.

8.5 Soil samples are refrigerated at 4 ± 2 °C. Analysis hold time is 14 days from collection.

8.5.1 Medium level solid extracts are aliquoted into 2 - 5 mL glass vials with Teflon lined caps and stored at $4^{o}C$ +/- $2^{o}C$. The extracts are stored with minimum headspace.

8.6 For 5035 analysis

8.6.1 Solid samples, for low level analysis, may be field preserved with sodium bisulfate solution, or collected unpreserved using the Encore (or equivalent)™ sampler and shipped to the laboratory within 48 hours of sampling.

8.6.1.1 Following shipment back to the lab the soil is preserved with sodium bisulfate or kept frozen until analysis.

8.6.1.2 It is recommended that two Encore (or equivalent) samplers be used for each field sample position, to allow for any reruns than may be necessary.

8.6.2 Solid samples, for medium level analysis, may be field extracted with methanol, or collected unpreserved using the Encore (or equivalent)™ sampler and shipped to the laboratory within 48 hours of sampling.

8.6.2.1 It is recommended that two Encore (or equivalent) samplers be used for each field sample position, to allow for any reruns than may be necessary.

8.6.2.2 Solid samples – field extracted with methanol

8.6.2.2.1 Prepare a 2 oz sample container by adding 25 mL purge and trap grade methanol. (If a 5 g sample is to be used, add 5 mL methanol to a 2 oz container or VOA vial).

8.6.2.2.2 Seal the bottle and attach a label.

8.6.2.2.3 Weigh the bottle to the nearest 0.01g and note the weight on the label.

8.6.2.2.4 Ship with appropriate sampling instructions.

8.6.2.2.4.1 At client request, the methanol addition and weighing may also be performed in the field.

8.6.2.2.4.2 When the samples are returned to the lab, obtain the weight of the soil added to the vial and note on the label.

8.6.2.3 Solid samples – field extracted with methanol

8.6.2.3.1 When the samples are returned to the lab, extrude the (nominal) 5g (or 25g) sample into a pre-weighed VOA vial containing 5mL methanol (25mL methanol for the 25g sampler). Obtain the weight of the soil added to the vial and note on the label.

8.7 An additional sample is collected for percent moisture determination.

8.8 At specific client request, unpreserved soils packed into glass jars or brass tubes may be accepted and sub-sampled in the lab.

8.8.1 This is an older procedure based on method 5030A.

9.0 QUALITY CONTROL

9.1 **Batch**

9.1.1 A sample batch is a maximum of 20 environmental samples, which are prepared together using the same process and same lot(s) of reagents. Where no preparation method exists (e.g. water sample volatile organics, water sample anion analysis) the batch is comprised of a maximum of 20 environmental samples which are analyzed together with the same process, lots of reagents and personnel.

9.1.2 Instrument conditions must be the same for all standards, samples and QC samples.

9.1.3 For this analysis, batch QC consists of a method blank, a Laboratory Control Sample (LCS), Matrix Spike (MS) and Matrix Spike Duplicate (MSD). In the event that there is insufficient sample to analyze a MS/MSD, an LCS Duplicate (LCSD) is prepared and analyzed.

9.1.4 Samples having different QC codes, due to non-standard client specific QC requirements, must be batched separately in the LIMS. A method blank and LCS may be shared across QC codes provided the actual “sample batch” does not exceed 20 environmental samples. Duplicates (and MS/MSD if applicable) must be performed for each separate QC code.

9.2 **Method Blank**

9.2.1 A method blank is a blank matrix processed simultaneously with, and under the same conditions as, samples through all steps of the procedure.

9.2.2 A method blank must be analyzed with every analysis water or low soil batch.

9.2.3 A method blank must be prepared with every medium level soil batch (20 or fewer samples of the same matrix). The medium level method blank is tied to an extraction and does not require repeated analysis with each sample analysis batch.

9.2.4 For Water analyses, the method blank is comprised of HPLC water.

9.2.5 For Soil analyses, the method blank is comprised of glass beads.

9.3 **Laboratory Control Sample**

9.3.1 An LCS is a blank matrix spiked with a known amount of analyte(s), processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.3.2 An LCS must be analyzed with every analysis water or low soil batch.

9.3.3 An LCS must be prepared with every medium level soil batch (20 or fewer samples of the same matrix).

9.3.3.1 The medium level LCS is tied to an extraction and does not require repeated analysis with each sample analysis batch.

9.3.4 For Water analyses, the LCS is comprised of HPLC water fortified with aromatic volatiles (the PID portion) or gasoline (the FID portion).

9.3.4.1 For water analyses, the LCS and ICV are the identical. If an ICV was already run in the 12 hour analysis clock, the analyst may chose to omit running a second LCS. The ICV is uploaded as the LCS.

9.3.5 For Soil analyses, the LCS is comprised of glass beads fortified with aromatic volatiles (the PID portion) or gasoline (the FID portion).

9.3.6 A separate aromatic volatiles (the PID portion) LCS and gasoline (the FID portion) LCS is performed.

9.4 **Matrix Spike (MS) /Matrix Spike Duplicate (MSD)**

9.4.1 A Matrix Spike is an aliquot of a field sample to which a known amount of target analyte(s) is added, and is processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.4.2 MS/MSD samples do not count towards the 20 environmental samples in a sample batch.

9.4.3 MS/MSD samples, when requested, must be performed with every sample batch and every LIMS batch.

9.4.4 A separate aromatic volatiles (the PID portion) MS/MSD and gasoline (the FID portion) MS/MSD is required.

9.5 **Surrogate**

9.5.1 A surrogate is a non-target analyte similar in chemical composition and behavior, which mimics the target analytes during preparation, extraction and analysis.

9.5.2 Surrogate(s) is added to every field sample, method blank, LCS and MS/MSD for analysis at the beginning of the sample preparation process.

9.6 **Procedural Variations/ Nonconformance and Corrective Action**

9.6.1 Any variation shall be completely documented using a Nonconformance Memo and approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

9.6.2 Any deviations from QC procedures must be documented as a nonconformance, with applicable cause and corrective action approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

10.0 CALIBRATION AND STANDARDIZATION

10.1 External standard calibration is used.

10.2 The PID initial calibration (the aromatic volatile portion) and the FID initial calibration (the volatile petroleum hydrocarbon portion) are independent calibrations and need not be performed within the same 12 hour shift.

10.2.1 A failed PID initial calibration does not require the FID initial calibration to be repeated and vice versa; however, the analyst may elect to run them jointly.

10.3 Sample peak areas are compared to peak areas of the standards. The ratio of the detector response to the amount concentration of analyte in the calibration standard is defined as the response factor (RF) or calibration factor (CF).

10.4 **PID Initial Calibration**

10.4.1 Prepare a multi-point calibration curve by fortifying 5ml of HPLC water with incrementing concentrations of BTEX/MTBE standard.

10.4.2 Analyze standards in ascending order.

10.4.3 The initial calibration contains a minimum of 5 points, for each target. The low level standard must be at or below the reporting limit. The other standards define the working range of the detector, with the highest level standard establishing the linear range of the instrument.

10.4.3.1 Note OA-1 requires a minimum 3 point calibration. The low level standard must be at or below the reporting limit. The other standards define the working range of the detector, with the highest level standard establishing the linear range of the instrument.

10.4.4 A new calibration curve must be generated after major changes to the system or when the continuing calibration criteria cannot be met. Major changes include new columns, any significant changes in instrument operating parameters, and major instrument maintenance.

10.4.5 Except in specific instances, it is NOT acceptable to remove points from a calibration curve for the purpose of meeting criteria. Refer to the TestAmerica Policy CA-T-P-0002, Selection of Calibration Points.

10.4.6 For initial calibration criteria see section 10.6

10.5 **FID Initial Calibration**

10.5.1 Prepare a multi-point calibration curve by fortifying 5ml of HPLC water with incrementing concentrations of Gasoline standard.

10.5.2 Analyze standards in ascending order.

10.5.3 The initial calibration contains a minimum of 5 points, for each target. The low level standard must be at or below the reporting limit. The other standards define the working range of the detector, with the highest level standard establishing the linear range of the instrument.

10.5.3.1 Note OA-1 requires a minimum 3 point calibration. The low level standard must be at or below the reporting limit. The other standards define the working range of the detector, with the highest level standard establishing the linear range of the instrument.

10.5.4 For initial calibration criteria see section 10.6

10.6 **Initial Calibration Criteria**

10.6.1 SW-846 chromatographic methods allow the use of both linear and non-linear models for the calibration data.

10.6.2 The first way is to begin with the simplest approach, the linear model through the origin, and then progress through other options until the calibration acceptance criteria are met. The second way is to use technical knowledge of the detector response to the target compound to choose the calibration model.

10.6.3 The option for non-linear calibration may be necessary to address specific instrumental techniques. However, it is not EPA's intent to allow non-linear calibration to be used to compensate for detector saturation or to avoid proper instrument maintenance.

10.6.4 **Linear calibration using the average response factor**

10.6.4.1 The Relative Standard Deviation (RSD) of the calibration points from the curve used must be $\leq$ 20% for each target analyte.

10.6.4.2 If the %RSDs in the initial calibration is > 20%, then calibration using a linear regression may be employed.

10.6.5 **Linear calibration using a least squares regression**

10.6.5.1 The intercept of the curve at zero response must be less than + or – the reporting limit for the analyte.

10.6.5.2 r (correlation coefficient) must be ≥ 0.995 OR r^2 (coefficient of difference) must be ≥ 0.990.

10.6.5.3 **Linear calibration using a least squares regression, forcing thru zero**

10.6.5.3.1 Forcing the curve through zero is not the same as including the origin as a fictitious point in the calibration. In essence, if the curve is forced through zero, the intercept is set to 0 *before* the regression is calculated, thereby setting the bias to favor the low end of the calibration range by "pivoting" the function around the origin to find the best fit and resulting in one less degree of freedom. It may be appropriate to force the regression though zero for some calibrations.

10.6.5.3.2 Curve must still meet criteria in 10.6.5.1 and 10.6.5.2.

10.6.5.4 **Linear calibration using a least squares regression, weighting of data points**

10.6.5.4.1 In linear, the points at the lower end of the calibration curve have less absolute variance than points at the high concentration end of the curve. This can cause severe errors in quantitation at the low end of the calibration. For this reason it may preferable to increase the weighting of the lower concentration points. 1/Concentration^2 weighting (often called $1/X^2$ weighting) to improve accuracy at the low end of the curve.

10.6.5.4.2 Curve must still meet criteria in 10.6.5.1 and 10.6.5.2.

10.6.6 **Non-linear calibration**

10.6.6.1 In situations where the analyst knows that the instrument response does not follow a linear model over a sufficiently wide working range, or when the other approaches have not met the acceptance criteria, a non-linear calibration model may be employed.

10.6.6.2 It is not EPA's intent to allow non-linear calibration to be used to compensate for detector saturation or to avoid proper instrument maintenance. Thus, non-linear calibrations are not be employed for analytes shown to consistently exhibit linear calibration for the analytes of interest.

10.6.6.3 The intercept of the curve at zero response must be less than + or – the reporting limit for the analyte.

10.6.6.4 r (correlation coefficient) must be ≥ 0.995 OR r^2 (coefficient of difference) must be ≥ 0.990.

10.6.6.5 If a quadratic curve fit is used, a minimum of 6 points are required.

10.7 **Initial Calibration Verification (ICV)**

10.7.1 The initial calibration verification standard should be from a different standard source than the one used for the initial calibration. Due to manufacturer differences in hydrocarbon types, the Gasoline ICV is from the same vendor but a separate standard lot from the calibration standard.

10.7.2 An ICV must be performed with each initial calibration.

10.7.3 The ICV performance must be within +/- 15% D criteria for each analyte.

10.7.3.1 Not meeting this requirement may be indicative of serious system malfunction or inaccuracies in the standards used for the initial calibration curve or ICV standard.

10.7.3.2 Corrective action must be taken (including reanalysis of the ICV or analysis of a different ICV).

10.7.3.3 Any decision to proceed with analysis of samples when the ICV is out-of-control must be taken with great care and in consultation with the QA department and the laboratory director. Any such action must be documented in an NCM.

10.8 **Continuing Calibration Verification (CCV)**

10.8.1 A CCV may be from the same source as the calibration or may be from a second source.

10.8.2 Analyte response factors must be verified at the beginning of each analytical run (either by an ICV or a CCV), after every 10 samples and at the end of the analytical run, by analyzing a mid-level calibration standard.

10.8.2.1 The ending CCV may be omitted for OA-1.

10.8.3 Analyze a CCV for the aromatic volatiles and/or gasoline being analyzed. It is not necessary to analyze both CCVs if only the PID or FID analysis is required for the set of samples.

10.8.4 The aromatic volatiles CCV %D must be within +/- 15%D.

10.8.4.1 If a CCV has failed and the analyst can document the reason for failure (e.g. broken vial, carryover from the previous sample etc.) then a second CCV may be analyzed without any adjustments to the instrument.

10.8.4.1.1 If this second CCV meets the acceptance criteria the analysis run may continue; however, the preceding samples must be reanalyzed.

10.8.4.1.2 If this second CCV does not meet criteria, the analysis run is terminated. Instrument maintenance is performed and the instrument may require calibration.

10.8.5 The gasoline CCV %D must be within +/- 15%D.

10.8.5.1 If a CCV has failed and the analyst can document the reason for failure (e.g. broken vial, carryover from the previous sample etc.) then a second CCV may be analyzed without any adjustments to the instrument.

10.8.5.1.1 If this second CCV meets the acceptance criteria the analysis run may continue; however, the preceding samples must be reanalyzed.

10.8.5.1.2 If this second CCV does not meet criteria, the analysis run is terminated. Instrument maintenance is performed and the instrument may require calibration.

10.9 **Marker Standards**

10.9.1 Marker Standards are run daily per the requirements of the method being utilized.

10.9.1.1 Method 8015 GRO analysis: Marker standards used to determine the retention time range are 2-methylpentane and 1,2,4-trimethylbenzene.

10.10 **Retention Time (RT) Windows**

10.10.1 Retention Time (RT) windows must be determined for all analytes.

10.10.1.1 Establishing RT windows:

10.10.1.1.1 Make an injection of all analytes of interest each day over a three day period. Calculate the standard deviation of the three retention times for each analyte (relative retention times may also be used).

10.10.1.1.2 The width of the retention time window for each analyte, surrogate, and major constituent in multi-component analytes is defined as ± 3 times the standard deviation of the mean absolute retention time established during the 72-hour period or 0.03 minutes,whichever is greater.

10.10.1.1.3 The center of the retention time window is the retention time from the average of three standards used to calculate the RT window.

10.10.1.1.4 The center of the window is updated with the midpoint standard of the initial calibration.

10.10.1.1.5 A new retention time window is established each time a new column is installed or the GC column has been shortened during maintenance.

10.10.1.1.5.1 The new windows must be generated within one week of the installation of the new column.

10.10.1.1.5.2 Until these standards have been run on the new column, the retention time windows from the old column may be used, updated with the retention times from the new initial calibration.

10.10.2 Retention Time Criteria

10.10.2.1 The retention times of all compounds in each continuing calibration must be within the retention time windows established.

10.10.2.1.1 If this condition is not met, all samples analyzed after the last compliant standard must be reanalyzed.

10.10.2.1.2 The retention time range for GRO is defined during initial calibration. Two specific gasoline components are used to establish the range, 2-methylpentane and 1,2,4-trimethylbenzene. The procedure described in

Method 8000 is used to establish the retention time windows for these two components. The GRO retention time range is then calculated based on the lower limit of the RT window for the first eluting component and the upper limit of the RT window for the last eluting component.

11.0 PROCEDURE

11.1 Allow standards, samples and sample extracts to reach ambient temperature before analysis.

11.2 All analysis conditions and injection volumes for samples must be the same for the calibration standards. (Including purge time and flow desorb time and temperature, column temperatures, multiplier setting etc.).

11.3 Water, soil and medium level extract analyses are all performed by heated purge (40^{o}C).

11.4 **<u>Water Sample Preparation (5030B method)</u>**

11.4.1 Remove 5ml sample with 5ml syringe.

11.4.2 Transfer the 5ml sample into an empty labeled 40ml VOA vial.

11.4.3 Add 5ul or 10ul of surrogate to sample.

11.4.3.1 Prepare a method blank with 5µL surrogate (8021B) or 10µL surrogate (8015B) using 5ml of HPLC water.

11.4.3.2 Prepare a LCS with 5µL of surrogate (8021B) or 10µL surrogate (8015B) and 10µL of spike (8015B) or 20µL of spike (8021B) 5ml of HPLC water.

11.4.3.3 For samples designated for MS/MSD analysis, add 10µL (8015B) or 20µL (8021B) of spiking solution.

11.4.4 Seal the vial.

11.4.5 Check and document the pH of the sample of the remaining sample.

11.4.5.1 Do not check pH prior to taking aliquot for analysis.

11.5 **<u>Low-Level Soil Preparation (5035A method)</u>**

11.5.1 If samples arrive unpreserved, the laboratory must, within 48 hours of collection, preserve samples with sodium bisulfate or by freezing.

11.5.1.1 Check the preparation method code of the SAC to determine preservation.

11.5.1.1.1 Sodium bisulfate code: 4D

11.5.1.1.2Freezing code: 4P

11.5.2 <u>If samples arrive in the Encore (or equivalent) sampler and require Sodium bisulfate preservation</u>:

11.5.2.1 Pre-weigh a labeled 40ml VOA vial.

11.5.2.1.1Label with an indelible marker rather than a paper label, since paper labels may cause the autosampler to bind and malfunction.

11.5.2.2 Extrude the soil sample from the Encore (or equivalent) sampler into the VOA vial.

11.5.2.3 Weigh the vial to the nearest 0.05g.

11.5.2.4 Record weight on the label and runlog.

11.5.2.5 Add a magnetic stir bar, approximately 1g of sodium bisulfate and 5mL of HPLC water.

11.5.2.5.1Soils containing carbonates may effervesce when adding the sodium bisulfate solution. If this is the case, retrieve a second Encore sample plug, add 5mL of water instead, and freeze at <10^{o}C until analysis.

11.5.2.6 Seal the vial.

11.5.2.7 Add 5ul surrogate (8021B) or 10µL surrogate (8015B) through the septum to each sample and QC.

11.5.2.7.1For samples designated for MS/MSD analysis, add 10µL (8015B) or 20µL (8021B) of spiking solution to the vials.

11.5.2.7.2Prepare a Method Blank using 5.0g of glass beads and 5mL of HPLC grade water. Add 5µL surrogate (8021B) or 10µL surrogate (8015B) to the vial.

11.5.2.7.3Prepare a LCS using 5.0g glass beads, and 5ml HPLC water. Add 5µL surrogate (8021B) or 10µL surrogate (8015B) and 10µL (8015B) or 20µL (8021B) of spiking solution.

11.5.3 <u>If samples arrive 40ml VOA vial already preserved with Sodium bisulfate</u>:

11.5.3.1 Add 5µL of surrogate (8021B) or 10µL surrogate (8015B) through the septum to each sample and QC.

11.5.3.1.1 For samples designated for MS/MSD analysis, add 10µL (8015B) or 20µL (8021B) of spiking solution to the vials.

11.5.3.1.2 Prepare a Method Blank using 5.0g of glass beads and 5mL of HPLC grade water. Add 5µL surrogate (8021B) or 10µL surrogate (8015B) to the vial.

11.5.3.1.3 Prepare a LCS using 5.0g glass beads, and 5ml HPLC water. Add 5µL surrogate (8021B) or 10µL surrogate (8015B) and 10µL (8015B) or 20µL (8021B) of spiking solution.

11.5.4 <u>If samples arrive in the Encore (or equivalent) sampler and require freezing as preservation:</u>

11.5.4.1 Freeze sample until time of analysis.

11.5.4.2 Pre-weigh a labeled 40ml VOA vial.

11.5.4.2.1 Label with an indelible marker rather than a paper label, since paper labels may cause the autosampler to bind and malfunction.

11.5.4.3 Extrude the soil sample from the Encore (or equivalent) sampler into the VOA vial.

11.5.4.4 Weigh the vial to the nearest 0.05g

11.5.4.5 Record weight on the label and runlog.

11.5.4.6 Add a magnetic stir bar, and 5mL of HPLC water.

11.5.4.7 Add 5µL of surrogate (8021B) or 10µL surrogate (8015B) to each sample and QC.

11.5.4.7.1 For samples designated for MS/MSD analysis, add 10µL (8015B) or 20µL (8021B) of spiking solution to the vials.

11.5.4.7.2 Prepare a Method Blank using 5.0g of glass beads and 5mL of HPLC grade water. Add 5µL surrogate (8021B) or 10µL surrogate (8015B) to the vial.

11.5.4.7.3 Prepare a LCS using 5.0g glass beads, and 5ml HPLC water. Add 5µL surrogate (8021B) or 10µL surrogate (8015B) and 10µL (8015B) or 20µL (8021B) of spiking solution

11.5.4.8 Seal the vial.

11.5.5 <u>If samples arrive in 40ml VOA vial and require freezing as preservation</u>:

11.5.5.1 Freeze sample until time of analysis.

11.5.5.2 Add 5mL of HPLC water

11.5.5.3 Add 5µL of surrogate (8021B) or 10µL surrogate (8015B) to each sample and QC

11.5.5.3.1 For samples designated for MS/MSD analysis, add 10µL (8015B) or 20µL (8021B) of spiking solution to the vials.

11.5.5.3.2 Prepare a Method Blank using 5.0g of glass beads and 5mL of HPLC grade water. Add 5µL surrogate (8021B) or 10µL surrogate (8015B) to the vial.

11.5.5.3.3 Prepare a LCS using 5.0g glass beads, and 5ml HPLC water. Add 5µL surrogate (8021B) or 10µL surrogate (8015B) and 10µL (8015B) or 20µL (8021B) of spiking solution of spiking solution.

11.5.5.4 Seal the vial.

11.6 **<u>Low-Level Soil Preparation (superseded 5030A method)</u>**

11.6.1 See SOP ST-QA-0038 for the procedure for sub sampling.

11.6.2 Weigh 5g +/- 0.5 of the sample into a pre-weighed 40mL glass labeled vial.

11.6.2.1 If the sample is suspected or known to have high concentrations of analytes, reduce the sample aliquot to 1.0 g

11.6.3 Record the weight.

11.6.4 Add 5ml HPLC water

11.6.5 Add 5µL surrogate (8021B) or 10µL surrogate (8015B)

11.6.6 Seal the vial.

11.6.7 The above steps should be performed rapidly and without interruption to avoid loss of volatile organics.

11.6.7.1 Prepare a Method Blank using 5.0g of glass beads and 5mL of HPLC grade water, add 5µL of surrogate (8021B) or 10µL surrogate (8015B) to the vial.

11.6.7.2 Prepare a LCS using 5.0g glass beads, 5µL of surrogate and 20µL of spiking solution.

11.6.7.3 For samples designated as for MS/MSD, add 10µL (8015B) or 20µL (8021B) of spiking solution of spiking solution.

11.7 **Methanol Extraction of Soils (5035A method)**

11.7.1 Extrude the (nominal) 5g sample into a pre-weighed VOA vial containing 5mL methanol (25mL methanol for the 25g sampler).

11.7.2 Obtain the weight of the soil added to the vial and note on the label.

11.7.2.1 Prepare a Method Blank using 5.0g of glass beads and 10mL methanol. Add 4µL (8021B) surrogate parent or 8µL (8015) surrogate parent solution

11.7.2.2 Prepare a LCS using 5.0g glass beads, 10mL methanol, 4µL (8021B)surrogate parent or 8µL (8015) surrogate parent solution and 10µL spiking parent (8021B) or 5µL medium level spiking mix (8015B).

11.7.3 Using a vortex mixer, agitate sample for at least half a minute.

11.8 **Methanol Extraction of Soils (superseded 5030A method)**

11.8.1 See SOP ST-QA-0038 for the procedure for sub sampling.

11.8.2 Weigh 5 g +/- 0.5 of the sample into a pre-weighed 40mL glass labeled vial.

11.8.2.1 If the sample is suspected or known to have high concentrations of analytes, reduce the sample aliquot to 1.0 g

11.8.3 Record the weight.

11.8.4 Add 10mL of purge and trap methanol.

11.8.4.1 Prepare a Method Blank using 5.0g of glass beads and 10mL methanol. Add 4µL (8021B) surrogate parent or 8µL (8015) surrogate parent solution to the vial.

11.8.4.2 Prepare a LCS using 5.0g glass beads, 10mL methanol, 4µL (8021B) surrogate parent or 8µL (8015B) surrogate parent solution and 10µL spiking parent (8021B) or 5µL medium level spiking solution (8015B).

11.8.4.3 For the MS/MSD, add 4ul (8021B) surrogate parent or 8ul (8015B) surrogate and 10ul spiking parent (8021B) or 5ul medium level spiking mix (8015B) medium level spike mix.

11.8.5 Seal the vial.

11.8.6 Using a vortex mixer, agitate sample for at least half a minute.

11.9 **Volatile Analysis**:

11.9.1 Load each 40ml VOA sample vial (and QC) in the purge and trap autosampler.

11.9.1.1 Medium Level Analysis

11.9.1.1.1Fill gas-tight syringe with 5ml HPLC water.

11.9.1.1.2 Add sample methanol extract to the syringe (no more than 100µL for a 5mL purge).

11.9.1.1.2.1 If less than 1µL of methanol extract is to be added to the water, dilute the methanol extract using a serial dilution.

11.9.1.1.3Transfer methanol extract/HPLC water in syringe to a labeled 40ml VOA vial.

11.9.2 Record autosampler sample analysis sequence in logbook.

11.9.3 Start analysis.

11.9.4 After purging is complete, desorb the sample, start the GC temperature program, and begin data acquisition.

11.9.5 After desorption, bake the trap for 5-10 minutes to condition it for the next analysis. When the trap is cool, it is ready for the next sample.

11.9.6 When the standards and extracts are not being used, refrigerate them at 4 $\pm$ 2^{o}C, protected from light in screw cap vials equipped with unpierced Teflon lined septa.

12.0 DATA ANALYSIS AND CALCULATIONS

12.1 Commonly used calculations (e.g. % recovery and RPD) and standard instrument software calculations are given in the TestAmerica St. Louis QAM.

12.2 External Standard Calculations

12.2.1 See Target software for calculations.

12.3 Manual Integrations

12.3.1 Identified compounds are reviewed for proper integration. Integrations are performed automatically by the data system. If necessary, manual integrations are performed and are documented by the analyst. Manual integrations are denoted with a "M" flag on the Target quantitation report. See Corporate policy: S-Q-004, Manual Integration.

12.4 Quantitation of Hydrocarbons

12.4.1 Quantitate any peaks within the retention times from n-hexane to n-decane (excluding the surrogate) as gasoline using the average calibration factor from the initial calibration.

12.4.2 Use the total integrated area that results from a common baseline (include all of the area down to the baseline) between the established retention time limits, to quantify total volatile petroleum hydrocarbons in the sample.

12.5 Dilutions

12.5.1 If the concentrations of any analytes exceed the working range as defined by the calibration standards, then the sample must be diluted and reanalyzed.

12.5.2 A dilution should target the most concentrated analyte in the upper half (over 50% of the high level standard) of the client specific project requirements.

12.5.2.1 Aqueous samples requiring less than a 1:5000 dilution can be diluted directly using a 5-ml syringe

12.5.2.2 Low level soil samples may re-analyzed using a 1g sample aliquot or utilizing the methanol extraction technique.

12.6 Carryover

12.6.1 When a sample has a high response for a compound, there is a real possibility that some of the sample may carry over into the sample analyzed immediately afterward.

12.6.1.1 If a sample analyzed after a sample with high concentrations has negative results, carryover did not occur.

12.6.1.2 If a sample analyzed after a sample with high concentrations has positive results for the same analytes, carryover may have occurred.

12.6.1.2.1 This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred

12.6.1.3 If the chromatographic profile resembles the previous sample, the results are questionable.

12.6.1.3.1 This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred.

13.0 DATA ASSESSMENT AND ACCEPTANCE CRITERIA; CORRECTIVE ACTIONS FOR OUT OF CONTROL DATA

13.1 Method OA-1 evaluation:

13.1.1 For hydrocarbons, the analyst should rely primarily on pattern recognition.

13.1.2 Also used for identification are Retention Time windows in tandem with the "pattern" produced by major peaks of these analytes in the standard. The ratios of the areas of the major peaks are also taken into consideration. Identification may be made even if the retention times of the peaks in the sample fall outside of the retention time windows of the standard, if in the analyst's judgment the pattern resembles the standard chromatogram.

13.1.3 Weathering can make pattern determination difficult. In weathering, the early eluting peaks of the hydrocarbon are often diminished and peaks may not be in the anticipated ratios. If severe weathering is indicated, the analyst may base hydrocarbon pattern on the general shape of the chromatography (e.g. diesel crown) and later eluting peaks.

13.1.4 Weathering, single peaks and comments regarding pattern, issues or anomalies should be documented using the NCM process.

13.2 Method 8015 evaluation:

13.2.1 For 8015, evaluation is based on carbon ranges, not pattern. All peaks observed within the prescribed carbon range are used in quantitation.

13.2.2 If the peaks observed, appear single peak in nature (e.g. BTEX) rather than "hydrocarbon like" (multi-peaks), the analyst may exclude them from quantitation.

13.2.3 Weathering, single peaks and comments regarding pattern, issues or anomalies should be documented using the NCM process.

13.3 Method 8021 evaluation:

13.3.1 Confirmation analysis (e.g. second column confirmation or GC/MS confirmation) results is required.

13.3.2 Dual column quantitation

13.3.2.1 As per 8000C, report the lower result of the two columns, unless the Client SOW requires that the higher result be reported. See Client Requirements Sheet for determination.

13.3.2.2 For non-detect (ND) results, report from the A channel, unless there is evidence of chromatographic interference in the A channel's performance.

13.3.2.3 If one result is significantly higher (e.g., >40%), check the chromatograms to see if an obviously overlapping peak is causing an erroneously high result. If no overlapping peaks are noted, examine the baseline parameters established by the instrument data system (or operator) during peak integration. If no anomalies are noted, review the chromatographic conditions. If there is no evidence of chromatographic problems, report the lower result. The data user should be advised of the disparity between the results on the two columns.

13.3.2.4 Use the higher result if there is obvious chromatographic interference on the column with the lower result.

13.3.2.5 If the CCV performance on one of the two channels is outside acceptance criteria due to confirmed matrix interference, report sample data from the column with acceptable performance, irrespective of it being the higher or lower result.

13.3.2.5.1See Clouseau for data assessment and narration.

13.3.2.6 The QC should be reported from the column that reflects the column used for the majority of the samples associated with the QC.

13.3.2.7 The surrogate should be reported from the column that reflects the column used for the majority of the analytes associated with a sample.

13.3.3 GC/MS confirmation

13.3.3.1 When utilizing GC/MS confirmation, the GC result is reported with narration that GC/MS was used to confirm results. The narrative should include comment as to comparability in results.

13.4 The data assessment and corrective action process is detailed through the Clouseau Nonconformance Memorandum (NCM) process. The NCM process is described in SOP: ST-QA-0036. A hardcopy of all the data assessment types and descriptions along with their associated corrective actions is included in the SOP. Below is a subset of the data assessment and QC excursion types within Clouseau; the text in underline is the exact "type" line in Clouseau. For a complete and current listing, please access the Clouseau software program.

13.5 Method Blank

13.1.1 Acceptance Criteria:

13.1.1.1 No target analytes may be present in the method blank above the reporting limit.

13.1.1.2 The method blank must have acceptable surrogate recoveries.

13.1.1.3 Project specific requirements if more stringent than our routine procedure (e.g. no target analytes present above ½ RL), will be noted on the client requirements sheet.

13.1.2 Corrective Action for Method Blanks not meeting acceptance criteria:

13.1.2.1 <u>Method Blank Contamination</u> – See Clouseau NCM for corrective action. Note: certain analytes are common laboratory contaminants and require special narrative comment. These compounds are so designated in Clouseau.

13.1.2.2 <u>Method Blank Surrogate excursion</u> – See Clouseau NCM for corrective action.

13.2 Laboratory Control Sample (LCS)

13.2.1 Acceptance Criteria:

13.2.1.1 All control analytes should be within established control limits for accuracy (%Recovery) and precision (RPD).

13.2.1.1.1 For long analyte spike list, marginal exceedances (ME) are allowed as follows:

13.2.1.1.2 < 11 analytes in LCS, no analytes allowed in ME of the LCS control limit.

13.2.1.1.3 11-30 analytes in LCS, 1 analytes allowed in ME of the LCS control limit.

13.2.1.1.4 31-50 analytes in LCS, 2 analytes allowed in ME of the LCS control limit.

13.2.1.1.5 51-70 analytes in LCS, 3 analytes allowed in ME of the LCS control limit.

13.2.1.1.6 71-90 analytes in LCS, 4 analytes allowed in ME of the LCS control limit.

13.2.1.1.7 > 90 analytes in LCS, 5 analytes allowed in ME of the LCS control limit.

13.2.1.1.8 No LCS recoveries may be outside the Marginal Exceedance limit.

13.2.1.1.9 Marginal exceedances must be random. If the same LCS analyte exceeds the control limit repeatedly, it is an indication of a systemic problem. The source of the error must be located and corrective action taken.

13.2.1.2 The LCS should have acceptable surrogate recoveries.

13.2.2 Corrective Action for LCS not meeting acceptance criteria:

13.2.2.1 <u>LCS Spike Recovery excursion (high)</u> – See Clouseau NCM for corrective action.

13.2.2.2 <u>LCS Spike Recovery excursion (low)</u> – See Clouseau NCM for corrective action.

13.2.2.3 <u>LCS Surrogate Recovery excursion</u> – See Clouseau NCM for corrective action.

13.2.2.4 <u>RPD excursion for MS/MSD or LCS/LCSD</u> – See Clouseau NCM for corrective action.

13.3 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

13.3.1 All analytes should be within established control limits for accuracy (%Recovery) and precision (RPD).

13.3.2 Corrective Action for MS/MSD not meeting acceptance criteria:

13.3.2.1 <u>MS/MSD Spike Rec. excursion</u> may not necessarily warrant corrective action other than narration. See Clouseau NCM to determine if re-preparation and/or re-analysis is required.

13.4 Surrogate

13.4.1 All Surrogates should be within established control limits for accuracy (%Recovery).

13.4.2 Corrective Action for Surrogate not meeting acceptance criteria:

13.4.2.1 <u>Surrogate Spike Rec. excursion</u> may not necessarily warrant corrective action other than narration. See Clouseau NCM to determine if re-preparation re-analysis is required.

13.5 Sample result evaluation

13.5.1 Dilutions

13.5.1.1 If the response for any compound exceeds the working range of the analytical system, a dilution of the extract is prepared and analyzed. An appropriate dilution should be in the upper half of the calibration range.

13.5.1.1.1<u>Dilution: Sample</u>– See Clouseau NCM for corrective action.

13.5.1.1.2Dilution: Surrogate(s) diluted out– See Clouseau NCM for corrective action.

13.5.1.1.3Dilution: Surrogates(s) and/or Spike(s) diluted out– See Clouseau NCM for corrective action.

13.5.2 Carryover

13.5.2.1 When a sample has a high response for a compound, there is a real possibility that some of the sample may carry over into the sample analyzed immediately afterward.

13.5.2.2 If a sample is analyzed after a sample with high concentrations has negative results, carryover did not occur.

13.5.2.3 If a sample analyzed after a sample with high concentrations has positive results for the same analytes, or if the chromatographic profile resembles the previous sample, the results are questionable. This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred.

13.5.3 Insufficient Sample

13.5.3.1 For each prescribed re-preparation corrective action, if there is insufficient sample to repeat the analysis, a narrative comment stating such is included in the report narrative. The insufficient sample description is included in the Clouseau NCM within the type defining the excursion.

14.0 METHOD PERFORMANCE AND DEMONSTRATION OF CAPABILITY

14.1 Method performance data, Reporting Limits, and QC acceptance limits, are given in the appendix of this SOP.

14.2 Demonstration of Capability

14.2.1 Initial and continuing demonstrations of capability requirements are established in the QAM.

14.3 Training Qualification

14.3.1 The manager/supervisor has the responsibility to ensure that this procedure is performed by an analyst who has been properly trained in its use and has the required experience.

14.3.2 The analyst must have successfully completed the initial demonstration capability requirements prior to working independently. See requirements in the QAM.

14.4 Annually, the analyst must successfully demonstrate proficiency to continue to perform this analysis. See requirements in the QAM.

15.0 VALIDATION

15.1 Laboratory SOPs are based on standard reference EPA Methods that have been validated by the EPA and the lab is not required to perform validation for these methods. The requirements for lab demonstration of capability are included in QAM. Lab validation data would be appropriate for performance based measurement systems or non-standard methods. TestAmerica St. Louis will include this information in the SOP when accreditation is sought for a performance based measurement system or non-standard method.

16.0 WASTE MANAGEMENT AND POLLUTION PREVENTION

16.1 It is TestAmerica's policy to evaluate each method and look for opportunities to minimize waste generated (i.e., examine recycling options, ordering chemicals based on quantity needed, preparation of reagents based on anticipated usage and reagent stability). Employees must abide by the policies in Section 13 of the Corporate Environmental Health and Safety Manual (CW-E-M-001) for "Waste Management and Pollution Prevention."

16.2 Waste management practices are conducted consistent with all applicable rules and regulations. Excess reagents, samples and method process wastes are disposed of in an accepted manner. Waste description rules and land disposal restrictions are followed. Waste disposal procedures are incorporated by reference to ST-HS-0001, "Waste Minimization Plan".

16.3 Waste Streams Produced by the Method

16.3.1 The following waste streams are produced when this method is carried out.

16.3.1.1 Solvent waste generated. Solvent waste must be accumulated in the appropriate waste accumulation container, labeled as Drum Type "D".

16.3.1.2 Contaminated disposable glass or plastic materials utilized in the analysis are disposed of in the sanitary trash. If the lab ware was used for the analysis of radioactive samples and contains radioactivity at a level of 100 cpm over background as determined by a GM meter, the lab ware will be collected in waste barrels designated for solid rad waste for disposal by the EH&S Coordinator.

18.0 MODIFICATIONS FROM REFERENCED METHOD

18.1 Chapter 1 of SW-846 states that the Method Blank should not contain any analyte of interest at or above the Method Detection Limit. This SOP states that the Method Blank must not contain any analyte of interest at or above the reporting limit. Common lab contaminants are allowed to be up to 5 times the reporting limit in the blank, following consultation with the client.

18.2 Method OA-1 only requires a 3 point calibration. We routinely perform a 5 point calibration

19.0 CHANGES TO PREVIOUS SOP REVISION

19.1 Rev 9: No changes made annual review.
19.2 Rev 10:
19.2.1 Marker standards add to Sections 7 and 10
19.2.2 Defined retention time for GRO in Section 10.10
19.3 Rev 11:
19.3.1 Updated calibration standards for gasoline in methanol in section 7.5.
19.3.2 Updated surrogate and spiking amounts for methods 8015B and 8021B throughout section 11.0.

Quality Assurance Manager	Laboratory Director

This SOP was previously identified as SOP No. ST-GC-0005 Rev. 17

Facility Distribution No.: 0 **Distributed To: See Electronic Distribution Sheet**

1.0 SCOPE AND APPLICATION

1.1 This SOP documents the procedure used to determine extractable petroleum hydrocarbons (EPH), also known as total recoverable petroleum hydrocarbons (TRPH), or TPH in environmental samples by Gas Chromatograph with a Flame Ionization Detector (GC/FID).

1.2 Matrices to which this procedure is applicable are water, water miscible wastes, soil, sludges, oil and miscellaneous solids.

1.3 This procedure is amenable to the determination of common hydrocarbon mixtures which are soluble in methylene chloride, are amenable to gas chromatography, and have boiling points between approximately 150 and 450 °C.

1.4 Carbon ranges from C10 to C40 are detected. Typical hydrocarbons are Diesel, Motor Oil, Kerosene, Jet fuel, Mineral Spirits and Hydraulic Oil.

1.5 Sample preparation techniques are described in SOP ST-OP-0002.

1.6 This SOP is based on SW-846 methods 8000C and 8015C, and the IOWA method OA-2.

1.7 The laboratory target analytes supported by this method, the reporting limits, method detection limits and QC limits are maintained in the Laboratory Information Management System (LIMs).

1.7.1 Additional compounds may be amenable to this procedure. The minimum requirement for non-standard analytes is that the reporting limit be set at the lowest required concentration that can actually be detected by the instrument. When an MDL study can not be conducted, the MDL is set equal to the reporting limit.

2.0 SUMMARY OF METHOD

2.1 Organic compounds are extracted from neutral pH environmental samples with methylene chloride. The volume of methylene chloride is concentrated to give an extract of known volume.

2.2 A portion of the extract is analyzed by GC/FID. The GC must be previously calibrated using multi-level calibration standards. The petroleum hydrocarbons are quantified as Diesel Range Organics (DRO) or Oil Range Organics (ORO) unless a specific hydrocarbon product is requested by the client.

3.0 DEFINITIONS

3.1 See the Quality Assurance Manual (QAM) for a glossary of common laboratory terms and data reporting qualifiers.

3.2 For method 8015C:

3.2.1 Diesel is defined as hydrocarbon peaks eluting in the carbon range C10-C28.

3.2.2 Motor oil is defined as hydrocarbon peaks eluting in the carbon range C28-C40.

3.3 For method OA-2, hydrocarbons are determined by their elution pattern.

4.0 INTERFERENCES

4.1 Any GC chromatographable compound, organic or inorganic, which gives a flame detector response in the retention time window selected, will be included in the quantification of total petroleum hydrocarbons. The method is non-specific and all co-extracted compounds are detected.

4.2 Solvents, reagents, glassware and other sample processing hardware may yield artifacts and interferences to sample extracts. Strict attention to glassware cleaning and handling and demonstration of solvent purity will lead to minimization of these interferences.

5.0 SAFETY

5.1 Employees must abide by the policies and procedures in the Corporate Safety Manual, Radiation Safety Manual and this document.

5.2 SPECIFIC SAFETY CONCERNS OR REQUIREMENTS

5.2.1 The gas chromatograph contains zones that have elevated temperatures. The analyst needs to be aware of the locations of those zones, and must cool them to room temperature prior to working on them.

5.2.2 There are areas of high voltage in both the gas chromatograph. Depending on the type of work involved, either turn the power to the instrument off, or disconnect it from its source of power.

5.3 PRIMARY MATERIALS USED

5.3.1 The following is a list of the materials used in this method, which have a serious or significant hazard rating. **NOTE: This list does not include all materials used in the method. The table contains a summary of the primary hazards listed in the MSDS for each of the materials listed in the table.** A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the MSDS for each material before using it for the first time or when there are major changes to the MSDS.

Material (1)	Hazards	Exposure Limit (2)	Signs and symptoms of exposure
Methylene Chloride	Carcinogen Irritant	25 ppm (TWA) 125 ppm (STEL)	Causes irritation to respiratory tract. Has a strong narcotic effect with symptoms of mental confusion, light-headedness, fatigue, nausea, vomiting and headache. Causes irritation, redness and pain to the skin and eyes. Prolonged contact can cause burns. Liquid degreases the skin. May be absorbed through skin.
1 – Always add acid to water to prevent violent reactions.			
2 – Exposure limit refers to the OSHA regulatory exposure limit.			
TWA – Time weighted average			
STEL – Short term exposure limit			

6.0 EQUIPMENT AND SUPPLIES

6.1 GC/FID system: The lab utilizes an Agilent 6890 with dual flame ionization detector (FID) system with autosampler.

6.1.1 The GC column type, and instrument run conditions are posted in the maintenance log and reside in the Chemstation method.

6.2 Data System – Chemstation for acquisition and Target™ for data processing.

6.3 Amber vials. Crimp top seals.

6.4 Pipettes, disposable

6.5 Micro syringes: 10µL, 250µL, 500µL, 1000µL. Hamilton 1700 Series.

6.6 Analytical Balance, capable of weighing ± 0.01 grams.

6.7 Volumetric flasks, Class A, various volumes

7.0 REAGENTS AND STANDARDS

7.1 All standards and reagent preparation, documentation and labeling must follow the requirements of SOP ST-QA-0002, current revision.

7.2 Primary standards

7.2.1 Standards are either purchased from a commercial vendor or prepared by dilution of neat liquid mixtures in methylene chloride.

7.2.2 Storage: The standards are stored at -20 to 0° C in amber glass vials with Teflon-lined caps.

7.2.3 Shelf life:

7.2.3.1 Unopened ampoules: manufacturer's expiration date.

7.2.3.2 Opened ampoules and Intermediate standards: Manufacturer's expiration date, or 1 year, whichever is sooner.

7.2.3.3 Working standards: Primary standard's expiration date or 6 months, whichever is sooner.

7.2.4 Degradation:

7.2.4.1 If standard degradation is indicated, the standard is discarded, irrespective of its' shelf life.

7.3 o-Terphenyl surrogate

7.4 Calibration Standards

7.4.1 Calibration standards for total petroleum hydrocarbon analysis may vary according to the requests of clients. A diesel #2 standard and motor oil (a mid-weight oil) are used for initial calibrations. Other hydrocarbons, such as Kerosene, Jet Fuel A, Mineral Spirits, and Fuel Oil #6 can be analyzed upon request.

7.4.2 Secondary Standards - Secondary standards for calibration are prepared by dilution in methylene chloride of the primary standards mentioned. The secondary standards are subject to the same storage requirements as the primary standards.

7.4.3 Working Calibration Standards - The working calibration standards are prepared in methylene chloride: diesel and motor oil at a minimum of five concentration levels. One of the concentration levels should be ≤ to the concentration of the reporting limit, and the remaining levels should define the expected range of concentrations in the samples or the linear range of the instrument. All working calibration standards expire after 6 months or at the expiration date of their primary standards, whichever is shorter. Working standards are stored in the freezer.

7.4.4 Second Source for calibration verification (ICV). Purchased from a different vendor than the calibration standards.

7.5 Carbon range retention time marker standard

7.5.1 This marker standard includes C10 (decane), C12 (dodecane), C24, C28 and C40.

7.6 Gases for carrier and make- up: Hydrogen carrier, Nitrogen make-up

8.0 SAMPLE COLLECTION, PRESERVATION AND STORAGE

8.1 TestAmerica St. Louis supplies sample containers and chemical preservatives in accordance with the method. TestAmerica St. Louis does not perform sample collection. Samplers should reference the methods referenced and other applicable sample collection documents for detailed collection procedures. Sample volumes and preservative information is given in ST-PM-0002.

8.2 Water samples are unpreserved and refrigerated at 4 ± 2 °C.

8.3 Soil samples are refrigerated at 4 ± 2 °C.

8.4 The extraction holding time for water samples is 7 days.

8.5 The extraction holding time for soil samples is 14 days.

8.6 The extract analysis holding time is 40 days from the date of extraction.

9.0 QUALITY CONTROL

9.1 **Batch**

9.1.1 A sample batch is a maximum of 20 environmental samples, which are prepared together using the same process and same lot(s) of reagents.

9.1.2 Instrument conditions must be the same for all standards, samples and QC samples.

9.1.3 For this analysis, batch QC consists of a method blank, a Laboratory Control Sample (LCS), and Matrix Spike (MS)/ Matrix Spike Duplicate (MSD). In the event that there is insufficient sample to analyze a sample duplicate, an LCS Duplicate (LCSD) is prepared and analyzed.

9.1.3.1 Matrix Spike (MS) and Matrix Spike Duplicate (MSD) may be performed upon client request, and are noted in the Client Requirement Sheets and Log-in.

9.2 **Method Blank (MB)**

9.2.1 A method blank is a blank matrix processed simultaneously with, and under the same conditions as, samples through all steps of the procedure.

9.2.2 A method blank must be prepared with every sample batch.

9.2.3 DI water is used as the blank matrix for water batches.

9.2.4 Sodium sulfate is used as the blank matrix for solid batches.

9.3 **Laboratory Control Sample (LCS)**

9.3.1 An LCS is a blank matrix spiked with a known amount of analyte(s), processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.3.2 An LCS must be prepared with every sample batch.

9.3.3 DI water, spiked with the analytes of interest is used as the LCS for water batches.

9.3.4 Sodium sulfate, spiked with the analytes of interest is used as the LCS for solid batches.

9.4 **Matrix Spike (MS) /Matrix Spike Duplicate (MSD)**

9.4.1 A Matrix Spike is an aliquot of a field sample to which a known amount of target analyte(s) is added, and is processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.5 **Procedural Variations/ Nonconformance and Corrective Action**

9.5.1 Any variation shall be completely documented using a Nonconformance Memo and approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

9.5.2 Any deviations from QC procedures must be documented as a nonconformance, with applicable cause and corrective action approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

10.0 CALIBRATION AND STANDARDIZATION

10.1 External standard calibration is used.

10.2 Marker Standard

10.2.1 Analyze a carbon range retention time marker standard daily.

10.2.2 This marker standard includes C10 (decane), C12 (dodecane), C24, C28 and C40. Additional markers may be analyzed upon client request.

10.3 Initial Calibration

10.3.1 Inject an aliquot of each level of the calibration standard, minimum 5 points, for the target compounds being analyzed (i.e., diesel and/or motor oil). The low level standard should be at or below the reporting limit. The highest level standard defines the working range of the detector. Quadratic (Second order curves) require 6 calibration points.

10.3.1.1 If additional hydrocarbons are requested (e.g. kerosene), a minimum 5 point calibration for SW 8015 or a minimum 3 point calibration for OA-2 is performed, with the low level standard at or below the reporting limit.

10.3.2 A new calibration curve must be generated after major changes to the system or when the continuing calibration criteria cannot be met. Major changes include new columns, any significant changes in instrument operating parameters, and major instrument maintenance (e.g., FID replacement).

10.3.3 Except in specific instances, it is NOT acceptable to remove points from a calibration curve for the purpose of meeting criteria. Refer to the TestAmerica corporate policy, "Selection of Calibration Points", CA-T-P-002.

10.3.4 The Relative Standard Deviation (RSD) of the calibration points from the curve used must be $\leq$ 20%.

10.3.5 If the %RSD in the initial calibration is > 20%. Linear regression may be used to evaluate the curve or recalibration may be done.

10.3.5.1 If a linear regression curve is used, the intercept of the curve at zero response must be less than the reporting limit for the analyte.

10.3.5.2 If a linear regression curve is used, r^2 must be $\geq$ 0.990

10.3.5.3 Use of 1/Concentration^2 weighting is recommended to improve the accuracy of quantitation at the low end of the curve.

10.4 Initial Calibration Verification (ICV)

10.4.1 The initial calibration verification standard should be from a different standard source than the one used for the initial calibration.

10.4.2 An ICV for the target compounds being analyzed (diesel and/or motor oil) must be performed with every initial calibration.

10.4.2.1 If additional hydrocarbons were requested, an ICV is analyzed for those hydrocarbons.

10.4.3 The ICV performance must be within +/- 20% D criteria for each analyte.

10.4.3.1 Not meeting this requirement may be indicative of serious system malfunction or inaccuracies in the standards used for the initial calibration curve or ICV standard.

10.4.3.2 Corrective action must be taken (including reanalysis of the ICV or analysis of a different ICV).

10.4.3.3 Any decision to proceed with analysis of samples when the ICV is out-of-control must be taken with great care and in consultation with the QA department and the laboratory director. Any such action must be documented in an NCM.

10.5 Continuing Calibration Verification (CCV)

10.5.1 A CCV may be from the same source as the calibration or a second source.

10.5.2 Analyze a CCV for each target hydrocarbon being analyzed. It is not necessary to analyze a CCV for every hydrocarbon having an initial calibration, **only** those being analyzed.

10.5.3 **8015 requirements**

10.5.3.1 Analyte response factors must be verified at the beginning of each analytical run, (by either an ICV or a CCV), after every 10 samples and at the end of the analytical run through the analysis of a mid-level calibration standard.

10.5.3.2 A CCV %D must be within +/- 20% D for each analyte.

10.5.4 **OA-2 requirements**

10.5.4.1 Analyte response factors must be verified on each working day by the measurement of one or more calibration standards. The laboratory runs a calibration standard at the beginning of each analytical run, (by either an ICV or a CCV), after every 10 samples and at the end of the analytical run through the analysis of a mid-level calibration standard.

10.5.4.2 The ending CCV may be omitted for OA-2.

10.5.4.3 A CCV %D must be within +/- 20% D for each analyte.

10.5.5 If a CCV has failed and the analyst can document the reason for failure (e.g. broken vial, carryover from the previous sample etc.) then a second CCV may be analyzed without any adjustments to the instrument.

10.5.5.1 If this CCV meets criteria then sample analysis may continue; however the preceding samples must be reanalyzed.

10.5.5.2 If this second CCV does not meet criteria, the analysis run is terminated. Instrument maintenance is performed and the instrument may require calibration and all samples run after the last passing CCV must be reanalyzed.

10.6 Retention Time Windows

10.6.1 Retention Time Windows: analytes and surrogate(s):

10.6.1.1 Retention time windows must be determined for all analytes. Make an injection of all analytes of interest each day over a three day period. Calculate the standard deviation of the three retention times for each analyte (relative retention times may also be used). Plus or minus three times the standard deviation of the retention times of each analyte defines the retention time window.

10.6.1.2 The center of the retention time window is the retention time from the last of the three standards. The centers of the windows are updated with the midpoint standard of the initial calibration. The widths of the windows will remain the same until new windows are generated following the installation of a new column.

10.6.1.3 If the retention time window as calculated above is less than +/- 0.015 minutes, use +/- 0.015 minutes as the retention time window. This allows for slight variations in retention times caused by sample matrix.

10.6.1.4 The laboratory must calculate new retention time windows each time a new column is installed. The new windows must be generated within one week of the installation of the new column. Until these standards have been run on the new column, the retention time windows from the old column may be used, updated with the retention times from the new initial calibration.

10.6.2 Retention Time Window for Target Analytes

10.6.2.1 Retention Time windows for hydrocarbons are established daily. The retention time window is based on the retention time of the applicable carbon marker standard.

10.6.3 Corrective Action for Retention Times

10.6.3.1 The retention times of all compounds in each continuing calibration must be within the retention time windows established. If this condition is not met, all samples analyzed after the last compliant standard must be reanalyzed.

11.0 PROCEDURE

11.1 Allow standards, samples and sample extracts to reach ambient temperature before analysis.

11.2 All analysis conditions and injection volumes for samples must be the same as for the calibration standards.

11.3 Sample introduction:

11.3.1 The samples are introduced by direct injection of the extract. Samples, standards, and QC must be introduced using the same procedure.

11.4 Perform all qualitative and quantitative measurements. When the standards and extracts are not being used, refrigerate them at -20 to 0^{o}C and protected from light in screw cap vials equipped with unpierced Teflon lined septa.

12.0 DATA ANALYSIS AND CALCULATIONS

12.1 Commonly used calculations (e.g. % recovery and RPD) and standard instrument software calculations are given in the TestAmerica St. Louis QAM.

12.2 External Standard Calculations

12.2.1 Analyte Concentration (µg/L) in sample

Concentration (µg/L):

$$[C] = \frac{A_x * V_t * D}{\overline{CF} * V_i * V_s}$$

Where:

$[C]$	=	*Analyte Concentration in sample (µg/L)*
A_x	=	*Area of peak (response)*
V_t	=	*Total volume of extract (µL)*
D	=	*Dilution factor*
$\overline{CF}$	=	*Calibration factor ($\overline{RF}$ in target) – Response factor*
V_i	=	*Volume of extract injected (µL)*
V_s	=	*Volume of sample extracted*

12.2.2 *On column concentration (ug/mL):*

$$[OC] = \frac{A_x}{\overline{\overline{CF}}}$$

Where:

$[OC]$ = *On Column Concentration [typically expressed in µg/mL (ppm)]*

Then substitute/derive

$$[C] = [OC]\left(\frac{V_t * D}{V_i * V_s}\right)$$

When *on column concentration* $[OC]$ is equal to the *CAL-AMT (calibration amount)* of the low level standard needed to support the *reporting limit (μg/L)* and we solve the equation for *concentration (μg/L)*

Then

$$[C] \equiv RL \equiv [OC]\left(\frac{V_t * D}{V_i * V_s}\right)$$

Where:

RL = Reporting Limit

12.3 Manual Integrations

12.3.1 Identified compounds are reviewed for proper integration. Manual integrations are performed if necessary and are documented by the analyst or automatically by the data system. See TestAmerica policy: CA-Q-S-002, Manual Integration. Manual integrations are denoted with a "M" flag on the Target quantitation report.

12.4 Use the total integrated area that results from a common baseline (include all of the area down to the baseline) between the retention time limits established, to quantify total extractable petroleum hydrocarbons in the sample.

12.5 Quantitation of Hydrocarbons

12.5.1 Total Area Response is the total response in the chosen retention time window.

12.6 Dilutions

12.6.1 If concentrations of any analytes exceed the working range as defined by the calibration standards, then the sample must be diluted and reanalyzed. Dilutions should target the most concentrated analyte in the upper half (over 50% of the high level standard) of the calibration range.

12.6.2 It may be necessary to dilute samples due to matrix.

12.7 Carryover

12.7.1 When a sample has a high response for a compound, there is a real possibility that some of the sample may carry over into the sample analyzed immediately afterward.

12.7.1.1 If a sample analyzed after a sample with high concentrations has negative results, carryover did not occur.

12.7.1.2 If a sample analyzed after a sample with high concentrations has positive results for the same analytes, or if the chromatographic profile resembles the previous sample, the results are questionable. This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred.

13.0 DATA ASSESSMENT AND ACCEPTANCE CRITERIA; CORRECTIVE ACTIONS FOR OUT OF CONTROL DATA

13.1 OA-2 evaluation:

13.1.1 For hydrocarbons, the analyst should rely primarily on pattern recognition.

13.1.2 Retention time windows are used for identification, but the "pattern" produced by major peaks of those analytes in the standard is used in tandem with the retention times for identification. The ratios of the areas of the major peaks are also taken into consideration. Identification may be made even if the retention times of the peaks in the sample fall outside of the retention time windows of the standard, if in the analyst's judgment the pattern resembles the standard chromatogram.

13.1.3 Weathering can make pattern determination difficult. Often the early eluting peaks of the hydrocarbon are diminished and peaks may not be in the anticipated ratios. If severe weathering is indicated, the analyst may base hydrocarbon pattern on the general shape of the chromatography (e.g. diesel crown) and later eluting peaks.

13.2 8015 evaluation:

13.2.1 For 8015, evaluation is based on carbon ranges, not pattern. All peaks observed within the prescribed carbon range are used in quantitation.

13.2.2 If the peaks observed appear as a single peak (e.g. PAHs) rather than "hydrocarbon like" (multi-peaks), the analyst may exclude them from quantitation. An NCM is written to document the reason for the exclusion.

13.3 Weathering, single peaks and comments regarding pattern should be documented using the NCM process.

13.4 The data assessment and corrective action process is detailed through the Nonconformance Memorandum (NCM) process. The NCM process is described in SOP: ST-QA-0036. A hardcopy of all the data assessment types and descriptions along with their associated corrective actions is included in the SOP. Below is a subset of the data assessment and QC excursion types.

13.5 Method Blank

13.5.1 Acceptance Criteria:

13.5.1.1 No target analytes may be present in the method blank above the reporting limit.

13.5.1.2 The method blank must have acceptable surrogate recoveries.

13.5.1.3 Corrective Action for Method Blanks not meeting acceptance criteria:

13.5.1.3.1 Method Blank Contamination – Blank contamination above the RL (>1/2 RL for some programs – see specific Client Requirement Memos for details) requires re-prep of batch unless all associated samples are < RL or greater than 10 times the amount detected in the method blank.

13.5.1.3.2 Method Blank Surrogate excursion – If excursion is limited to the blank, data may be reported with an NCM. If surrogates are also outside criteria in samples, re-prep and re-anlaysis is required. In cases where the surrogate recovery is high and the samples are non-detect, the data may be reported with an NCM.

13.6 Laboratory Control Sample (LCS)

13.6.1 Acceptance Criteria: All control analytes must be within established control limits for accuracy (%Recovery) and precision (RPD). Control limits can be found in LIMS.

13.6.1.1 The LCS must have acceptable surrogate recoveries. .

13.6.1.2 Corrective Action for LCS not meeting acceptance criteria:

13.6.1.2.1 LCS Spike Recovery excursion (high) – Samples that are non-detect may be reported with an NCM (unless prohibited by client requirements). Samples with detects for the analyte recovered high in the LCS are re-prepped and re-analyzed. . In cases where the surrogate recovery is high and the samples are non-detect, the data may be reported with an NCM

13.6.1.2.2 LCS Spike Recovery excursion (low) – batch is re-prepped and re-analyzed.

13.6.1.2.3 LCS Surrogate Recovery excursion – If excursion is limited to the LCS, data may be reported with an NCM. If target analytes are in control in the LCS, data may be reported with an NCM. If surrogates are also outside criteria in samples, re-prep and re-analysis is required.

13.6.1.2.4 RPD excursion for LCS/LCSD – If target analytes recoveries are in control, data may be reported with an NCM

13.6.2 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

13.6.3 All analytes should be within established control limits for accuracy (%Recovery) and precision (RPD). Control limits can be found in LIMS.

13.6.4 Corrective Action for MS/MSD not meeting acceptance criteria:

13.6.4.1 MS/MSD Spike Rec. excursion may not necessarily warrant corrective action other than narration. If affected analyte concentration in the original sample is greater than four times the amount spiked, percent recovery information is ineffective. Data is reported with an NCM. If the excursion is due to a physically evident matrix interference, the data is reported with an NCM (the physical interference must be described in the NCM). If there is no evidence of interference and the RPD as well as spike recoveries out outside limits out, sample re-prep and re-analysis are required.

13.6.5 Sample result evaluation

13.6.5.1 Dilutions

13.6.5.1.1 If the response for any compound exceeds the working range of the analytical system, a dilution of the extract is prepared and analyzed. An appropriate dilution should be in the upper half of the calibration range.

13.6.5.1.1.1 Dilution: Sample– An NCM is written to document the reason for the dilution.

13.6.5.1.1.2 Dilution: Surrogate(s) and/or spike(s) diluted out– An NCM is written to document the reason for the dilution.

13.6.5.2 Carryover

13.6.5.2.1 When a sample has a high response for a compound, there is a real possibility that some of the sample may carry over into the sample analyzed immediately afterward.

13.6.5.2.2 If a sample analyzed after a sample with high concentrations has negative results, carryover did not occur.

13.6.5.2.3 If a sample analyzed after a sample with high concentrations has positive results for the same analytes, or if the chromatographic profile resembles the previous sample, the results are questionable. This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred.

13.6.5.3 Insufficient Sample

13.6.5.3.1 For each prescribed re-preparation corrective action, if there is insufficient sample to repeat the analysis a narrative comment stating such is included in the report narrative. An NCM is written to document the insufficient volume.

14.0 METHOD PERFORMANCE AND DEMONSTRATION OF CAPABILITY

14.1 Method performance data, reporting limits, and QC acceptance limits, are maintained in the LIMs.

14.2 Demonstration of Capability

14.2.1 Initial and continuing demonstrations of capability requirements are established in the QAM.

14.3 Training qualification

14.3.1 The manager/supervisor has the responsibility to ensure that this procedure is performed by an analyst who has been properly trained in its use and has the required experience.

14.3.2 The analyst must have successfully completed the initial demonstration capability requirements prior to working independently. See requirements in the QAM.

14.4 Annually, the analyst must successfully demonstrate proficiency to continue to perform this analysis. See requirements in the QAM.

15.0 VALIDATION

15.1 Laboratory SOPs are based on standard reference EPA Methods that have been validated by the EPA and the lab is not required to perform validation for these methods. The requirements for lab demonstration of capability are included in LQM. Lab validation data would be appropriate for performance based measurement systems or non-standard methods. TestAmerica St. Louis will include this information in the SOP when accreditation is sought for a performance based measurement system or non-standard method

16.0 WASTE MANAGEMENT AND POLLUTION PREVENTION

16.1 Waste Streams Produced by the Method

16.1.1 The following waste streams are produced when this method is carried out.

16.1.1.1 Solvent waste generated. Solvent waste must be accumulated in the appropriate waste accumulation container, labeled as Drum Type "D".

16.1.1.2 Contaminated disposable glass or plastic materials utilized in the analysis are disposed of in the sanitary trash. If the lab ware was used for the analysis of radioactive samples and contains radioactivity at a level of 100 cpm over background as determined by a GM meter, the lab ware will be collected in waste barrels designated for solid rad waste for disposal by the EH&S Coordinator.

18.0 MODIFICATIONS FROM REFERENCE METHOD

18.1 Chapter 1 of SW-846 states that the Method Blank should not contain any analyte of interest at or above the Method Detection Limit. Common lab contaminants are allowed to be up to 5 times the reporting limit in the blank following consultation with the client.

19.0 CHANGES TO PREVIOUS SOP REVISION

19.1 No Changes, Annual Review.
19.2 Rev 16;
- 19.2.1 Annual Review, No Changes

19.3 Rev 17:
- 19.3.1 Updated scope in section 1.0.
- 19.3.2 Removed Gasoline Range Organics (GRO) from the section 2.0.
- 19.3.3 Removed the definition for gasoline for method 8015C in section 3.0.
- 19.3.4 Updated equipments and supplies throughout section 6.0.
- 19.3.5 Updated calibration standards in sections 7.4, 7.5 and 7.6.
- 19.3.6 Updated the retention time standard being analyzed daily in section 10.2.
- 19.3.7 Updated initial calibration in section 10.3.
- 19.3.8 Updated ICV and CCV information in sections 10.4 and 10.5.
- 19.3.9 Updated the storage temperature for extracts in section 11.0.
- 19.3.10 Added external calibration calculations to Section 12.2
- 19.3.11 Updated the quantitation of hydrocarbons in section 12.5.
- 19.3.12 Removed the reference to “Quantims” and “Clouseau”.
- 19.3.13 Updated corrective action for non-conformances in section 13.0.
- 19.3.14 Corrected references to Corporate Policies in Sections 17.6 & 17.7.

19.4 Rev 18:
- 19.4.1 Added carbon range retentiontime marker to Section 7
- 19.4.2 Changed “stock” to “primary” for clarification in Section 7
- 19.4.3 Added six point requirement for quadratic curves to Section 10.
- 19.4.4 Added requirement for NCM when excluding peaks to Section 13.
- 19.4.5 Added location of Control Limits (found in LIMS) to Section 13.

Title: ANALYSIS OF METALS BY INDUCTIVELY COUPLED PLASMA / MASS SPECTROMETRY [SW-846 6020A; EPA 200.8]

Approvals (Signature/Date):

Fernando Cruz Inorganics Department Manager	1/18/12 Date	Michael Ridenhower Health & Safety Manager / Coordinator	1/18/12 Date
Marti Ward Quality Assurance Manager	1-18-12 Date	Elaine Wild Laboratory Director	1/18/12 Date

This SOP was previously identified as SOP No. ST-MT-0001 Rev. 19

Facility Distribution No.: 0 **Distributed To:** See Electronic Distribution Sheet

1.0 SCOPE AND APPLICATION

1.1 This method is applicable to the determination of metals by inductively coupled plasma mass spectrometry (ICP-MS) by EPA SW846 Method 6020A, EPA 200.8 and ASTM Method D5673-03.

1.2 This method is applicable to surface, and saline waters; soil and waste samples.

1.3 The aqueous sample digestion procedure is found in SOP: ST-IP-0013, Acid Digestion of Aqueous Samples and Extracts for Total Metals for Analysis by ICP Spectroscopy, and ICP/MS (Method 3010A, EPA 200.7 and EPA 200.8) and the soil sample digestion procedure is found in SOP: ST-IP-0002, Acid Digestion of Soils, SW846 Method 3050B for ICP, and ICP/MS.

1.3.1 The Technetium-99 soil procedure is found in SOP ST-RC-0125, Determination of Technetium-99 Using Eichrom® Teva Resin, taking the following deviations: Rhenium is used instead of Technetium-99 meta as the tracer, there is no need to let the tracer decay out and the tracer is analyzed on the ICPMS.

1.4 The laboratory target analytes supported by this method, the reporting limits, method detection limits and QC limits are maintained in the Information Management System (QuantIMS). A copy of the Structure and Analysis Code (SAC), which lists this information, is included in the appendix of this SOP.

1.4.1 Additional elements may be amendable to this method provided the laboratory has established a MDL and the elements meets the QC requirements as prescribed in the associated preparation and analysis SOP.

2.0 SUMMARY OF METHOD

2.1 Sample digestates are nebulized into a spray chamber where a stream of argon carries the sample aerosol through a quartz torch and injects it into a radio frequency plasma. There the sample is decomposed and desolvated. The ions produces are entrained in the plasma gas and by means of a water-cooled, differentially pumped interface, introduced into a high-vacuum chamber that houses a quadrupole or octoplole mass spectrometer. The ions are sorted according to their mass-to-charge ratio and measured with a channel electron multiplier.

3.0 DEFINITIONS

3.1 See the TestAmerica St. Louis Quality Assurance Manual (QAM) for a glossary of common laboratory terms and data reporting qualifiers.

3.2 EPA and SW methodology use different terminology. Our SOP references the SW 846 terminology:

3.2.1 The ICV satisfies the QCS requirements found in method 200.8 and D5673-03.
3.2.2 The LCS satisfies the requirements of the LFB found in method 200.8 and D5673-03.
3.2.3 The MS satisfies the requirements of the LFM found in method 200.8 and D5673-03.
3.2.4 The CCV satisfies the requirements of the IPC found in method 200.8.
3.2.5 The LLICV satisfies the requirements of the CRI.

3.3 Dissolved Metals: Those elements which pass through a 0.45 um membrane filter. (Sample is acidified <u>after</u> filtration)

3.4 Suspended Metals: Those elements retained by a 0.45 um filter.

3.5 Total Metals: The concentration determined on an unfiltered sample following vigorous digestion.

3.6 Total Recoverable Metals: The concentration determined on an unfiltered sample following treatment with hot, dilute mineral acid.

3.7 Dilution Test – the terminology "dilution test" found in later versions of 200.8 and 6020A is referred to as a Serial Dilution in this SOP.

4.0 INTERFERENCES

4.1 Isobaric elemental interferences: Isobaric elemental interferences associated with naturally occurring isotopes are automatically corrected by the instrument software.

4.2 Isobaric molecular interferences: Corrections for molecular interferences will be applied where appropriate based on known or suspected interferences.

4.3 Common molecular ion interferences are listed in Table 1 of this SOP.

4.4 Matrix interferences: Internal standards are used to correct for some matrix interferences.

4.4.1 Internal standards are added at a level to give approximately 100,000 - 10,000,000 counts of raw signal intensity. The mass of the internal standard used should ideally be within ±50 amu of the mass of the affected analyte.

4.4.2 Severe matrix effects will be monitored by comparing the internal standard intensity in the sample to the internal standard intensity of the initial calibration blank .

5.0 SAFETY

5.1 Employees must abide by the policies and procedures in the Corporate Environmental Health and Safety Manual (CW-E-M-001), Radiation Safety Manual and this document. This procedure may involve hazardous material, operations and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats and closed-toe, nonabsorbent shoes are a minimum.

5.2 SPECIFIC SAFETY CONCERNS OR REQUIREMENTS

5.2.1 The ICP plasma emits strong UV light, harmful to vision. Analysts must avoid looking directly at the plasma.

5.3 PRIMARY MATERIALS USED

5.3.1 The following is a list of the materials used in this method, which have a serious or significant hazard rating. NOTE: This list does not include all materials used in the method. The table contains a summary of the primary hazards listed in the MSDS for each of the materials listed in the table. A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the MSDS for each material before using it for the first time or when there are major changes to the MSDS.

Material (1)	Hazards	Exposure Limit (2)	Signs and symptoms of exposure
Nitric Acid	Corrosive Oxidizer Poison	2 ppm (TWA) 4 ppm (STEL)	Nitric acid is extremely hazardous; it is corrosive, reactive, an oxidizer, and a poison. Inhalation of vapors can cause breathing difficulties and lead to pneumonia and pulmonary edema, which may be fatal. Other symptoms may include coughing, choking, and irritation of the nose, throat, and respiratory tract. Can cause redness, pain, and severe skin burns. Concentrated solutions cause deep ulcers and stain skin a yellow or yellow-brown color. Vapors are irritating and may cause damage to the eyes. Contact may cause severe burns and permanent eye damage.

Material (1)	Hazards	Exposure Limit (2)	Signs and symptoms of exposure
Hydrochloric Acid	Corrosive Poison	5 ppm (Ceiling)	Inhalation of vapors can cause coughing, choking, inflammation of the nose, throat, and upper respiratory tract, and in severe cases, pulmonary edema, circulatory failure, and death. Can cause redness, pain, and severe skin burns. Vapors are irritating and may cause damage to the eyes. Contact may cause severe burns and permanent eye damage.
1 – Always add acid to water to prevent violent reactions.			
2 – Exposure limit refers to the OSHA regulatory exposure limit.			
TWA – Time Weighted Average			
STEL – Short Term Exposure Limit			
Ceiling – At no time should this exposure limit be exceeded.			

6.0 EQUIPMENT AND SUPPLIES

6.1 Perkin Elmer/Sciex ELAN 6100 ICP-MS with Autosampler/ Agilent 7500/ Agilent 7700 (all with auto samplers)

6.2 Helium gas: 5.5 trace analytical grade

6.3 Hydrogen gas: ultra high purity grade

6.4 Argon gas: High-purity grade (99.99%)

6.5 Chiller (water cooling device)

6.6 Peristaltic Pump

6.7 Calibrated automatic pipettes or Class A glass volumetric pipettes

6.8 Teflon flasks

6.9 Instrument software: ELAN version 2.3.2 or Mass Hunter version B.01.01.

7.0 REAGENTS AND STANDARD

7.1 All standards and reagent preparation, documentation and labeling must follow the requirements of SOP ST-QA-0002, current revision.

7.2 Concentrated nitric acid (HNO3), trace metal grade

7.3 Concentrated hydrochloric acid (HCl), trace metal grade

7.4 DI water from the Millipore unit

7.4.1 Water must be free of the analytes of interest as demonstrated through the analysis of method blanks. Water must be shown to have a resistivity greater than or equal to 16.67 Mohm-cm.

7.5 Standards, NIST traceable

7.5.1 Purchased as custom multi-element mixes or as single-element solutions.

7.5.2 All standards must be stored in FEP fluorocarbon or unused polyethylene or polypropylene bottles.

7.5.3 Working calibration and calibration verification solutions may be used for up to 1 week and must be replaced sooner if verification from an independent source indicates a problem. Standards should be prepared in a matrix of 2% hydrochloric and 2% nitric acid.

7.5.4 Internal Standard Solution: Prepare internal standards (Au, Sc, Ge, In, Ho, Li6) when needed.

7.5.5 Tuning solution: Prepare tuning solution (Be, Ba, Ce, Co, In, Pb, Li) when needed.

8.0 SAMPLE COLLECTION, PRESERVATION AND STORAGE

8.1 TestAmerica St. Louis supplies sample containers and chemical preservatives in accordance with the method. TestAmerica St. Louis does not perform sample collection. Samplers should reference the methods referenced and other applicable sample collection documents for detailed collection procedures. Sample volumes and preservative information is given in ST-PM-0002.

8.2 Aqueous samples for total metals must be digested before analysis using an appropriate digestion procedure, ST-IP-0013.

8.3 Soil or waste samples are digested before analysis using an appropriate digestion procedure. Method 3050B of SW846 is the appropriate digestion procedure, ST-IP-0002.

8.4 Digestate holding time is 6 months from sample collection.

9.0 QUALITY CONTROL

9.1 **Batch**

9.1.1 A sample batch is a maximum of 20 environmental samples, which are prepared together using the same process and same lot(s) of reagents.

9.1.2 Instrument conditions must be the same for all standards, samples and QC samples.

9.1.3 For this analysis, batch QC consists of a method blank, a Laboratory Control Sample (LCS), and Matrix Spike (MS)/ Matrix Spike Duplicate (MSD). In the event that there is insufficient sample to analyze a MS/MSD an LCS Duplicate (LCSD) is prepared and analyzed.

9.2 **Method Blank (MB)**

9.2.1 A method blank is a blank matrix processed simultaneously with, and under the same conditions as, samples through all steps of the procedure.

9.2.2 A method blank must be prepared with every sample batch.

9.3 **Laboratory Control Sample (LCS)**

9.3.1 An LCS is a blank matrix spiked with a known amount of analyte(s), processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.3.2 An LCS must be prepared with every sample batch.

9.4 **Matrix Spike (MS) /Matrix Spike Duplicate (MSD)**

9.4.1 A Matrix Spike is an aliquot of a field sample to which a known amount of target analyte(s) is added, and is processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.5 **Serial Dilution**

9.5.1 A dilution test is performed to determine whether significant physical or chemical interferences exist due to the sample matrix.

9.5.2 The test is performed by running a sample at a 5x (1:4) dilution.

9.5.3 Samples identified as field blanks cannot be used for dilution tests.

9.5.4 The serial dilution results shall agree within +\- 10% of the undiluted sample results, if the undiluted sample results are greater than 10 times the reporting limit. There is no criteria for sample results less than 10 times the reporting limit.

9.6 **Post Digestion Spike** (PDS)

9.6.1 Post digestion spike are applicable to 6020A only.

9.6.1.1 A post digestion spike is a sample which has been fortified with target analytes of interest after the digestion process.

9.6.2 The laboratory requires the analysis of a serial dilution for all batches and thus does not perform the intermediate post digestion spike QC step.

9.6.3 The method stipulates that a PDS be performed on the sample chosen for MS/MSD and if the PDS fails to proceed to performing a serial dilution on the sample. If the PDS is acceptable, the laboratory is not required to perform a serial dilution. Since the laboratory has elected to perform the serial dilution routinely, the outcome of the PDS is not critical. There is no qualification made to the data based on the performance of the PDS.

9.6.4 For client project or programs requiring a PDS, the laboratory will include a PDS in the batch in addition to the serial dilution. This requirement is noted by the Project Manager in the client requirement sheet and/or client summary report.

9.6.4.1 If a PDS is performed, the acceptance criteria is 80%-120%, with a spike concentration between 10-100 times the MDL, UNLESS, the project/program criteria is given.

9.7 **Method of Standard Addition** (MSA)

9.7.1 This technique involves adding known amounts of standard to one or more aliquots of the processed sample solution. This technique compensates for a sample interferent that may enhance or depress the analyte signal, thus producing a different slope from that of the calibration standards. It will not correct for additive interferences which cause a baseline shift.

9.7.2 MSA are not required by the method.

9.7.3 MSAs are not considered normal batch QC and if required by the client, must appear on the client requirement sheet or client summary report.

9.8 **Procedural Variations/ Nonconformance and Corrective Action**

9.8.1 Any variation shall be completely documented using a Nonconformance Memo and approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

9.8.2 Any deviations from QC procedures must be documented as a nonconformance, with applicable cause and corrective action approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

10.0 CALIBRATION AND STANDARDIZATION

10.1 Follow the instrument start-up procedure outlined in the Perkin Elmer Elan 6100 Operator's Manual or the Agilent 7500/ 7700 operator's manual.

10.2 Cone Conditioning

10.2.1 Aspirating a 25% tap water solution for at least 1 hour can enhance instrument performance. This procedure 75% ICPMS rinse solution should be used daily after a thorough cleaning of the interface cones or the installation of new cones takes place.

10.3 Rinse Time Determination

10.3.1 Prior to calibration and between each sample/standard the system is rinsed with the calibration blank solution. The minimum rinse time between analytical samples is 60 seconds unless following the protocol outlined in this SOP it can be demonstrated that a shorter rinse time may be used.

10.3.1.1 To determine the appropriate rinse time, a linear range verification standard should be aspirated as a regular sample followed by the analysis of a series of rinse blanks. The length of time required to reduce the analyte signals to < RL will define the rinse time for the system. For some analytes it may be impractical to set the rinse time based on the linear range standard result (i.e., analyte not typically detected in environmental samples at that level and an excessive rinse time would be required at the linear range level). The concentration levels used to establish the rinse time must be taken into consideration when reviewing the data.

10.4 All calibration procedures described in the subsequent subsections of section 10 applies to both detector systems.

10.5 Instrument Tuning (For no gas He and H2 mode)

10.5.1 Frequency:

10.5.1.1 Daily with each initial calibration

10.5.2 Aspirate a 10 ppb tuning solution containing all of the tuning elements. The typical tuning elements for the Perkin Elmer are He, Mg, Rh. Ce, Pb and Ba. For the Agilent the elements are Li, Y, TL, Co, In, Ce, and Tl.

10.5.3 Tune Criteria:

10.5.3.1 Mass calibration and resolution checks must be documented and included as part of the raw data package.

10.5.3.1.1 Resolution must be < 0.9 amu at 10% peak height for method 6020A or produce a peak width of approximately 0.75 amu at a peak height of 5% for method 200.8

10.5.3.1.2 Mass calibration must be within $\pm$ 0.1 amu from the actual value for the tuning elements of interest or the mass calibration must be adjusted.

10.5.3.1.3 Using the Tuning Solution, an Auto-lens calibration is performed to ensure that optimum voltages are being applied to the Auto-lens. The default calibration should range from 4-10 volts (Perkin Elmer Only).

10.5.3.1.4 The tuning elements must have RSDs below 5%. Mg must be at or above 30,000 counts. Pb must be at or above 100,000 counts. Rh must be at or above 150,000 (Perkin Elmer Only). counts and the oxides/polyatomic ions must be below 3.0%. The background must be less than or equal to 30 counts (Perkin Elmer Only).

10.5.3.1.4.1 If any of these conditions are not met repairs or optimization procedures must be performed until these specifications are met.

10.6 **Initial Calibration**

10.6.1 Multi-point Calibration:

10.6.1.1 A calibration curve, consisting of 3 standards and a blank, must be analyzed daily.

10.6.1.2 Calibration criteria:

10.6.1.2.1 Correlation Coefficient of ≥ 0.998

10.6.1.2.2 The low level standard in the curve must be at or below the laboratory's routine reporting limit. See structure and analysis code (SAC) information appended to this SOP.

10.6.1.2.2.1 If a client requested reporting limit is below the laboratory's routine reporting limit and thus below the low level verification standard, the laboratory will discuss with the client, prior to sample analysis, how to proceed with this requirement.

10.7 **Initial Calibration Verification/Initial Calibration Blank** (ICV/ICB)

10.7.1 The initial calibration accuracy is verified by analyzing a second source standard (ICV).

10.7.2 ICV Frequency:

10.7.2.1 Perform with each initial calibration

10.7.3 ICV Criteria:

10.7.3.1 **Method 200.8 and D6573-03**, the ICV result must fall within 10% of the true value for that solution.

10.7.3.2 **Method 6020A**, the ICV must fall within 10% of the true value for that solution.

10.7.3.3 The internal standard intensity must be 70-140% the IS intensity in the instrument standardization solution.

10.7.4 LLICV (Low Level Initial Calibration Verification)

10.7.4.1 Same source as calibration.

10.7.4.2 Perform with each initial calibration.

10.7.4.3 +/- 30% criteria

10.7.4.4 Internal standard should be 70-140%.

10.7.5 ICB Frequency:

10.7.5.1 An ICB is analyzed immediately following the ICV to monitor low level accuracy and system cleanliness.

10.7.6 ICB Criteria:

10.7.6.1 The ICB result must fall within +/- the RL from zero.

10.7.6.2 The internal standard intensity must be 70-140% the IS intensity in the instrument standardization solution.

10.7.7 If either the ICV or ICB fail to meet criteria, the analysis should be terminated, the problem corrected, the instrument recalibrated and the calibration reverified.

10.7.7.1 Not meeting this requirement may be indicative of serious system malfunction or inaccuracies in the standards used for the initial calibration curve or ICV standard. Corrective action must be taken (including reanalysis of the ICV, or analysis of a different ICV). Any decision to proceed with analysis of samples when the ICV is out-of-control must be taken with great care and in consultation with the QA department and the laboratory director. Any such action must be documented in an NCM.

10.8 **Continuing Calibration Verification/Continuing Calibration Blank (CCV/CCB)**

10.8.1 Calibration is monitored throughout the analytical run through the analysis of a known standard.

10.8.2 A CCV may be a second source or the same source as the calibration

10.8.3 CCV Frequency:

10.8.3.1 Analyte response factors must be verified at the beginning of each analytical run (by either an ICV or a CCV), after every 10 samples and at the end of the analysis run through the analysis of a mid-level calibration standard.

10.8.4 CCV Criteria:

10.8.4.1 For **200.8**: The CCV must fall within 15% of the true value for that solution.

10.8.4.2 For **6020A and D5673-03**: The CCV must fall within 10% of the true value for that solution.

10.8.4.2.1 If a CCV has failed and the analyst can document the reason for failure (e.g mis-injection, etc.) then a second CCV may be analyzed without any adjustments to the instrument. If this CCV meets criteria then sample analysis may continue; however the preceding 10 samples must be reanalyzed. If this second CCV does not meet criteria, the analysis run is terminated. Instrument maintenance is performed and the instrument may require re-calibration (ie initial calibration).

10.8.4.3 The internal standard intensity must be within 70-140% of the IS intensity in the instrument standardization solution.

10.8.4.3.1 If not, the analyst will review the data. If the sample internal standard recoveries are within control and the CCV is within 10% of its true value and the CCB is <RL, it is apparent that whatever interference affected the internal standard for the QC standards has not affected the element bracketed by that internal standard based upon the criteria being met. If these specific occurrences are met then an NCM will be generating stating why the data is acceptable.

10.8.5 CCB Frequency:

10.8.5.1 A CCB is analyzed immediately following each CCV.

10.8.6 CCB Criteria:

10.8.6.1 The CCB result must fall within +/- RL from zero.

10.8.6.2 The internal standard intensity must be 70-140% of the IS intensity in the instrument standardization solution.

10.8.6.2.1 If not, the analyst will review the data. If the sample internal standard recoveries are within control and the CCV is within 10% of its true value and the CCB is <RL, it is apparent that whatever interference affected the internal standard for the QC standards has

not affected the element bracketed by that internal standard based upon the criteria being met. If these specific occurrences are met then an NCM will be generating stating why the data is acceptable.

10.9 **Interference Check Standard** (ICSA/ICSAB)

10.9.1 Interference check standards are applicable to 6020A only.

10.9.2 The validity of the interelement correction factors is demonstrated through the successful analysis of interference check solutions.

10.9.3 **ICSA**:

10.9.3.1 The ICSA contains only interfering elements. Refer to Table II for the details of ICSA composition.

10.9.3.2 Custom multielement ICS solutions must be used.

10.9.3.3 Elements known to be interferents on a required analyte must be included in the ICPMS run when that analyte is determined. Aluminum, iron, calcium and magnesium must always be included in all ICPMS runs.

10.9.4 **ICSB**:

10.9.4.1 The ICSAB contains analytes and interferents.

10.9.4.2 Refer to Table II for the details of ICSAB composition.

10.9.4.3 Custom multielement ICS solutions must be used.

10.9.5 ICSA/ICSAB Frequency:

10.9.5.1 For **6020A**: The ICSA and ICSAB must run with each initial calibration or every 12 hours whichever is shorter.

10.9.6 ICSA/ICSAB Criteria:

10.9.6.1 The ICSAB results for interferents must fall within 80% – 120% of the true value.

10.9.6.2 ICSA results for the non-interfering elements with RLs < 10 µg/L must fall within ± 2x RL from zero. ICSA results for the non-interfering elements with RLs > 10 µg/L must fall within ± 1xRL from zero.

10.10 Liner Dynamic Range

10.10.1 Prior to running the instrument, the upper limit of quantition must be established for each analyte.

10.10.2 This upper limit is tested by running a standard containing high concentrations of the analytes against a calibration curve.

10.10.3 The LDR standard must recover within ten percent of its true value.

10.10.4 The concentration of the LDR standard is higher than the high calibration standard.

10.10.5 LDR study is performed daily.

10.11 Calibration Sequence

CCB
End

* If sequence time is longer than 12 hours, the ICSA and ICSAB standard must be re-analyzed.

11.0 PROCEDURE

11.1 The aqueous sample digestion procedure is found in SOP: ST-IP-0013, Acid Digestion of Aqueous Samples and Extracts for Total Metals for Analysis by ICP Spectroscopy, and ICP/MS (Method 3010A, EPA 200.7 and EPA 200.8)

11.1.4 For 200.8 analyses, dissolved samples must be digested.

11.2 The soil sample digestion procedure is found in SOP: ST-IP-0002, Acid Digestion of Soils, SW846 Method 3050B for ICP, and ICP/MS.

11.3 Instrument conditions, including rinse times, must be the same for all standards and samples.

11.4 Internal standards are introduced to the standards and sample digestates by the instrument.

11.5 Load autosampler with standards and digestates in accordance with the sequence given in section 10.

11.6 Analyze samples.

11.7 When analysis is completed, return unused digestate to proper storage area.

12.0 DATA ANALYSIS AND CALCULATIONS

12.1 Commonly used calculations (e.g. % recovery and RPD) and standard instrument software calculations are given in the TestAmerica St. Louis QAM.

12.2 All measurements must fall within the defined linear range where spectral interference correction factors are valid.

12.2.1 Dilute and reanalyze all samples for required analytes that exceed the linear range.

12.2.2 Acid strength must be maintained in the dilution of samples.

12.3 The mass ions used for determination of the element of interest is given in Table 1 of this SOP

12.4 Internal Standard recovery

12.4.1 Internal Standard Criteria:

12.4.1.1 For **6020A**: Recovery 70%-140% of the intensity of that internal standard in the initial calibration standard for all samples and QC standards.

12.4.1.2 For **200.8 and D5673-03**: Recovery 60-125% of the response in the calibration blank for all samples and QC standards.

12.4.2 If this criteria is not met, the sample should be diluted and re-analyzed until the IS recoveries are within specified limits.

12.5 Tracer Calculations

12.5.1 Tracer Recovery: The measured concentration and the actual concentration for the tracer is entered into spreadsheet SL-INORG-0128. This spreadsheet uses the following formula:

$$\frac{\text{Measured Tracer Concentration}}{\text{Actual Tracer Concentration}} = \text{Final Recovery}$$

12.5.1.1 Tracer Criteria: The tracer recovery must fall within 40-110%.

12.5.2 Final concentration (corrected for tracer): the Technetium-99 measured concentration and the tracer recovery is entered into spreadsheet SL-INORG-0128. This spreadsheet uses the following formula:

$$\frac{\text{Measured Sample Concentration}}{\text{Tracer Recovery}} = \text{Final SampleConcentration}$$

13.0 DATA ASSESSMENT AND ACCEPTANCE CRITERIA; CORRECTIVE ACTIONS FOR OUT OF CONTROL DATA

13.1 The data assessment and corrective action process is detailed through the Clouseau Nonconformance Memorandum (NCM) process. The NCM process is described in SOP: ST-QA-0036. Below is a subset of the data assessment and QC excursion types within Clouseau; the text in underline is the exact "type" line in Clouseau. For a complete and current listing, please access the software program.

13.2 Method Blank

13.2.1 Acceptance Criteria:

13.2.1.1 No target analytes may be present in the method blank above the reporting limit.

13.2.1.2 Project specific requirements if more stringent than our routine procedure (e.g. no target analytes present above ½ RL), will be noted on the client requirements sheet.

13.2.2 Corrective Action for Method Blanks not meeting acceptance criteria:

13.2.2.1 <u>Method Blank Contamination</u> – See Clouseau NCM for corrective action (e.g. re-prep/reanalysis, narration). Note certain analytes are common laboratory contaminants which require special narrative comment. These compounds are so designated in Clouseau.

13.3 Laboratory Control Sample (LCS)

13.3.1 Acceptance Criteria:

13.3.1.1 All control analytes should be within established control limits for accuracy (%Recovery) and precision (RPD).
Corrective Action for LCS not meeting acceptance criteria:

13.3.1.2 <u>LCS Spike Recovery excursion (high)</u> – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).

13.3.1.3 <u>LCS Spike Recovery excursion (low)</u> – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).

13.3.1.4 <u>RPD Duplicate excursion</u> – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).

13.4 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

13.4.1 Analytes should be within control limits for accuracy (%Recovery) and precision (RPD).

13.4.2 Corrective Action for MS/MSD not meeting acceptance criteria:

13.4.2.1 <u>MS/MSD Spike Rec. excursion</u> may not necessarily warrant corrective action other than narration. See Clouseau NCM to determine if re-preparation re-analysis is required.

13.5 Sample result evaluation

13.5.1 Dilutions

13.5.1.1 If the response for any compound exceeds the calibration range of the analytical system, a dilution of the extract is prepared and analyzed. An appropriate dilution should be in the upper half of the calibration range.

13.5.1.2 <u>Dilution: Sample</u>– See Clouseau NCM for corrective action.

13.5.2 Insufficient Sample

13.5.2.1 For any prescribed re-preparation corrective action, if there is insufficient sample to repeat the analysis and narrative comment stating such is included in the report narrative. The insufficient sample description is included in the the Clouseau NCM within the type defining the excursion.

14.0 METHOD PERFORMANCE

14.1 Method performance data, Reporting Limits, and QC acceptance limits, are given in the appendix of this SOP.

14.2 Demonstration of Capability

14.2.1 Initial and continuing demonstrations of capability requirements are established in the QAM.

14.3 Training Qualification

14.3.1 The manager/supervisor has the responsibility to ensure that this procedure is performed by an analyst who has been properly trained in its use and has the required experience.

14.3.2 The analyst must have successfully completed the initial demonstration capability requirements prior to working independently. See requirements in the QAM.

14.4 Annually, the analyst must successfully demonstrate proficiency to continue to perform this analysis. See requirements in the QAM.

15.0 VALIDATION

15.1 Laboratory SOPs are based on standard reference EPA Methods that have been validated by the EPA and the lab is not required to perform validation for these methods. The requirements for lab demonstration of capability are included in LQM. Lab validation data would be appropriate for performance based measurement systems or non-standard methods. TestAmerica St. Louis will include this information in the SOP when accreditation is sought for a performance based measurement system or non-standard method.

16.0 WASTE MANAGEMENT AND POLLUTION PREVENTION

16.1 All waste will be disposed of in accordance with Federal, State and Local regulations. Where reasonably feasible, technological changes have been implemented to minimize the potential for pollution of the environment. Employees will abide by this method and the policies in section 13 of the Corporate Safety Manual for “Waste Management and Pollution Prevention.”

16.2 Waste Streams Produced by the Method

16.2.1 The following waste streams are produced when this method is carried out.

16.2.1.1 Acidic sample waste generated. All acidic waste will be accumulated in the appropriate waste accumulation container, labeled as Drum Type “A” or “B.”

16.2.1.2 Contaminated disposable glass or plastic materials utilized in the analysis are disposed of in the sanitary trash. If the lab ware was used for the analysis of radioactive samples and contains radioactivity at a level of 100 cpm over background as determined by a GM meter, the lab ware will be collected in waste barrels designated for solid rad waste for disposal by the EH&S Coordinator.

18.0 CLARIFICATIONS, MODIFICATIONS TO THE REFERENCE METHOD

18.1 The post spike is not performed per batch. Internal standards are used to monitor matrix interferences in all samples. Post spikes are done per specific QAPP or program requirements. Post-spikes using analytes other than the internal standards may be used if an analyst encounters a new or unusual matrix.

18.2 Method 6020A requires a single point plus a blank for initial calibration. Rather than assume linearity across the instrument range, TestAmerica St. Louis uses a multi-point calibration (3 standards plus a blank) to establish linearity.

18.3 (Lower limit of quantitation check) The LLQC sample is analyzed annually with the MDL study.

18.4 Method 6020 requires the analysis of a Lower Limit Quantitation Check Sample (LLQC) to establish and confirm the lowest quantitation limit. TestAmerica St. Louis fills this requirement with the running of a MDL verification standard which is taken through the entire sample preparation procedure. The method suggested recovery criteria of ± 30% is not applied.

18.5 Method 6020 suggests the analysis of a Low Level Continuing Calibration Verification (LLCCV) standard. This standard should be at the laboratory limit of quantitation and be run periodically throughout an analytical sequence. TestAmerica St. Louis runs this standard only at the beginning of each analytical run.

18.6 Method SW846 1311 requires that the Method Standard Addition (MSA) be used when matrix spike recovery is less than 50% and the measured sample results is within the range of 80-120% of the Toxicity Characteristics Limit. TestAmerica St. Louis does not run an MSA. Spike results outside QC limits are flagged and noted in the case narrative.

19.0 CHANGES TO PREVIOUS REVISION

19.1 Updated formatting and spelling errors throughout SOP.
19.2 Updated section 4.4 referring to the amount of an internal standard being used.
19.3 Added new instrument and gases used in section 6.0.
19.4 Added Lithium to section 7.0 as part of the new reagents and standards used.
19.5 Made reference to new instruments for calibration in section 10.0.
19.6 Add new list of tuning element for both instruments in section 10.5.
19.7 Updated the internal standard intensity throughout section 10.7 and section 10.8

19.8 Added new elements to table 2.

19.9 Rev. 18;

19.9.1 Added LLICV to definitions in section 3.2.

19.9.2 Removed Hydrogen Peroxide from Safety Section (included in prep SOP's.)

19.9.3 Added tuning solution to section 7.5.5.

19.9.4 Updated cone conditioning solution, make up and frequency of use.

19.9.5 Added clarification to tuning section 10.5.

19.9.6 Added Low Level initial calibration verification standards plus criteria to section 10.0.

19.9.7 Updated tables 1 and 2, added analytes, updated concentrations.

19.9.8 Added method 1311 MSA requirements information to section 18.0.

19.9.9 Spelling and grammatical corrections.

19.10 Rev. 19:

19.10.1 Updated Table III regarding QC Criteria limits.

19.11 Revision 20:

19.11.1 Updated section 1.3 adding reference to the Technetium-99 soil procedure.

19.11.2 Added formulas for determining the Tracer Recovery and the Final tracer Corrected Concentration to section 12.5.

19.11.3 Added instrument software and hardware to section 6.0.

19.11.4 Updated the PDS acceptance criteria in section 9.6.

$ArCa^+$	80	

MATRIX OXIDES*

Molecular Ion	Mass	Element Interference
TiO	62-66	Ni, Cu, Zn
ZrO	106-112	Ag, Cd
MoO	108-116	Cd

* Oxide interferences will normally be very small and will only impact the method elements when present at relatively high concentrations. Some examples of matrix oxides are listed of which the analyst should be aware. It is recommended that Ti and Zr isotopes are monitored in solid waste samples, which are likely to contain high levels of these elements. Mo is monitored as a method analyte.

This SOP was previously identified as SOP No. ST-MT-0007 Rev. 11

Facility Distribution No.: 0 **Distributed To:** See Electronic Distribution Sheet

1.0 SCOPE AND APPLICATION

1.1 This procedure describes the preparation and analysis of mercury by Cold Vapor Atomic Absorption (CVAA) Spectroscopy using SW-846 Method 7471B.

1.2 CVAA analysis provides for the determination of total mercury (organic and inorganic). The combination of the oxidants, potassium permanganate, has been found to give 100% recovery with both types of compounds. Detection limits, sensitivity and optimum concentration ranges for mercury analysis will vary with the matrices, instrumentation and volume of sample used.

1.3 Method 7471B is applicable to the preparation and analysis of mercury in soils, sediments, bottom deposits and sludge-type materials. All matrices require sample preparation prior to analysis.

1.4 The laboratory target analytes supported by this method, the reporting limits, method detection limits and QC limits are maintained in the Information Management System (QuantIMS). A copy of the Structure and Analysis Code (SAC), which lists this information, is included in the appendix of this SOP.

2.0 SUMMARY OF METHOD

2.1 This SOP describes a technique for the determination of mercury in solution. The procedure is a physical method based on the absorption of radiation at 253.7 nm by mercury vapor. A representative portion of the sample is digested in hydrochloric and nitric acids. Organic mercury compounds are oxidized with potassium permanganate and the mercury reduced to its elemental state with stannous chloride and aerated from solution in a closed system. The mercury vapor passes through a cell positioned in the light path of an atomic absorption spectrophotometer. Absorbance is measured as a function of mercury concentration. Concentration of the analyte in the sample is determined by comparison of the sample absorbance to the calibration curve (absorbance vs. concentration).

3.0 DEFINITIONS

3.1 See the TestAmerica St. Louis Quality Assurance Manual (QAM) for a glossary of common laboratory terms and data reporting qualifiers.

4.0 INTERFERENCES

4.1 Potassium permanganate, which is used to breakdown organic mercury compounds, also eliminates possible interferences from sulfide. Concentrations as high as 20 mg/L of sulfide as sodium sulfide do not interfere with the recovery of inorganic mercury from reagent water.

4.2 Copper has also been reported to interfere with recovery of mercury; however, copper concentrations as high as 10 mg/L had no effect on the recovery of mercury from spiked samples.

4.3 Interference from certain volatile organic materials that absorb at this wavelength may also occur. If suspected, a preliminary run without stannous chloride can determine if this type of interference is present. While the possibility of absorption from certain organic substances present in the sample does exist, this problem is not routinely encountered. This is mentioned only to caution the analyst of the possibility. If this condition is found to exist, the mercury concentration in the sample can be determined by subtracting the result of the sample run without the reducing reagent (stannous chloride) from that obtained with the reducing reagent.

4.4 Samples containing high concentrations of oxidizable organic materials, as evidenced by high COD levels, may not be completely oxidized by this procedure. When this occurs the recovery of mercury will be low. The problem can be eliminated by reducing the volume of original sample used.

5.0 SAFETY

5.1 Employees must abide by the policies and procedures in the Corporate Environmental Health and Safety Manual (CW-E-M-001), Radiation Safety Manual and this document. This procedure may involve hazardous material, operations and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats and closed-toe, nonabsorbent shoes are a minimum.

5.2 SPECIFIC SAFETY CONCERNS OR REQUIREMENTS

5.2.1 Samples that contain high concentrations of carbonates or organic material or samples that are at elevated pH can react violently when acids are added.

5.3 PRIMARY MATERIALS USED

5.3.1 The following is a list of the materials used in this method, which have a serious or significant hazard rating. NOTE: This list does not include all materials used in the method. The table contains a summary of the primary hazards listed in the MSDS for each of the materials listed in the table. A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the MSDS for each material before using it for the first time or when there are major changes to the MSDS.

Material (1)	Hazards	Exposure Limit (2)	Signs and symptoms of exposure
Mercury (1,000 PPM in Reagent)	Oxidizer Corrosive Poison	0.1mg/M3 for Hg Compounds (Ceiling)	Extremely toxic. Causes irritation to the respiratory tract. Causes irritation. Symptoms include redness and pain. May cause burns. May cause sensitization. Can be absorbed through the skin with symptoms to parallel ingestion. May affect the central nervous system. Causes irritation and burns to eyes. Symptoms include redness, pain, and blurred vision; may cause serious and permanent eye damage.
Nitric Acid	Corrosive Oxidizer Poison	2 ppm (TWA) 4 ppm (STEL)	Nitric acid is extremely hazardous; it is corrosive, reactive, an oxidizer, and a poison. Inhalation of vapors can cause breathing difficulties and lead to pneumonia and pulmonary edema, which may be fatal. Other symptoms may include coughing, choking, and irritation of the nose, throat, and respiratory tract. Can cause redness, pain, and severe skin burns. Concentrated solutions cause deep ulcers and stain skin a yellow or yellow-brown color. Vapors are irritating and may cause damage to the eyes. Contact may cause severe burns and permanent eye damage.
Hydrochloric Acid	Corrosive Poison	5 ppm (Ceiling)	Inhalation of vapors can cause coughing, choking, inflammation of the nose, throat, and upper respiratory tract, and in severe cases, pulmonary edema, circulatory failure, and death. Can cause redness, pain, and severe skin burns. Vapors are irritating and may cause damage to the eyes. Contact may cause severe burns and permanent eye damage.
Potassium Permanganate	Oxidizer	5 mg/M3 for Mn Compounds (Ceiling)	Causes irritation to the respiratory tract. Symptoms may include coughing, shortness of breath. Dry crystals and concentrated solutions are caustic causing redness, pain, severe burns, brown stains in the contact area and possible hardening of outer skin layer. Diluted solutions are only mildly irritating to the skin. Eye contact with crystals (dusts) and concentrated solutions causes severe irritation, redness, and blurred vision and can cause severe damage, possibly permanent.

Material (1)	Hazards	Exposure Limit (2)	Signs and symptoms of exposure
1 – Always add acid to water to prevent violent reactions.			
2 – Exposure limit refers to the OSHA regulatory exposure limit.			
TWA – Time weighted average			
STEL – Short term exposure limit			
Ceiling – At no time should this exposure limit be exceeded			

6.0 EQUIPMENT AND SUPPLIES

6.1 Temperature controlled hot block (capable of maintaining a temperature of 95 ± 3°C).

6.2 Leeman Labs Mercury Analyzer.

6.3 Hydra II AA software: Envoy version 2.8

6.4 Hydra AA software: WinHg version 1.4

6.5 150 ml plastic containers, or equivalent.

6.6 Argon gas supply, welding grade or equivalent.

6.7 Pipettes

6.8 Volumetric flasks, class A

6.9 Top-loading balance, capable of reading +/- 0.01 g

6.10 Thermometer (capable of reading 95 ± 3°C).

6.11 Disposable cups or tubes.

7.0 REAGENTS AND STANDARDS

7.1 All standards and reagent preparation, documentation and labeling must follow the requirements of SOP ST-QA-0002, current revision.

7.2 DI Water, obtained from the Milli-Q unit

7.3 Nitric acid (HNO_3), concentrated, trace grade

7.4 Hydrochloric Acid (HCl), concentrated, trace grade

7.5 Aqua Regia: Prepare immediately before use by carefully adding three volumes of concentrated HCl to one volume of concentrated HNO_3.

7.6 Stannous chloride - Dissolve 100g of stannous chloride into 1000 ml of 10% HCl.

7.7 Hydroxylamine sulfate/12% Sodium hydroxide solution, a certified stock standard is purchased
NOTE: Hydroxylamine hydrochloride (12%) may be used in place of Hydroxylamine sulfate. (120g →1000mL)

7.8 Potassium permanganate, 5% solution (w/v) -certified stock reagent is purchased.
7.8.1 Alternately, dissolve 5 g of potassium permanganate for every 100 mL of DI water.

7.9 Mercury standard – NIST traceable standard (100 ppm)

7.9.1 Intermediate mercury standard (0.1 ppm): Add 2ml of concentrated HNO_3 to a 100 m1 volumetric flask. Add 0.1 mL of the stock ICV mercury standard and dilute to a 100 mL final volume in DI water.

7.9.1.1 The intermediate standard must be made daily.

7.9.1.2 Mercury calibration standards must be prepared fresh daily from the intermediate standard by transferring 0, 0.2, 0.5, 1.0, 5.0 and 10.0 mL aliquots of the intermediate mercury standard into sample prep bottles and proceeding as specified in Section 11.1

7.10 Mercury standard – ICV Stock (100 ppm) in 5% HNO_3 , NIST traceable standard

7.10.1 The initial calibration verification (ICV) standard must be made from a different stock solution than that of the calibration standards.

7.10.2 ICV Intermediate mercury standard (0.1 ppm) - Add 2ml of concentrated HNO_3 to a 100 m1 volumetric flask. Add 0.1 mL of the stock mercury standard and dilute to a 100 mL final volume in DI water.

7.10.2.1 The ICV intermediate standard must be made daily.

7.10.2.1.1 ICV mercury standard must be prepared fresh daily from the intermediate standard by transferring 2.5ml aliquots of the ICV intermediate mercury standard into sample prep bottles and proceeding as specified in Section 11.1

7.10.3 All standards must be processed through the entire analytical procedure including sample preparation.

8.0 SAMPLE COLLECTION, PRESERVATION AND STORAGE

8.1 TestAmerica St. Louis supplies sample containers and chemical preservatives in accordance with the method. TestAmerica St. Louis does not perform sample collection. Samplers should reference the methods referenced and other applicable sample collection documents for detailed collection procedures. Sample volumes and preservative information is given in ST-PM-0002.

8.2 The sample holding time for mercury is 28 days from time of collection to the time of analysis.

8.3 Soil samples do not require chemical preservation but must be stored at 4° C ± 2° C until the time of analysis.

9.0 QUALITY CONTROL

9.1 **Batch**

9.1.1 A sample batch is a maximum of 20 environmental samples, which are prepared together using the same process and same lot(s) of reagents. Where no preparation method exists (e.g. water sample volatile organics, water sample anion analysis) the batch is comprised of a maximum of 20 environmental samples which are analyzed together with the same process, lots of reagents and personnel.

9.1.2 Instrument conditions must be the same for all standards, samples and QC samples.

9.1.3 For this analysis, batch QC consists of a method blank, an Laboratory Control Sample (LCS), and Matrix Spike (MS) and Matrix Spike Duplicate (MSD) In the event that there is insufficient sample to analyze a MS/MSD, an LCS Duplicate (LCSD) is prepared and analyzed.

9.1.3.1 At the instrument, a Serial dilution is performed with every batch.

9.1.4 Samples having different QC codes, due to non-standard client specific QC requirements, must be batched separately in the LIMS. A method blank and LCS may be shared across QC codes provided the actual "sample batch" does not exceed 20 environmental samples. Duplicates (and MS/MSD if applicable) must be performed for each separate QC code.

9.2 **Method Blank**

9.2.1 A method blank is a blank matrix processed simultaneously with, and under the same conditions as, samples through all steps of the procedure.

9.2.2 A method blank must be prepared with every sample batch.

9.2.3 For Soil analyses, the method blank is comprised of glass beads.

9.3 **Laboratory Control Sample**

9.3.1 An LCS is a blank matrix spiked with a known amount of analyte(s), processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.3.2 An LCS must be prepared with every sample batch.

9.3.3 For Soil analyses, the LCS is a commercially prepared purchased solid reference material containing mercury.

9.3.3.1 Alternately, the LCS may be comprised of glass beads fortified with mercury, if client requirements request or QC criteria dictate such.

9.4 **Matrix Spike (MS) /Matrix Spike Duplicate (MSD)**

9.4.1 A Matrix Spike is an aliquot of a field sample to which a known amount of target analyte(s) is added, and is processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.4.2 MS/MSD samples do not count towards the 20 environmental samples in a sample batch.

9.4.3 MS/MSD samples must be performed with every sample batch and every LIMS batch.

9.4.3.1 If there is insufficient sample to perform a MS and/or MSD, a duplicate LCS is analyzed. A NCM is written to document the insufficient volume and the utilization of a LCSD to demonstrate precision.

9.5 **Sample Duplicate (SD)**

9.5.1 A Sample Duplicate is an additional aliquot of a field sample taken through the entire analytical process to demonstrate precision.

9.5.1.1 Certain client project requirements may request a sample duplicate in lieu of a MSD. Please check client requirements.

9.6 **Serial Dilution**

9.6.1 A sample digestate is diluted 1:5 and reanalyzed to assess the present of a matrix interference.

9.6.2 A serial dilution is performed with every analytical batch.

9.6.3 Agreement within 10% between the concentration for the undiluted sample and five times the concentration for the diluted sample indicates the absence of interferences.

9.7 **Post Digestion Spikes (PDS)**

9.7.1 A known amount of mercury is added to the sample chosen for MS/MSD to bring the concentration of mercury to 2 to 5 times the original concentration. If the sample's mercury concentration is below the detection limit, spike at a concentration between the low and mid-level standard.

9.7.2 At client's request, a post digestion spike is performed when MS/MSD fails.

9.7.2.1 Post digestion spike recovery criteria: 85%-115%.

9.8 **Method of Standard Addition (MSA)**

9.8.1 This technique involves adding known amounts of standard to one or more aliquots of the processed sample solution. This technique compensates for a sample interferent that may enhance or depress the analyte signal, thus producing a different slope from that of the calibration standards. It will not correct for additive interferences which cause a baseline shift.

9.8.2 MSAs are not considered normal batch QC and if required by the client, must appear on the Client Requirement Sheet.

9.9 **Procedural Variations/ Nonconformance and Corrective Action**

9.9.1 Any variation shall be completely documented using a Nonconformance Memo and approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

9.9.2 Any deviations from QC procedures must be documented as a nonconformance, with applicable cause and corrective action approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

10.0 CALIBRATION AND STANDARDIZATION

10.1 Initial Calibration

10.1.1 Calibration standards must be processed through the preparation procedure, section 11.

10.1.1.1 Due to the differences in preparation protocols, separate calibration and calibration verification standards must be prepared for aqueous and solid matrices.

10.1.1.2 Record the prep of the calibration standard on the digestion record.

10.1.2 Calibration must be performed daily (every 24 hours) and each time the instrument is set up.

10.1.3 Set up the instrument with the operating parameters recommended by the manufacturer.

10.1.4 Allow the instrument to become thermally stable before beginning calibration.

10.1.5 Calibrate the instrument according to instrument manufacturer's instructions, using a minimum of five standards and a blank.

10.1.5.1 One standard must be at the reporting limit. . The other standards define the working range of the detector, with the highest level standard establishing the linear range of the instrument.

10.1.5.2 Analyze standards in ascending order beginning with the blank.

10.1.6 Calibration criteria:

10.1.6.1 A correlation coefficient must be $\geq$0.995

10.1.6.2 If the calibration curve does not meet method requirements, perform maintenance and perform another calibration curve.

10.2 Initial Calibration Verification (ICV)

10.2.1 An ICV is a second source verification of the calibration.

10.2.2 An ICV must be performed with every calibration.

10.2.3 ICV criteria:

10.2.3.1 ICV recovery must be +/- 10% of the known true value.

10.2.3.1.1 If the ICV fails to meet criteria ($\pm$10%), the analysis is terminated, the problem corrected, the instrument recalibrated and the calibration re-verified.

10.2.3.1.2 If it is suspected that the failure was attributed to a poor sample introduction to the instrument, the ICV may be rerun once, provided no samples have been analyzed after the failing ICV. If the second ICV is acceptable, analysis may continue.

10.3 Initial Calibration Blank (ICB)

10.3.1 Analyze the initial continuing calibration blank (ICB) immediately following the ICV.

10.3.2 ICB criteria:

10.3.2.1 The absolute value of the ICB result must be less than or equal to the reporting limit (RL).

10.3.2.1.1 If the result is not within the control level, terminate the analysis, correct the problem, and recalibrate the instrument if necessary

10.3.2.1.2 Certain client programs may require more stringent ICB criteria, please see Client Requirement sheets.

10.4 Low Level Check (LLC) aka CRA (when requested by client)

10.4.1 An LLC is analyzed at the beginning of each analytical run.

10.4.2 The LLC must fall within 30% of the known value.

10.4.3 LLC must be spiked at RL.

10.4.4 If the result is not within the control level, terminate the analysis, correct the problem and recalibrate.

10.4.5 If it is suspected that the failure was attributed to a poor sample introduction to the instrument, the CCV may be rerun once, provided no samples have been analyzed after the failing CCV. If the second CCV is acceptable, analysis may continue.

10.5 Continuing Calibration Verification (CCV)

10.5.1 A CCV is analyzed after every 10 samples and at the end of the analytical sequence run.

10.5.2 CCV criteria:

10.5.2.1 The CCV must fall within 20% of the known true value.

10.5.2.1.1 If the CCV does not meet QC criteria, the analysis must be terminated, the problem corrected, the instrument recalibrated, and the preceding 10 samples reanalyzed.

10.5.2.1.2 If it is suspected that the failure was attributed to a poor sample introduction to the instrument, the CCV may be rerun once, provided no samples have been analyzed after the failing CCV. If the second CCV is acceptable, analysis may continue.

10.6 Continuing Calibration Blank (CCB)

10.6.1 Analyze a continuing calibration blank (CCB) immediately following the CCV.

10.6.2 CCB criteria:

10.6.2.1 The absolute value of the ICB result must be less than or equal to the reporting limit (RL).

10.6.2.1.1 If the result is not within the control level, terminate the analysis, correct the problem, and recalibrate the instrument if necessary

10.6.2.1.2 Certain client programs may require more stringent ICB criteria, please see Client Requirement sheets.

11.0 PROCEDURE

11.1 Sample Preparation:

11.1.1 Pipette 0, 0.2, 0.5, 1.0, 5.0 and 10.0 mL aliquots of the curve intermediate standard into a series of sample digestion bottles. Bring up all to 10mL final volume with DI water.

11.2 To Prepare a ICV,

11.2.1 Pipette 2.5ml of QC intermediate into a sample digestion bottle and bring up to a 10ml final volume with DI water

11.3 To Prepare a LLC,

11.3.1 Pipette 0.2 ml calibration into a digestion bottle and bring up to a final volume of 10ml.

11.4 To prepare a CCV,

11.4.1 To prepare the CCV, pipette 5.0 ml of QC intermediate into a sample digestion bottle and bring up all to a 10ml final volume with DI water.

11.4.2 Transfer 0.6g of well mixed sample to a clean sample digestion bottle.

11.4.2.1 Reduced sample size can be used as long as a representative sample can be obtained and the reagent levels are adjusted to maintain the sample to reagent ratio.

11.4.3 Hot Block protocol:

11.4.3.1 Spike MS/MSD with 1ml of the QC intermediate.

11.4.3.2 To each **standard** bottle: Add 5 mL of aqua regia.

11.4.3.3 To each **sample** bottle: Add 5 mL of reagent water and 5 mL of aqua regia.

11.4.3.4 Heat for 2 minutes in a hot block at 95 ± 3°C.
11.4.3.5 Cool.
11.4.3.6 Add 50 mL of DI water.
11.4.3.7 Add 15 mL of potassium permanganate solution, mix thoroughly
11.4.3.8 Let stand until purple color persists for 15 minutes, adding additional portions of permanganate solution if needed. If additional portions of permanganate solution are needed, an equivalent portion must also be added to all QC and client samples being prepped. Amount must be equal to that of the highest amount added to any sample.
11.4.3.9 Heat for 30 minutes in the hot block at 95 ± 3°C.
11.4.3.10 Cool.
11.4.3.11 Add 6 mL of sodium chloride-hydroxylamine sulfate solution to reduce the excess permanganate.
11.4.3.12 Bring sample to a final volume of 100mL with DI water.

11.5 Sample Analysis:

11.5.1 The samples must be allowed to cool to room temperature prior to analysis or a decrease in the response signal can occur.
11.5.2 Follow instructions provided by instrument manufacturer.
11.5.3 Baseline correction is acceptable as long as it is performed after every sample or after the CCV and CCB; resloping is acceptable as long as it is immediately preceded and followed by a compliant CCV and CCB.
11.5.4 Analytical sequence:
Instrument Initial Calibration (5 standard plus a blank)
ICV
ICB
LLC
CCV
CCB
Maximum 10 samples
CCV
CCB
Repeat sequence of 10 samples between CCV/CCB pairs as required to complete run.
CCV
CCB

NOTE: Samples include the method blank, LCS, LCS dup, MS, MSD, duplicate, field samples and sample dilutions.

NOTE: Analytical sequence must close with a CCV/CCB pair.

NOTE: If the instrument stops during the sequence, the instrument may be restarted. When restarting the instrument, the run must begin with an acceptable CCV/CCB.

12.0 DATA ANALYSIS AND CALCULATIONS

12.1 Commonly used calculations (e.g. % recovery and RPD) and standard instrument software calculations are given in the TestAmerica St. Louis QAM.

12.2 Sample results are reported to three significant figures in accordance with the significant figure policy.

All measurements must fall within the defined calibration range to be valid. Dilute and reanalyze all samples for analytes that exceed the highest calibration standard.

13.0 DATA ASSESSMENT AND ACCEPTANCE CRITERIA; CORRECTIVE ACTIONS FOR OUT OF CONTROL DATA

13.1 The data assessment and corrective action process is detailed through the Clouseau Nonconformance Memorandum (NCM) process. The NCM process is described in SOP: ST-QA-0036. A hardcopy of all the data assessment types and descriptions along with their associated corrective actions is included in the SOP. Below is a subset of the data assessment and QC excursion types within Clouseau; the text in underline is the exact "type" line in Clouseau. For a complete and current listing, please access the software program.

13.2 Method Blank
- 13.2.1 Acceptance Criteria:
  - 13.2.1.1 No target analytes may be present in the method blank above the reporting limit.
- 13.2.2 Corrective Action for Method Blanks not meeting acceptance criteria:
  - 13.2.2.1 <u>Method Blank Contamination</u> – See Clouseau NCM for corrective action.

13.3 Laboratory Control Sample (LCS)
- 13.3.1 Acceptance Criteria:
  - 13.3.1.1 All control analytes must be within established control limits for accuracy (%Recovery) and precision (RPD).
- 13.3.2 Corrective Action for LCS not meeting acceptance criteria:
  - 13.3.2.1 <u>LCS Spike Recovery excursion (high)</u> – See Clouseau NCM for corrective action.
  - 13.3.2.2 <u>LCS Spike Recovery excursion (low)</u> – See Clouseau NCM for corrective action.

13.4 Matrix Spike/Matrix Spike Duplicate (MS/MSD)
- 13.4.1 Recovery (%)
  - 13.4.1.1 All analytes should be within established control limits for accuracy (%Recovery) and precision (RPD).
  - 13.4.1.2 Corrective Action for MS/MSD not meeting acceptance criteria:
    - 13.4.1.2.1 Perform a Post Digestion Spike, see section 9.
    - 13.4.1.2.2 Write NCM referencing MS/MSD failure and PDS corrective action.
- 13.4.2 RPD (%D)
  - 13.4.2.1 <u>% D excursion for sample/sample duplicate</u> – See Clouseau NCM for corrective action.

13.5 Post Digestion Spike (PDS)
- 13.5.1 Post digestion spike (PDS) recovery criteria: 85%-115%.
  - 13.5.1.1 If PDS recoveries exceed this, perform a serial dilution.
  - 13.5.1.2 Write NCM referencing PDS failure and serial dilution corrective action.

13.6 Serial Dilution
- 13.6.1 Agreement within 10% between the concentration for the undiluted sample and five times the concentration for the diluted sample indicates the absence of interferences.
- 13.6.2 Write NCM for serial dilution excursion – See Clouseau NCM for narration.

13.7 Sample result evaluation
- 13.7.1 Analyses must fall within the calibration range.
- 13.7.2 Analyses are performed using duplicate injections.
  - 13.7.2.1 The absorbance and/or concentration of each injection must be reported in the raw data as well as the average absorbance and/or concentration value. Average concentration values are to be used for reporting purposes.
- 13.7.3 Dilutions
  - 13.7.3.1 If the response for any compound exceeds the working range of the analytical system, a dilution of the extract is prepared and analyzed. An appropriate dilution should be in the upper half of the calibration range.

13.7.3.1.1 <u>Dilution: Sample</u>– See Clouseau NCM for corrective action.
13.7.3.1.2 <u>Dilution: Spike(s) diluted out</u>– See Clouseau NCM for corrective action.

13.7.4 Carryover

13.7.4.1 When a sample has a high response for a compound, there is a real possibility that some of the sample may carry over into the sample analyzed immediately afterward.

13.7.4.2 If a sample analyzed after a sample with high concentrations has negative results, carryover did not occur.

13.7.4.3 If a sample analyzed after a sample with high concentrations has positive results for the same analytes, the results are questionable. This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred.

13.8 Insufficient Sample

13.8.1 For each prescribed re-preparation corrective action, if there is insufficient sample to repeat the analysis a narrative comment stating such is included in the report narrative. The insufficient sample description is included in the Clouseau NCM within the type defining the excursion.

14.0 METHOD PERFORMANCE AND DEMONSTRATIONS OF CAPABILITY

14.1 Method performance data, Reporting Limits, and QC acceptance limits, are given in the appendix of this SOP.

14.2 Demonstration of Capability

14.2.1 Initial and continuing demonstrations of capability requirements are established in the QAM.

14.3 Training Qualification

14.3.1 The manager/supervisor has the responsibility to ensure that this procedure is performed by an analyst who has been properly trained in its use and has the required experience.

14.3.2 The analyst must have successfully completed the initial demonstration capability requirements prior to working independently. See requirements in the QAM.

14.4 Annually, the analyst must successfully demonstrate proficiency to continue to perform this analysis. See requirements in the QAM.

15.0 VALIDATION

15.1 Laboratory SOPs are based on standard reference EPA Methods that have been validated by the EPA and the lab is not required to perform validation for these methods. The requirements for lab demonstration of capability are included in LQM. Lab validation data would be appropriate for performance based measurement systems or non-standard methods. TestAmerica St. Louis will include this information in the SOP when accreditation is sought for a performance based measurement system or non-standard method.

16.0 WASTE MANAGEMENT AND POLLUTION PREVENTION

16.1 All waste will be disposed of in accordance with Federal, State and Local regulations. Where reasonably feasible, technological changes have been implemented to minimize the potential for pollution of the environment. Employees will abide by this method and the policies in section 13 of the Corporate Safety Manual for “Waste Management and Pollution Prevention.”

16.2 Waste Streams Produced by this Method

16.2.1 Acidic sample waste

16.2.1.1 All acidic waste will be accumulated in the appropriate waste accumulation container, labeled as Drum Type “A” or “B.”

16.2.1.2 Contaminated disposable glass or plastic materials utilized in this analysis are disposed of in the sanitary trash. If the lab ware was used for the analysis of radioactive samples and contains radioactivity at a level of 100 cpm over background as determined by a GM meter, the lab ware will be collected in waste barrels designated for solid rad waste and disposed of by the EH&S Coordinator.

17.4.7 ST-IP-0004, Labware Preparation for Inorganic and Trace Metals Analysis

18.0 CLARIFICATIONS, MODIFICATIONS AND ADDITIONS TO REFERENCE METHOD

18.1 Stannous chloride is used in place of Stannous sulfate.

18.2 TestAmerica-St.Louis uses less DI water in steps 11.1.5.12 and 11.1.5.13 than the method suggests. The laboratory considers the volume of 15ml km mot to be significant enough to render compensation/adjustment when diluting sample to final volume. The lab has adjusted the final volume of the standards and samples by 15ml.

18.3 TestAmerica uses an ERA solid reference material for the LCS. Control limits supplied by ERA are used to determine acceptability of the LCS recovery.

18.4 Method SW846 1311 requires that the Method Standard Addition (MSA) be used when matrix spike recovery is less than 50% and the measured sample results is within the range of 80-120% of the Toxicity Characteristics Limit. TestAmerica St. Louis does not run an MSA. Spike results outside QC limits are flagged and noted in the case narrative.

19.0 CHANGES TO PREVIOUS REVISION

19.1 Removed sulfuric acid from section 5.0. It is no longer used in this method.
19.2 Updated section 10.0 by adding Low Level Check (LLC)
19.3 Added instructions on how to prepare an ICV, LLC and CCV in section 11.0
19.4 Added LLC, CCV and CCB to the list of analytical sequences in section 11.2.
19.5 Rev. 10;

19.5.1 Updated post digestion spike section 9.7; removed serial dilution requirements.
19.5.2 Updated MSA section 9.8; removed suggested criteria for MSA analysis.
19.5.3 Added Method 1311 MSA requirements, section 18.4.

19.6 Rev. 11:

19.6.1 Added instrument hardware and software to section 6.0.

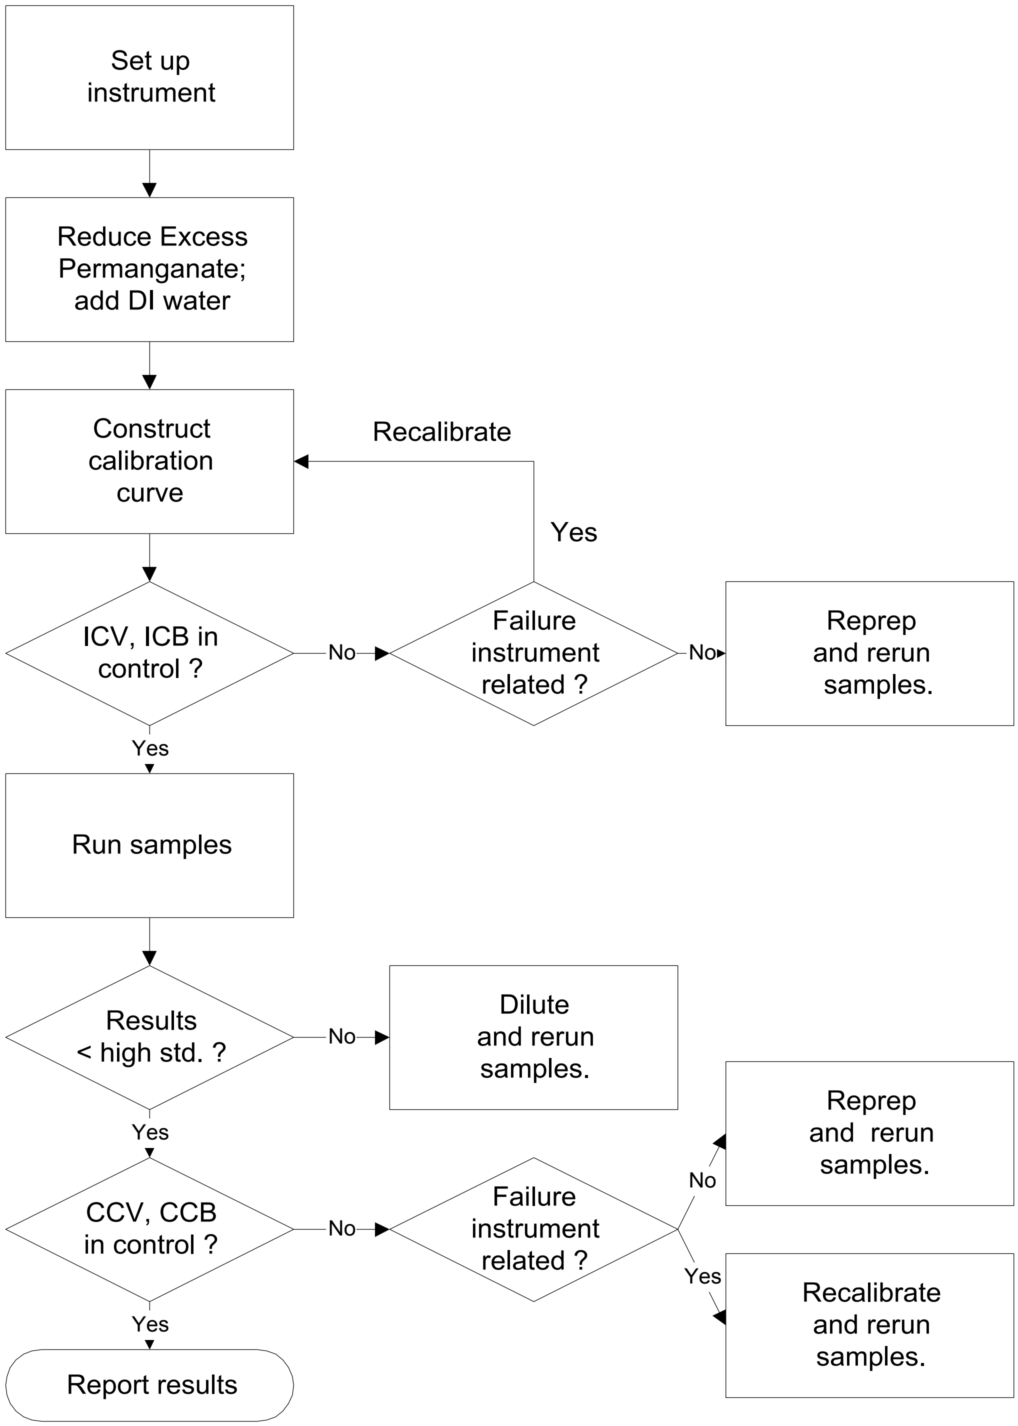
19.6.2 Added requirement to document preparation of calibration standard to section 10.1.

19.6.3 Clarified instructions on addition of permanganate solution in section 11.4.

19.7 Rev: 12:

19.7.1 Updated requirement for prepping all client and QC samples in section 11.4.3.8.

CVAA Mercury Analysis



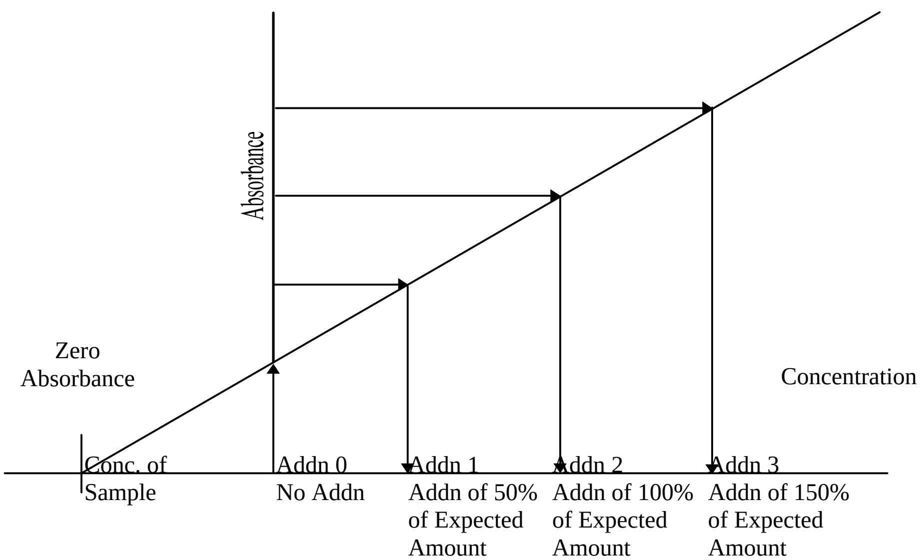
MSA GUIDANCE

Method of Standard Addition

Four equal volume aliquots of sample are measured and known amounts of standards are added to three aliquots. The fourth aliquot is the unknown and no standard is added to it. The concentration of standard added to the first aliquot should be 50% of the expected concentration. The concentration of standard added to the second aliquot should be 100% of the expected concentration and the concentration of standard added to the third aliquot should be 150% of the expected concentration. The volume of the unspiked and spiked aliquots should be the same (i.e., the volume of the spike added should be negligible in relation to the volume of sample).

To determine the concentration of analyte in the sample, the absorbance (or response) of each solution is determined and a linear regression performed. On the vertical axis the absorbance (or response) is plotted versus the concentrations of the standards on the horizontal axis using 0 as the concentration of the unspiked aliquot. An example plot is shown in Figure 1. When the resulting line is extrapolated back to zero absorbance, the point of interception of the horizontal axis is the concentration of the unknown. Calculate the correlation coefficient (r) and the x-intercept (where y=0) of the curve. The concentration in the digestate is equal to the negative x-intercept.

Figure



- For the method of standard additions to be correctly applied, the following limitations must be taken into consideration.
- The plot of the sample and standards must be linear over the concentration range of concern. For best results, the slope of the curve should be similar to that of a plot of the aqueous standard curve.
- The effect of the interference should not vary as the ratio of the standard added to the sample matrix changes.

This SOP was previously identified as SOP No. ST-MT-0005 Rev. 11

Facility Distribution No.: 0	**Distributed To:** See Electronic Distribution Sheet

1.0 SCOPE AND APPLICATION

1.1 This procedure describes the preparation and analysis of mercury (Hg, CAS # 7439-97-6) by Cold Vapor Atomic Absorption Spectroscopy (CVAA) using SW-846 Method 7470A and MCAWW Method 245.1.

1.2 CVAA analysis provides for the determination of total mercury (organic and inorganic).

1.3 Method 7470A is applicable to the preparation and analysis of mercury in ground water, aqueous samples, wastes, TCLP, EP and other leachates/extracts. All matrices require sample preparation prior to analysis.

1.4 Method 245.1 is applicable to the determination of mercury in drinking, surface and saline waters, domestic and industrial wastes. All matrices require sample preparation prior to analysis.

1.5 The laboratory target analytes supported by this method, the reporting limits, method detection limits and QC limits are maintained in the Information Management System (QuantIMS). A copy of the Structure and Analysis Code (SAC), which lists this information, is included in the appendix of this SOP.

2.0 SUMMARY OF METHOD

2.1 This SOP describes a technique for the determination of mercury in solution. The procedure is a physical method based on the absorption of radiation at 253.7 nm by mercury vapor. A representative portion of the sample is digested in sulfuric and nitric acids. Organic mercury compounds are oxidized with potassium permanganate and potassium persulfate and the mercury reduced to its elemental state with stannous chloride and aerated from solution in a closed system. The mercury vapor passes through a cell positioned in the light path of an atomic absorption spectrophotometer. Absorbance is measured as a function of mercury concentration. Concentration of the analyte in the sample is determined by comparison of the sample absorbance to the calibration curve (absorbance vs. concentration).

3.0 DEFINITIONS

3.1 See the TestAmerica St. Louis Quality Assurance Manual (QAM) for a glossary of common laboratory terms and data reporting qualifiers.

3.2 Dissolved Metals: Those elements which pass through a 0.45 um membrane. (Sample is acidified after filtration).

3.3 Suspended Metals: Those elements which are retained by a 0.45 um membrane.

3.4 Total Metals: The concentration determined on an unfiltered sample following digestion.

3.5 EPA and SW methodology use different terminology. This SOP references the SW 846 terminology:

- 3.5.1 The ICV satisfies the QCS requirements found in method 245.1.
- 3.5.2 The LCS satisfies the requirements of the LFB found in method 245.1.
- 3.5.3 The CCV satisfies the requirements of the IPC found in method 245.1.

4.0 INTERFERENCES

4.1 Chemical and physical interferences may be encountered when analyzing samples using this method.

4.2 Potassium permanganate which is used to breakdown organic mercury compounds also eliminates possible interferences from sulfide. Concentrations as high as 20 mg/L of sulfide as sodium sulfide do not interfere with the recovery of inorganic mercury from reagent water.

4.3 Copper has also been reported to interfere; however, copper concentrations as high as 10 mg/L had no effect on the recovery of mercury from spiked samples.

4.4 Chlorides can cause a positive interference. Seawaters, brines and industrial effluents which are high in chlorides require additional permanganate (as much as 25 mL) because, during the oxidation step, chlorides are converted to free chlorine, which also absorbs radiation at 253.7 nm. Care must be taken to ensure that free chlorine is absent before the mercury is reduced and swept into the cell. This is accomplished by adding excess hydroxylamine reagent (25 mL) and purging the sample headspace before stannous chloride

is added. Both inorganic and organic mercury spikes have been quantitatively recovered from seawater using this technique.
Note: Sufficient addition of permanganate is apparent when the purple color persists at least 15 minutes. Some samples may require dilution prior to digestion due to extremely high concentrations of chloride.

4.5 Interference from certain volatile organic materials that absorb at this wavelength may also occur. If suspected, a preliminary run without stannous chloride can determine if this type of interference is present. While the possibility of absorption from certain organic substances present in the sample does exist, this problem is not routinely encountered. This is mentioned only to caution the analyst of the possibility. If this condition is found to exist, the mercury concentration in the sample can be determined by subtracting the result of the sample run without the reducing reagent (stannous chloride) from that obtained with the reducing reagent.

4.6 Samples containing high concentrations of oxidizable organic materials, as evidenced by high COD levels, may not be completely oxidized by this procedure. When this occurs the recovery of mercury will be low. The problem can be eliminated by reducing the volume of original sample used.

5.0 SAFETY

5.1 Employees must abide by the policies and procedures in the Corporate Environmental Health and Safety Manual (CW-E-M-001), Radiation Safety Manual and this document. This procedure may involve hazardous material, operations and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats and closed-toe, nonabsorbent shoes are a minimum.

5.2 Specific Safety Concerns or Requirements

5.2.1 Samples that contain high concentrations of carbonates or organic material or samples that are at elevated pH can react violently when acids are added.

5.3 Primary Materials Used

5.3.1 The following is a list of the materials used in this method, which have a serious or significant hazard rating. NOTE: This list does not include all materials used in the method. The table contains a summary of the primary hazards listed in the MSDS for each of the materials listed in the table. A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the MSDS for each material before using it for the first time or when there are major changes to the MSDS.

Material (1)	Hazards	Exposure Limits (2)	Signs and Symptoms of Exposure
Nitric Acid	Corrosive Poison Oxidizer	2 ppm (TWA) 4 ppm (STEL)	Nitric acid is extremely hazardous; it is corrosive, reactive, an oxidizer, and a poison. Inhalation of vapors can cause breathing difficulties and lead to pneumonia and pulmonary edema, which may be fatal. Other symptoms may include coughing, choking, and irritation of the nose, throat, and respiratory tract. Can cause redness, pain, and severe skin burns. Concentrated solutions cause deep ulcers and stain skin a yellow or yellow-brown color. Vapors are irritating and may cause damage to the eyes. Contact may cause severe burns and permanent eye damage. Contact with other material may cause fire. Liquid and mist cause severe burns to all body tissue.
Sulfuric Acid	Corrosive	1 Mg/M3-	Inhalation produces damaging effects on the mucous

Material (1)	Hazards	Exposure Limits (2)	Signs and Symptoms of Exposure
	Oxidizer Dehydrator Poison	(TWA)	membranes and upper respiratory tract. Symptoms may include irritation of the nose and throat, and labored breathing. Symptoms of redness, pain, and severe burn can occur. Contact can cause blurred vision, redness, pain and severe tissue burns. Can cause blindness. Sulfuric acid is extremely corrosive. Liquid and mist cause severe burn to all body tissue.
Hydrochloric Acid	Poison Corrosive	5 ppm (Ceiling)	Inhalation of vapors can cause coughing, choking, inflammation of the nose, throat, and upper respiratory tract, and in severe cases, pulmonary edema, circulatory failure, and death. Can cause redness, pain, and severe skin burns. Vapors are irritating and may cause damage to the eyes. Contact may cause severe burns and permanent eye damage. Hydrochloric acid is corrosive. Liquid and mist causes severe burn to all body tissue.
Potassium permanganate	Oxidizer	5 mg/m3 (Ceiling)	Causes irritation to the respiratory tract. Symptoms may include coughing, shortness of breath. Dry crystals and concentrated solutions are caustic causing redness, pain, severe burns, brown stains in the contact area and possible hardening of outer skin layer. Diluted solutions are only mildly irritating to the skin. Eye contact with crystals (dusts) and concentrated solutions causes severe irritation, redness, and blurred vision and can cause severe damage, possibly permanent. Contact with other materials may cause fire. Causes burns to any area of contact. Harmful if swallowed or inhaled.
Hydroxylamine Hydrochloride	Poison Corrosive	None established	Inhalation symptoms may include burning sensation, coughing, wheezing, laryngitis, shortness of breath, headache nausea and vomiting. Skin contact may cause irritation and burns. Eye contact may cause severe irritation and corneal damage. Causes burns to any area of contact. Harmful if swallowed of inhaled.
Mercury	Poison Corrosive	0.1 mg/m3 (TWA)	Inhalation symptoms include sore throat, coughing, pain, tightness in chest, breathing difficulties, shortness of breath, headache, muscle weakness, anorexia, gastrointestinal disturbance, ringing in the ear, liver changes, fever, bronchitis and pneumonitis. Skin contact produces redness and pain. May be absorbed through skin with symptoms paralleling those of inhalation. Eye contact symptoms include redness, pain, and blurred vision. Causes burns to skin, eyes, and respiratory tract. May be fatal if swallowed or inhaled. Harmful if absorbed through skin.
Potassium Persulfate	Oxidizer	0.1 mg/m3 (TWA)	Causes irritation to the respiratory tract. Symptoms may include coughing, shortness of breath. Causes irritation to skin and eyes. Symptoms include redness, itching, and pain. May cause dermatitis, burns, and moderate skin necrosis. Contact with other material may cause fire. Harmful if swallowed.

1 – Always add acid to water to prevent violent reactions.
2 – Exposure limit refers to the OSHA regulatory exposure limit.
STEL – Short Term Exposure Limit
TWA – Time Weighted Average
Ceiling – At no time should this limit be exceeded.

6.0 EQUIPMENT AND SUPPLIES

6.1 Temperature controlled hot block (capable of maintaining a temperature of 90-95 °C).

6.2 Leeman Labs Mercury Analyzer

6.3 50 ml plastic containers, or equivalent

6.4 Argon gas supply, welding grade or equivalent.

6.5 Calibrated automatic pipettes or Class A glass volumetric pipettes.

6.6 Class A volumetric flasks.

6.7 Thermometer (capable of accurate readings at 95 °C).

6.8 Disposable cups or tubes.

6.9 Hydra II AA software: Envoy Version 2.8

6.10 Hydra AA Software: WinHg Version 1.4

7.0 REAGENTS AND STANDARDS

7.1 All standards and reagent preparation, documentation and labeling must follow the requirements of SOP ST-QA-0002, current revision.

7.2 Reagent water must be produced by a Millipore DI system or equivalent. Reagent water must be free of the analytes of interest as demonstrated through the analysis of method blanks.

7.3 Nitric acid (HNO_3), concentrated, analytical reagent grade (AR) or better.

7.4 Hydrochloric acid concentrated, analytical reagent grade (AR) or better

7.5 Sulfuric acid (H_2SO_4), concentrated, analytical reagent grade (AR) or better

7.6 Stannous chloride: Dissolve 100g of stannous chloride into 1000 mL of 10% HCl.

7.7 Sodium chloride-hydroxylamine sulfate solution: Add 12 g of sodium chloride and 12 g of hydroxylamine sulfate to every 100 mL of reagent water or a certified stock reagent may be purchased from a vendor.

7.8 Potassium permanganate, 5% solution (w/v): Dissolve 5 g of potassium permanganate for every 100 mL of reagent water or a certified stock reagent may be purchased from a vendor.

7.9 Potassium persulfate, 5% solution (w/v): Dissolve 5 g of potassium persulfate for every 100 mL of reagent water or a certified stock reagent may be purchased from a vendor.

7.10 Stock (100 ppm) mercury standards (in 5% HNO_3) are purchased as custom solutions. All standards must be stored in FEP fluorocarbon or previously unused polyethylene or polypropylene bottles. Stock standard solutions must be replaced prior to the expiration date provided by the manufacturer. If no expiration date is provided, the stock solutions may be used for up to one year and must be replaced sooner if verification from an independent source indicates a problem.

7.11 Intermediate mercury standard (0.1 ppm): Take 0.1 mL of the stock mercury standard and dilute to 100 mL with reagent water. The intermediate standard must be made daily and must be prepared in a matrix of 2% HNO_3 . This acid (2 mL of concentrated HNO_3) must be added to the flask/bottle before the addition of the stock standard aliquot.

7.12 The calibration standards must be prepared fresh daily from the intermediate standard by transferring 0, 0.06, 0.15, 0.3, 1.5 and 3.0 mL aliquots of the intermediate mercury standard into 30 mL flasks and diluting to volume with reagent water.

Note: Alternate approaches to standard preparation may be taken and alternate volumes of standard may be prepared. For example, automated mercury systems do not require 100 mL of standard and therefore smaller volumes may be generated to reduce waste generation.

7.13 The initial calibration verification standard must be made from a different stock solution than that of the calibration standards.

7.14 All standards must be processed through the entire analytical procedure including sample preparation (for 245.1)

8.0 SAMPLE COLLECTION, PRESERVATION AND STORAGE

8.1 TestAmerica St. Louis supplies sample containers and chemical preservatives in accordance with the method. TestAmerica St. Louis does not perform sample collection. Samplers should reference the methods referenced and other applicable sample collection documents for detailed collection procedures. Sample volumes and preservative information is given in ST-PM-0002. Sample collection is not performed by the laboratory for this analysis.

8.2 Sample shipments received by the laboratory will be reviewed against the Sample Acceptance Policy described in SOP ST-PM-0002, "Sample Receipt and Chain of Custody."

8.3 The sample holding time for mercury is 28 days from time of collection to the time of analysis.

8.4 Aqueous samples are preserved with nitric acid to a pH of <2 and may be stored in either plastic or glass. Refrigeration is not required. Preservation must be verified prior to analysis.

9.0 QUALITY CONTROL

9.1 **Batch**

9.1.1 Definition: environmental samples, which are prepared and/or analyzed together with the same process, using the same lot(s) of reagents. A preparation batch is composed of one to 20 environmental samples of a similar matrix, meeting the above mentioned criteria. Where no preparation method exists (example, volatile organics, water) the batch is defined as environmental samples that are analyzed together with the same process and personnel, using the same lots of reagents, not to exceed 20 environmental samples. An analytical batch is composed of prepared environmental samples, extracts, digestates or concentrates that are analyzed together as a group. An analytical batch can include prepared samples originating from various environmental matrices and can exceed 20 samples.

9.1.2 Conditions must be the same for all standards, samples and QC samples.

9.1.3 Each analytical batch may contain up to 20 environmental samples, a method blank, and a single Laboratory Control Sample (LCS), and Matrix Spike/Matrix Spike Duplicate (MS/MSD). In the event that there is insufficient sample to analyze a duplicate, an LCS Duplicate (LCSD) is prepared and analyzed.

9.1.4 Samples that have assigned QC limits different than the standard limits contained in QuantIMS QC code 01 must be batched separately, but can share the same QC samples.

9.2 **Method Blank**

9.2.1 Definition: a blank matrix processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.2.2 A method blank must be included with each batch of samples. The matrix for aqueous is reagent (DI) water.

9.2.3 A method blank must be prepared with every batch (20 or fewer samples of the same matrix).

9.3 **Laboratory Control Sample**

9.3.1 Definition: a blank matrix spiked with a known amount of analyte(s), processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.3.2 An LCS must be prepared with every batch.

9.3.3 The water LCS is reagent (DI) water fortified with mercury.

9.4 **Matrix Spike/Matrix Spike Duplicate**

9.4.1 Definition: Two aliquots of a field sample to which a known amount of target analyte(s) is added.

9.4.2 Additional MS/MSDs do not count towards the 20 samples in an analytical batch.

9.4.3 Matrix spikes are performed every 10 samples for EPA 245.1.

9.5 **Sample Duplicates**

9.5.1 Definition: Sample Duplicate – a separate aliquot of a field sample taken through the entire analytical process.

9.5.2 Additional Sample Duplicates do not count towards the 20 samples in an analytical batch.

9.5.3 If there is insufficient sample to perform a Sample Duplicate, a duplicate LCS is analyzed.

9.6 **Serial Dilution**

9.6.1 Definition: a sample is diluted 1:5 and reanalyzed to assess the present of a matrix interference.

9.6.2 A serial dilution is performed with every analytical batch.

9.6.3 Agreement within 10% between the concentration for the undiluted sample and five times the concentration for the diluted sample indicates the absence of interferences.

9.7 **Post Digestion Spikes**

9.7.1 Definition: A known amount of mercury is added to the sample chosen for serial dilution to bring the concentration of mercury to 2 to 5 times the original concentration. If the sample's mercury concentration is below the detection limit, spike at 20 times the detection limit.

9.7.2 At client's request, a post digestion spike is performed when the serial dilution test fails.

9.7.2.1 Post digestion spike recovery criteria: 85%-115%.

9.8 **Method of Standard Addition (MSA)**

9.8.1 Definition: This technique involves adding known amounts of standard to one or more aliquots of the processed sample solution. This technique compensates for a sample interferent that may enhance or depress the analyte signal, thus producing a different slope from that of the calibration standards. It will not correct for additive interferences which cause a baseline shift.

9.8.1.1 Client Requirement Checklists - Certain clients may require specific project or program QC which may supersede the SOP requirements. These are documented on the client Requirement Checklist or Client Requirement Memos.

9.8.2 MSAs are not considered normal batch QC and if required by the client, must appear on the Client Requirement Checklist.

9.9 **Procedural Variations/ Nonconformance and Corrective Action**

9.9.1 Any variation shall be completely documented using a Nonconformance Memo and approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

9.9.2 Any deviations from QC procedures must be documented as a nonconformance, with applicable cause and corrective action approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

10.0 CALIBRATION AND STANDARDIZATION

10.1 Initial Calibration

10.1.1 Calibration standards must be processed through the preparation procedure.

10.1.2 Due to the differences in preparation protocols separate calibration and calibration verification standards must be prepared for aqueous and solid matrices.

10.1.3 Calibration must be performed daily (every 24 hours) and each time the instrument is set up. The instrument calibration date and time must be included in the raw data.

10.1.4 Set up the instrument with the operating parameters recommended by the manufacturer. Allow the instrument to become thermally stable before beginning calibration .

10.1.5 Calibrate the instrument according to instrument manufacturer’s instructions, using a minimum of five standards and a blank. One standard must be at the reporting limit. Analyze standards in ascending order beginning with the blank.

10.1.6 The calibration curve must have a correlation coefficient of ≥0.995 or the instrument shall be stopped and recalibrated prior to running samples. Sample results can not be reported from a curve with an unacceptable correlation coefficient.

10.1.7 If the calibration curve does not meet method requirements, another calibration curve should be performed.

10.2 Initial Calibration Verification (ICV)

10.2.1 An ICV is a second source verification of the initial calibration.

10.2.2 An ICV must be performed with every initial calibration.

10.2.3 If the ICV fails to meet criteria ±5% for Method 245.1 or ±10% for method 7470A, the analysis should be terminated, the problem corrected, the instrument recalibrated and the calibration reverified.

10.2.4 Not meeting this requirement may be indicative of serious system malfunction or inaccuracies in the standards used for the initial calibration curve or ICV standard. Corrective action must be taken (including reanalysis of the ICV, or analysis of a different ICV).

10.3 Initial Calibration Blank (ICB)

10.3.1 Analyze the initial continuing calibration blank (ICB) immediately following the ICV.

10.3.2 The absolute value of the result must be less than or equal to the reporting limit (RL). If the result is not within the control level, terminate the analysis, correct the problem, and recalibrate the instrument if necessary.

10.4 Low Level Check (LLC) aka CRA (When requested by client)

10.4.1 Can be the same source as your calibration.

10.4.2 Must be performed with every initial calibration.

10.4.3 Must fall within 30% of the true value.

10.4.4 Must be spiked at RL

10.4.5 If the LLC does not meet QC criteria, the analysis must be terminated, the problem corrected and the instrument recalibrated

10.5 Continuing Calibration Verification (CCV)

10.5.1 A CCV is analyzed after every 10 samples and at the end of the analytical sequence run.

10.5.2 The CCV for EPA 7470A must fall within 20% of the true value for that solution; for EPA 245.1, the CCV must fall within 10% of the true value.

10.5.3 If the CCV does not meet QC criteria, the analysis must be terminated, the problem corrected, the instrument recalibrated, and the preceding 10 samples reanalyzed.

10.6 Continuing Calibration Blank (CCB)

10.6.1 Analyze a continuing calibration blank (CCB) immediately following the CCV.

10.6.2 The absolute value of the result must be less than or equal to the reporting limit (RL). If the result is not within the control level, terminate the analysis, correct the problem, and recalibrate the instrument if necessary.

11.0 PROCEDURE

11.1 All calibration and calibration verification standards (ICV, ICB, LLC, CCV, CCB) are processed through the digestion procedure as well as the field samples.

11.2 Calibration Standard/Verification Standard Preparation:

11.2.1 Transfer 0, 0.06, 0.15, 0.3, 1.5, 3.0 mL aliquots of the intermediate standard onto a series of sample digestion bottles, and bring to 30 mL final volume with DI water.

11.2.2 Transfer 0.75 of QC intermediate for ICV, and bring to 30 mL final volume with DI water.

11.2.3 Transfer 1.5 ml of QC intermediate for CCV, and bring to 30 mL final volume with DI water.

11.2.4 Transfer 0.06ml of calibration intermediate for LLC and bring to 30ml to final volume with DI.

11.3 Sample and Batch QC Preparation:

11.3.1 Transfer 30 mL aqueous sample, 6mls for TCLP leachate, or 1 ml for CWET leachate to a pre-labled sample centrifuge tube. If not already at 30 mL, bring up to a final volume of 30 mls with DI water.

11.3.1.1 Spike the aqueous MS/MSD aliquots with 0.3 mL of the intermediate mercury standard.

11.3.1.2 Spike the TCLP or CWET MS/MSD aliquot with 1.5 mL of the intermediate mercury standard..

11.3.2 For the aqueous method blank, transfer 30 mL DI water to a pre-labeled sample centrifuge tube. For TCLP and CWET method blanks, use 30 ml of the appropriate leaching fluid.

11.3.2.1 Use 6mls of TCLP fluid diluted to 30mls with DI water.

11.3.2.2 Use 1ml of c-wet fluid diluted to 30mls with DI water.

11.3.3 For the aqueous LCS, spike 0.3 mL of the QC intermediate mercury standard into a pre-labeled centrifuge tube and bring to a 30 mL final volume with DI water. For TCLP and CWET LCS, spike 1.5 mL of QC the intermediate mercury standard into a pre-labeled centrifuge tube and bring to a 30 mL final volume with the appropriate leaching fluid.

11.4 Digestion:

11.4.1 Add 1.5 ml (5ml if 100 ml final volume) of concentrated H_2SO_4 and .75 ml (2.5 ml if 100 ml final volume) of concentrated HNO_3 mixing after each addition.

11.4.2 Add 4.5 ml (15 ml if 100 ml final volume) of potassium permanganate solution.

11.4.2.1 Permanganate color must persist for at least 15 minutes. Additional permanganate may be added. Shake and add additional portions of permanganate solution until a purple color persists for at least 15 minutes. If additional portions of permanganate solution are needed, an equivalent portion must also be added to all QC and client samples being prepped to match the highest amount added to any one sample. If after the addition of up to 25 mL additional permanganate the color does not persist, sample dilution prior to reanalysis may be required.

11.4.2.2 When performing analyses using automated vs. manual techniques the sample dilution resultant from the addition of more than the original aliquot of permanganate solution must be compensated for by the addition of the same volume of permanganate to all other associated samples and standards in the run. *In instances, where this is not feasible, the addition of additional reagent can be achieved without effecting the sample volume through the addition of small portions, 0.5g aliquots, of solid potassium permanganate.*

11.4.3 Add 2.4 mL (8 ml if 100 ml final volume) of potassium persulfate solution and heat for two hours in a hot block at 95 °C.

11.4.4 Cool samples.

11.4.5 The samples must be allowed to cool to room temperature prior to analysis or a decrease in the response signal can occur.

11.5 Sample Analysis:

11.5.1 Add 2 mL of sodium chloride-hydroxylamine sulfate solution (6ml if 100ml final volume is utilized) to the samples to reduce the excess permanganate (the permanganate has been reduced when no purple color remains).

11.5.2 Automated determination: Follow instructions provided by instrument manufacturer.

11.5.3 Check Stannous chloride solution volume is sufficient to cover sample run.

11.5.3.1 Stannous chloride is introduced to the sample by the instrument.

11.5.4 The following analytical sequence must be used with 7470A and 245.1:

Instrument Calibration (5pt plus blank)
ICV
ICB
LLC
CCV
CCB
Repeat sequence of 10 samples between CCV/CCB pairs as required to complete run
CCV
CCB

11.5.5 If the instrument analysis is stopped for any reason, the run may be resumed. The resumed run must begin with CCV/CCB only if the run has been stopped for more than 2 hours.

11.5.6 Baseline correction is acceptable as long as it is performed after every sample or after the CCV and CCB; re-sloping is acceptable as long as it is immediately preceded and followed by a compliant CCV and CCB.

12.0 DATA ANALYSIS AND CALCULATIONS

12.1 Commonly used calculations (e.g. % recovery and RPD) and standard instrument software calculations are given in the TestAmerica St. Louis LQM.

12.2 Appropriate factors must be applied to sample values if dilutions are performed.

12.3 Sample results should be reported with up to three significant figures in accordance with the significant figure policy.

13.0 DATA ASSESSMENT AND ACCEPTANCE CRITERIA; CORRECTIVE ACTIONS FOR OUT OF CONTROL DATA

13.1 The data assessment and corrective action process is detailed through the Clouseau Nonconformance Memorandum (NCM) process. The NCM process is described in SOP: ST-QA-0036. A hardcopy of all the data assessment types and descriptions along with their associated corrective actions is included in the SOP. Below is a subset of the data assessment and QC excursion types within Clouseau; the text in underline is the exact “type” line in Clouseau. For a complete and current listing, please access the software program.

13.2 Method Blank

13.2.1 Acceptance Criteria:

13.2.1.1 No target analytes may be present in the method blank above the reporting limit.

13.2.2 Corrective Action for Method Blanks not meeting acceptance criteria:

13.2.2.1 <u>Method Blank Contamination</u> – See Clouseau NCM for corrective action.

13.3 Laboratory Control Sample (LCS)

13.3.1 Acceptance Criteria:

13.3.1.1 All control analytes must be within established control limits for accuracy (%Recovery) and precision (RPD).

13.3.2 Corrective Action for LCS not meeting acceptance criteria:

13.3.2.1 LCS Spike Recovery excursion (high) – See Clouseau NCM for corrective action.

13.3.2.2 LCS Spike Recovery excursion (low) – See Clouseau NCM for corrective action.

13.4 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

13.4.1 All analytes should be within established control limits for accuracy (%Recovery) and precision (RPD).

13.4.2 Matrix spike recovery acceptance criteria for EPA 245.1 is 70-130%.

13.4.3 Matrix spike recovery acceptance criteria for 7470A is 75-125%

13.4.4 Corrective Action for MS/MSD not meeting acceptance criteria:

13.4.4.1 MS/MSD Spike Rec. excursion may not necessarily warrant corrective action other than narration. See Clouseau NCM to determine if re-preparation re-analysis is required.

13.5 Post-digestion Spike

13.5.1 A post digestion spike should be performed on one sample per prep batch. Spike recovery results that fall outside of the 85-115% recovery window will be narrated in an NCM.

13.6 Sample result evaluation

All measurements must fall within the defined calibration range to be valid. Dilute and reanalyze all samples for analytes that exceed the highest calibration standard.

13.6.1 Dilutions

13.6.1.1 If the response for any compound exceeds the working range of the analytical system, a dilution of the extract is prepared and analyzed. An appropriate dilution should be in the upper half of the calibration range.

13.6.1.1.1 Dilution: Sample– See Clouseau NCM for corrective action.

13.6.1.1.2 Dilution: Spike(s) diluted out– See Clouseau NCM for corrective action.

13.6.2 Carryover

13.6.2.1 When a sample has a high response for a compound, there is a real possibility that some of the sample may carry over into the sample analyzed immediately afterward.

13.6.2.2 If a sample analyzed after a sample with high concentrations has negative results, carryover did not occur.

13.6.2.3 If a sample analyzed after a sample with high concentrations has positive results for the same analytes, the results are questionable. This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred.

13.7 RPD (%D)

13.7.1 % D excursion for sample/sample duplicate – See Clouseau NCM for corrective action.

13.8 Insufficient Sample

13.8.1 For each prescribed re-preparation corrective action, if there is insufficient sample to repeat the analysis and narrative comment stating such is included in the report narrative. The insufficient sample description is included in the Clouseau NCM within the type defining the excursion.

14.0 METHOD PERFORMANCE AND DEMONSTRATIONS OF CAPABILITY

14.1 Method performance data, reporting limits, and QC acceptance limits, are given in the appendix of this SOP.

14.2 Demonstration of capability

14.2.1 Initial and continuing Demonstrations of Capability requirements are established in the QAM.

14.3 Training qualification

14.3.1 The manager/supervisor has the responsibility to ensure that this procedure is performed by an analyst who has been properly trained in its use and has the required experience.

14.3.2 The analyst must have successfully completed the initial Demonstration of Capability requirements prior to working independently. See requirements in the QAM.

14.4 Annually, the analyst must successfully demonstrate proficiency to continue to perform this analysis. See requirements in the QAM.

15.0 VALIDATION

15.1 Laboratory SOPs are based on standard reference EPA Methods that have been validated by the EPA and the lab is not required to perform validation for these methods. The requirements for lab demonstration of capability are included in LQM. Lab validation data would be appropriate for performance based measurement systems or non-standard methods. TestAmerica St. Louis will include this information in the SOP when accreditation is sought for a performance based measurement system or non-standard method.

16.0 WASTE MANAGEMENT AND POLLUTION PREVENTION

16.1 All waste will be disposed of in accordance with Federal, State and Local regulations. Where reasonably feasible, technological changes have been implemented to minimize the potential for pollution of the environment. Employees will abide by this method and the policies in section 13 of the Corporate Safety Manual for "Waste Management and Pollution Prevention."

16.2 Waste Streams Produced by the Method

16.2.1 The following waste streams are produced when this method is carried out.

16.2.1.1 Acidic sample waste generated. All acidic waste will be accumulated in the appropriate waste accumulation container, labeled as Drum Type "A" or "B."

16.2.1.2 Contaminated disposable glass or plastic materials utilized in the analysis are disposed of in the sanitary trash. If the lab ware was used for the analysis of radioactive samples and contains radioactivity at a level of 100 cpm over background as determined by a GM meter, the lab ware will be collected in waste barrels designated for solid rad waste for disposal by the EH&S Coordinator.

18.0 CLARIFICATIONS, MODIFICATIONS TO THE REFERENCE METHOD

18.1 Modifications/Interpretations from reference method.

18.2 Modifications from both 7470A and 245.1.

18.2.1 The 200 series methods and Chapter 1 of SW846 specify the use of reagent water with a purity equivalent to ASTM Type II water. This SOP specifies the use of a Millipore DI system or equivalent to produce reagent water. This SOP requires that reagent water must be free of the analytes of interest as demonstrated through the analysis of method blanks.

18.2.2 This SOP allows for the use of reduced sample volumes to decrease waste generation. Reagent levels are adjusted to maintain the same ratios as stated in the source methods. According to a letter from Robert Booth of EPA EMSL-Cinn to David Payne of EPA Region V, "Reduction in sample size and appropriate corresponding reduction in sample volume is not considered a significant change in the methodology."

18.3 Modifications from Method 7470A

18.3.1 Chapter 1 of SW-846 states that the method blank should not contain any analyte of interest at or above the MDL. This SOP states that the method blank must not contain any analyte of interest at or above the reporting limit.

18.4 Modifications from 245.1

18.4.1 Method 245.1 Section 9.3 states concentrations should be reported as follows: Between 1 and 10 ug/L, one decimal; above 10 ug/L, to the nearest whole number. TestAmerica reports all Hg results under this SOP to two significant figures.

18.5 Method SW846 1311 requires that the Method Standard Addition (MSA) be used when matrix spike recovery is less than 50% and the measured sample results is within the range of 80-120% of the Toxicity Characteristics Limit. TestAmerica St. Louis does not run an MSA. Spike results outside QC limits are flagged and noted in the case narrative.

19.0 CHANGES FROM PREVIOUS REVISION

19.1 Updated section 10.0 by adding Low Level Check instructions.

19.2 Added section 11.2.4, pre of Low Level Calibration Check.

19.3 Added Low Level Checks to the Instrument Calibration list in section 11.5.4.

19.4 Rev. 9;

19.4.1 Updated post digestion spike section 9.7; removed MSA requirements

19.4.2 Removed section 18.3.2: redundant ICV criteria.

19.4.3 Added Method 1311 MSA requirements, section 18.5.

19.5 Rev. 10;

19.5.1 Updated the spike recovery acceptance criteria for methods EPA 245.1 and 7470A in section 13.4.

19.6 Rev. 11:

19.6.1 Updated instrument software used in section 6.0.

19.6.2 Updated permanganate solution needed for method blank and LCS in section 11.4.

19.7 Rev. 12:

19.7.1 Updated requirement for prepping all client and QC samples in section 11.4.2.1.

TROUBLESHOOTING GUIDE

Problem	**Possible Cause**
Poor or No Absorbance or Sensitivity Check failed	Incorrect wavelength Dirty windows Window loose Etched or dirty optics Bad lamp Not enough or no sample introduced Empty sample cup Incorrectly made standards Gas leak
Erratic Readings	Source lamp not aligned properly Lamp not prewarmed Contaminated reagents Contaminated glassware Drying tube saturated Bad lamp Leak in sample tubing Power fluctuations Air bubbles in tubing
Standards reading twice or half normal absorbance or concentration	Incorrect standard used Incorrect dilution performed Dirty cell

Subject: Re: Asbestos SOP with signatures

Lisa,

When we give a customer or compliance agency an SOP for review, we no longer have control over it, so it called an uncontrolled document. We can only control what's inside our building. The annual review is handled primarily in our corporate office, though we do review it with our annual internal audits. For years, and probably decades now, the versions have been approved and released without the signatures. Our compliance officer did clarify that the asbestos SOP released to a customer without signatures is to indicate that it's an uncontrolled document and should be accepted as the current and reviewed document we operate under. That's the policy and why you received it that way. Review notes are part of other internal records that we don't release, and no further changes have been made to the version you have.

Glenn

AmeriSci Group. Standard Operating Procedures

SECTION III - A

Analysis of Asbestos in Bulk Building Materials by Polarized Light Microscopy (PLM)

(40 CFR Ch. I (1-1-87 edition) Pt 763, Subpt. F, App. A, pages 293-299)

1. Principle and Application

1.1. Application

This method of analysis is useful for the qualitative identification of asbestos and the semi-quantitative determination of asbestos content of bulk samples, which is useful information to characterize the potential hazard of a given material with regard to asbestos. This method is strictly applicable to friable building materials only. Quantitative removal of matrix and other non-asbestos components sensitive to heat and/or acid treatment may provide additional information for selected samples (see section III-A.6). Non-friable materials are addressed in other portions of Section III (see III-B and III-C). Asbestos is a fibrous, fire-resistant mineral once widely used in building materials and now known to be a human carcinogen. Hazardous materials must be identified so that necessary safety precautions may be taken when the material is handled.

1.2. Principle

1.3. Accessory Methods for Problem Samples

Some types of friable samples and most non-friable samples present a series of problems of varying difficulty for the asbestos analyst. Typical problem materials include matrix coated materials including plaster samples, joint compound, roofing samples, mastic, vinyl or asphalt floor tiles, cement products, caulking, rubberized coatings, paints and other materials. Coatings on asbestos bundles which prevent the proper observation of characteristic optical properties may be removed by mechanical, chemical (HCl treatment) or thermal (ashing at 480C) treatment. Great care must be taken when applying matrix modification or removal in order to track the processes quantitatively by Gravimetric Reduction (section III-A-6.). Analysis of non-friable materials and other special materials is addressed in Section III-C. Materials such as floor tiles, plasters, or paints suspected of having substantial quantities of fibers with diameters thinner than 0.25 micrometers (optical limitation of the light microscope) should be referred for TEM preparation and examination (section VII). Foreign soil samples are subject to special handling requirements (USDA Circular Q-330.300-2) and disposal treatments (section XXII-A). The CARB 435 method requires 400 pt ct analysis of samples with <10% asbestos content by visual estimate.

2. Equipment and Materials

2.1. Microscope, polarized light, and:

2.1.1. 10 x oculars with cross-hair reticule

2.1.2. Objectives such as 4x, 10x, 20x, and 40x

2.1.3. Polarizer placed parallel to the reticule cross-line and analyzer capable of being placed at 90° angle to polarizer.

2.1.4. Accessory slot for wave plate and analyzer

2.1.5. Retardation plate (red I compensator plate), 550 nm retardation with known fast and slow vibration directions

2.1.6. 360° rotatable stage

2.1.7. Substage condenser with iris diaphragm

2.1.8. Light source with iris diaphragm and blue day-light filter

2.2. Microscope slides: 75 mm x 25 mm

2.3. Cover slips: 18 mm x 18 mm, No 1 1/2

2.4. HEPA-filtered hood

2.5. Mortar and pestle

2.6. Stereomicroscope, ca. 10x to 45x, with incandescent light source

2.7. Mini-hot plate

2.8. Tweezers, dissecting needles, spatulas, probes, and scalpels

2.9. Pencils, #2

2.10. Glassine weighing papers or plastic weighing boats

2.11. Analytical balance readable to one milligram

2.12. 10 ml Pyrex beakers

2.13. Muffle furnace capable of 500° C

2.14. Filters, 0.4 µm pore size polycarbonate

2.15. Petri dishes, disposable (locking and non-locking)

2.16 Glass filtration assembly with vacuum pump

2.17. Drying oven

2.18. Desiccator with silica gel

2.19 10 ml graduated pipettes

2.20. 500 ml volumetric flasks

2.21. Nalgene wash bottles

2.22. Ultrasonic bath

2.23 Timers

2.24. Wrist action grinder with removable cups

2.25. High temperature thermometer (500 C) readable to 5° C

2.26. Room temperature thermometer readable to 2° C

2.27. Chalkley point count reticule

2.28. Monochromatic filter - 589.3 nm (orange)

2.29. Alcohol burner lamp

2.30. 200 Tyler mesh sieve

3. Reagents

3.1. Refractive index (RI) liquids 1.490-1.570 high dispersion and 1.580-1.720 in increments of 0.005 or less

3.2 Asbestos reference samples such as SRM #1866 and #1867, available from the National Institute of Standards and Technology

3.3 Calibrated refractory glasses for verifying refractive indices

3.4 Distilled water

3.5. Concentrated HCl and NaCl, reagent grade

4. Sample Collection and Identification Procedure

4.1. A sample size of 1 to 10 grams is recommended, although sufficient sample size is sample-type dependent. Sample size should be adjusted to ensure that it is representative of the parent material. Samples should be submitted in a carefully sealed and labeled sample container and packed to prevent damage or sample loss.

4.2. A sample submitted for testing should contain all layers of a material and should be relatively undisturbed so that the analyst may view the sample in its original form. Since each layer must be analyzed as a separate sample, separable layers should be separated and identified in the field if possible. If not separable, an identifier should be used which will allow later identification by orientation, position, color, texture, etc. If identifiable, the outside or top of a sample should be labeled as the first layer.

4.3 When logged into the AmeriSci data base each sample or separable layer must be labeled with and thereafter referred to by the unique lab assigned job/sample number consisting of an 9 digit job number followed by sequential digits which serve as the specific sample identifier within the job (ex. 1-0201-1523-27). For layered samples not addressed by unique client identifiers at Log-in the job/sample number may be further subdivided by creation of a decimal addition to the sample specific digit such that each of the decimals relate to the original client identifier. For example, the third layer from the top in a roofing sample would be identified as 1-0201-1523-27.3 unless specified differently by the client. As an alternative procedure, different materials combined under a single client sample number may be identified by a Letter suffix rather than a decimal. For example, a floor tile, mastic group identified by a single client number might be identified by AmeriSci as 1-0201-1523-27T and 1-0201-1523-27M. Letters available for use as suffixes include: M, T, C and F which may be followed by sequencing digits for more that one occurrence of a material in a sample bag such as -27T, -27M1 and 27M2.

5. Sample Slide Preparation Procedure

5.1. Examine the paperwork for necessary client information regarding processing and reporting of the samples. Samples may be analyzed individually after preparation or prepped and analyzed as a job batch depending on analyst preference. Prepare a QC-blank test slide with standard non-asbestos particulate material after every 19 client samples in a job batch (see 5.20.). Record any sample modification or treatment must be on the sample worksheet (or directly in the LIMS using comment/footnote).

5.2. If the sample has been selected for quality control analysis place the sample container in the analyst specific quality control bin after completion of primary analysis.

5.3. Visually examine samples with a low-magnification stereomicroscope under a ventilation hood with HEPA filtration. Samples should only be opened for examination under a properly operating HEPA hood.

5.3.1. Observe and note the following on the sample worksheet (or directly into the LIMS):

5.3.1.1. AmeriSci job/sample number (decimal sample number indicates layered sample)

5.3.1.2. Homogeneity

5.3.1.3. Color

5.3.1.4. Texture

5.3.1.5. Semi-quantitative estimation of amount of fibrous material present

5.4. If the sample appears to be wet, transfer to a labeled petri dish and dry in a low temperature drying oven at 60C. Cool before proceeding.

5.5. Label a slide with the sample's AmeriSci number (job # plus individual sample #).

5.6. Under the hood, remove a portion of the sample and examine the edges for emergent fibers. If any layers are observed they should be addressed as individual samples for analysis and reporting purposes if possible.

5.7. If there are obvious separable layers, analyze and report each layer separately using a suffix (decimal or letter identifier added to the AmeriSci job/sample number). If not entering analysis directly into the LIMS package add the suffix to the sample number on the analysis sheet and use a blank analysis sheet for each additional layer/material. Attach the additional layer sheets to the original sample sheet.

> **Note:** Under EPA guidelines (40 CFR 61, FR 59.3.542) single, combined analyses may not be reported except for a joint compound / wallboard system. OSHA does not allow combined analyses.

5.8 Forceps and a scalpel may be used to cut the sample layers into smaller pieces after placing it in the RI liquid on the slide. The scalpel blade may also be used to "scrape" coatings from fiber bundles in order to remove interference effects.

5.9 Grind non-homogeneous samples in a mortar until thoroughly mixed.

5.10. If the sample has large hard particles, grind in a mortar to reduce grain size to less than 200 Tyler mesh to facilitate accurate quantitation (required by CARB 435).

5.11. Place a small drop of 1.550 HD dispersion staining fluid on appropriately labeled slide.

5.12. Using forceps, randomly transfer a small pinch sample from the homogenized sample to the mounting medium on the slide.

5.13. Evenly disperse the sample throughout the fluid using needles or a mincing action with forceps and a scalpel.

5.14. Using needles, scalpel and forceps tease homogenous samples not previously ground to facilitate separation of fibers from matrix materials. Bundles of fibers should be "scraped" with a scalpel to remove adhering particulate which causes a "milky way effect" when observed by PLM/DS. Pretreatment with dilute HCl may aid removal.

5.15. Place a coverslip over preparation. Add more refractive index fluid if necessary by dropping liquid on slide rather than touching the slide. Note: This must be done cautiously since the RI fluid may be easily contaminated at this point.

5.16. An even dispersion of sample should cover the entire area under the cover slip. If necessary, a clean pencil eraser may be used to grip the coverslip while sliding it over the preparation to thin and evenly distribute the material. Mild heating may assist separation of binder materials.

5.17. For those samples which will have quantitation by EPA 400 pt. (or 1000 pt.) point-counting, eight (twenty) or more sub-samples must be mounted on labeled microscope slides under separate coverslips. A maximum of 50 points per mount should be counted. Two mount/coverslips may be mounted on the same slide.

5.18. Prepare additional subsamples as necessary in specified RI fluid by repeating steps 5.7 through 5.17.

5.19. If specified, QC slides for duplicate and replicate analysis may be prepared by repeating steps 5.7. through 5.17.

5.20. Prepare a QC-Blank slide by placing small pinch sample of blank fiberglass or NaCl on a slide following steps 5.11. through 5.16. (See “SOP for Housekeeping”, Section V.4. for further information concerning QC-blank sample evaluation.)

5.21. Thoroughly clean work area, mortar and pestle and all other mounting tools between each sample preparation.

5.23. Repeat sample preparation steps for all samples in the client’s job request and all QC samples indicated by the accompanying paperwork.

6. Gravimetric Reduction (Point Count or TEM preparation - modified Chatfield)

This procedure is not part of the standard procedure for friable samples. This method is particularly useful to reduce the possibly of false negatives if thin fibers below the resolution limit of the light microscope are suspected and to provide additional quantitative data for samples which contain low levels of asbestos. Such samples when requested, may be gravimetrically reduced prior to PLM slide preparation. A Gravimetric Reduction Worksheet must be completed for each job. All Non-friable Organically Bound (NOB) samples are addressed by Section III-B or III-C.

6.1 Examine the paperwork for necessary client information regarding processing and reporting of the samples. Using a scalpel or other tool, shave or break off approximately 300 to 500 mg (100 minimum)of homogenous sample into a marked, pre-weighed 10 ml beaker and weigh. Non-homogenous, layered and mixed type samples must be separated as previously described in sections 4 & 5.

6.2. Record sample color, morphology and weight on appropriate Gravimetric Reduction (GR) worksheet as described in section 5. Maintain GR worksheet with job folder.

6.3. Cover and place in a muffle furnace at 480°C for 6-12 hours or until sample weight stabilizes. Record temp/time into and out of the furnace on the GR worksheet.

6.4. Cool in a desiccator with silica gel (Do Not use Drierite due to contaminating dust).

6.5 Reweigh and record weight on appropriate worksheet.

6.6. Add approximately 5 ml of 6:1 HCl and using a spatula or probe break up any lumps or residue in beaker.

6.7. Cover and place sample in ultrasonic bath for approximately 10 minutes.

6.8. Preweigh a plastic petri dish and 0.4 µm polycarbonate filter for each sample. A locking petri dish should be used if the sample is to be saved, shipped or for PLM.

6.9. When all obvious signs of reaction (bubbling) have stopped, pour sample solution into filtration apparatus containing a pre-weighed 0.4 µm polycarbonate filter.

6.10. Using distilled water, thoroughly rinse beaker into filtration apparatus and rinse down the inside of the apparatus. Record treatment time on GR worksheet.

6.11. When filtration is complete, carefully transfer filter and residue to the appropriate pre-weighed petri dish.

6.12. Dry filter and residue (in petri dish) in drying oven. The presence of any large grains of aggregate material must be noted on the Gravimetric Reduction Worksheet (Rocks Y/N) and accounted for quantitatively.

6.13. Re-weigh filter and residue in petri-dish. Record weight on appropriate work sheet.

6.14. If residue weight is less than 1% of original subsample weight, analysis may be halted and sample reported as a non-ACM. Note: Unless analysis termination is requested at this point by the client, analysis should continue in order to make client aware of potential site or personal contamination by low level , non-regulated, asbestos containing material.

6.15. If residue weight is ≥ 1% of original subsample weight, transfer petri-dish to a HEPA filtered preparation hood for PLM analysis.

6.16. Cut the filter in half. Retain one undisturbed half in the petri-dish. Detach a section of residue from the second half filter and mount random pinch samples on 2 separate, clearly labeled slides making 2 coverslip preparations on each slide using steps 5.11 thru 5.17. Additional mounts may be necessary. During analysis compare the sample to 2 known standards with similar type and amount of asbestos, if available.

6.17. Save the remaining half filter in the petri-dish for possible TEM confirmation.

6.18. Thoroughly clean filtration apparatus between each sample.

7. Sample Analysis Procedure - Qualitative Assessment

7.1. Microscope Setup: Refer to "SOP for Calibration and Maintenance of Equipment - Asbestos" for details on daily microscope calibration and setup.

7.2. Inspect the sample macroscopically and note the color and bulk morphology on the analyst's worksheet (either hard copy or computer file). Prepare slides as necessary for PLM examination following procedures outlined in Section III.A.5.

7.3. Examine the slide under PLM. All fibrous components in the sample must be identified.

7.3.1. If matrix material coats the fibers, place a pencil eraser on the coverslip to press and slide the coverslip until the fibers are freed, (heating may assist). Some coatings may require "scraping" with a scalpel blade or solvent treatment prior to applying the coverslip.

7.3.2. Asbestos fibers must be positively identified by observing each of the following criteria. If not entering data directly into the LIMS package record all observations in the appropriate space on the analyst's worksheet for each sample analyzed.

7.3.2.1. Scan the preparation using crossed polars with the first order red compensator inserted. For each type of suspected asbestos fiber found, observe and record the following on the analyst's worksheet.

7.3.2.2. Morphology: refer to EPA Test Method Table 2-2 for optical properties of asbestos fibers.

7.3.2.3. Sign of elongation: note as either + (positive) or - (negative) on analyst's worksheet.

7.3.2.4. Remove the first order red compensater and observe extinction characteristics. Note angle of extinction as parallel, or in degrees if different from parallel, on analyst's worksheet.

7.3.2.5. Remove the analyzer and observe under plane polarized light for color and pleochroism. Record observations on analyst's worksheet.

7.3.2.6. Insert the dispersion staining objective and observe dispersion staining colors parallel and perpendicular to the fiber length. Record these colors in that order on worksheet. Refer to EPA Test Method Table 2-3 for typical central stop dispersion staining colors.

7.3.2.7. Record index of refraction (RI) parallel and perpendicular to the fiber length. Note: See Reference- Single Liquid Method - for assistance in determining RI values by Dispersion Staining Method; record all RI values to 4 significant figures.

7.3.2.7.1 Most samples are originally mounted in 1.550 HD refractive index (RI) oil. It will be necessary to mount subsamples of original bulk materials with suspect amphiboles in other RI oils.

7.3.2.7.1.1 Mount suspected amosite samples in 1.680 RI oil.

7.3.2.7.1.2 Mount suspected crocidolite samples in 1.680 and 1.700 RI oil.

7.3.2.7.1.3. Mount suspected anthophyllite, actinolite, or tremolite samples in 1.605 RI oil.

7.3.2.7.2. Dispersion staining colors along with temperature may be used to establish refractive indices of chrysotile, amosite, and crocidolite. Alternatively, refractive indices may be established by observation of Becke lines under plane polarized light.

7.3.2.8. Record Birefringence on analyst's worksheet as none (isotropic), high, med. (medium), or low.

7.3.3. All fibrous components of the sample must be positively identified as asbestiform or non-asbestiform. Check synthetic "chrysotile" look-likes by heating with mini-hot plate, they should melt at 300-500 F. Only one distinguishing characteristic for each non-asbestos fiber type needs to be recorded. Refer to EPA Test Method Tables 2-4 and 2-5 for optical properties of non-asbestos fibers.

7.4. Man Made Vitreous Fibers - Some non-asbestos fibers such as man made vitreous fibers (MMVFs) and in particular refractory ceramic fibers (RCFs) may be identified by a combination of physical and PLM optical methods which are not addressed in the EPA methods.

7.4.1. Vitreous fibers are fibers which are isotropic (glass) and may be either natural or synthetic. Refractory ceramic fibers (RCFs) are synthetic, vitreous fibers which may be separated from other MMVFs such as glass wool, mineral wool, rock wool or slag wool based upon refractive index measurements and a flame test as follows (Buetow, 1998):

7.4.1.1. Isotropic MMVFs may be separated into rock/slag/mineral wool and glass wool/RCFs based upon refractive index either above or below 1.600 respectively. RCFs exhibit indices of refraction between 1.54 and 1.59. Glass wool fibers generally have indices between 1.51 and 1.54. Rock/Slag wool have higher indices in the range of 1.6 to 1.8.

7.4.1.2. Hold a bundle of suspect fibers in the flame of an alcohol lamp (about 1050 C) for at least 60 seconds. Vitreous Refractory ceramic fibers (RCFs which have a melting point above 1500 C) will glow red but will not melt. Fiberglass, rock, mineral and slag wool should melt at temperatures over 100 degrees below the temperature of the alcohol flame.

7.4.1.3. Suspect RCFs from a positive flame test should be referred to chemical composition testing by TEM/EDS for identification as to RCF type.

8. Sample Analysis Procedure - Quantitative Assessment

8.1 Semi Quantitation by Visual Estimation

8.1.1. Estimate the content of the asbestos type present in the sample using the 1.550 RI preparation. Do not use HCl or heat treated samples unless losses were quantified.

8.1.2. Express the estimate as an area percent of all material present, taking into account the loading and distribution of all sample material on the slide. Use permanently mounted, in-house calibration standards to aid in arriving at an estimate, if available. Alternatively, for samples in ranges where no in-house standard are yet available, refer to Appendix B “Visual Estimation Comparators”, also see illustrations in NIOSH 9002 document.

8.1.3. If additional unidentified fibers are present in the sample, continue with the qualitative assessment (Section III.A.7.).

8.1.4. Record on the analyst’s worksheet estimated percentages of all other materials identified which are present at greater than trace levels. The sum of expressed percentages should equal 100% of material observed. Note: If evaluating inert residue from matrix reduction process the expressed percentages should equal the inert residue percentage.

8.1.5. The quantity of asbestos by visual estimation is reported as **trace** if six or more asbestos fibers are observed in a minimum of three slides. The background level has been determined to be a single fiber in a minimum of three slides. Four fibers are required to be considered statistically significant above background, for a total of six fibers in a minimum of three slides.

8.1.6. Indicate calibrated visual estimation (CVES) as the method of quantitation

8.2 Quantitation by Point Counting (EPA 400 pt or 1000 pt)

8.2.1. Summary and Application

Samples with less than 10% asbestos by visual estimation need further quantification using either the 400 or 1000 point count method, which may be extended in order to provide lower detection limits as appropriate. Point counting may be performed only on friable materials or those non-friable materials having undergone gravimetric reduction.

8.2.2. Point Counting Criteria

A **Point** is a discrete point (as on a Chalkley Reticule) or the intersection of two mutually perpendicular lines in the eyepiece reticule. A non-empty point is the visual superimposition of such a **Point** over any material in the slide preparation. Empty points are those points which lie over areas containing no materials.

8.2.2.1. A non-empty point must be noted as one of the following:

8.2.2.1.1. Specific asbestos varieties

8.2.2.1.1.1. CH: chrysotile
8.2.2.1.1.2. AM: amosite
8.2.2.1.1.3. CR: crocidolite
8.2.2.1.1.4. TR/AC: tremolite/actinolite
8.2.2.1.1.5. AN: anthophyllite

8.2.2.1.2. Specific non-asbestos fibers (optional)

8.2.2.1.2.1. CF: cellulose fiber
8.2.2.1.2.2. FG: fibrous glass (mineral/glass wool)
8.2.2.1.2.3. SF: synthetic fiber
8.2.2.1.2.4. WL: wollastonite
8.2.2.1.2.5. OF: other fiber (talc, brucite, etc.)

8.2.2.1.3. Non-fibrous material

8.2.2.3. Before beginning analysis for a particular sample, scan each preparation and thin or re-prepare as necessary. Ideally, slides should contain approximately 50% non-empty points with a minimum of clumping.

8.2.2.4. Moving to new fields of view must always be done at random, with the analyst looking away temporarily while moving the slide. The slide must never be deliberately moved to preferred fields of view under the reticule.

8.2.2.5. If the **point** lies over an area of heavy clumping, randomly move the slide to another area to avoid attempting to count multiple layers under a point. Record only one point if two or more points are positioned over some particle or fiber.

8.2.2.6. If two particles are occasionally superimposed under a **point**, count both particles as separate points.

8.2.3. Point Counting Rules

8.2.3.1. All counting must be done at 100x magnification, usually between crossed polars with the first order red compensator inserted in the 45° port above the slide. (In some situations where extremely fine asbestos fibers are present, it may be preferable to analyze the sample between slightly uncrossed polars without the compensator. Other situations may warrant point counting in a dispersion-staining mode.)

8.2.3.2. For each of the coverslip preparations, count until 50 non-empty points are counted.

8.2.3.3. Continue counting until 400 (or 1000) non-empty points have been counted on eight (or twenty) preparations (mounts). When extending the points counted, maintain the system with a maximum of 50 points per slide..

8.2.3.4. Utilize a uniform scan pattern (i.e. always begin with upper left point in NW quadrant and end with lower right point in SW quadrant counting each point between in a systematic pattern) so that an asbestos fiber is not always the first point counted in a field.

8.2.3.5. If asbestos appears in a field of view but not directly under a point, the analyst must note this on the sheet and "trace asbestos" must be noted on the final report.

8.2.3.6. If the analyst suspects asbestos from the macroscopic examination but none is detected during the point count analysis, the analyst must retrieve the original bulk material, remove any suspicious fibers, mount them in an appropriate medium, and determine their identity. If the fibers are confirmed as asbestos, this is noted on the analysis sheet. Although these observations will not be used for quantitation, they will be incorporated into the final report to prevent false negatives.

8.3 Continue qualitative and quantitative analysis for each sample in the work order until all samples for that order including appropriate Quality Control samples (duplicates and blanks) have been completed. The final report will not be released until replicate QC samples have been completed.

8.4. Analyze QC samples in-line with other samples if available. For each QC sample, record on a separate "Intralaboratory QC Bulk Analysis Worksheet" (or directly in the appropriate LIMS QA job) all information recorded for initial analyses (Section

III-A.7 - 7.3.3).

8.5. Contamination Testing - Blank Slides - Note that any material (asbestos or non-asbestos) should be considered contamination.

Analyze QC-Blank slides in-line with other samples (after nineteen samples). If suspected contamination may have occurred, a blank slide may be prepared at any time. Note that any fibrous material (asbestos or non-asbestos) must be identified and may be considered contamination. Record the following in the appropriate "Contamination Check" spaces of the Calibration logbook.

8.5.1. Initials of analyst (or analysts) analyzing blank slide

8.5.2. Date of analysis

8.5.3. Note "none" if no fibrous contamination is apparent. Note percentage and type of contamination detected if found. Cease analyses until the source of the contamination is resolved. Notify the laboratory supervisor for necessary corrective action.

8.5.3.1. If non-asbestos, fibrous contamination is detected, clean all tools and workspace. Mount and analyze samples of NaCl until the source of the contamination is resolved. Reanalyze any samples analyzed after the previous clean blank, which may have been affected by the contamination.

8.5.3.2. If asbestos contamination is detected, clean all tools and workspace. Mount and analyze samples of Reference fiberglass until the source of the contamination is resolved. Reanalyze any samples analyzed after the previous clean blank, which may have been affected by the contamination.

8.5.3.3. Document completely the sequence of events leading to the contamination event and its resolution. Report the event in its entirety to the Quality Control Officer.

9. <u>Calculations</u>

9.1. Point Count (EPA 400 point or 1000 point)

9.1.1. The percentage of each asbestos type, non-asbestos fiber types, and non-fibrous components are calculated by dividing the number of non-empty points of that component by the total non-empty points counted for that sample.

If AP = 0 report "NAD" (no asbestos detected)

If 0 < AP ≤ 3 report "<1% asbestos"

If AP ≥ 4 calculate the % Asbestos as follows

Thus: % Asbestos = (AP / TP) 100%

Where: AP = number of points counted for a specific asbestos type
TP = total number of non-empty points counted (400 or 1000)

9.1.2. For example, if point counting yielded 15 chrysotile points and amosite was counted as 4 points, then:

TP = 400 (total non-empty points counted) or 1000 (total non-empty points counted)

<u>AP for chrysotile</u> = 15 (total chrysotile points counted) ;
thus (15 / 400) X 100% = 3.75% chrysotile
or (15/1000) X100% = 1.50% chrysotile

<u>AP for amosite</u> = 4 (total amosite points counted);
thus (4 / 400) X 100% = 1.00% amosite
or (4/1000) X 100% = 0.40% amosite

<u>AP for total asbestos</u> = 4 (amosite) + 15 (chrysotile) = 19 (total);
thus (19 / 400) X 100% = 4.75% asbestos
or (19/1000) X 100% = 1.90% asbestos

9.2 Gravimetric Reduction

9.2.1. Percent Asbestos for samples which have undergone gravimetric reduction is calculated using the following formula:

$$\% \text{ Asbestos} = (W_{Res}/W_{Orig.}) \times \text{Asb\%}$$

where: W_{Res} = Weight of residue after furnace and acid treatments (mg)
W_{Orig} = Weight of original subsample (mg)
Asb% = Mean percentage of asbestos (versus inorganic residue) in

final slide preparations

10. Calibration and Quality Control Measures

10.1 Contamination Control

10.1.1. Blank slides prepared within the work flow from verified non-ACM (NaCl, Reference fiberglass or NIST 1866 fiberglass) are analyzed at a rate of one after every nineteen client samples.

10.2 Calibration of Equipment and Supplies

10.2.1. **Refractive Index Media**

10.2.1.1. The refractive index of the dispersion staining oils currently in use are checked monthly, when any bottle is first opened or refilled from a larger bottle, or when in question for any reason. If a bottle is used after a period of non-use longer than a month the bottle must be calibrated in order to verify the reference value.

10.2.1.2. Refer to SOP for Calib. and Maint. - Asbestos for details on RI verification.

10.2.2. Polarized Light Microscope

10.2.2.1. Check PLM calibration daily and document the calibration in the microscope log book.

10.2.2.2. See SOP for Equip. Calib. and Maint. - Asbestos for calibration details.

11. Available Reference Standards

11.1. NIST Standard 1866 for chrysotile, amosite, crocidolite, and fibrous glass, and the NIST Standard 1867 for anthophyllite, actinolite, and tremolite. Low level ACM standards and slides are available.

11.2. All NIST and other proficiency testing materials are retained for use as reference standards and training materials.

11.3. Cargille Optical Glass reference sets (M-8 and M-25) are available for verifying refractive index oils.

11.4. Reagent grade NaCl, Reference fiberglass and SRM 1866 fiberglass are available for use as contamination testing materials.

11.5. Various samples of industrial grade materials such as mineral wool, talc, cellulose, etc. are available for comparison.

12. Bulk Asbestos Quality Control

12.1. Because quality control for bulk samples is difficult to quantify, the QC for bulk asbestos samples is based on a error classification scheme in which various differences between two analyses of the same bulk material are denoted by an error category and an error type.

12.2. There are two error categories: major and minor.

12.2.1. A major error requires immediate attention to determine if the analysis was invalid.

12.2.2. Minor errors are not considered significant unless repeated frequently by an analyst.

12.3. The various error types are given in the table below:

Error Category	Error Type	Meaning
Major	False positive	A substance was found in the original analysis but not in the QC analysis. Note: Trace vs NAD is considered a Minor quantitation error.
Major	False negative	A substance was found in the QC analysis but not in the original analysis. Note: Trace vs NAD is considered a Minor quantitation error.
Major	Mis-ID	An asbestos mineral was found in the original analysis but a different asbestos mineral was found in the QC analysis (except for actinolite-tremolite; see below).
Major	Quantitation	The quantity of a substance found in the original sample analysis differs 30% or more from the quantity of the same substance found in the QC analysis.
Minor	Mis-ID	Actinolite was found in the original sample but tremolite was found in the QC analysis, or vice versa.
Minor	Quantitation	The quantity of a substance found in the original analysis differs 15% to 29% from the quantity of the same substance found in the QC analysis. Note: Trace vs NAD is considered a Minor quantitation error.

12.4. The only analytes considered in the classification scheme are the asbestos minerals.

12.5. **Intralaboratory Quality Control**

12.5.1. Intralaboratory quality control is used to estimate the variability of bulk asbestos identification within the laboratory. One out of every ten bulk samples is chosen to be analyzed blind in duplicate and/or replicate. A QC-blank sample is prepared after every nineteen client samples.

12.5.1.1. Duplicate: one sample is blindly analyzed two times by the same analyst; monitoring analyst precision.

12.5.1.2. Replicate: one sample is blindly analyzed by two different analysts; monitoring intralaboratory precision and accuracy.

12.5.2. Corrective action: If a major error is found (by either duplicate or replicate QC evaluations), the Laboratory Supervisor will have the sample reanalyzed, preferably by someone other than the original analyst. The sample will continue to be reanalyzed until at least two analyses do not have any major errors. All other like samples (as described in the Sample Identification field of the sample submittal form) within the work order will also be reanalyzed. If the error is NSD vs Trace or a low asbestos percentage TEM verification may be requested.

12.5.2.1. Contaminated Blanks: If fibrous material (asbestos or non-asbestos) is detected in a QC-blank sample, the prep area and equipment are cleaned and new blanks analyzed until the problem is resolved (see Section III.A.8.5. for a detailed discussion). All samples analyzed since the previous clean blank will also be reanalyzed.

12.5.3. If subsequent analysis shows that an error has been reported prior to the final report being issued, the report is corrected without an amended note (since the data faxed is marked preliminary) and the client contact notified of the change from the preliminary data. If for any reason the final report has been issued an amended report is issued and the client contact notified of the change prior to it being sent. With approval by the laboratory director the client may receive credit for the invoice if already issued.

12.5.4. The Quality Control Coordinator will on at least a monthly basis provide a blank sample and a known asbestos containing sample for blind analysis. Additional samples may be provided at any time if deemed necessary.

12.5.4.1. SRM 1866, Reference fiberglass or other asbestos standards are submitted as a blind sample at least once per month.

12.6. Interlaboratory Quality Control

12.6.1. Interlaboratory quality control is performed by Round Robin analyses in order to provide a comparison of AmeriSci analysts and analysts at other accredited laboratories.

12.6.2. NVLAP Proficiency Testing Program

Samples are prepared semi-annually by a NVLAP contractor. The results of all analyses of these materials and the comparison of AmeriSci's analysis with NIST's analysis are maintained in AmeriSci's QC files. Additionally, individual analyst's results are reviewed with NIST's analysis to monitor individual performance. These samples are available and used for training and QA/QC purposes

12.6.3. Round Robin Programs

AmeriSci participates with other accredited laboratories by analyzing submitted samples semi-annually. Participating laboratories rotate the responsibility of initiating samples and summarizing the analysis results. The round robin program gives AmeriSci an external QC check on samples typical of those analyzed on a daily basis.

12.7. Monthly Summaries

The Quality Control Coordinator at each facility will provide monthly summaries of QA analyses, including results from: blanks, duplicates, replicates, proficiency testing and interlaboratory testing as available. The report will also include discussion of any deficiency corrections addressed during the month. Overall accuracy and precision for each analyst will be maintained in individual personnel folders and addressed in the monthly report.

13. Evaluation of Method

13.1 Interferences

Other fibers with optical properties similar to the asbestos minerals may give positive interferences. Optical properties of asbestos fibers may be obscured by coatings on the fibers. Fibers finer than the resolving power of the microscope (ca. 0.25 µm) will not be detected. Heat and acid treatment may alter the index of refraction of asbestos and change its color.

13.2. Limitations

The method is useful for the qualitative identification of asbestos and the semi-quantitative determination of asbestos content of bulk samples, expressed as a percent of projected area. The method measures percent asbestos as perceived by the analyst in comparison to the standards which include real calibration samples, projections, photos, and drawings. The method is not applicable to samples containing large amounts of fine fibers below the resolution of the light microscope.

Since some samples may contain fibers too small to be resolved by PLM (<0.25 µm in diameter), quantitation of total fibers in such samples may not be possible without use of transmission electron microscopy (TEM).

13.3 Range and Limit of Detection (may be extended by gravimetric reduction and/or point counting)

13.3.1. Range of Detection: 1% to 100% asbestos

13.3.2. Estimated Limit of Detection:
<1% asbestos for CVES
< 0.25% for 400 points counted
< 0.10% for 1000 points counted

14. Evaluation of Analysis Results

Any material containing asbestos at any level is considered to be a potential health hazard and must be handled with applicable precautions.

15. Safety Considerations

Standard laboratory safety should be observed during all benchwork procedures. Lab coats should be worn at all times. All sample inspection and mounting procedures should be conducted under the exhaust hood. More extensive safety guidelines can be found in the AmeriSci Health & Safety Manual and Chemical Hygiene Plan.

This SOP was previously identified as SOP No. ST-GC-0017 Rev. 11

Facility Distribution No.: 0 **Distributed To:** See Electronic Distribution Sheet

1.0 SCOPE AND APPLICATION

1.1 This SOP describes procedures to be used for the analysis of Herbicides by GC/ECD.

1.2 Sample preparation techniques are described in SOP ST-OP-0007.

1.3 This SOP is based on EPA SW-846 Method 8000B, 8000C and 8151A.

1.4 The laboratory target analytes supported by this method, the reporting limits, method detection limits and QC limits are maintained in the Information Management System (QuantIMS). A copy of the Structure and Analysis Code (SAC), which lists this information, is included in the appendix of this SOP.

1.4.1. Additional compounds may be amendable to this method. The minimum requirement for non-standard analytes is that the reporting limit be set at the lowest required concentration that can actually be detected by the instrument, and when an MDL study can not be conducted, the MDL be set equal to the reporting limit.

2.0 SUMMARY OF METHOD

2.1 Aqueous samples are separatory funnel extracted in diethylether, hydrolyzed and esterified with TMS diazomethane. Solid samples are sonicator extracted in methylene chloride/acetone and esterified with TMS diazomethene. Waste samples are extracted using the waste dilution procedure followed by esterification.

2.2 After the initial preparation step, the sample is introduced to the instrument equipped with capillary columns and dual Electron Capture Detectors (ECD). Concentrations of target analytes are measured by the detector response within a defined retention time window, relative to the response to standard concentrations. The external standardization procedure is used.

2.3 Herbicides are spiked and prepared as methyl acid and analyzed as their methyl esters.

3.0 DEFINITIONS

3.1 See the TestAmerica ST. Louis Quality Assurance Manual (QAM) for a glossary of common laboratory terms and data reporting qualifiers.

4.0 INTERFERENCE

4.1 Organic acids, especially chlorinated acids, interfere with the determination by methylation. Phenols, including chlorophenols, may also interfere with this procedure. Alkaline hydrolysis and subsequent extraction of the basic solution removes many chlorinated hydrocarbons and phthalate esters that might otherwise interfere with the ECD. The hydrolysis may result in the loss of dinoseb and the formation of aldol condensation products if any residual acetone remains from the extraction of solids.

4.2 Interferences co-extracted from samples will vary considerably from source to source. The presence of interferences may raise quantitation limits for individual samples. Specific cleanups may be performed on the sample extracts, including florisil cleanup (Method 3620), Gel Permeation Chromatography (Method 3640), and Sulfur cleanup (Method 3660).

4.3 Contamination by carryover can occur when a low concentration sample is analyzed after a high concentration sample. Co-elution of target analytes with non-targets can occur, resulting in false positives or biased high results.

5.0 SAFETY

5.1 Employees must abide by the policies and procedures in the Corporate Safety Manual, Radiation Safety Manual and this document. This procedure may involve hazardous material, operations and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats and closed-toe, nonabsorbent shoes are a minimum.

5.2 SPECIFIC SAFETY CONCERNS OR REQUIREMENTS

5.2.1. The gas chromatograph contains zones that have elevated temperatures. The analyst needs to be aware of the locations of those zones, and must cool them to room temperature prior to working on them.

5.2.2. There are areas of high voltage in both the gas chromatograph. Depending on the type of work involved, either turn the power to the instrument off, or disconnect it from its source of power.

5.3 PRIMARY MATERIALS USED

5.3.1. The following is a list of the materials used in this method, which have a serious or significant hazard rating. NOTE: This list does not include all materials used in the method. The table contains a summary of the primary hazards listed in the MSDS for each of the materials listed in the table. A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the MSDS for each material before using it for the first time or when there are major changes to the MSDS.

Material (1)	**Hazards**	**Exposure Limit (2)**	**Signs and symptoms of exposure**
Hexane	Flammable Irritant	500 ppm (TWA)	Inhalation of vapors irritates the respiratory tract. Overexposure may cause lightheadedness, nausea, headache, and blurred vision. Vapors may cause irritation to the skin and eyes.
Methanol	Flammable Poison Irritant	200 ppm (TWA)	A slight irritant to the mucous membranes. Toxic effects exerted upon nervous system, particularly the optic nerve. Symptoms of overexposure may include headache, drowsiness and dizziness. Methyl alcohol is a defatting agent and may cause skin to become dry and cracked. Skin absorption can occur; symptoms may parallel inhalation exposure. Irritant to the eyes.
1 – Always add acid to water to prevent violent reactions.			
2 – Exposure limit refers to the OSHA regulatory exposure limit.			
TWA – Time Weighted Average			

6.0 EQUIPMENT AND SUPPLIES

6.1 GC/ECD system: The lab utilizes a Hewlett Packard GC 5890 dual ECD system and an Agilent GC 6890 dual micro ECD system

6.1.1. GC column type, and instrument run conditions are posted on the individual GC instruments.

6.1.2. Columns used: Restek RTX Pest 1 and Pest 2 with guard.

6.2 Amber vials. Crimp top seals.

6.3 Disposal pipettes

6.4 Micro syringes- 10µL, 250µL, 500µL, 1000µL. Hamilton 1700 series.

6.5 Volumetric flasks, Class A

6.6 Analytical Balance, capable of weighing ± 0.01 grams.

7.0 REAGENTS AND STANDARDS

7.1 All standards and reagent preparation, documentation and labeling must follow the requirements of SOP ST-QA-0002, current revision.

7.2 See recipes for standards and QC samples in the Standards Log program.

7.3 Herbicide stock standard solutions must be replaced after 6 months or manufacturer's expiration date whichever is shorter. Calibration solutions must be refrigerated at $\leq 6^{o}$C and protected from light. Intermediate and working standards must be replaced at least every six months, or the stock solutions expiration date, whichever is sooner. Additionally standards are discarded if comparison with check standards indicates a problem.

7.4 ICV standards, NIST traceable:

7.4.1. The Herbicide ICV standard is a second source from the calibration standard.

7.4.2. ICV standard is prepared and stored in the same way as calibration standards.

7.5 Standards used in calibration are the methyl ester forms, as opposed to the methyl acids used for spiking in the extraction process. The methyl esters are corrected for the difference in the molecular weight of the acid herbicide.

7.5.1. Herbicide calibration may be performed using either derivatized herbicide acids or using the methyl ester compounds. Calibrations requiring compliance with SW846 methods are to be derivatized from the free acid form to the methyl ester form in the laboratory.

7.6 Derivitization of Standards

7.6.1. Add 1mL of room temperature standard to a 10mL certified, calibrated or class A concentrator tip.

7.6.2. Add 0.5mL of Ether.

7.6.3. Bring up to 4mL with hexane and mix with a pipet.

7.6.4. Add 0.5mL of Diazomethane and stir until mixture is yellow.

7.6.4.1 Diazomethane should be kept in a refrigerated location.

7.6.5. Let sit 1 hour.

7.6.6. Bring up to 10mL with hexane.

7.6.6. Add solid salicic acid until it reaches the 3 mL mark of the tube.

7.6.7. Let standard sit until bubbling stops and acid settles.

7.6.8. Vial and label standard.

7.6.9. Standards are good for six months.

7.7 Gases for carrier and make-up: Hydrogen carrier, Nitrogen make-up

8.0 SAMPLE COLLECTION, PRESERVATION AND STORAGE

8.1 TestAmerica St. Louis supplies sample containers and chemical preservatives in accordance with the method. TestAmerica St. Louis does not perform sample collection. Samplers should reference the methods referenced and other applicable sample collection documents for detailed collection procedures. Sample volumes and preservative information is given in ST-PM-0002.

8.2 Water samples are unpreserved and stored at 4 ± 2°C.

8.3 Soil samples are refrigerated at 4 ± 2°C.

8.4 Extraction is initiated within 7 days of the sampling date for aqueous samples, 14 days for solid samples.

8.5 For TCLP leachates, the extraction is initiated within seven days of the completion of TCLP leach tumbling, excluding the filtration step.

8.6 Extracts must be refrigerated at <6° and analyzed within 40 days of the start of extraction.

9.0 QUALITY CONTROL

9.1 **Batch**

9.1.1. A sample batch is a maximum of 20 environmental samples, which are prepared together using the same process and same lot(s) of reagents.

9.1.2. Instrument conditions must be the same for all standards, samples and QC samples.

9.1.3. For this analysis, batch QC consists of a method blank, a Laboratory Control Sample (LCS), and Matrix Spike (MS)/ Matrix Spike Duplicate (MSD). In the event that there is insufficient sample to analyze a MS/MSD, an LCS Duplicate (LCSD) is prepared and analyzed.

9.2 **Method Blank (MB)**

9.2.1. A method blank is a blank matrix processed simultaneously with, and under the same conditions as, samples through all steps of the procedure.

9.2.2. A method blank must be prepared with every sample batch.

9.3 **Laboratory Control Sample (LCS)**

9.3.1. An LCS is a blank matrix spiked with a known amount of analyte(s), processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.3.2. An LCS must be prepared with every sample batch.

9.4 **Matrix Spike (MS) /Matrix Spike Duplicate (MSD)**

9.4.1. A Matrix Spike is an aliquot of a field sample to which a known amount of target analyte(s) is added, and is processed simultaneously with, and under the same conditions as, samples through all steps of the analytical procedure.

9.5 **Surrogate**

9.5.1. A surrogate is a non-target analyte similar in chemical composition and behavior, which mimics the target analytes during preparation, extraction and analysis.

9.5.2. Surrogate(s) is added to every field sample, method blank, LCS and MS/MSD for analysis at the beginning of the sample preparation process.

9.6 **Procedural Variations/ Nonconformance and Corrective Action**

9.6.1. Any variation shall be completely documented using a Nonconformance Memo and approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

9.6.2. Any deviations from QC procedures must be documented as a nonconformance, with applicable cause and corrective action approved by the Supervisor and QA Manager. See SOP ST-QA-0036 for details regarding the NCM process.

10.0 CALIBRATION AND STANDARDIZATION

10.1 External standard calibration is used.

10.2 Herbicide calibration may be performed using either derivatized herbicide acids or using the methyl ester compounds. Calibrations requiring compliance with SW846 methods are to be derivatized from the free acid form to the methyl ester form in the laboratory.

10.2.1. If calibration is performed using herbicide acid calibration standards, the standards have to have been analyzed in the same manner as the samples. TestAmerica St. Louis uses derivative acids for the initial calibration. (Section 7.6)

10.2.2. If calibration is performed using methyl ester standards, then the calculation of concentration must include a correction for the molecular weight of the methyl ester versus the acid herbicide.

10.3 Initial Calibration

10.3.1. Prepare a Herbicide standard at a minimum of five concentration levels. The low level standard should be at or below the reporting limit. The other standards define the working range of the detector.

10.3.2. A new calibration curve must be generated after major changes to the system or when the continuing calibration criteria cannot be met. Major changes include new columns, any significant changes in instrument operating parameters, and major instrument maintenance (e.g., ECD replacement).

10.3.3. Except in specific instances, it is NOT acceptable to remove points from a calibration curve for the purpose of meeting criteria. Refer to the TestAmerica Policy CA-T-P-0002, Selection of Calibration Points

10.3.4. Sample peak areas are compared to peak areas of the standards. The ratio of the detector response to the amount concentration of analyte in the calibration standard is defined as the response factor (RF) or calibration factor (CF).

10.3.5. SW-846 chromatographic methods allow the use of both linear and non-linear models for the calibration data.

10.3.5.1 The first way is to begin with the simplest approach, the linear model through the origin, and then progress through other options until the calibration acceptance criteria are met. The second way is to use technical knowledge of the detector response to the target compound to choose the calibration model.

10.3.5.2 The option for non-linear calibration may be necessary to address specific instrumental techniques. However, it is not EPA's intent to allow non-linear calibration to be used to compensate for detector saturation or to avoid proper instrument maintenance.

10.3.5.3 For SW846 Method 8000B, the curve must not be forced through zero.

10.3.6. **Linear calibration using the average response factor**

10.3.6.1 The Relative Standard Deviation (RSD) of the calibration points from the curve used must be $\leq$ 20% for each target analyte.

10.3.6.2 If the %RSDs in the initial calibration is > 20%, then calibration using a linear regression may be employed.

10.3.7. **Linear calibration using a least squares regression**

10.3.7.1 The intercept of the curve at zero response must be less than + or – the reporting limit for the analyte.

10.3.7.2 r (correlation coefficient) must be $\geq$ 0.995 OR r^2 (coefficient of difference) must be $\geq$ 0.990.

10.3.7.3 **Linear calibration using a least squares regression, forcing thru zero**

10.3.7.3.1 Forcing the curve through zero is not the same as including the origin as a fictitious point in the calibration. In essence, if the curve is forced through zero, the intercept is set to 0 *before* the regression is calculated, thereby setting the bias to favor the low end of the calibration range by “pivoting” the function around the origin to find the best fit and resulting in one less degree of freedom. It may be appropriate to force the regression though zero for some calibrations.

10.3.7.3.2 Curve must still meet criteria in 10.4.3.1 and 10.4.3.2.

10.3.7.4 **Linear calibration using a least squares regression, weighting of data points**

10.3.7.4.1 In linear, the points at the lower end of the calibration curve have less absolute variance than points at the high concentration end of the curve. This can cause severe errors in quantitation at the low end of the calibration. For this reason it may preferable to increase the weighting of the lower concentration points. 1/Concentration^2 weighting (often called $1/X^2$ weighting) to improve accuracy at the low end of the curve.

10.3.7.4.2 Curve must still meet criteria in 10.4.3.1 and 10.4.3.2.

10.3.8. **Non-linear calibration**

10.3.8.1 In situations where the analyst knows that the instrument response does not follow a linear model over a sufficiently wide working range, or when the other approaches have not met the acceptance criteria, a non-linear calibration model may be employed.

10.3.8.1.1 It is not EPA's intent to allow non-linear calibration to be used to compensate for detector saturation or to avoid proper instrument maintenance. Thus, non-linear calibrations are not be employed for analytes shown to consistently exhibit linear calibration for the analytes of interest.

10.3.8.2 The intercept of the curve at zero response must be less than + or – the reporting limit for the analyte.

10.3.8.3 r (correlation coefficient) must be ≥ 0.995 OR r^2 (coefficient of difference) must be ≥ 0.990.

10.3.8.4 South Carolina does not allow the use of non-linear regression.

10.4 Initial Calibration Verification (ICV)

10.4.1. An initial calibration verification standard must be a different standard source than the one used for the initial calibration.

10.4.2. An ICV must be performed with every initial calibration.

10.4.3. The ICV performance must be within +/- 30% D criteria.

10.4.3.1 Not meeting this requirement may be indicative of serious system malfunction or inaccuracies in the standards used for the initial calibration curve or ICV standard. Corrective action must be taken (including reanalysis of the ICV, or analysis of a different ICV). Any decision to proceed with analysis of samples when the ICV is out-of-control must be taken with great care and in consultation with the QA department and the laboratory director. Any such action must be documented in an NCM.

10.5 Continuing Calibration Verification (CCV)

10.5.1. A CCV may be the same source or second source as the calibration.

10.5.2. Analyte response factors must be verified at the beginning of each analytical run (by either an ICV or a CCV), after every 10 samples and at the end of the analysis run through the analysis of a mid-level calibration standard.

10.5.3. **SW846 8000C**: The CCV performance must be with +/- 20% D criteria.

10.5.3.1 If a CCV has failed and the analyst can document the reason for failure (e.g. broken vial, carryover from the previous sample etc.) then a second CCV may be analyzed without any adjustments to the instrument. If this CCV meets criteria then sample analysis may continue; however the preceding samples must be reanalyzed. If this second CCV does not meet criteria, the analysis run is terminated. Instrument maintenance is performed and the instrument may require re-calibration (i.e. initial calibration)

10.5.3.2 **SW846 8000B**: The CCV performance must be with +/- 15% D criteria

10.6 Retention Time (RT) Windows

10.6.1. Retention Time (RT) windows must be determined for all analytes.

10.6.1.1 Establishing RT windows:

10.6.1.1.1 Make an injection of all analytes of interest each day over a three day period. Calculate the mean and standard deviation of the three retention times for each analyte.

10.6.1.1.2 The width of the retention time window for each analyte, surrogate, and major constituent in multi-component analytes is defined as ± 3 times the standard deviation of the mean absolute retention time established during the 72-hour period or 0.03 minutes, whichever is greater. Historically, calibrations RT windows have not been greater than 0.03 minutes. Windows larger than 0.03 minutes are indicative of equipment issues.

10.6.1.1.3 The center of the retention time window is the retention time from the CCV performed at the beginning of the analytical run. For samples run during the same shift as the initial calibration, use the retention time of the mid-point standard from the initial calibration. Some clients may have specific requirements regarding the updating of RT windows. Review the Client Requirement Memo for instructions.

10.6.1.1.4 A new retention time window is established annually or each time a new column is installed.

10.6.1.1.4.1 Until these standards have been run on the new column, the retention time windows from the old column may be used, updated with the retention times from the new initial calibration.

10.6.2. Retention Time Criteria

10.6.2.1 The retention times of all compounds in each continuing calibration must be within the retention time windows established.

11.0 PROCEDURE

11.1 Allow standards, samples and sample extracts to reach ambient temperature before analysis.

11.2 All analysis conditions and injection volumes for samples must be the same as for the calibration standards.

11.3 Sample Introduction

11.3.1. Herbicide analytes are introduced by direct injection of the extract. Samples, standards, and QC must be introduced using the same procedure.

11.4 Perform all qualitative and quantitative measurements. When the standards and extracts are not being used, refrigerate them at 4 $\pm$ 2°C, protected from light in screw cap vials equipped with unpierced Teflon lined septa.

12.0 DATA ANALYSIS AND CALCULATIONS

12.1 Commonly used calculations (e.g. % recovery and RPD) and standard instrument software calculations are given in the TestAmerica St. Louis QAM.

12.2 External Standard Calculations

12.2.1 See Target software for calculations.

12.3 Manual Integrations

12.3.1 Identified compounds are reviewed for proper integration. Manual integrations are performed if necessary and are documented by the analyst or automatically by the data system. See TestAmerica Policy CA-Q-S-001, Acceptable Manual Integration Practices. Manual integrations are denoted with a “M” flag on the Target quantitation report.

12.4 Dilutions

12.4.1 If the concentrations of any analytes exceed the working range as defined by the calibration standards, then the sample must be diluted and reanalyzed.

12.4.2 A dilution should target the most concentrated analyte in the upper half (over 50% of the high level standard) of the client specific project requirements.

12.5 Carryover

12.5.1 When a sample has a high response for a compound, there is a real possibility that some of the sample may carry over into the sample analyzed immediately afterward.

12.5.1.1 If a sample analyzed after a sample with high concentrations has negative results, carryover did not occur.

12.5.1.2 If a sample analyzed after a sample with high concentrations has positive results for the same analytes, carryover may have occurred.

12.5.1.2.1 This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred.

12.5.1.3 If the chromatographic profile resembles the previous sample, the results are questionable.

12.5.1.3.1 This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred.

12.6 Dual column quantitation

12.6.1 As per 8000C, report the lower result of the two columns, unless the Client SOW requires that the higher result be reported. See Client Requirements Sheet for determination.

12.6.1.1 For non-detect (ND) results, report from the A channel, unless there is evidence of chromatographic interference in the A channel's performance.

12.6.1.2 If one result is significantly higher (e.g., >40%), check the chromatograms to see if an obviously overlapping peak is causing an erroneously high result. If no overlapping peaks are noted, examine the baseline parameters established by the instrument data system (or operator) during peak integration. If no anomalies are noted, review the chromatographic conditions. If there is no evidence of chromatographic problems, report the lower result. The data user should be advised of the disparity between the results on the two columns.

12.6.1.3 Use the higher result if there is obvious chromatographic interference on the column with the lower result.

12.6.1.4 If the CCV performance on one of the two channels is outside acceptance criteria due to confirmed matrix interference, report sample data from the column with acceptable performance, irrespective of it being the higher or lower result.

12.6.1.4.1 See Clouseau for data assessment and narration.

12.6.2 The QC should be reported from the column that reflects the column used for the majority of the samples associated with the QC.

12.6.3 The surrogate should be reported from the column that reflects the column used for the majority of the analytes associated with a sample.

13.0 DATA ASSESSMENT AND ACCEPTANCE CRITERIA; CORRECTIVE ACTIONS FOR OUT OF CONTROL DATA

13.1 The data assessment and corrective action process is detailed through the Clouseau Nonconformance Memorandum (NCM) process. The NCM process is described in SOP: STL-QA-0036. Below is a subset of the data assessment and QC excursion types within Clouseau; the text in underline is the exact "type" line in Clouseau. For a complete and current listing, please access the software program.

13.1 Method Blank

13.1.1 Acceptance Criteria:

13.1.1.1 No target analytes may be present in the method blank above the reporting limit.

13.1.1.2 Project specific requirements if more stringent than our routine procedure (e.g. no target analytes present above ½ RL), will be noted on the client requirements sheet.

13.1.2 Corrective Action for Method Blanks not meeting acceptance criteria:

13.1.2.1 Method Blank Contamination – See Clouseau NCM for corrective action (e.g. reprep/reanalysis, narration). Note certain analytes are common laboratory contaminants which require special narrative comment. These compounds are so designated in Clouseau.

13.2 Laboratory Control Sample (LCS)

13.2.1 Acceptance Criteria:

13.2.1.1 All control analytes should be within established control limits for accuracy (%Recovery) and precision (RPD).

13.2.1.1.1 For long analyte spike list, marginal exceedances (ME) are allowed as follows:

13.2.1.1.2 < 11 analytes in LCS, no analytes allowed in ME of the LCS control limit.

13.2.1.1.3 11-30 analytes in LCS, 1 analytes allowed in ME of the LCS control limit.

13.2.1.1.4 31-50 analytes in LCS, 2 analytes allowed in ME of the LCS control limit.

13.2.1.1.5 51-70 analytes in LCS, 3 analytes allowed in ME of the LCS control limit.

13.2.1.1.6 71-90 analytes in LCS, 4 analytes allowed in ME of the LCS control limit.

13.2.1.1.7 > 90 analytes in LCS, 5 analytes allowed in ME of the LCS control limit.

13.2.1.1.8 No LCS recoveries may be outside the Marginal Exceedance limit.

13.2.1.1.9 Marginal exceedances must be random. If the same LCS analyte exceeds the control limit repeatedly, it is an indication of a systemic problem. The source of the error must be located and corrective action taken.

13.2.2 Marginal Exceedance is not recognized by the state of South Carolina. LCS recovery must meet the criteria of 70 – 130% for all compounds.

13.2.3 The LCS should have acceptable surrogate recoveries.

13.2.4 Corrective Action for LCS not meeting acceptance criteria:

13.2.4.1 LCS Spike Recovery excursion (high) – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).

13.2.4.2 LCS Spike Recovery excursion (low) – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).

13.2.4.3 RPD Duplicate excursion – See Clouseau NCM for corrective action (e.g. , reanalysis, narration).

13.3 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

13.3.1 Analytes should be within control limits for accuracy (%Recovery) and precision (RPD).

13.3.2 Corrective Action for MS/MSD not meeting acceptance criteria:

13.3.2.1 MS/MSD Spike Rec. excursion may not necessarily warrant corrective action other than narration. See Clouseau NCM to determine if re-preparation re-analysis is required.

13.4 Surrogate

13.4.1 All Surrogates should be within established control limits for accuracy (%Recovery).

13.4.2 Corrective Action for Surrogate not meeting acceptance criteria:

13.4.2.1 Surrogate Spike Rec. excursion may not necessarily warrant corrective action other than narration. See Clouseau NCM to determine if re-preparation reanalysis is required.

13.5 Sample result evaluation

13.5.1 Dilutions

13.5.1.1 If the response for any compound exceeds the working range of the analytical system, a dilution of the extract is prepared and analyzed. An appropriate dilution should be in the upper half of the calibration range.

13.5.1.2 Dilution: Sample– See Clouseau NCM for corrective action.

13.5.1.3 Dilution: Surrogate(s) diluted out– See Clouseau NCM for corrective action.

13.5.1.4 Dilution: Surrogates(s) and/or Spike(s) diluted out– See Clouseau NCM for corrective action.

13.5.2 Carryover

13.5.2.1 When a sample has a high response for a compound, there is a real possibility that some of the sample may carry over into the sample analyzed immediately afterward.

13.5.2.2 If a sample analyzed after a sample with high concentrations has negative results, carryover did not occur.

13.5.2.3 If a sample analyzed after a sample with high concentrations has positive results for the same analytes, or if the chromatographic profile resembles the previous sample, the results are questionable. This sample must be reanalyzed under conditions in which carryover can be confirmed to not have occurred.

13.6 Insufficient Sample

13.6.1 For any prescribed re-preparation corrective action, if there is insufficient sample to repeat the analysis and narrative comment stating such is included in the report narrative. The insufficient sample description is included in the Clouseau NCM within the type defining the excursion.

14.0 METHOD PERFORMANCE AND DEMONSTRATION OF CAPABILITY

14.1 Method performance data, Reporting Limits, and QC acceptance limits, are given in the appendix of this SOP.

14.2 Demonstration of Capability

14.2.1 Initial and continuing demonstrations of capability requirements are established in the QAM.

14.3 Training Qualification

14.3.1 The manager/supervisor has the responsibility to ensure that this procedure is performed by an analyst who has been properly trained in its use and has the required experience.

14.3.2 The analyst must have successfully completed the initial demonstration capability requirements prior to working independently. See requirements in the QAM.

14.4 Annually, the analyst must successfully demonstrate proficiency to continue to perform this analysis. See requirements in the QAM.

14.5 An annual MDL study is required for the State of South Carolina. See SOP ST-QA-0016 for determination of MDLs.

15.0 VALIDATION

15.1 Laboratory SOPs are based on standard reference EPA Methods that have been validated by the EPA and the lab is not required to perform validation for these methods. The requirements for lab demonstration of capability are included in QAM. Lab validation data would be appropriate for performance based measurement systems or non-standard methods. TestAmerica St. Louis will include this information in the SOP when accreditation is sought for a performance based measurement system or non-standard method.

16.0 WASTE MANAGEMENT AND POLLUTION PREVENTION

16.1 All waste will be disposed of in accordance with Federal, State and Local regulations. Where reasonably feasible, technological changes have been implemented to minimize the potential for pollution of the environment. Employees will abide by this method and the policies in section 13 of the Corporate Safety Manual for "Waste Management and Pollution Prevention."

16.2 Waste Streams Produced by the Method

16.2.1 The following waste streams are produced when this method is carried out.

16.2.1.1 Solvent waste generated. Solvent waste must be accumulated in the appropriate waste accumulation container, labeled as Drum Type "D".

16.2.1.2 Vials containing sample extract will be accumulated in the appropriate waste accumulation container, labeled as Drum Type "C".

17.7.8 ST-QA-0036, Non-conformance Memorandum (NCM) Process

18.0 MODIFICATIONS, CLARIFICATIONS TO THE REFERENCE METHOD

18.1 Chapter 1 of SW-846 states that the method blank should not contain any analyte of interest at or above the Method Detection Limit. This SOP states that the Method Blank must not contain any analyte of interest at or above the reporting limit. Common lab contaminants are allowed to be up to 5 times the reporting limit in the blank following consultation with the client.

18.2 SW846 requires that new retention time windows be established if a GC column has been shortened during maintenance. Given the matrices of the sample the laboratory receives, and the number of times the GC column may require clipping, TestAmerica St. Louis does not perform a

RT study after clipping a column. RT studies done by the laboratory show that, historically, RT windows have not been greater than the method allowed 0.03 minutes. The lab defaults to a 0.03 minute RT window as allowed by the method.

19.0 CHANGES TO PREVIOUS REVISION

19.1 Columns used added to Section 6.
19.2 Section 7.5 updated to include derivatization of free acids for SW846 compliance
19.3 Updated Section 10.3.8 to include South Carolina requirement that non-linear calibration is not to be used.
19.4 Updated Section 13.2 to disallow marginal exceedance for South Carolina LCS and added South Carolina LCS recovery limits.
19.5 Added South Carolina annual MDL requirement to Section 14.
19.6 Rev 10:
 19.6.1 Annual Review, No Changes.
19.7 Rev 11:
 19.7.1 Added section 7.6, instructions for the derivitization of standards.
 19.7.2 Added statement regarding the use of derivitized acids for initial calibrations to section 10.2.1.
19.8 Rev 12:
 19.8.1 Updated requirements for performing RT window studies.

J/R/P

BLANKS

a. common contaminants ≤ 10X and < CRQL b. common contaminants ≤ 10X and ≥ CRQL c. other contaminants ≤ 5X and < CRQL d. other contaminants ≤ 5X and ≥ CRQL e. common contaminants > 10X and other contaminants > 5X f. no method blank	a. raise to CRQL, U/A compound b. U/A compound c. raise to CRQL, U/A compound d. U/A compound e. no qualification f. R/P all detects

DATA QUALIFICATIONS FOR GC/MS ANALYSES

SURROGATE SPIKES

a. %Rec > upper limit (UL)	a. J/A all detects, SVOA:one out no qualification
b. %Rec > 10% and < lower limit (LL)	b. J/UJ/A all compounds, SVOA:one out no qualification
c. %Rec < 10%	c. J/R/A
d. method blank exceedance	d. change A to P
- %Rec = 0 qualify associated samples	-NJ all detects/A
e. confirmation of exceedance including blank	e. qualify per a-c
f. no confirmation performed when required	f. change A to P
g. exceedance at a ≥ 10X dilution (SVOA; medium level soil VOA)	g. no qualification (if VOA surrogates added during extraction)
h. exceedance at a ≥ 5X to 10X dilution (SVOA; medium level soil VOA)	h. J/UJ or Jdets/A or no qual (professional judgement)
i. MS/MSD and/or LCS out	i. no qualification

MATRIX SPIKE/MATRIX SPIKE DUPLICATES

a. %Rec > UL	a. J/A detects
b. %Rec < LL	b. J/UJ/A
c. %Rec = 0	c. J/R/A
d. RPD > UL	d. J/UJ/A compound
e. no MS/MSD (client specified)	e. no qualification
f. no MS/MSD (method/SOW)	f. None/P
g. > 20 samples associated with MS/MSD(client specified)	g. no qualification
h. > 20 samples associated with MS/MSD(method/SOW)	h. None/P
i. concentration > 4X the spike amount	i. no qualification
j. exceedance at a ≥ 10X dilution	j. J/UJ/A RPD or no qual (professional judgement)
k. exceedance at a ≥ 5X to 10X dilution	k. J/UJ/A RPD, no qualification for %R
l. recalculated value > 10% D	l. note in report
- both values in	- no qualification
- recalculation out	- None/P, qualify per a-d
- original out,recalculation in	- None/P
- both values out	- None/P, qualify per a-d

LABORATORY CONTROL SAMPLES

a. %Rec > UL	a. J/P detects
b. %Rec < LL	b. J/UJ/P
c. %Rec < 10	c. J/R/P
d. RPD > UL	d. J/UJ/P
e. no LCS, MS/MSD out non-CLP	e. None/P LCS, J/UJ/A MS/MSD
f. no LCS, no MS/MSD, with surrogates non-CLP	f. J/UJ/P LCS, None/P or No qual MS/MSD
g. no LCS, no MS/MSD, no surrogates non-CLP	g. J/R/P LCS, None/P or No qual MS/MSD,No qual or J/R/P surrogates
h. LCS/LCSD (averaged)	h. qualify as normal based on average
i. *no LCS for low concentration level SOW*	i. *None/P (for low concentration level SOW)*

INTERNAL STANDARDS

a. < -50% area	a. J/UJ/A associated compounds
b. > +100% area	b. J/A detects associated compounds
c. < -10% area	c. J/R/A associated compounds
d. > + 30 seconds	d. NJ/ R/A associated compounds
e. confirmation of exceedance	e. qualify per a-d
f. no confirmation performed	f. change A to P
g. MS/MSD and/or LCS out	g. no qualification

TARGET COMPOUND IDENTIFICATION

a. > ± 0.06 RRT units	a. NJ/P detects or J/R/P all non-detects by professional judgement
b. missing spectra	b. R/P detects
c. spectra doesn't match	c. R/A detects
d. spectra doesn't match due to interference	d. NJ/A detects

COMPOUND QUANTITATION AND REPORTED CRQLs

a. 1uL injection instead of 2 uL as required for CLP SVOA	a. None/P
b. recalculated value > 10% D	b. J/P all detects
c. non-detect recalculated as detect and vice versa	c. R/P compound
d. compound above calibration range	d. J/A detects
e. no dilution for compound above calibration range	d. J/P detects
f. no adjustment of CRQL for % moisture	f. Note as text in DVR

DATA QUALIFICATIONS FOR GC/MS ANALYSES

TENTATIVELY IDENTIFIED COMPOUNDS (TICs)	
a. spectra doesn't match library b. required amount of TIC's not searched, TICs not reported as required by CLP c. no adjustment of CRQL for % moisture	a. R/P detects b. None/P c. Note as text in DVR
FIELD DUPLICATES	
a. RPD > UL	a. No qualification
SYSTEM PERFORMANCE	
a. professional judgement	
OVERALL ASSESSMENT OF DATA	
a. professional judgement	

DATA QUALIFICATIONS FOR GC ANALYSES

HOLDING TIMES

a. > holding time	a. J/UJ/P
b. > 2X holding time (gasoline, VOA only)	b. J/R/P
c. reanalysis or reextracted sample	c. change P to A same as a & b
d. Encore samples (gasoline, VOA)	d.
- no preservation , > 2 days < 14 days	J/UJ/P, > 14 days J/R/P
- preserved with methanol or sodium bisulfate, >14 days < 28days	J/UJ/P, > 28 days J/R/P
- frozen, > 7 days <14 days	J/UJ/P, > 14 days J/R/P

SAMPLE CONDITION

a. cooler temperature >6°C but <10.9°C	a. Note as text in DVR
b. cooler temperature 11°C to 15°C	b. J/UJ/A
c. cooler temperature >15°C	c. J/R/A (gas,VOA), J/UJ/A (SVOA) or professional judgement
d. Air bubbles present < 1/4 inch (gas,VOA)	d. Note as text in DVR
e. Air bubbles present > 1/4 inch or headspace (gas,VOA)	e. J/UJ/P

INITIAL CALIBRATION

a. > 20.0% RSD	a. J/UJ/A
b. RT outside RT windows	b. NJ/P detects or J/R/P
c. r2 < 0.990	c. J/UJ/A
d. recalculated value > 10% D	d. professional judgement
- both values in	- no qualification
- recalculation out	- None/P,qualify per a-b
- original out,recalculation in	- None/P
- both values out	- None/P,qualify per a-b
e. no ICAL	e. R/P
f. minimum 5 pts not performed	f. none/P

CONTINUING CALIBRATION

a. > 20.0% D	a. J/UJ/A
b. Frequency (one every 10 samples)	b. text
c. RT outside RT windows	c. NJ/P detects or J/R/P
d. recalculated value > 10% D	d. professional judgement
- both values in	- no qualification
- recalculation out	- None/P,qualify per a-b
- original out,recalculation in	- None/P
- both values out	- None/P,qualify per a-b
e. no CCAL	e. J/UJ/P

BLANKS

a. contaminants ≤ 5X and > RL	a. U/A leave as reported
b. contaminants ≤ 5X and < RL	b. U/A raise to RL
c. contaminants > 5X blank	c. no qualification
d. no method blank	d. R/P all detects

SURROGATE SPIKES

a. %Rec > upper limit (UL)	a. J/A all detects
b. %Rec > 10% and < lower limit (LL)	b. J/UJ/A all compounds
c. %Rec < 10%	c. J/R/A
d. method blank exceedance	d. change A to P
- %Rec = 0 qualify associated samples	-NJ all detects/A
e. confirmation of exceedance including blank	e. qualify per a-c
f. no confirmation performed when required	f. change A to P
g. exceedance at ≥ 10X dilution (extractables only)	g. no qualification

MATRIX SPIKE/MATRIX SPIKE DUPLICATES

a. %Rec > UL	a. J/A detects
b. %Rec < LL	b. J/UJ/A
c. %Rec = 0	c. J/R/A
d. RPD > UL	d. J/UJ/A compound
e. no MS/MSD (client specified)	e. no qualification
f. no MS/MSD (method/SOW)	f. None/P
g. > 20 samples associated with MS/MSD(client specified)	g. no qualification
h. > 20 samples associated with MS/MSD(method/SOW)	h. None/P
i. concentration > 4X the spike amount	i. no qualification
j. exceedance at a ≥ 10X dilution	j. no qualification
k. recalculated value > 10% D	k. note in report
- both values in	- no qualification

DATA QUALIFICATIONS FOR GC ANALYSES

- recalculation out - original out,recalculation in - both values out	- None/P, qualify per a-d - None/P - None/P, qualify per a-d

LABORATORY CONTROL SAMPLES

a. %Rec > UL b. %Rec < LL c. %Rec < 10 d. RPD > UL e. no LCS, MS/MSD out non-CLP f. no LCS, no MS/MSD, with surrogates non-CLP g. no LCS, no MS/MSD, no surrogates non-CLP h. LCS/LCSD (averaged) i. *no LCS for low concentration level SOW*	a. J/P detects b. J/UJ/P c. J/R/P d. J/UJ/P e. None/P LCS, J/UJ/A MS/MSD f. J/UJ/P LCS, None/P or No qual MS/MSD g. J/R/P LCS, None/P or No qual MS/MSD,No qual or J/R/P surrogates h. qualify as normal based on average i. *None/P (for low concentration level SOW)*

TARGET COMPOUND IDENTIFICATION

a. out of RT windows b. fingerprint pattern do not match	a. NJ/P detects or J/R/P all non-detects by professional judgement b. NJ/P detects

COMPOUND QUANTITATION AND REPORTED CRQLs

a. recalculated value > 10% D b. non-detect recalculated as detect and vice versa c. compound above calibration range d. no dilution for compound above calibration range e. no adjustment of CRQL for % moisture	a. J/P all detects b. R/P compound c. J/A detects d. J/P detects e. Note as text in DVR

FIELD DUPLICATES

a. RPD > QAPP limits	a. No qualification

SYSTEM PERFORMANCE

a. professional judgement	

OVERALL ASSESSMENT OF DATA

a. professional judgement	

Data Qualifications for Metals by EPA SW-846 6020

HOLDING TIMES

a. > Holding time (>180 days) b. Reanalysis	a. J detect/R non-detect/P all analytes b. J detect/R non-detect/A all analytes

ICP-MS TUNING

a. Tune not performed b. Mass calibration not within 0.1 amu c. %RSD >5%	a. R/P all analytes b. J detect/UJ non-detect/P associated isotope c. J detect/UJ non-detect/P all analytes

INITIAL CALIBRATION

a. No daily calibration b. Incorrect # of standards used c. Correlation coefficient < 0.995 d. ICV %R >160 e. ICV 110 < %R ≤160 f. ICV 75 ≤ %R < 90 g. ICV %R < 75	a. R/P all analytes b. None/P or J detect/UJ non-detect/P by processional judgement c. J detect/UJ non-detected/P d. R/P all detects e. J /P all detects f. J detect/UJ non-detected/P g. J detect/R non-detected/P

CONTINUING CALIBRATION

a. > 10 samples between CCV's b. CCV %R >160 c. CCV 110 < %R ≤160 d. CCV 75 ≤%R < 90 e. CCV %R < 75	a. None/P b. R/P all detects c. J/P all detects d. J detect/UJ non-detect/P e. J detect/R non-detect/P

BLANKS

a. No method blank b. >20 samples per PB c. contaminants ≤ 5X method blank or ICB/CCB d. contaminants > 5X method blank or ICB/CCB	a. R/P all detects b. None/P c. U/A leave as reported d. No qualification

ICP INTERFERENCE CHECK SAMPLE (ICS) ANALYSIS

a. Not performed or not performed as required b. %R of AB solution < 80% or > 120% - %R > 120 - 50 ≤ %R < 80 - %R < 50	a. interferents <90% of spike - None/P interferents ≥90% of spike – J detect/UJ non-detect/P b. For samples with Al,Ca,Fe,Mg,Na,P,K,S,C,Cl,Mo,Ti at conc. ≥90% spike value: - J/P all detects - J detect/UJ non-detect/P - R/P all analytes For samples with Al,Ca,Fe,Mg,Na,P,K,S,C,Cl,Mo,Ti at conc.< 90% spike value: - None/P

LABORATORY CONTROL SAMPLE

a. No LCS b. >20 samples per LCS c. %R > UL d. 50 ≤ %R < LL e. %R < 50 f. RPD > UL	a. None/P b. None/P c. J/P all detects d. J detect/UJ non-detect/P e. J detect/R non-detect/P f. J/UJ non-detect/P

Data Qualifications for Metals by EPA SW-846 6020

MATRIX DUPLICATES	
a. RPD > UL; sample and duplicate results > 5X PQL b. Difference > PQL; sample and duplicate results ≤ 5X PQL	Qualify all samples of the same matrix a. J detect/UJ non-detect/A b. J detect/UJ non-detect/A
MATRIX SPIKE/MATRIX SPIKE DUPLICATE	
a. %R > UL b. 30 ≤ %R < LL c. %R < 30 d. RPD > UL	Qualify all samples of the same matrix, no qualification when sample concentration exceeds the spike concentration by a factor of 4 or greater a. J/A all detects b. J detect/UJ non-detect/A c. J detect/R non-detect/A if no post spike performed or post spike < 75% - J detect/UJ non-detect/A if post spike ≥ 75% d. J/UJ/A
INTERNAL STANDARDS	
a. No internal standards b. %R > 120 or < 30	a. R/P all analytes b. J detect/UJ non-detect/A
ICP SERIAL DILUTION	
a. Sample concentration > 100X MDL and %D > 10	Qualify all samples of the same matrix a. J detect/UJ non-detect/A
FIELD DUPLICATES	
a. RPD > UL	a. No qualification
SAMPLE CALCULATION VERIFICATION	
a. Recalculated value > 10% D b. Non-detect recalculated as detect and vice versa c. Result above calibration range and not diluted d. MDL > QAPP PQL	a. J/P detects b. R/P c. J/P detects d. None/P
OVERALL ASSESSMENT OF DATA	
a. Professional judgement	

A: Indicates the finding is based upon technical validation criteria
P: Indicates the finding is related to a protocol/contractual deviation

Data Qualifications for Mercury by 7470/7471

HOLDING TIMES

1.0 INTRODUCTION

This Project Contractor Quality Control (PCQC) Plan establishes the procedures and methods to be implemented for specific components of the multilayer soil cover (cover) to be placed at Installation Restoration (IR) Site 2, located at the former Naval Air Station Alameda, Alameda Point in Alameda, California. Tetra Tech EC, Inc. (TtEC) has been contracted by Naval Facilities Engineering Command Southwest under Contract Task Order (CTO) 0009, issued under the Radiological Environmental Multiple Award Contract (RAD EMAC) No. N62473-10-D-0809. This PCQC Plan fulfills the TtEC quality control (QC) system requirement. In conjunction with the TtEC Program Construction Quality Control Management Plan (TtEC 2010), this PCQC Plan meets the requirements of *California Code of Regulations* Title 22, Section 66264.19.

1.1 SITE BACKGROUND

Former NAS Alameda was an active military installation from the 1930s to the 1990s, which primarily provided facilities and support for fleet aviation activities. The area of present day IR Site 2 was originally open water until 1956 when a sea wall was constructed along the southern and western shorelines to confine and protect the area. Dredged fill was hydraulically placed within the seawall creating the area encompassed by IR Site 2.

The IR Site 2 landfill, also called the West Beach Landfill, was used as the main disposal area for the Alameda Point from approximately 1952 through 1978. An estimated 1.6 million tons of waste was deposited (E&E 1983). Historical waste disposal methods at the site generally consisted of trench-and-fill operations. Wastes included municipal solid waste, waste chemical drums (contents unknown), solvents, oily waste and sludge, paint waste, plating wastes, industrial strippers and cleaners, acids, mercury, polychlorinated biphenyl (PCB)-containing liquids, batteries, low-level radioactive waste (LLRW) including but not limited to radioluminescent dials and dial painting, scrap metal, inert ordnance, asbestos, several pesticides (solid and liquid), tear gas agent, biological waste from the Oak Knoll Naval Hospital, creosote, dredge spoils, and waste medicines and reagents (E&E 1983). Ordnance and explosives waste (OEW) may have also been deposited in the 2.5-acre (approximate) Possible OEW Burial Site located in the southern part of the landfill.

In 1978, the Department of the Navy (DON) developed plans to close the landfill in accordance with the requirements of the Water Board's *Minimum Criteria for Proper Closure of Class II Solid Waste Disposal Sites* (Resolution No. 77-7). In 1983, the Water Board issued Order No. 83-35 to implement a final cover, leachate cutoff barrier, methane gas control, earthquake damage control, drainage control, and erosion control, and to generate compliance reports for the former landfill. Between 1983 and 1995, the DON responded by placing a partial clay-soil cover, installing an 820-foot-long, 2-foot-wide and 20- to 30-foot-deep slurry wall to restrict potential contaminant migration to San Francisco Bay. A gas venting system was installed for methane gas control, and repairs were made to the seawall also during this time period. In 1986, 20,000 cubic yards of imported fill soil was spread on the former landfill, which was insufficient in achieving a uniform cover layer of appropriate thickness over the landfill area. Also in 1986, the landfill was graded to prevent ponding, and an earthen perimeter berm was constructed around the landfill.

In August 1999, IR Site 2 was officially added to the U.S. Environmental Protection Agency's National Priority List of Superfund sites and assigned Comprehensive Environmental Response, Compensation, and Liability Information System identification number CA2170023236.

1.2 PURPOSE

The purpose of this PCQC Plan is to establish specific procedures and methods for field inspections, and provide an effective QC system to ensure the quality of all work performed by TtEC and its subcontractor personnel during the construction activities. This plan is applicable to all definable features of work (DFWs) listed in Section 3.0 and will be available at the project field office. All work activities will be conducted in accordance with this PCQC Plan and the Remedial Action Work Plan (RAWP) to which it is attached. Contractor Quality Control Forms are provided in Appendix A.

1.3 DEFINITIONS

1. Construction Quality Assurance (CQA): CQA includes inspections, audits, and evaluations of materials and workmanship to determine and document the quality of the constructed facility. CQA is performed or directed by the DON.

2. Construction Quality Control (CQC) Testing Laboratory: The CQC testing laboratory will perform QC conformance tests required by the specifications and PCQC Plan. The CQC testing laboratory will be contracted by TtEC.

3. Geosynthetics: A generic classification given to synthetic (man-made plastic and fabric) materials used in geotechnical and construction applications. Included are geomembrane or flexible membrane liners (high-density polyethylene), geotextiles, geosynthetic clay liner, geonets, geogrids, geocomposites, and geocells.

4. Geotechnical Construction Quality Control for Earthwork: The protocols to be followed in evaluating the adequacy of the project's work with regard to all elements of earthworks construction with the exception of line and grade (survey) control. Said work will include but need not be limited to all QC activities delineated herein and in the Specifications. Geotechnical QC is to be provided by a party independent of the Project Superintendent.

5. Geotextile: A permeable synthetic fabric providing protection to other systems or serving to separate different materials.

6. Project Documents: Project Documents include all Construction Drawings, Record Drawings, Construction Specifications, CQC Plans, Health and Safety Plans, Project Schedules, and Project Superintendent Submittals.

7. Quality Assurance (QA): An integrated system of management activities involving planning, implementation, assessment, reporting, and quality improvement to ensure that a process, item, or service is the type and quality needed and expected by the customer. QA is performed by the DON on the RAD EMAC.

8. Quality Control: QC is the overall system of checks to measure the attributes and performance of a process, item, or service against defined standards to verify that they meet established requirements. QC is considered an element of the overall QA program. The QC element is usually limited to inspection and test activities used to verify acceptance of an item. QC is performed by TtEC on the RAD EMAC.

9. Work: All tools, equipment, supervision, labor, and materials or supplies necessary to complete the project as specified herein and as shown on the project plans.

This page intentionally left blank.

2.0 PROJECT ORGANIZATION, RESPONSIBILITY, AND POINTS OF CONTACT

This section describes the organization and authority of project personnel. The organizational structure, functional responsibilities, levels of authority, and lines of communication within the organization have been established to ensure high-quality work. The project organization chart showing the reporting lines for key personnel is provided on Figure 2-1. The responsibilities of key personnel are described in the following subsections. A listing of the points of contact for the project is provided in Section 2.18.

2.1 REMEDIAL PROJECT MANAGER

The Remedial Project Manager (RPM) has primary responsibility with the DON for day-to-day management of the project activities performed under this RAWP and for its successful completion. The RPM is responsible for the following:

- Perform project management for the DON.
- Ensure the project scope of work requirements are fulfilled.
- Oversee the project cost and schedule.
- Provide formal technical direction to the TtEC project team, as needed.
- Coordinate with other RPMs for other projects being performed to ensure that proper controls are in place.
- Act as lead in interacting with regulatory agencies.

2.2 QUALITY ASSURANCE OFFICER

The Quality Assurance Officer (QAO) is the DON representative with primary responsibility for ensuring that the contract-required QA measures are in place and effective for the work performed. The QAO is responsible for the following:

- Review and approve Sampling and Analysis Plans (SAPs).
- Provide DON oversight of the TtEC QC Program.
- Provide quality-related directives through the Contracting Officer.
- Act as the point of contact for matters pertaining to generating data and maintaining the quality of data.
- Authorize the suspension of project execution if QC requirements are not adequately met.

2.3 RESIDENT OFFICER IN CHARGE OF CONSTRUCTION

The Resident Officer in Charge of Construction (ROICC) is the DON representative with the primary responsibility for providing on-site QC and safety oversight of contractors. The ROICC is responsible for the following:

- Verify that all work has been completed per contract and technical specifications prior to final government acceptance.
- Perform ongoing field inspection to verify that all work is in compliance with both contract and technical specifications.
- Notify the contractor of any work not in compliance.
- Notify the contractor of any work being performed in an unsafe manner.
- Interact with the contractor's Project Quality Control Manager (PQCM) on quality-related issues.
- Review and sign waste manifests as the generator's representative.
- Review daily CQC Reports for completeness and accuracy.
- Attend preparatory phase, initial phase, prefinal, and final acceptance inspections.
- Attend weekly QC meetings.

2.4 PROJECT MANAGER

The Project Manager (PjM) is the TtEC representative responsible for the direction, execution, and successful completion of project tasks to achieve overall project goals. The PjM has responsibility for and the authority to direct all segments of the project including technical, construction, and administrative activities. The PjM is responsible for the following:

- Coordinate work activities of subcontractors and TtEC personnel and ensure that all personnel adhere to the administrative and technical requirements of the project.
- Monitor the status and progress of work and ensure that project deliverables are completed on time and within the project budget.
- Monitor the budget and schedule, and notify the client and the Program Manager of any changes that may require administrative actions.
- Ensure adherence to the quality requirements of the contract, project scope of work, and the QC plans.
- Ensure that all work meets the requirements of the project plans, procedures, and technical specifications and complies with applicable codes and regulations.
- Ensure that all work activities are conducted in a safe manner in accordance with the Accident Prevention Plan (APP)/Site Safety and Health Plan (SSHP), Safety and Health Requirements (Engineer Manual [EM] 385-1-1) (USACE 2008), and all applicable Occupational Safety and Health Administration regulations.

- Ensure that change conditions are properly identified and documented with the appropriate approvals.
- Serve as the primary contact with the DON and TtEC for actions and information related to the work, and make sure to include appropriate TtEC lead and experts in decision-making.
- Coordinate satisfactory resolution and completion of evaluation and acceptance for Nonconformance Reports (NCRs).
- Attend required meetings, including the preconstruction conference, weekly QC meetings, pre- and postconstruction site inspections, and other scheduled and unscheduled meetings.

2.5 PROJECT ENVIRONMENTAL SAFETY MANAGER

The Project Environmental Safety Manager (PESM) is the TtEC representative responsible for implementing and overseeing the Contract Health and Safety Program and for developing, implementing, and approving all APP/SSHP documents. Any changes to the established Contract Health and Safety Program or APP/SSHP must be at the direction and approval of the PESM, with concurrence of the DON Administrative Contracting Officer. The PESM or designee will not necessarily be on-site during all remedial activities but will be readily available for consultation when required.

The PESM or designee is a Certified Industrial Hygienist who is certified by the American Board of Industrial Hygiene. The PESM supervises and directs the activities of the Site Safety and Health Officer (SSHO). The PESM has the authority to stop unsafe operations, remove unqualified personnel from the work area, and approve changes to the APP/SSHP. The PESM is responsible for the following:

- Oversee all aspects of the APP/SSHP from development to implementation.
- Advise the SSHO on all related health and safety matters.
- Review site-specific plans for completeness and compliance.
- Review other site documents as they affect health and safety (e.g., Activity Hazard Analyses [AHAs] and sampling plans).
- Review and evaluate all monitoring results.
- Establish and monitor all related health and safety procedures through site safety inspections and audits.
- Ensure that TtEC employees receive required environmental health and safety (EHS) regulatory training.
- Fulfill specific responsibilities for project EHS personnel that are identified within each EHS procedure.

- Function as a technical resource for all environmental compliance, safety, loss control, and industrial hygiene issues.

2.6 QUALITY CONTROL PROGRAM MANAGER

The Quality Control Program Manager (QCPM) is the TtEC representative responsible for the oversight of program QC, including field activities and data acquisition. The QCPM is responsible for the following:

- Coordinate and resolve quality concerns.
- Provide quality-related direction and ensure the training of the PQCM and others performing quality-related functions.
- Suspend project activities if quality standards are not maintained.
- Interact with the DON, including the QAO, on quality-related issues.
- Review audit and surveillance reports.
- Implement the DON technical directives related to quality.

2.7 PROJECT QUALITY CONTROL ENGINEER

The Project Quality Control Engineer (PQCE) is the TtEC representative responsible for oversight of implementing the cover design and specification. The PQCE is responsible for the following:

- Inspect the cover construction on a weekly basis, or as required.
- Review and approve QC testing and inspections as required by the Design and Test Plan and Log (Appendix C).
- Participate in weekly CQC meetings with the ROICC.
- Suspend construction activities if nonconforming conditions are identified that would compromise the quality of landfill.
- Review and approve any proposed design changes prior to being submitted to the Design Engineer of Record.
- Review and approve the as-built drawings after completion of the cover construction.
- Oversee the PQCM duties outlined in Sections 4.0 and 5.0 of this PCQC Plan.

2.8 PROJECT SUPERINTENDENT

The Project Superintendent is a TtEC representative who reports to the PjM and is responsible for coordinating, directing, implementing, and supervising site construction activities. The Project Superintendent or designated representative will be on-site at all times during field activities. The Project Superintendent is responsible for the following:

- Implement field activities in accordance with the RAWP.
- Direct support personnel and subcontractors.
- Administer site access and communication.
- Maintain the work site, facilities, vehicles, and equipment.
- Coordinate work activities and ensure all personnel adhere to the administrative and technical requirements of the project.
- Prepare status reports and estimate future scheduling needs.
- Prepare daily Contractor Production Reports.
- Monitor the status and progress of field activities and ensure that project deliverables are completed on time and within the project budget.
- Ensure work activities in the field are conducted in a safe manner in accordance with the APP/SSHP.
- Investigate with the SSHO all incidents, accidents, injuries, illnesses, and near misses.

2.9 PROJECT QUALITY CONTROL MANAGER

The PQCM is the TtEC representative responsible for overall management of project QC and reports to the QCPM. The PQCM has the authority to stop work on site-related issues affecting the quality of the work performed and for directing the correction of all nonconforming work. The PQCM or designated representative will be on-site at all times during field activities. A delegation of authority letter is provided as Appendix B. The PQCM is responsible for the following:

- Provide and maintain an effective QC system for all site activities.
- Monitor QC activities to ensure conformance with authorized policies, procedures, contract specifications, required standards, and methods of quality construction.
- Prepare the daily CQC Reports.
- Coordinate and perform the three phases of inspection (preparatory, initial, and follow-up) for all DFWs.
- Responsible for issuance, maintenance, and enforcement of NCRs and other quality actions.
- Ensure that on-site and off-site inspections, testing, and sampling are performed in accordance with the plans, procedures, specifications, and applicable codes.
- Ensure that all required tests and inspections are performed and documented.
- Conduct required QC meetings, including the coordination and mutual understanding meeting, site survey visit, and other scheduled meetings.

- Coordinate and maintain submittal register, photograph log sheet, request for information, and NCR log and other required logs or registers.
- Review and maintain records of approved submittals, Design Change Notices (DCNs), and Field Change Requests (FCRs) for construction activities.
- Inspect material delivery handling and storage in accordance with technical specifications.
- Review and approve submittals and shop drawings and/or forward submittals as information only or for approval.
- Review project plans and procedures for quality issues.
- Confirm the removal or rework of material, equipment, or work activity that is not in compliance with plans and specifications.

2.10 GEOTECHNICAL PROJECT ENGINEER

The Geotechnical Project Engineer is the TtEC representative responsible for the design and specifications for the earthwork and geosynthetic elements of the Design Plans and Specifications. The Geotechnical Project Engineer is a geologic/geotechnical professional registered in the State of California. The Geotechnical Project Engineer or designated representative will be on-site at all times during earthwork and geosynthetic related field activities. The Geotechnical Project Engineer is responsible for the following:

- Observing, testing, and documenting activities related to QC for all geotechnical and geosynthetic aspects of construction except for engineering and survey control
- Performing the three phases of inspection (preparatory, initial, and follow-up) for all earthwork related DFWs
- Monitoring earthwork and geosynthetic activities to ensure conformance with authorized policies, procedures, contract specifications, required standards, and methods of quality construction
- Conducting testing of soils and geosynthetics to ensure conformance with contract specifications and required standards
- Providing approval of all completed geotechnical work

2.11 LANDFILL ENGINEER

The Landfill Engineer is the TtEC representative responsible for the design and preparation of the Design Plans and Specifications including the containment system that fulfills the regulatory and operational requirements of the permitting agencies and the DON, respectively. The Landfill Engineer is responsible for the following:

- Providing Design Plans and Specifications for all construction work

- Modifying or changing the design if unexpected or unanticipated site conditions are encountered during construction
- Providing approval of all completed construction work

2.12 SITE SAFETY AND HEALTH OFFICER

The SSHO is the TtEC representative who reports directly to the PESM and ensures all elements of the APP/SSHP are implemented and enforced on-site. The SSHO has full authority to issue stop work orders or evacuation orders when work operations or noncompliance(s) may threaten the health and safety of site workers or the public. The SSHO is responsible for the following:

- Ensure that all personnel understand the requirements of the TtEC EHS program and procedures through training and communication.
- Investigate with the Project Superintendent all incidents, accidents, injuries, illnesses, and near misses.
- Ensure project personnel are trained in the hazards of substances used on the project, maintain Material Safety Data Sheets and make them accessible to project personnel, and perform inspections and oversight to ensure the Waste Management Plan is being followed.
- Ensure tailgate safety meetings are conducted daily prior to start of work and are documented.
- Ensure project safety equipment is inspected and in good working order as required by the EHS program.
- Coordinate site health and safety requirements with the Project Superintendent and PjM.
- Ensure that all health and safety monitoring equipment and personal protective equipment are maintained and direct site-monitoring activities.
- Coordinate daily field activities with the Project Superintendent.
- Coordinate site safety and emergency response duties and verify site communications system with site personnel.
- Report incidents to the ROICC as required by EM 385-1-1 (USACE 2008).
- Report immediately to the PjM, RPM, and ROICC any fatal injury, persons admitted to a hospital, or damage to government property.
- Ensure all personnel have the required training and medical clearance prior to entering the exclusion zone at the site; inform the Project Superintendent of any site personnel with medical restrictions.
- Determine and post routes to medical facilities and telephone numbers for emergency transportation to medical facilities.
- Serve as the Project Hazard Communication Coordinator.

- Maintain training records and medical certifications for all on-site personnel, including subcontractors.
- Initiate revisions or changes to the APP/SSHP to support changing site conditions.
- Maintain site control procedures.
- Maintain current records of certification for first aid and cardiopulmonary resuscitation training for field personnel.
- Attend meetings, including the preconstruction conference, weekly QC meetings, pre- and post-construction site inspections, and other project meetings.

2.13 RADIATION SAFETY OFFICER

The Radiation Safety Officer (RSO), from TtEC, is responsible for implementing, directing, and supervising all project-related radiological activities. The RSO is responsible for the following:

- Assist in the development of the APP/SSHP.
- Ensure that project radiological analysis needs are identified and provide technical support in subcontractor selection and execution of the Radiological Control program.
- Provide health physics guidance.
- Ensure that Radiological Control Technicians (RCTs) and project personnel properly execute and maintain radiological records.
- Ensure that required radiological safety training is conducted.
- Review and approve project field procedures for the handling of radioactive materials or access to radiological areas.
- Ensure timely review of records prior to approval.
- Approve and ensure radiological records meet the quality standards.
- Conduct radiation incident investigations.
- Conduct radiological project inspections.
- Conduct data assessment.

2.14 RADIATION SAFETY OFFICER REPRESENTATIVE

The Radiation Safety Officer Representative (RSOR), from TtEC, is responsible for oversight of the inspection and certification activities for radiological activities. In accordance with DON requirements, the RSOR or designee will be on-site during radiological work. The RSOR is responsible for the following:

- Provide radiological material-related safety briefings.
- Ensure specified radiological safety procedures are followed and radiological safety tests and inspections are complete and acceptable.

- Conduct daily oversight and field safety inspections and tests as required by the plans, procedures, technical specifications, and regulatory requirements.
- Attend required meetings, including the preconstruction conference, weekly QC meetings, pre- and postconstruction site inspections, and other appropriate project meetings.
- Verify compliance with on-site Radiation Work Permits (RWPs) and Standard Operating Procedure (SOPs), including laboratory SOPs.
- Ensure radiological safety documentation is provided to the PQCM for inclusion in the project files.
- Provide surveillance of radiologically related activities.
- Act as the site contact person for Nuclear Regulatory Commission site inspections.

2.15 RADIOLOGICAL CONTROL TECHNICIAN

The RCT, from TtEC, will support projects in the field and laboratory and is responsible for the following:

- Conduct and document field surveys, sampling, and laboratory support in accordance with the plans and SOPs.
- Interpret and verify field data accumulated from surveys and monitoring activities.
- Support dose assessments and ensure compliance with QC programs, emergency plans, and procedures.
- Perform effluent monitoring and radioactive material inventories.
- Perform survey equipment efficiencies, response checks, and daily checks and calibration of the survey instruments.
- Conduct safety evaluations of health physics field and laboratory equipment.
- Prepare and implement RWPs at active work areas to ensure compliance with the RWPs.

2.16 PROGRAM CHEMIST

The Program Chemist is the TtEC representative who oversees sample collection, handling, analysis, and analytical data reporting. The Program Chemist is responsible for the following:

- Develop the SAP.
- Evaluate and select qualified subcontract laboratories.
- Implement data QC procedures and perform audits of field performance.
- Review off-site laboratory data prior to use.
- Ensure that a proper review of on-site laboratory data is performed.

- Coordinate data validation of off-site laboratory data.
- Review data validation reports.
- Prepare analytical reports and supporting project reports.

2.17 SUBCONTRACTORS AND VENDORS

Qualified subcontractors may be selected to provide various construction services for this project. The subcontractor is required to provide labor, material, and equipment necessary to conduct construction activities as directed by the PjM. Subcontractors and vendors will conform to TtEC's quality requirements including all approved procedures, technical specifications, and contract provisions.

Subcontractors will be required for the following tasks:

- Land surveying
- Geophysical underground utility locations
- Erosion/drainage control
- Radiological Controls
- LLRW removal
- Chemical soil analysis
- Geotechnical testing
- Groundwater monitoring well and gas probe installation

(Note: This list is not all-inclusive and may change as required under the CTO.)

The subcontractor will be responsible for field inspection of their construction and operating activities. TtEC personnel will monitor, oversee, and make on-site observations and inspections of work in progress to determine whether the subcontractor's work is proceeding in accordance with TtEC's quality requirements.

Subcontractor personnel are responsible for maintaining a daily log of the project activities they perform and for providing information needed to complete the daily CQC Report. All inspection records, including inspection reports, deficiency reports, and reinspections of corrective actions, will be documented.

2.18 POINTS OF CONTACT

The following is a list of the key project, DON, and regulatory points of contact:

Organization	Title	Contact
BRAC PMO West 1455 Frazee Road, Ste. 900 San Diego, CA 92108-4310	Lead RPM	Mr. Bill McGinnis (619) 532-0907 william.mcginnis@navy.mil
BRAC PMO West 1455 Frazee Road, Ste. 900 San Diego, CA 92108-4310	RPM	Mr. Jacques P. Lord (619) 532-0902 jacques.lord.ctr@navy.mil
NAVFAC SW 1455 Frazee Road, Ste. 900 San Diego, CA 92108-4310	Contract Specialist	Ms. Joyce Howell-Payne (619) 532-0931 joyce.howell-payne@navy.mil
NAVFAC SW 2450 Saratoga Street, Building 114, Ste. 200 Alameda Point, Alameda, CA 94501-7545	ROICC	Mr. Robert Perricone (510) 521-8600 robert.perricone@navy.mil
NAVFAC SW 2450 Saratoga Street, Building 114, Ste. 200 Alameda Point, Alameda, CA 94501-7545	ROICC	Mr. Gregory Grace (510) 521-8709 gregory.grace@navy.mil
BRAC PMO West CSO – San Francisco Bay Area 410 Palm Ave., Building 1, Ste. 161 San Francisco, CA 94130-1806	ECM/CSO	Mr. Doug DeLong (415) 743-4713 douglas.delong@navy.mil
NAVSEA Detachment RASO Building 1971 NWS P.O. Box Drawer 260 Yorktown, VA 23691-0260	Radiological EPM	Mr. Matthew Slack (757) 887-4212 matthew.slack@navy.mil
NAVFAC SW 1220 Pacific Coast Highway San Diego, CA 92132-5190	QAO	Mr. Joseph Michalowski (619) 532-3046 joseph.michalowski@navy.mil
EPA, Region IX 75 Hawthorne Street (SFD-8-3) San Francisco, CA 94105	EPA RPM	Ms. Xuan-Mai Tran (415) 972-3002 tran.xuan-mai@epa.gov
Cal/EPA DTSC Office of Military Facilities 700 Heinz Ave., Building F, Ste. 200 Berkeley, CA 94710	Cal/EPA DTSC RPM	Mr. James Fyfe (510) 540-3850 jfyfe@dtsc.ca.gov
CDPH 1616 Capital Avenue; MS 7405 Sacramento, CA 95899-7377	CDPH PjM	Mr. Robert Wilson (916) 449-5688 robert.wilson@cdph.ca.gov
TtEC Alameda NAS 1090 ½ W. Tower Avenue Alameda, CA 94124	Project Manager	Mr. Hedy Abedi (949) 892-7593 hedy.abedi@tetratech.com

Organization	Title	Contact
TtEC 1230 Columbia St., Ste. 750 San Diego, CA 92101-8536	Technical Lead	Mr. Pete Everds (619) 471 3504 pete.everds@tetratech.com
TtEC Alameda NAS 1090 ½ W. Tower Avenue Alameda, CA 94124	Construction Superintendent	Mr. Bob Wells (650) 766-7279 robert.wells@tetratech.com
TtEC Alameda NAS 1090 ½ W. Tower Avenue Alameda, CA 94124	RSOR	Mr. Nathan Smith (614) 332-5838 nathan.smith@tetratech.com
TtEC 1230 Columbia St., Ste. 750 San Diego, CA 92101-8536	QCPM	Mr. Greg Joyce (360) 780-0371 greg.joyce@tetratech.com
TtEC Alameda NAS 1090 ½ W. Tower Avenue Alameda, CA 94124	PQCM	Mr. Vince Richards (949) 283-0589 vincent.richards@tetratech.com
TtBAS 1360 Valley Vista Drive Diamond Bar, CA 91765	PQCE	Peter Skopek (906) 860-7777 peter.skopek@tetratech.com
TtBAS 1360 Valley Vista Drive Diamond Bar, CA 91765	Landfill Engineer	Caleb Moore (906) 860-7777 caleb.moore@tetratech.com
TtEC Twins Oak, Suite 309 5700 Lake Wright Drive Norfolk, VA	RSO	Mr. Erik Abkemeier, CIH, CSP (757)-944-0921 erik.abkemeier@tetratech.com
TtEC 1230 Columbia St., Ste. 750 San Diego, CA 92101-8536	PESM	Mr. Roger Margotto, CIH, CSP (619) 471-3503 roger.margotto@tetratech.com
TtEC Alameda Point Kollman Circle Apt C. Alameda, CA 94501	SSHO	Mr. Keith Rademacher (509) 430-2822 keith.rademacher@tetratech.com
TtEC 17885 Von Karman Avenue, Ste. 500 Irvine, CA 92614-6213	Program Chemist	Ms. Lisa Bienkowski (949) 809-5028 lisa.bienkowski@tetratech.com
TtEC 17885 Von Karman Avenue, Ste. 500 Irvine, CA 92614-6213	Regulatory Compliance Specialist	Ms. Jennifer Dessort (949) 809-5063 jennifer.dessort@tetratech.com

Abbreviations and Acronyms:

Cal/EPA – California Environmental Protection Agency
CHMM – Certified Hazardous Materials Manager
CIH – Certified Industrial Hygienist
CQA – Construction Quality Assurance
CSP – Certified Safety Professional
DTSC – Department of Toxic Substances Control
FEAD – Facilities Engineering and Acquisition Division
NAVFAC SW – Naval Facilities Engineering Command Southwest
NTR – Navy Technical Representative
PQCM – Project Quality Control Manager
PESM – Program Environmental and Safety Manager
PjM – Project Manager
PQCE – Project Quality Control Engineer
QC – quality control
ROICC – Resident Officer in Charge of Construction
RPM – Remedial Project Manager
SSHO – Site Safety and Health Officer
TtEC – Tetra Tech EC, Inc.
Water Board – Regional Water Quality Control Board

3.0 DEFINABLE FEATURES OF WORK

A DFW is an activity or task separate and distinct from other activities that requires separate control activities. The DFW establishes the control measures required to verify both the quality of work performed and compliance with specified requirements, which include inspecting materials and workmanship before, during, and after each DFW. Preparatory and initial inspections will be performed on all DFWs, with the exception of the environmental resources survey, mobilization, and site cleanup and final inspection (demobilization). Activities that will be covered by the PQCM during the inspections are listed in Table 3-1. The following DFWs have been identified for the project:

- Mobilization and site setup
- Environmental resource survey
- Installation of temporary fences and gates
- Implementation of temporary erosion and sediment control measures
- Removal/abandonment of existing site facilities including but not limited to groundwater monitoring wells, gas probes, weir structure, and passive gas vent system
- Topographical surveys
- Clearing of vegetation and debris
- Excavations, backfill, and compaction of excavated waste areas (if required)
- Screening of potentially radiologically impacted materials
- Radiological surveys including personnel and equipment
- Subgrade placement
- Characterization survey of subgrade
- Animal intrusion barrier (geonet layer) placement
- Installation of the cover system and access road
- Final erosion control drainage installation
- Installation of groundwater monitoring wells, gas perimeter probes, and gas venting system
- Revegetation of the work area
- Final status survey of final grade
- Transportation and disposal of soil and debris

- Installation of institutional controls
- Site restoration and demobilization

4.0 SUBMITTALS

This section describes the review and approval process for submittals. TtEC will institute a submittal register (Appendix A) that will be maintained on-site by the PQCM to track submittals from issuance to approval. A list of required submittals will be developed at the initiation of project activities and revised as necessary. Submittals will be scheduled, reviewed, certified, and managed in accordance with the procedures defined in this section.

Standard Unified Facilities Guide Specification submittal titles are as follow:

- SD-01 Preconstruction Submittals
- SD-02 Shop Drawings
- SD-03 Product Data
- SD-04 Samples
- SD-05 Design Data
- SD-06 Test Reports
- SD-07 Certificates
- SD-08 Manufacturer's Instructions
- SD-09 Manufacturer's Field Reports
- SD-10 Operation and Maintenance Data
- SD-11 Closeout Submittals

Descriptions of the submittals listed above are provided in Specification Section 013300 (NAVFAC 2006). Not all submittals listed above are necessarily applicable to the DON's scope of work for this project.

4.1 REVIEW OF SUBMITTALS

Submittals will be reviewed to ensure completeness, accuracy, and contract compliance. Submittal of a certification will be inspected and approved by the PQCE for conformance to the project specifications or certification criteria. All items will be checked and approved by the PQCE. Any submittals requiring modifications or changes will be returned to the originating organization for correction and then resubmitted for review and approval prior to acceptance. Approved submittals will be signed or initialed, and dated. During the preparatory phase of the QC inspections, the PQCE will ensure that all materials and equipment have been tested and approved. No field activities will be performed without the required approval of applicable submittals.

4.2 SUBMITTAL PROCESS

Required submittals will be provided to project personnel as determined by the distribution schedule. Each submittal will be assigned a unique document control number.

A transmittal form will accompany each submittal. Each transmittal will be identified with:

- Contract and CTO number
- Name and address of the submitting organization
- Date of submittal
- Description of item being submitted, including reference to specification section (if applicable)
- Approval of submitting organization indicating conformance to the requirements

The PQCE will update the submittal register regularly.

4.3 REVIEW AND PROCESSING OF SUBMITTALS THAT DO NOT REQUIRE DON APPROVAL

Material submitted for review by the PQCE will indicate whether or not it conforms to established requirements. The PQCE will inform the submitter of the results of the review. The submittal log will be updated to indicate the status.

Conforming submittals will be transmitted to project and DON personnel as determined by the distribution schedule. A transmittal form will accompany all items sent to the DON and will list each item transmitted, the date it was reviewed by the PQCE, and its review status.

Nonconforming submittals will be returned to the submitter for correction, resolution of comments, and resubmittal.

4.4 REVIEW AND PROCESSING OF SUBMITTALS THAT REQUIRE DON APPROVAL

Submittals reviewed by the PQCE will be transmitted to the DON in accordance with the project distribution schedule for further review and approval. All items sent to the DON will use a transmittal form that will indicate each item transmitted, the date reviewed by the PQCE, and its review status. Upon completion of review, the ROICC will either return the transmittal form to the PQCE for further action or accept the submittal as complete.

The PQCE will advise the submitter of the results of the review in writing and include any comments. The submittal log will be updated to indicate status.

Nonconforming submittals may be returned to the submitter for correction, resolution of comments, and resubmittal, if required.

4.5 REVISED SUBMITTALS

Revised submittals will be logged, reviewed, and processed in a manner identical to the initial submittal. Revisions to a submittal will be identified using an alphabetic suffix to the original submittal number, e.g., submittal 18 will be revised to 18(a).

This page intentionally left blank.

5.0 TESTING

The PQCM or designated representative will verify the performance of all tests specified or required by the project-specific plans to ensure that control measures are adequate to provide a product conforming to contract specifications. General requirements for testing procedures to be implemented for this project are included in the Work Plan. The type, number, and frequency of required tests are specified in the Test Plan and Log (Appendix C). These tests include both operational and acceptance testing as appropriate.

5.1 DOCUMENTATION

All test results, both passing and failing, will be documented in the daily CQC Report for the day the results are obtained. Paragraph reference, location where tests were taken, and the sequential control number identifying the test will be given. The test reports will be available for review by the ROICC and transmitted with the Project Closure Report.

5.2 LABORATORY SERVICES

An independent testing laboratory will provide laboratory services, as needed. Per remedial design construction specifications, the laboratory will require DON approval through the Naval Facilities Engineering Service Center. The scope of the laboratory's accreditation will include the test methods required under the construction specifications. Acceptable accreditation programs include the National Institute of Standards and Technology/National Voluntary Laboratory Accreditation Program, the American Association of State Highway and Transportation Officials program, and the American Association for Laboratory Accreditation program. A copy of the Certificate of Accreditation and Scope of Accreditation and latest directory of the accrediting organization for selected laboratories will be required prior to qualification in accordance with project requirements.

5.3 TEST PLAN AND LOG

The Test Plan and Log lists tests required by the project specifications and drawings. The Test Plan and Log will be submitted with the last CQC Report of each month. Testing will be conducted to verify that control measures are adequate to provide a product conforming to contract specifications. General requirements for testing procedures to be implemented for this project are included in the project-specific plans.

This page intentionally left blank.

6.0 QUALITY CONTROL MEETINGS

6.1 COORDINATION AND MUTUAL UNDERSTANDING MEETING

Prior to the start of site work, a coordination and mutual understanding meeting will be held to discuss the QC Program requirements. DON personnel attending the meeting will include the RPM, ROICC, the ROICC's Construction Management Technician (CMT), and the Alameda Environmental Compliance Manager. The purpose of this meeting is to develop a mutual understanding of the QC details, including forms to be used, administration of on-site and off-site work, coordination of the field activities, production, and the PQCM duties with the ROICC. At a minimum, the TtEC personnel required to attend the meeting will include the PjM, Field Engineer, Project Superintendent, PQCM, and SSHO. Minutes of the meeting will be prepared by the PQCM and signed by the PjM and the DON's RPM and/or ROICC or designated representative. The meeting may be held in conjunction with the preconstruction meeting.

6.2 QC MEETINGS

After the start of field activities, the PQCM will conduct QC meetings at a frequency of once per week or as required by the ROICC. The meetings will be held at the project site and will be attended by the ROICC, ROICC CMT, Project Superintendent, SSHO, and PQCM. The PQCM will notify the ROICC at least 48 hours in advance of each meeting. The following will be covered at each meeting:

- Review the minutes of the previous meeting.
- Review the schedule:
  - Work or testing accomplished since last meeting
  - Rework items identified since last meeting
  - Rework items completed since last meeting
- Review the status of submittals:
  - Submittals reviewed and approved since last meeting
  - Submittals required in the near future
- Review the work to be accomplished in the following 2 weeks, documentation required, and schedule for the three phases of control and testing:
  - Establish completion date for rework items
  - Required preparatory phase inspections
  - Required initial phase inspections

  - Required follow-up phase inspections
  - Required testing
  - Status of off-site work or testing
  - Required documentation

- Identify deficient conditions.
- Resolve QC and production problems.
- Address items that may require revisions to the PCQC Plan.

7.0 INSPECTION

This section discusses the inspection process for the DFWs that will ensure compliance with the contract. The DFWs for this project are identified in Section 3.0 and listed in Table 3-1.

The PCQC Plan includes implementing the following three control phases for all aspects of the work specified:

- Preparatory phase
- Initial phase
- Follow-up phase

7.1 PREPARATORY PHASE INSPECTION

The PQCM will conduct preparatory phase inspections prior to starting the DFWs listed in Table 3-1 with the exception of the environmental resources survey, mobilization, and demobilization. These inspections will include the following:

- Review the project-specific plans (e.g., Work Plan, APP/SSHP, and SAP).
- Ensure that all required procurement forms for supplies and services are approved.
- Ensure that provisions have been made to provide the required QC inspection.
- Ensure that all personnel have the required training and certifications needed to perform the work.
- Examine the work area to ensure that all required preliminary work has been completed and is in compliance with the approved project plans.
- Examine the required materials and equipment to ensure that they are properly delivered to the site, conform to specifications, and are properly stored.
- Review the appropriate AHAs to ensure that safety requirements are met.
- Discuss procedures for performing the work, including potential repetitive deficiencies.
- Document workmanship standards for the particular phase of work.
- Ensure that the PCQC Plan for the work to be performed has been accepted by the DON.

The PQCM will conduct frequent internal inspections of mobilization and demobilization. The PQCM is not required to notify the DON or the PjM prior to these inspections.

The PjM, RPM, and ROICC will be notified at least 2 working days in advance of each preparatory phase activity. This phase will include a meeting conducted by the PQCM and attended by the Project Superintendent and any personnel involved in performing the DFW. When a subcontractor will accomplish a DFW, that subcontractor foreman will attend the preparatory phase meeting.

The issues discussed during the preparatory phase meetings will be documented on the Preparatory Inspection Checklist (Attachment 1). The PQCM will explain the acceptable level of workmanship required to personnel performing work activities.

7.2 INITIAL PHASE INSPECTION

An initial inspection will be performed at the beginning of a DFW and will include the following:

- Check preliminary work to ensure that it is in compliance with contract requirements.
- Review the Inspection Checklist documenting results of the preparatory meeting.
- Verify full contract compliance, including required control inspections.
- Establish the required level of workmanship, testing, and inspection to ensure that work meets minimum acceptable standards.
- Resolve all differences.
- Check safety requirements to include compliance with and upgrading of the APP/SSHP and AHAs.

The PjM, RPM, and ROICC will be notified at least 2 working days in advance of each initial phase activity. The PQCM will document initial inspections for each item using the Initial Phase Inspection Checklist developed from the Construction Specifications (Design Report) and attach it to the daily CQC Report. The location of the initial phase inspection and documentation will be identified for future reference and comparison with follow-up inspections.

The initial phase inspection will be reviewed each time a new crew arrives on-site or when DFWs change.

7.3 FOLLOW-UP PHASE INSPECTION

During the completion of a particular DFW, follow-up inspections will be conducted to ensure compliance with contract requirements. The frequency of the follow-up inspections will depend on the extent of the work being performed. Each follow-up inspection will be documented on the daily CQC Report. A Follow-up Inspection Checklist will be generated for any deficient conditions identified during the initial inspection and attached to the daily CQC Report when all items are resolved. A final follow-up check will be conducted on any completed work phase prior to the commencement of a subsequent phase.

7.4 RECEIPT INSPECTION

The PQCM will conduct inspections of materials prior to their use and installation. These inspections will be documented on a receipt inspection form and maintained on-site. Any material(s) that does not meet design specifications will be rejected and returned to the vendor. Nonconforming material will be segregated and marked accordingly, to prevent inadvertent use. The PQCM will record on the daily CQC Report that a material inspection was performed.

7.5 ADDITIONAL INSPECTIONS

The PQCM may conduct additional inspections on the same DFWs under the following circumstances:

- If the quality of ongoing work is unacceptable as determined by the PQCM, PjM, Project Superintendent, RPM, or ROICC
- If the quality of the work is suspected of being below the established criteria of acceptance
- If work on a DFW is resumed after a 2-month period of inactivity
- If other problems develop

7.6 COMPLETION INSPECTION

Completion inspections will be performed as summarized in this section.

7.6.1 Construction Quality Control Completion Inspections

The PQCM will conduct a detailed inspection prior to the prefinal inspection, when all the work or an increment of work is deemed to be substantially complete. The work will be inspected for conformance to plans and specifications, workmanship, and completeness. The PQCM will prepare an itemized list of work that does not conform to plans and specifications, inferior workmanship, or incomplete work. The list will also include outstanding administrative items, such as record (as-built) drawings. The list will be included in the QC documentation and submitted to the PjM following the inspection and will specify an estimated date for correction of each deficiency. The completion inspection will be documented on the Completion Inspection Checklist.

7.6.2 Prefinal Inspection

The PjM or designated representative will conduct the prefinal inspection. The RPM, ROICC, PQCM, Project Superintendent, and other primary management representative(s), as applicable, will attend. The PjM will schedule the prefinal inspection when notified by the PQCM that the work is ready for inspection. The PQCM is required to verify at this time that all specific items previously identified as being unacceptable, along with all remaining project work, will be complete and acceptable by the date scheduled for the prefinal inspection. At this inspection, the ROICC will develop a list of incomplete and/or unacceptable work performed under the contract and will provide this list to TtEC.

7.6.3 Final Acceptance Inspection

The PjM will schedule the final acceptance inspection based on notification from the PQCM of readiness. The RPM, Project Superintendent, ROICC, PQCM, and other primary management representative(s), as applicable, will attend. Notification will be provided prior to the planned final acceptance inspection date and will include verification that all specific items previously identified as being unacceptable, along with all remaining work performed under the contract, will be complete and acceptable by the date scheduled for the final acceptance inspection.

7.7 INSPECTION DOCUMENTATION

The PQCM is responsible for maintaining the inspection records. Inspection records will be legible and clearly provide all information necessary to verify that the items or activities inspected conform to the specified requirements. In the case of nonconforming conditions, the PQCM will provide evidence that the conditions were brought into conformance or otherwise accepted by the ROICC. All inspection records will be made available to the DON.

8.0 DOCUMENTATION

Preparation, review, approval, and issuance of documents affecting quality will be controlled to the extent necessary to ensure compliance to specified requirements. Project documents that will be controlled, if issued, include the following:

- Meeting minutes, conference notes, and confirmation notes
- Submittal Register
- Inspection documentation
- Contractor Production Report
- Daily CQC Report
- Material inspection and shipping logs
- NCRs
- NCR log
- FCRs
- Rework Items list
- Photograph log
- Field logbooks

8.1 DAILY CONTRACTOR QUALITY CONTROL REPORT

The PQCM is responsible for maintenance of current records of QC operation, activities, inspections, and tests performed, including the work of subcontractors and suppliers. The records will include factual evidence that the required QC activities and tests were performed. The daily CQC Report will be completed to document site activities covered by the PCQC Plan and will include:

- Records of inspection and/or testing performed
- Identification and location of each DFW and its current phase (preparatory, initial, follow-up) of completion
- Results of inspections and/or testing
- Location and description of deficiencies
- Deficiencies corrected as of the date of the report
- Rework items
- Deviations from plans, difficulties, and resolution

- Test and/or control activities performed with results and references to specifications and/or plan requirements, including the control phase (preparatory, initial, and follow-up) and deficiencies (along with corrective action)
- Material received, with statement as to its acceptability and storage
- Submittals reviewed with contract reference, reviewer, and action taken
- Off-site surveillance activities, including actions taken

The records will describe both conforming and nonconforming features and include a statement that equipment and materials incorporated in the work, and the workmanship, comply with the contract. The daily CQC Report attached to the Contractor Production Report will be furnished to the ROICC by 10:00 a.m. on the first work day following the date covered by the report, or as agreed to by the ROICC. The report need not be submitted for days in which no work is performed. At a minimum, one report will be prepared and submitted for every 7 days of no work and on the last day of a no-work period. All calendar days will be accounted for throughout the life of the contract. The first report following a day of no work will summarize work for that day only. Copies of the reports will be maintained on-site and will be available for review during business hours.

The daily CQC Report will be signed and dated by the PQCM and contain the following statement: "On behalf of the contractor, I certify that this report is complete and correct and equipment and material used and work performed during this reporting period is in compliance with the contract drawings and to the best of my knowledge, except as noted in this report." Other appropriate personnel, including subcontractors responsible for completion of activities, will sign and date the report as required. The report will include copies of test reports.

8.2 CONTRACTOR PRODUCTION REPORT

The Contractor Production Report will be prepared for each day work is performed and will be attached to the daily CQC Report prepared for the same day. The Contractor Production Report will be prepared, signed, and dated by the Project Superintendent or designated representative, and will contain the following information:

- Contractor and subcontractor(s) and their area of responsibility
- Trades working on the project that day and number of personnel
- Operating equipment, with hours worked, idle, or down for repair
- Work performed that day, including location, description, weather conditions, and who did the work
- Any delays encountered
- Site visitors and the purpose of the visit

- Job safety evaluations stating what was checked, results, and instructions or corrective actions
- A list of instructions given and/or received and conflicts in plans and/or specifications
- Contractor's verification statement

8.3 LOGBOOKS

The PQCM will maintain a logbook to document QC activities. The information in the logbook is intended to serve as a phone log and memory aide in the preparation of the daily CQC Report and in addressing follow-up questions that may arise.

8.4 PHOTOGRAPHS AND PHOTOGRAPH LOGS

The PQCM will maintain photographs and a photograph log to document site activities. Each photograph will have a date and time stamp on it or the photograph will show a sign board documenting the date and time clearly and legibly. The photograph log will identify each photograph by date, time, location, and activity.

8.5 CONFERENCE NOTES AND CONFIRMATION NOTES

In addition to other required documentation, the PQCM is responsible for taking notes and preparing the reports of all conferences. Conference notes will be typed and the original report furnished to the DON within 5 days of the date of the conference for concurrence and subsequent distribution to all attendees. At a minimum, this report will include the following:

- Date and place the conference was held
- List of attendees, including name, organization, and telephone number
- Comments made during the conference and decisions affecting criteria changes
- Conference notes that augment the written comments

The PjM is also responsible for providing a record of all discussions, verbal directions, telephone conversations, and so forth in which TtEC personnel or their representatives participate on matters relating to this contract and work. These records, titled Confirmation Notices, will be numbered sequentially and will fully identify participating personnel, subject discussed, and any conclusions reached. The PjM or designated representative will forward a reproducible copy of the confirmation notices to the DON RPM and ROICC within 5 working days.

This page intentionally left blank.

9.0 CHANGE MANAGEMENT

This section describes the DCN and FCR, the two main vehicles to document project changes.

9.1 DESIGN CHANGE NOTICES

The following sections detail the identification, preparation, and review and approval process for DCNs.

9.1.1 Identification

Any member of the Project Team may identify the need for a change to the design specifications or drawings. The Project Team member will notify the Field Engineer, who will evaluate the request and initiate a DCN, if determined necessary.

9.1.2 Preparation

The Field Engineer will generate a DCN form (Appendix A) and submit it to the Design Engineer for review and disposition. The DCN will identify the specification requirements, the proposed change, and the reason for the change.

9.1.3 Review and Approval

The PjM, Project Superintendent, and PQCM will review and approve the DCN. It is the responsibility of the PjM to gain the approval of the DON for the DCN prior to making any changes identified on the DCN.

9.1.4 Implementation of Approved DCNs

The Project Superintendent is responsible for the implementation of approved DCNs.

9.1.5 Records

Each approved DCN will be sequentially numbered as follows:

DCN-CTO X-YY

Where:

X is the task order number and YY is the DCN number, beginning with 01.

A DCN log will be maintained by the PQCM and will provide the DCN number, date of DCN, and brief description of contents.

Each DCN will be copied to all the management signatories, the Project Superintendent, PQCM, SSHO, and other personnel as deemed appropriate by the PjM.

Copies of the approved DCN will be posted or otherwise included in daily site briefings as appropriate to ensure that all site personnel are aware of the changes to the task order program. Copies of the DCN will be issued to all holders of controlled copies. DCNs are required to be maintained with the controlled copy of the changed document.

9.2 FIELD CHANGE REQUEST

Site personnel will document changes to the approved plans (except the design specifications and drawings) in the field through the FCR form (Appendix A). At a minimum, the following information will be documented in the FCR form:

- Project name
- CTO number
- FCR number
- Documents to which a change is requested (including revision number if applicable)
- Description of the item or condition for which the change is requested
- Reason for the change
- Recommended disposition
- Cost and schedule implication of the change, if any
- Approval of disciplines
- Approval of the PjM, Project Superintendent, PQCM, PESM, and QCPM and concurrence from the RPM or ROICC

10.0 NONCONFORMANCE

All deficiencies or nonconforming conditions discovered during inspections or other QC functions will be noted on either a Deficiency Notice (DN) or an NCR, as appropriate.

A DN is used to document the failure to develop, document, or implement effectively any applicable element of approved plans or to follow established procedures. A deficiency could lead to a nonconformance.

An NCR is used to document a nonconforming condition that renders the quality of an item, process, or product that has been defined in the specifications or drawings as unacceptable or indeterminate.

Copies of these forms are provided in Appendix A along with the logs used for tracking these documents. All deficiencies and nonconforming conditions will be resolved prior to completion of the project and in the timeliest manner possible. The DN will be used for all conditions that do not affect the final work product. An NCR will be used when a condition may affect the final work product.

The PQCM will be notified of all deficiencies and nonconforming conditions identified during the course of the field activities to ensure that each of these occurrences is documented, reported, and tracked, and that corrective actions are taken and follow-up verification is conducted.

The PQCM will also document deficiencies and nonconforming conditions in the daily CQC Report, noting the items found to be deficient or nonconforming; the date, time, and location; the person who identified the deficiency or nonconformance; and the status of the item to which the deficiency or nonconformance applies.

The PQCM will update the status of the deficiency when it changes. Before the work activities of the day begin, the PQCM will note the deficiencies or nonconforming conditions that require follow-up verification that day. New or changed status will be entered into the file at the end of each day. The daily CQC Report will document completion of the corrective action for each deficiency or nonconformance for that day. Nonconforming conditions or deficiencies that require rework for resolution will be noted on the Rework Items List included in Appendix A.

10.1 ROOT CAUSE ANALYSIS

The DN and the NCR forms both include space to enter information regarding the cause of the problem and the proposed resolution. The determination of the root cause of a deficiency or nonconformance is an integral part of the QC process. Root cause analysis will be made by the

PQCM in conjunction with other appropriate site personnel such as the Project Superintendent and the SSHO. Criteria considered in the analysis will include:

- Staff qualifications and training
- Adequacy of procedures and methods
- Adequacy of equipment
- Adequacy of QC measures

Input will be obtained, as necessary, from field staff and technical advisors in order to identify the factors that led to the problem.

10.2 CORRECTIVE ACTION

Following the root cause analysis, the PQCM will evaluate potential solutions (corrective actions) to determine which remedy is most effective in correcting the problem. This process will include all appropriate staff. Potential remedies considered will include:

- Supplemental staff training
- Changes of equipment or modification of equipment currently in use
- Acquisition of supplemental equipment
- Implementation of new procedures or modification of existing procedures
- Changes in QC procedures

Final approval of all remedies will be the responsibility of the PjM.

Successful implementation of corrective action will be documented by the PQCM in the appropriate areas of the DN or NCR. This documentation will be supported by changes to the inspection procedures or schedule as warranted (i.e., the PQCM will not certify that corrective action has been taken until inspection of the actions and the resulting changes in the program are complete).

10.3 CONDITION REQUIRING STOP WORK

If corrective actions are insufficient, resolution cannot be reached, or results of prior work are indeterminate, work may be stopped. The PQCM will notify the QCPM and direct the PjM to suspend work associated with the nonconformance until corrective action is complete. If there is a disagreement between the PQCM and the PjM, the difference will be brought to the attention of the QCPM until resolution is achieved.

The conditions of the suspension of work will be described in detail on the daily CQC Report and on the Rework Items List, if corrective action is not completed by the end of the working day. Work will not continue until directed by the individual who authorized it.

This page intentionally left blank.

11.0 QUALITY MANAGEMENT

In addition to the required QC field inspections, the TtEC Quality Program requires a quality management overview of the site QA/QC Program implementation. The PQCM will perform regular internal QC checks on the site implementation of the QA/QC Program. Reports of any deficiencies will be provided to the PjM for corrective action.

Inspections will be performed and checked for the following:

- Conformance with the Execution Plan and associated plans
- Thoroughness of performance
- Identification and completeness of documentation generated during performance

The PQCM will maintain a list of work items that do not comply with the contract and identify each item that needs rework, the date the item was discovered, the date the item will be corrected, and the date the item was corrected.

The PQCM will ensure that as-built drawings are kept current on a daily basis. The PQCM (or designee) will initial each revision. At the end of the project, updated as-built drawings will be submitted.

TABLE 3-1

DEFINABLE FEATURES OF WORK

SCHEDULED ACTIVITY # and DESCRIPTION	THE FOLLOWING ACTIVITIES WILL BE VERIFIED BY THE PQCM
Mobilization and Site Setup #40	Preparatory, initial, and follow-up phase inspections are not applicable to mobilization. However, the following list of controls must be met: • Verify schedule notification with the RPM, ROICC and CSO. • Verify that all pertinent permitting and notifications have been initiated. • Verify that all pertinent meetings have been held. • Verify that all material and contractor procurements are in place. • Verify that all pertinent documents are approved. • Review the RAWP. • Verify that all site personnel, including contractors, have submitted health and safety and qualification documentation, and are prequalified by Program Health and Safety Manager. • Review all applicable regulations and base requirements for traffic control and equipment operation. • Verify that required equipment and materials are on hand to conduct work in accordance with RAWP and procurement documents. • Review the AHAs for this activity. • Verify that an Operation Readiness Review has been conducted. • Verify base traffic patterns and requirements. Traffic control will be carried out in accordance with the approved Traffic Control Plan. • Check compliance with APP/SSHP and task AHAs. • Verify radiological training, health and safety training and site orientation of all field personnel. • Verify the establishment of staging area and general support area. • Verify compliance with RAWP requirements. • Verify any electrical work to connect trailers or other systems are done by a certified electrician. • Verify that the proper materials are on hand and comply with specifications. • Verify that stockpiles are managed per the RAWP. • Inspect stockpiles daily per the EPP.

TABLE 3-1

DEFINABLE FEATURES OF WORK

SCHEDULED ACTIVITY # and DESCRIPTION	THE FOLLOWING ACTIVITIES WILL BE VERIFIED BY THE PQCM
Environmental Resources Survey #41	Preparatory, initial, and follow-up phase inspections are not applicable to the environmental resources surveying. However, the following list of controls must be met: • Review survey areas as identified in the Environmental Protection Plan. • Verify that RPM has been notified about the environmental survey. • Verify that ROICC has been notified. • Review AHAs. • Verify that a project kickoff meeting was held. • Verify that project kickoff meeting minutes were prepared, reviewed, and distributed. • Verify the qualifications of TtEC's wildlife biologist. • Verify that the biological resource requirements have been met. • Inspect record for biological resources awareness training for all workers. • Inspect environmental survey documentation. • Verify that qualified SSHO is present at active work areas. • Verify that site activities are being photographed. • Verify that environmental resource survey is conducted in all areas where field activities will take place and adjacent areas. • Ensure that sensitive locations at the site are delineated and work crews are aware of any restricted areas. • Verify that photographs are logged and stored.

TABLE 3-1

DEFINABLE FEATURES OF WORK

SCHEDULED ACTIVITY # and DESCRIPTION	PREPARATORY	DONE	INITIAL	DONE	FOLLOW-UP	DONE
Installation of Temporary Fencing and Gates #40	• Review site drawings and fence specification. • Verify that site security and radiological posting requirements have been reviewed.		• Verify that fence is installed as shown in the site plan drawing and in accordance with specifications. • Verify that site security and radiological posting requirements have been followed.		• Inspect fence installation.	
Implementation of Temporary Erosion and Sediment Control Measures #41	• Ensure that a site plan identifying sensitive areas is prepared. • Ensure that the SWPPP has been reviewed with ROICC. • Review AHA(s) for this activity. • Ensure equipment and products are appropriate for work and are stored on-site. • Verify that material and equipment for erosion control measures meet requirements of RAWP and SWPPP.		• Identify inspection requirements. • Identify sensitive areas in field.		• Inspect field control BMPs. • Ensure and verify implementation of erosion control measures. • Verify that site activities are being photographed. • Verify that photographs are logged and stored.	

TABLE 3-1

DEFINABLE FEATURES OF WORK

SCHEDULED ACTIVITY # and DESCRIPTION	PREPARATORY	DONE	INITIAL	DONE	FOLLOW-UP	DONE
Removal and Abandonment Existing Site Facilities including but not limited to Gas Probes, Weir Structure and Passive Gas Venting System #42	• Verify that the ROICC and CSO have been notified. • Verify that a site plan identifying sensitive areas has been prepared. • Verify that the SWMP has been reviewed with the ROICC. • Verify that training requirements are met for all personnel. • Verify that proper equipment is on site to perform work. • Review the RAWP and Design Plan. • Review the AHAs. • Verify that PPE is available and meets the requirements of the HASP. • Verify that radiation awareness training has been completed and that training is documented. • Verify that designated personnel have assigned dosimeters.		• Verify that the RCT and SSHO are present in an active work area. • Verify that air monitoring and initial baseline sampling are being performed per HASP. • Verify that required dosimetry is being worn. • Verify that all personnel have signed the RWP(s). • Verify that the removal protocols, as described in the RAWP and Design Plan, are being followed. • Verify that site activities are being photographed.		• Verify that an RCT and SSHO are present in an active work area. • Verify that airborne concentrations do not exceed the established levels. • Verify that air and water samples are collected as required. • Verify that required dosimetry is being worn. • Verify that daily safety briefings discuss status of RWP(s). • Verify that RWP is available at the work location. • Verify that RWP is modified in the event of changes to the conditions. • Verify that tools, material, and equipment are cleaned, wiped down, and surveyed prior to removal.	

TABLE 3-1

DEFINABLE FEATURES OF WORK

SCHEDULED ACTIVITY # and DESCRIPTION	PREPARATORY	DONE	INITIAL	DONE	FOLLOW-UP	DONE
Topographical Surveys #41	• Verify that RPM have been notified. • Verify the land surveyors are licensed in the State of California • Verify that survey instrument certification is current and in good condition. • Verify that sensitive locations at the site are delineated and work crews are aware of restricted areas. • Review control points. • Review AHAs. • Review the RAWP and Design Plan and drawings for this activity. • Review boundaries and extent of survey. • Verify that radiation awareness training has been completed and that training is documented.		• Verify that SSHO is present at active work areas. • Verify that surveyor understands the work scope and coordinates system to be used. • Verify the measurement of grid system. • Verify that site activities are being photographed. • Verify that settlement monuments are placed on the final landfill service in accordance to the design		• Verify that SSHO is present at active work areas. • Verify that pre-excavation drawings/maps are complete and correct. • Verify that survey includes limits of excavation and identifiable features. • Verify that boundaries of survey have been met. • Verify that nodes of each grid system are marked. • Verify that photographs are logged and stored. • Verify that site activities are being photographed.	
Clearing of Vegetation and Debris #42	• Verify that PPE is available and meets requirements of the SSHP. • Verify boundaries and features for vegetation and debris clearance are established in the field based on design drawing and pre-construction surveys. • Verify that the area has been walked/visually inspected for items that could interfere with clearing (utilities, rebar, etc.). • Verify that biological awareness training has been completed and that training is documented. • Review AHAs.		• Verify that SSHO is present at active work areas. • Verify that vegetation and/or debris is removed throughout the designated excavation area. • Verify that the activity is photographed. • Verify that waste vegetation and/or debris is being managed as required.		• Verify that vegetation is disposed of in accordance with the RAWP requirements, and that the stockpile locations are cleaned up. • Verify that site activities are being photographed. • Verify that photographs are logged and stored.	

TABLE 3-1

DEFINABLE FEATURES OF WORK

SCHEDULED ACTIVITY # and DESCRIPTION	PREPARATORY	DONE	INITIAL	DONE	FOLLOW-UP	DONE
Excavations, Backfill Placement, and Compaction of Excavated Waste Areas (if required) #43	• Review work with ROICC and verify work area. • Verify that an OSHA excavation permit is on site. • Verify that equipment and material are surveyed for radiation and survey results are documented. • Review RAWP and project schedule. • Complete safety checks on all heavy equipment. • Ensure that all equipment operators are certified to operate the equipment. • Ensure dust control measures are in place per the RAWP. • Review AHA(s) for this activity. Verify that PPE is available and meets the requirements of the APP/SSHP and RWP. • Verify that radiation awareness training has been completed and documented. • Verify that all personnel have assigned dosimeters • Verify that the RWP is in place and that all workers have read the requirements. • Verify that compaction equipment is available. • Review the RAWP and construction specifications to verify that adequate material is available for fill and site has been surveyed.		• Ensure that materials and equipment delivered to the site are as identified in the RAWP. • Verify equipment operation maintenance and safety conditions. • Verify that excavation boundary is properly delineated. • Verify that excavation is conducted per RSOR instructions. • Verify that contractor has required health and safety documentation. • Verify that backfill placement and compaction are completed in accordance with the plans and specifications.		• Protect work area from water runoff. • Verify correct excavation depth and limits • Survey excavation depth and limits • Verify that site activities are being photographed. • Verify that photographs are logged and stored. • Conduct ongoing inspection of backfilling and compaction operation. • Verify that backfill placement and compaction are completed in accordance with the plans and specifications. • Verify that site activities are being photographed. • Verify that photographs are logged and stored.	

TABLE 3-1

DEFINABLE FEATURES OF WORK

SCHEDULED ACTIVITY # and DESCRIPTION	PREPARATORY	DONE	INITIAL	DONE	FOLLOW-UP	DONE
Screening of Potentially Radiologically Impacted Materials #44	• Verify that the DON and the RASO have been notified and verify the work area. • Verify that stormwater BMP requirements have been reviewed. • Verify that proper equipment is on-site to perform work. • Review the RAWP. • Review AHAs. • Verify that radiation awareness training has been completed and that training is documented. • Verify that dust control and erosion control measures are in place per the RAWP. • Verify that designated personnel have assigned dosimeters. • Verify that material and equipment for erosion control meet requirements for stormwater at the site. • Verify that equipment and products are appropriate for work and are stored on site. • Verify that materials and equipment delivered to the site are as identified in the RAWP. • Verify that safety checks on all heavy equipment have been completed. • Verify that all equipment operators are certified to operate the equipment and completed radiological training. • Review AHAs for this activity.		• Verify that stormwater BMPs are implemented. • Verify equipment maintenance and safety conditions. • Verify that sediment free of radioactive debris is segregated and placed in the proper stockpile area. • Verify that the background reference area measurements for each instrument being used to survey have been obtained using the procedure described in the RAWP. • Verify that daily checks are performed on all portable survey instruments. • Verify that required dosimetry is being worn. • Verify that the RWP is available at the work site. • Verify that field logbooks and proper forms are in use. • Verify that measurements are being collected in accordance with the RAWP and relevant SOPs.		• Inspect field control BMPs. • Verify implementation of the stormwater BMPs. • Verify that work area is protected from water runoff. • Verify that all radiological safety procedures are being followed. • Verify equipment maintenance and safety. • Verify that any suspected material location is marked, flagged, and documented. • Verify that daily instrument checks and background measurements are obtained and documented. • Verify that survey results are documented as required by the RAWP and SOPs. • Verify that RWP is available at the work site. • Verify that personnel have read and signed the revised RWP, if revision is required. • Verify that survey data and sample analysis results are reviewed and approved as required per the RAWP and SOPs.	

TABLE 3-1

DEFINABLE FEATURES OF WORK

SCHEDULED ACTIVITY # and DESCRIPTION	PREPARATORY	DONE	INITIAL	DONE	FOLLOW-UP	DONE
Potentially Radiologically Impacted Materials (continued) #44	• Verify that the relevant SOPs and/or manufacturers' instructions are available and have been reviewed for equipment to be used for radiological surveys. • Verify that dust control and erosion control measures are in place per the RAWP. • Verify that background reference area(s) for instrument background determinations have been identified. • Verify current calibration of survey instrument. • Verify that a daily operation check instrument logbook or data sheet is available.		• See above		• See above	
Radiological Surveys including Personnel and Equipment #44	• Verify that the RPM, RASO, and CSO are notified. • Verify that an approved RWP is available and has been read and signed by assigned personnel. • Verify that the RAWP and AHAs have been reviewed. • Verify that assigned personnel are trained and qualified. • Verify that training record documentation is being maintained. • Verify that personnel have been given an emergency notification procedure. • Verify that workers assigned dosimetry have completed NRC Form 4.		• Verify that radiological instruments are as specified in the RAWP. • Verify that a qualified RCT and SSHO are present at active work areas. • Verify that site activities are being photographed. • Verify that the background reference area measurements for each instrument being used to survey have been obtained using the procedure described in the RAWP		• Verify that the site is properly posted and secured, if necessary. • Conduct ongoing inspection of material and equipment. • Verify that a qualified RCT and SSHO are present at active work areas. • Verify that required dosimetry is being worn. • Verify that any suspected material location is marked, flagged, and documented. • Verify that daily instrument checks and background measurements are obtained and documented.	

TABLE 3-1

DEFINABLE FEATURES OF WORK

SCHEDULED ACTIVITY # and DESCRIPTION	PREPARATORY	DONE	INITIAL	DONE	FOLLOW-UP	DONE
Radiological Surveys including Personnel and Equipment (continued) #44	• Verify that the relevant SOPs and/or manufacturers' instructions are available and have been reviewed for equipment to be used for radiological surveys. • Verify that the limits and boundaries of surveys have been established and are understood. • Verify background reference area(s) for instrument background determinations has been identified. • Verify that calibration of survey instrument is current. • Verify that equipment is on site. • Verify that instrument a daily operation check logbook or data sheet is available		• Verify that daily checks are performed on all portable survey instruments. • Verify that required dosimetry is being worn. • Verify that the RWP is available at the work site. • Verify that field logbooks and proper forms are in use. • Verify that measurements are being collected in accordance with the RAWP, SAP, and relevant SOPs. • Verify that the limits and boundaries of the survey are being met.		• Verify that survey results are documented as required by the RAWP and SOPs. • Verify that the RWP is available at the work site. • Verify that personnel have read and signed the revised RWP, if revision is required. • Verify that survey data and sample analysis results are reviewed as required by the RAWP, SAP, and SOPs. • Verify that survey activities conform to the RAWP and SOPs. • Verify that the boundaries of the survey have been met. • Verify that survey instrument is recalibrated after repairs or modifications. • Verify that personnel surveys are performed for all personnel leaving a radiologically controlled area. • Verify that equipment surveys are performed for all equipment leaving a radiologically controlled area. • Verify that the RASO is notified of discovered radioactive material. • Verify that areas known or suspected to contain radioactive material are isolated.	

TABLE 3-1

DEFINABLE FEATURES OF WORK

SCHEDULED ACTIVITY # and DESCRIPTION	PREPARATORY	DONE	INITIAL	DONE	FOLLOW-UP	DONE
Subgrade Placement #43	• Ensure that subgrade material complies with specifications. • Review work with ROICC and verify work area. • Complete safety checks on all heavy equipment. • Ensure that all equipment operators are certified to operate the equipment. • Review AHA(s) for this activity • Verify that radiation awareness training has been completed and documented. • Verify that all personnel have assigned dosimeters • Verify that the RWP is in place and that all workers have read the requirements. • Verify grading plan is finalized and land surveyors have correct data.		• Ensure that materials and equipment delivered to the site are as identified in the RAWP. • Ensure on-site geotechnical quality assurance contractor is on-site and results are being logged in the field. • Verify that appropriate soil tests are being conducted in accordance with specifications.		• Inspect operation and ensure that materials meet gradation specifications. • Protect work area from water runoff. • Complete Test Log entries. • Verify that site activities are being photographed. • Verify that photographs are logged and stored.	
Characterization Survey of Subgrade #44	• Verify that the ROICC and CSO have been notified. • Review AHAs. • Review the RAWP and SSHP. • Verify that radiation awareness training has been completed and training is documented. • Verify that designated personnel have assigned dosimeters and completed the NRC Form 4. • Verify that PPE is available. • Verify background areas approved. • Verify VTA equipment is in working order.		• Verify that the RCT and SSHO are present in an active work area. • Verify that required dosimetry is being worn. • Verify VTA data collection rates in accordance with specifications • Verify GPS systems control coordinates		• Verify that the RCT and SSHO are present in an active work area. • Verify that required dosimetry is being worn. • Conduct ongoing inspection of decontamination and survey activities. • Verify that site activities are being photographed. • Verify that survey forms are properly completed and stored. • Verify the grid layouts in in accordance with the RAWP.	

TABLE 3-1

DEFINABLE FEATURES OF WORK

SCHEDULED ACTIVITY # and DESCRIPTION	PREPARATORY	DONE	INITIAL	DONE	FOLLOW-UP	DONE
Biotic Barrier (Geonet Layer) Placement #46	• Verify that geonet data meet project requirements and specifications. • Review work with ROICC and verify work area. • Review submittals from material suppliers and document in submittal register. • Complete safety checks on all heavy equipment. • Ensure that all equipment operators are certified to operate the equipment. • Verify that radiation awareness training has been completed and documented. • Verify that all personnel have assigned dosimeters • Verify that the RWP is in place and that all workers have read the requirements • Review AHA(s) for this activity.		• Ensure that placement of geonet is conducted per specifications. • Ensure that materials and equipment delivered to the site are as identified in the RAWP. • Verify that contractor has required health and safety documentation. • Ensure geotechnical testing contractor is on-site and results are being logged in the field.		• Protect work area from water runoff. • Complete Test Log entries. • Verify that site activities are being photographed. • Verify that photographs are logged and stored.	
Installation of the Multilayer Soil Cover System and Access Road #47	• Ensure that soil material complies with specifications. • Review work with ROICC and verify work area. • Review the design plans • Complete safety checks on all heavy equipment. • Ensure that all equipment operators are certified to operate the equipment. • Review AHA(s) for this activity • Verify that radiation awareness training has been completed and documented.		• Ensure that materials and equipment delivered to the site are as identified in the RAWP. • Ensure on-site geotechnical quality assurance contractor is on-site and results are being logged in the field. • Verify that appropriate soil tests are being conducted in accordance with specifications.		• Inspect operation and ensure that materials meet gradation specifications. • Review compaction data. • Protect work area from water runoff. • Complete Test Log entries. • Verify that site activities are being photographed. • Verify that photographs are logged and stored. • Protect work area from water runoff.	

TABLE 3-1

DEFINABLE FEATURES OF WORK

SCHEDULED ACTIVITY # and DESCRIPTION	PREPARATORY	DONE	INITIAL	DONE	FOLLOW-UP	DONE
Installation of the Multilayer Soil Cover System and Access Road (continued) #47	• Verify that all personnel have assigned dosimeters • Verify that the RWP is in place and that all workers have read the requirements. • Verify grading plan is finalized and land surveyors have correct data. • Complete safety checks on all heavy equipment. • Ensure that all equipment operators are certified to operate the equipment.		• Verify grades and location of access road. • Verify depth of access road			
Final Erosion Control Drainage Installation #51	• Ensure that concrete complies with specifications. • Review work with ROICC and verify work area. • Review submittals from contractors. • Review design plans • Verify geotechnical laboratory meet project requirements. • Complete safety checks on all heavy equipment. • Ensure that all equipment operators are certified to operate the equipment. • Review AHA(s) for this activity.		• Ensure that materials and equipment delivered to the site are as identified in the RAWP and Design documents • Verify reinforcement requirements and inspect areas prior to any concrete pour.		• Protect work area from water runoff. • Verify that boundaries of survey have been met. • Verify that site activities are being photographed. • Verify that photographs are logged and stored.	

TABLE 3-1

DEFINABLE FEATURES OF WORK

SCHEDULED ACTIVITY # and DESCRIPTION	PREPARATORY	DONE	INITIAL	DONE	FOLLOW-UP	DONE
Installation of Gas Probes and Passive Gas Venting System #51	• Verify that the ROICC and CSO have been notified. • Verify that a site plan identifying sensitive areas has been prepared. • Verify that the WMP has been reviewed with the ROICC.		• Verify that the RCT and SSHO are present in an active work area. • Verify that air monitoring and initial baseline sampling are being performed per HASP. • Verify that required dosimetry is being worn. • Verify that all personnel have signed the RWP(s). • Verify that the removal protocols, as described in the RAWP and Design Plan, are being followed. • Verify that site activities are being photographed. • Verify that well, probe and venting system materials are being installed in accordance with specifications. • Verify proper decontamination procedures are being followed.		• Verify that an RCT and SSHO are present in an active work area. • Verify that airborne concentrations do not exceed the established levels. • Verify that soil and water samples are collected as required. • Verify that required dosimetry is being worn. • Verify that daily safety briefings discuss status of RWP(s). • Verify that RWP is available at the work location. • Verify that RWP is modified in the event of changes to the conditions. • Verify that tools, material, and equipment are cleaned, wiped down, and surveyed prior to removal. • Verify installations are surveyed for as-built information • Verify well installation information is provided to the appropriate agencies.	

TABLE 3-1

DEFINABLE FEATURES OF WORK

SCHEDULED ACTIVITY # and DESCRIPTION	PREPARATORY	DONE	INITIAL	DONE	FOLLOW-UP	DONE
Revegetation of the Work Area #54	• Review work with ROICC and verify work area. • Review submittals from contractors. • Review design plans • Review seed type • Review erosion mat specifications • Complete safety checks on all heavy equipment. • Ensure that all equipment operators are certified to operate the equipment. • Verify that radiation awareness training has been completed and documented. • Verify that all personnel have assigned dosimeters		• Verify proper seeds are being used. • Verify application rate. • Verify erosion control measures are in place. • Verify proper moisture is being maintained. • Verify erosion mat placed in accordance with specifications.		• Protect work area from water runoff. • Conduct ongoing inspection for moisture and verify that moisture content is maintained • Verify that site activities are being photographed. • Verify that photographs are logged and stored.	
Final Status Survey of Final Grade #49	• Verify that the ROICC and CSO have been notified. • Review AHAs. • Review the RAWP and SSHP. • Verify that radiation awareness training has been completed and training is documented. • Verify that designated personnel have assigned dosimeters and completed the NRC Form 4. • Verify that PPE is available. • Verify that PPE is available. • Verify background areas approved.		• Verify that the RCT and SSHO are present in an active work area. • Verify that required dosimetry is being worn. • Verify that up to 18 systematically located post-excavation samples are collected for each survey unit of the trench. • Verify that survey units are not greater than 1,000 m2		• Verify that the RCT and SSHO are present in an active work area. • Verify that required dosimetry is being worn. • Conduct ongoing inspection of decontamination and survey activities. • Verify that site activities are being photographed. • Verify that photographs are logged and stored. • Verify that survey forms are properly completed and stored.

DEFINABLE FEATURES OF WORK

SCHEDULED ACTIVITY # and DESCRIPTION	PREPARATORY	DONE	INITIAL	DONE	FOLLOW-UP	DONE
Final Status Survey of Final Grade (continued) #49	• Verify VTA equipment is in working order. • Verify GPS system is operable.		• Verify VTA data collection rates in accordance with specifications. • Verify GPS systems control coordinates.		• Verify the grid layout and sampling of the Final Status Survey units in accordance with the RAWP.	
Transportation and Disposal of Soil and Debris #55	• Verify that all transporters are authorized to haul the particular type of waste being transported. • Verify that the ROICC and CSO have been notified. • Review the RAWP and RWP for the portal monitor operations. • Verify that waste profiles have been approved by disposal sites. • Verify that the waste manifest has been approved and signed by DON representative. • Verify that locations of disposal with the ROICC have been confirmed. • Review submittal load tickets process from contractors. • Review the traffic pattern. • Review the road closure and traffic plan with ROICC and CSO. • Review signage requirements with ROICC and CSO. • Review truck decontamination requirements. • Review the AHA for this activity.		• Verify that all transporters are authorized to haul the particular type of waste being transported. • Verify trucks are passing portal monitor during ingress to the site and egress from the site. • Verify drivers sign manifest. • Verify that the contractor performs work as specified in the RAWP and Waste Management Plan. • Review load ticket record procedures. • Verify that truck decontamination is being conducted in accordance with the RAWP. • Verify sample collection and labeling of samples.		• Verify that data have been collected in compliance with the EPP. • Verify DOT labeling based on sample results and waste characterization. • Verify RSOR has monitored use of portal monitor • Verify manifest are signed and originals given to CSO • Verify that the contractor has provided delivery logs. • Verify that disposal loads are in accordance with the standard requirements of the RAWP. • Verify that all load tickets are accounted for.	

TABLE 3-1

DEFINABLE FEATURES OF WORK

SCHEDULED ACTIVITY # and DESCRIPTION	PREPARATORY	DONE	INITIAL	DONE	FOLLOW-UP	DONE
Installation of Permanent Site Features and Institutional Controls including but not limited to Settlement Monuments and Signage. #52 and #53	• Verify that the ROICC and CSO have been notified. • Verify that training requirements are met for all personnel. • Verify that proper equipment is on site to perform work. • Verify proper supplies are on site. • Review the RAWP and Design Plan. • Review the AHAs. • Verify that PPE is available and meets the requirements of the HASP. • Verify that radiation awareness training has been completed and that training is documented. • Verify that designated personnel have assigned dosimeters • Verify California licensed surveyors have been procured for the work.		• Verify that the RCT and SSHO are present in an active work area. • Verify that required dosimetry is being worn. • Verify that all personnel have signed the RWP(s). • Verify that the installation protocols, as described in the RAWP and Design Plan, are being followed. • Verify that site activities are being photographed. • Verify installations are in accordance with specifications. • Verify settlement monuments labeled properly. • Verified proper materials are in use.		• Verify that the RCT and SSHO are present in an active work area. • Verify that required dosimetry is being worn. • Conduct ongoing inspection of work activities. • Verify that site activities are being photographed. • Verify that photographs are logged and stored. • Verify that the survey data is prepared in a format to be included in final reports and signed by licensed surveyor.	
Site Restoration and Demobilization #55	Preparatory, initial, and follow-up phase inspections are not applicable to site restoration, cleanup and final inspections. However, the following list of controls must be met: • Review applicable sections of RAWP and RWP. • Review the AHAs for this activity. • Verify that required equipment and materials are on hand to conduct work in accordance with the RAWP. • Verify that all equipment and materials have been decontaminated and removed from the site in accordance with the RWP. • Verify that all disposable equipment and materials have been collected and disposed of. • Inspect and verify that work was performed in accordance with the RAWP.

DELEGATION OF AUTHORITY LETTERS
(on CD only)

This page intentionally left blank.

TETRA TECH EC, INC.

April 2, 2013

Mr. Vince Richards
Tetra Tech EC, Inc.
1090 ½ W. Tower Avenue
Alameda, CA 94501

Subject: Project Quality Control Manager

Reference: Contract No. N62473-10-D-0809,
Radiological Environmental Multiple Award Contract, Contract Task Order (CTO) No. 0009,
Alameda Point, Alameda, California

Dear Mr. Richards:

In accordance with the terms of the Tetra Tech EC, Inc. (TtEC) Contract No. N62473-10-D-0809, this letter notifies you of your appointment as the Project Quality Control Manager for CTO No. 0009, Remedial Action at Installation Restoration Site 2, Alameda Point, Alameda, California.

As the designated Project Quality Control Manager, you will be responsible for managing the site-specific quality control requirements in accordance with the approved plan. You will be responsible for conducting quality control meetings, performing the three phases of control, and performing submittal review. You will be required to be present during all field activities to ensure that any testing is conducted in accordance with approved plans. In addition, you will be required to prepare the necessary quality control certification and documentation.

You have the authority and responsibility for suspending work when conditions adverse to quality are identified and for directing the correction of all nonconforming work.

This letter is effective immediately until modified by the Quality Control Program Manager with concurrence of the TtEC Project Manager, the NAVFAC SW Remedial Project Manager, and the Resident Officer in Charge of Construction.

Sincerely,

Gregory D. Joyce

TtEC	Tetra Tech EC, Inc.
USACE	U.S. Army Corps of Engineers
U.S.C.	*United States Code*
USDA	U.S. Department of Agriculture
USFWS	U.S. Fish and Wildlife Service
Water Board	Regional Water Quality Control Board

1.0 INTRODUCTION

The purpose of this Environmental Protection Plan (EPP) is to present the applicable or relevant and appropriate environmental regulatory requirements for the implementation of the remedial action for soil and groundwater at Installation Restoration Program (IR) Site 2 as documented in the Record of Decision (ROD) (DON 2010). This EPP will help ensure that activities associated with the environmental management program at the facility are conducted in a systematic and well-documented manner. The EPP also details environmental compliance procedures and waste management, regulatory, procedural, and training requirements associated with conducting field activities. The Project Manager's (PjM's) responsibility is to verify that all project personnel are aware of the compliance requirements of this plan.

This page intentionally left blank.

2.0 PROJECT ORGANIZATION AND RESPONSIBILITIES

2.1 AGENCY/CLIENT/CONTRACTOR INTERFACE AND CONTRACTUAL RESPONSIBILITIES

The Federal Facility Agreement (FFA) signatories who provide regulatory oversight for the IR Site 2 RA are the U.S. Environmental Protection Agency (EPA), the California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control (DTSC), and the San Francisco Bay Regional Water Quality Control Board (Water Board).

2.2 AGENCY APPROVAL PROCESS/DOCUMENTATION

The regulatory agencies have provided review and comment on the remedial design work plan documents. A Final Remedial Design Work Plan was approved by the EPA, DTSC and the Water Board prior to commencement of the remedial action activities.

2.3 PROJECT PERSONNEL

A list of the key project team members and their responsibilities for the project is provided in Section 1.3 of the Remedial Action Work Plan (RAWP).

This page intentionally left blank.

3.0 SITE HISTORY

The location, description, general site history, and a summary of previous investigations can be found in Section 2.0 of the RAWP. The site location is included as Figure 1-1 of the RAWP. A figure showing site features is included as Figure 2-2 in the RAWP.

3.1 EXISTING NATURAL RESOURCES

The site generally consists of four distinct habitat types: uplands; tidal wetland (i.e., wetlands); seasonal wetland; and open water/mudflats. A description of the habitat types and a Figure showing the distribution are included in the Wetland Mitigation Plan (Attachment 7 to the RAWP).

Areas defined as uplands, seasonal and tidal wetlands, and open water/mudflats demonstrate variability in their extent depending on changes in water levels resulting from seasonal rainfall and tidal variability.

The habitat types present at IR Site 2 and their associated biota are described in more detail in the following Section 6.0.

This page intentionally left blank.

4.0 SCOPE OF WORK

The Department of the Navy (DON) has conducted a Feasibility Study (Battelle and BBL 2008) to evaluate the potential remedial alternatives for IR Site 2 and prepared a ROD (DON 2010) to document the selected remedy for the site. The selected remedy identified in the ROD consists of the following components:

- Scan the site surface and excavate surficial radiological hot spots.
- Install a multilayer soil cover over the former landfill.
- Implement engineering controls and institutional controls (ICs).
- Provide for any necessary wetland mitigation.
- Monitor wetland mitigation.
- Conduct methane gas monitoring (as necessary).
- Conduct monitored natural attenuation for site groundwater.

This page intentionally left blank.

5.0 REGULATORY FRAMEWORK

5.1 LEAD PROGRAM SUMMARY

Remedial activities at IR Site 2, former Naval Air Station Alameda, Alameda Point, Alameda, California are being conducted as part of the IR Program. Under this program, the Department of Defense (DoD) has been identifying, evaluating, and controlling environmental contamination at various sites identified at DoD facilities nationwide. The DON is implementing the remedy identified in the ROD/remedial action plan (RAP) (DON 2010) at IR Site 2 pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and the National Oil and Hazardous Substances Pollution Contingency Plan (NCP), 42 *United States Code* (U.S.C.) Section (§) 9604, 10 U.S.C. § 2701, and Federal Executive Order (EO) 12580. Pursuant to CERCLA; the Defense Environmental Restoration Program at 10 U.S.C. §§ 2701–2706, 2810, and 2811; and EO No. 12580, Congress and the President have delegated CERCLA response action authority and environmental restoration authority to the DoD for facilities under its jurisdiction.

Accordingly, DoD serves as the lead agency. In turn, DoD has re-delegated this authority to the individual military departments, including the DON, who serves as the lead agency for implementation of remedial action at IR Site 2.

This project is being conducted under the authority of the CERCLA and coordinated through a Federal Facilities Agreement with the U.S. Environmental Protection Agency. The coordination effort also includes the DTSC and the Water Board. The project area is located within the jurisdiction of the Bay Area Air Quality Management District (BAAQMD).

5.2 LEAD AGENCY SUMMARY

The EPA, California DTSC, and Water Board provide support to the DON in evaluating and selecting response actions. The DON, with concurrence from the EPA, California DTSC, and Water Board, selected the remedial action that includes construction of an alternative engineered cover described in the Final Remedial Design Work Plan for IR Site 2.

5.3 ENVIRONMENTAL MANAGEMENT REQUIREMENTS

The following agency review requirements will be implemented prior to construction activities associated with commencing project activities for the selected remedy. The applicable or relevant and appropriate requirements (ARARs) as provided in the ROD (DON 2010) are presented in Table 5-1.

5.3.1 California Fish and Game Code and California Endangered Species Act

The California Endangered Species Act and California Fish and Game Code Sections 1908, 2080, 3511, 4700, and 5050 were identified as state applicable or relevant and appropriate requirements (ARARs). Section 1908 prohibits importing, taking, possessing, or selling a native plant designated as endangered or rare. Section 2080 prohibits importing, exporting, taking, possessing, or selling of any state candidate, threatened, or endangered species. Sections 3511, 4700, and 5050 prohibit taking or possessing fully protected birds, mammals, and reptiles and amphibians, respectively. The DON will implement reasonable measures to ensure adequate protection of ecological receptors during excavation and cover placement. The DON will coordinate with the state prior to implementing such reasonable measures, but the DON retains the authority to select which measures it will implement.

5.3.2 United States Army Corps of Engineers

The project involves several factors that alleviate the applicability of Section 404(b)(1) of the Clean Water Act (CWA) and Section 10 of the Rivers and Harbors Act requirements as overseen by the United States Army Corps of Engineers (USACE). Agency-directed CERCLA-related activities are exempt from the need to obtain permits under Section 404 of the CWA or Section 10 of the Rivers and Harbors Act. As a courtesy, at the DON's request, the San Francisco District of USACE will be informally consulted on the status of this project.

Work conducted pursuant to the construction of the remedial design will be completed in accordance with the substantive aspects of Nationwide Permit (NWP) 38, which pertains to activities required to affect containment, stabilization, or removal of hazardous and toxic wastes. The general conditions of NWP 38, which include provisions for delineating sensitive areas of vegetation and aquatic sites, minimizing impacts from usage of heavy equipment, controlling soil erosion and sediment, preventing harm to aquatic life movements, and protecting endangered species, will be requisite. Project staff will be required to receive training to become familiar with the requirements of the permit and will be educated about how each of the NWP requirements is being met.

5.3.3 San Francisco Bay Conservation and Development Commission

The Bay Conservation and Development Commission (BCDC) is authorized under state law and under the federal Coastal Zone Management Act to review federal projects to determine "federal consistency." BCDC requires a permit for development in San Francisco Bay, certain waterways that flow into the bay, salt ponds or managed wetlands around the bay, and within BCDC's shoreline band jurisdiction, which extends 100 feet inland from the bay. The permits are required for any activity proposing to fill, extract materials, or change the use of water, land, or structures in BCDC's jurisdiction.

During implementation of the remedial design, the substantive BCDC requirements will be met without a formal BCDC permit application and review, pursuant to the permit exemption in Section 121(e) of CERCLA. The BCDC's published permit application requirements and conditions of project certification do not apply to federal projects, projects that require federal approval, or project activities that are supported by federal funds. Therefore, the DON is not required to submit an application or obtain a permit from BCDC to implement the remedial design.. However, in an effort to comply with the substantive provisions of the San Francisco Bay Plan, for IR Site 2 the DON has conducted a BCDC Consistency Evaluation, which is attached as Table 5-2.

5.3.4 Federal Endangered Species Act

The substantive provisions of the Federal Endangered Species Act (ESA) are ARARs for IR Site 2 because federally protected species may be present at the site. Based on site surveys and literature reviews, the only federally threatened species with some potential to be present at the project site is the western snowy plover (*Charadrius alexandrinus nivosus*). Federally endangered species with some potential to be present at the site are the California least tern (*Sterna antillarum brownie)*, the California clapper rail (*Rallus longirostris obsoletus*), and the salt marsh harvest mouse (*Reithrodontomys raviventris*). Evaluation of the potential presence of these species is discussed in Section 6.2.

Because federally listed species have either been observed near IR Site 2 or some potential for supporting habitat features may exist on site, the DON has coordinated with the USFWS during the remedy selection process. The DON will continue to coordinate with the USFWS during remedial design construction activities to ensure compliance with the ARARs provisions.

5.3.5 Executive Orders

Two EOs in 1977 established policies for all federal agencies associated with wetland and floodplain impacts. EO 11990, Protection of Wetlands, requires all federal agencies to "take" action to minimize the destruction, loss, or degradation of wetlands, and enhance the natural and beneficial values of wetlands" while carrying out their responsibilities. EO 11998, Floodplain Management, requires similar protection for floodplains, including avoiding activity in the floodplain when possible.

To meet the substantive requirements of these EOs, project implementation will need to avoid wetland or floodplain impacts, when practicable. Site-specific measures will need to be implemented to mitigate impacts from project activities (e.g., limit construction schedule to avoid adverse impacts to special-status species, provide biological monitoring during excavation and mobilization/demobilization activities, avoid or limit duration of operations during sensitive times of the year, delineate sensitive habitat areas, including but not limited to wetlands and floodplains, to limit disturbance).

5.3.6 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) (16 U.S.C. §§ 703–712) prohibits at any time, using any means or manner, the pursuit, hunting, capturing, and killing or attempting to take, capture, or kill any protected migratory bird. The MBTA also prohibits the possession, sale, export, and import of any migratory bird or any part of a migratory bird, as well as nests and eggs. A list of migratory birds for which this requirement applies is found at 50 *Code of Federal Regulations* (C.F.R.) § 10.13. Species listed under Section 10.13 of the MBTA have been observed within the project area. Protected avian species may require special management such as biological surveys, construction-timing restrictions, and/or monitoring. As avoidance of the entire nesting season is not likely to be practical given the current project schedule, on-site personnel will be trained to be sensitive to the MBTA and natural resource clearance surveys would be implemented immediately prior to field activities. Monitoring of construction activities may also be implemented, if appropriate, to ensure resources protected under the MBTA are not harmed.

5.4 Applicable or Relevant and Appropriate Requirements

ARARs for the IR Site 2 remedy, cited in the ROD (DON 2010) and included as Table 5-1, are location-, action-, and chemical-specific with portions of the FESA (16 U.S.C. §§ 1531–1543), the federal MBTA (16 U.S.C. §§ 703–712), and the California Endangered Species Act (CESA) (*California Fish and Game Code* §§ 2080–2081). As cited in the remedial design, the DON has concluded that the cover remedy does not extend to treatment and control of leachate (no generation of leachate is anticipated). The DON and state have concurred that the statutory requirements of 27 *California Code of Regulations* § 20080(g) do not apply with respect to groundwater monitoring.

6.0 ENVIRONMENTAL RESOURCE PROTECTION AND MITIGATION

The purpose of the environmental resource protection section and mitigation is to identify the protection measures that will be implemented to avoid, minimize, and mitigate potential impacts from the remedial action to special-status wildlife species. The following subsections summarize the existing natural environmental conditions at the site. More detailed information can be obtained from the ROD (DON 2010).

6.1 NATURAL RESOURCES AND VEGETATION

IR Site 2 borders San Francisco Bay and is situated along the Pacific Flyway. Most of the land at Alameda Point was originally created by filling existing tidelands, marshlands, and sloughs with dredged material from the bay and Oakland Inner Harbor. The site is generally considered "disturbed" due to historical filling and landfilling activities. The site is ecologically isolated as it is bordered by San Francisco Bay to the south and west, and by roads, runways, and other hardened or impermeable (e.g., concrete) surfaces to the north and east; in addition, the site is fenced along its entire (onshore) boundary. The identified habitat types and their associated biota are described in more detail in the following sections.

6.1.1 Upland

The landfill portion of IR Site 2 covers approximately 77 acres and, along with the interior margin, constitutes the upland area of the site. The area has been partially covered using fill materials dredged from the wetlands and imported from other sites across Alameda Point (E&E 1983). The terrestrial environment of the landfill has been characterized in the remedial investigation (RI) as coastal prairie and northern coastal scrub. The majority of the upland area is highly disturbed from historical landfill activities and is composed almost entirely of noxious invasive species including iceplant (*Carpobrorus edulis*), Pampas grass (*Cortaderia jubata*), and sweet fennel (*Foeniculus vulgarum*). Other less noxious ruderal species observed include black mustard (*Brassica negra*), Italian thistle (*Carduus pycnocephalus*), and wild radish (*Raphanus raphanistrum*). Approximately 1 acre of good quality coyote brush (*Baccharis pilularis*) and grassland habitat has been documented near the south pond during TtEC site surveys conducted in November 2011.

A coastal margin composed of the perimeter berm and riprap seawall is present between the landfill and/or wetland, and the bay, and is characterized as a thin strip of land, 100 feet at its narrowest, that acts as a buffer for the landfill and the wetland. Materials identified in the coastal margin differ from those in the landfill and wetlands.

6.1.2 Wetlands and Ponds

The wetland boundary consists of two ponds and adjacent areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. The wetland is both seasonally wet and wet during high tides.

A recent wetland delineation was conducted at IR Site 2 for the DON by CH2M HILL Kleinfelder, A Joint Venture (KCH), in conjunction with the Pre-Design Remedial Investigation Report, and in accordance with survey methodology followed USACE's 1987 *Wetland Delineation Manual* (Environmental Laboratory 1987) and the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE 2008). Field surveys were conducted by KCH on July 27, 2010, and March 31, 2011. The results of the wetland delineation identified the presence of 9.40 acres of open waters, including 4.41 acres of tidal waters, and 11.91 acres of wetlands, including 3.22 acres of tidal wetlands, within the boundaries of the 110-acre IR Site 2 (KCH 2011). This compilation of acreage is defined as approximately 33 acres of wetland habitat. Wetland boundaries were determined in the field based on changes in plant species composition and cover, the presence or absence of hydric soil, hydrologic indicators, and local micro-topography. All of these waters and wetlands were considered to be adjacent to San Francisco Bay and were therefore considered potential jurisdictional waters of the United States subject to regulation under the federal CWA.

Previous wetland delineations at IR Site 2 were conducted by the Habitat Restoration Group in October 1993 and February 1994, in association with PCR Environmental, Kinnetics Laboratories, Inc., and Tocsin, Inc.

Due to the existing limits of delineated refuse in the wetland area within the southwest corner of the site and to the north in the interior margin, approximately 2.27 acres of seasonal wetland and 0.89 acre of tidal wetland will require placement of fill to extend the limits of the landfill cover during construction. As defined in 33 U.S.C § 1344, this meets the definition of fill placed in waters of the United States where the material has the effect of replacing any portion of a water of the United States with dry land. This is defined as conversion of a CWA Section 404 wetland to a non-wetland, which is considered a change in use of an area of waters of the United States. Section 404 of the CWA applies to all jurisdictional waters of the United States, including wetlands that have significant nexus to interstate commerce. Given that the remedial activities will not cross navigable waters, Section 404 of the CWA would be the prevailing federal regulation for this project.

The federal and state goals of "no net loss" of wetlands are established in 40 C.F.R. parts 230–233 (404 (b)(1) guidelines) and in the State of California Executive Department, EO W-59–93, respectively, and will be complied with by providing compensatory mitigation through an aquatic resource restoration, establishment, enhancement, and/or preservation activity. Substantive requirements in accordance with mitigation required will include habitat replacement with an equivalent area of similar wetlands outside the cover, but within the IR Site 2 boundary in accordance with 33 C.F.R. Part 330. Additional mitigation details are provided in Section 6.3.3 and a complete wetlands mitigation plan is presented as Attachment 7.

The DON will also ensure applicable substantive requirements are followed to protect the beneficial uses of San Francisco Bay in compliance with the Coastal Zone Management Act and the San Francisco Bay Plan (an approved state management program).

6.1.3 Vegetation

Terrestrial vegetation associated with IR Site 2 is characterized by a variety of weedy native and naturalized grasses and forbs. Common species observed during the pre-design wetland delineation conducted by KCH (2011) on the levee, landfill, and other upland areas include rip-gut brome, wild oak, rat-tail fescue, Italian thistle, field mustard, wild radish, tarweed, fennel, and yellow star-thistle. Tall fescue is present in the northern part of the site, and dense patches of ice plant are common to the southwest and northeast of the landfill area. Coyote bush shrubs and Pampas grass are scattered throughout the site. A grouping of small trees was identified in the northeastern corner of the site, including black wood acacia and arroyo willow.

6.2 FISH AND WILDLIFE/THREATENED, ENDANGERED, AND SENSITIVE SPECIES

A variety of birds and mammals have been observed at the site during historical surveys (PRC 1995; TtEMI 1998). A list of mammalian and avian species observed at the site is presented in Tables 6-1 and 6-2. More than 130 species of birds have been observed at Alameda Point and may use IR Site 2 to some degree. Passerine birds that glean insects off of and feed on terrestrial vegetation are the most significant avian components of the upland terrestrial habitat. However, the most significant bird use is primarily associated with the wetlands and wetland ponds, which provide resting and foraging areas for migrating waterfowl and habitat for other resident bird species. No avian foraging from the wetland ponds was observed during the DON's RI sampling activities of 2004/2005 (Battelle and BBL 2006).

Commonly observed avian species include the barn swallow (*Hirundo rustica)*, European starling (*Sturnus vulgaris*), western meadowlark (*Sturnella neglecta*), and house finch (*Carpodacus mexicanus*). Please see Table 6-2 for a complete listing of avian species. Mammals that potentially live, forage, and/or reproduce in the upland terrestrial habitat include the domestic rabbit (*Oryctolagus cuniculus*), black-tailed hare (*Lepus californicus*), raccoon (*Procyon lotor*), long-tailed weasel (*Mustela frenata*), and striped skunk (*Mephitis mephitis*). The habitat also is suitable for the red fox (*Vulpes vulpes*), but this species has not been specifically observed at the site.

Existing ecological management at IR Site 2 consists of a Navy program administered by the USFWS and U.S. Department of Agriculture (USDA) for the protection of California least tern colonies residing at Alameda Point. Potential predators of terns and tern eggs that are managed through this program include red fox, coyote, and carnivorous birds. Potential predators of the tern colonies are harassed, temporarily relocated, or in extreme circumstances culled periodically by field staff from the USFWS/USDA to protect the terns.

Special-status avian species that could occur within remedial action areas at IR Site 2 include the California least tern, California clapper rail, and the western snowy plover.

Marginal habitat for the salt marsh harvest mouse occurs in the pickleweed marsh in the southwest part of IR Site 2. However, it was deemed unlikely that they would occur at this wetland, despite the presence of pickleweed, based on the following:

- The site is isolated from other expanses of tidal marsh, and is separated from the nearest extant population of salt marsh harvest mice by a distance of approximately 5 miles. It is also surrounded by developed areas. Salt marsh harvest mice would only be able to access the site by floating in, which is possible but improbable.
- There is an extremely narrow mid-high marsh zone at this site, so high tide refugia is very minimal. This greatly increases the chances that salt marsh harvest mice attempting to escape tidal inundation would be subject to predation.
- The pickleweed patch size is well below the estimated 150 acres that is generally assumed needed to support a viable salt marsh harvest mouse population.

Furthermore, protocol-level surveys for this species were completed in 2009, and concluded that no salt marsh harvest mice were present at Alameda Point, which includes IR Site 2 (H.T. Harvey Inc. 2009). Therefore, additional surveys or construction monitoring for the salt marsh harvest mouse will not be performed.

Scheduled remedial activities planned for the site are not anticipated to have an adverse effect on the listed species. Compliance with the following regulatory legislation for the protection of wetlands and wildlife will occur: MBTA of 1918; the Endangered Species Act (ESA) of 1973, as amended; CESA; the Fish and Wildlife Act of 1956, as amended by the Fish and Wildlife Improvement Act of 1978; and Sections 404 and 401 of the CWA.

6.3 MITIGATION MEASURES

The DON will fully implement and adhere to the following protection measures to avoid, minimize, and mitigate for potential impacts from remedial activities. Measures are divided into the following sections with detailed instructions for the designated special-status species.

6.3.1 Training

The DON will conduct an education program for all persons who will work at the site during project implementation and construction. The program will include a discussion of the biology/ecology of the site, threats, protection under the ESA and MBTA, and the protection measures provided herein. The program will consist of a presentation from a qualified biologist familiar with the ecology, behavior, and identifying signs of the sensitive natural resources potentially present on or near the site.

Training will occur during initial site orientation for all site personnel, and will include the following elements and guidelines:

- Instruction and appropriate compliance with substantive requirements of local, state, and federal regulatory agencies, environmental laws, and regulations (e.g., USACE, Water Board, USFWS, California Department of Fish and Game [CDFG], MBTA, FESA, and CESA).
- Instruction that no personnel working on the project will "take" or destroy wildlife including birds, eggs, or active nests (i.e., with viable eggs/chicks) that are protected under CESA, FESA, MBTA, and CFG code sections.
- Specify the biologist who will conduct surveys to assess the nesting status of any active nests in the action area, as well as provide intermittent monitoring, if necessary, during remedial construction activities. The USFWS and DTSC/CDFG will be contacted prior to conducting the surveys.
- Document active avian nests (i.e., with viable eggs/chicks) and establish an appropriate no-work buffer around each that will be maintained during active construction. Buffers will remain in-place until nests have reached their natural end (i.e., no viable eggs/chicks are present), as verified by a qualified biologist; at that point, the buffer would be removed.
- If an active nest is identified within 100 feet of remedial activities and appears to be insulated from construction, or the nesting birds appear habituated to the ongoing disturbance, the DON will be notified to consider whether a no-work buffer is required to ensure the MBTA is appropriately followed.
- Any personnel who inadvertently kills or injures wildlife will be required to immediately report the incident to the staff biologist and/or supervisor. The biologist or other appropriate representative shall contact the DON, who will be responsible to notify the USFWS and/or DTSC/CDFG as applicable.
- DON will be notified verbally and in writing within 24 hours of the accidental death or injury to any state- or federal-listed species during project-related activities, with summary information of the incident, the type of dead or injured animal, and other pertinent information. The notification will be forwarded to the USFWS and/or DTSC/CDFG as applicable.

- Limits of grading and other remedial construction activity impacts will be communicated to field personnel so that no land, water, or vegetation outside the delineated limits of the remedial construction area will be disturbed.
- Project-directed activities will remain within designated work areas and access roads. Approved work areas, access roads, and lay-down areas will be clearly marked and denoted. No field personnel may access or disturb lands outside of the designated remedial construction limits.
- Littering is prohibited and appropriate disposal of trash in designated containers will be instructed. All litter and construction debris will require removal daily from remedial construction areas.
- All personnel will practice fire prevention and safety through equipment maintenance and observance of designated hot work areas.
- Any and all feeding of wildlife by site personnel will be prohibited.
- Ensure site personnel understanding of all applicable environmental requirements before initiation of each remedial construction activity. It is the responsibility of each person working on the project to understand and comply with the environmental requirements associated with the project. Any and all questions are to be directed to a supervisor or biologist prior to starting work.
- All supervisors or other field managers will receive environmental awareness briefings prior to initiating ground-disturbing activities within the project area. Training will be documented and records maintained within the on-site project files.

A fact sheet or wallet-sized card containing this information will also be prepared and distributed. Upon completion of the education program, employees will sign a form stating that they attended the program and understand all protection measures.

6.3.2 Ecological Surveys

A qualified biologist will conduct ecological surveys of the plants and animals at IR Site 2 to collect current information on species present in or near the intended project areas and to complete an ecological checklist before work begins. These surveys will be conducted in accordance with appropriate survey guidelines and protocols and will be conducted at appropriate times of the year for identifying the presence of special status plant and animal species. The survey will include all planned staging and storage areas, site transportation routes, work areas, and stockpile areas. Preconstruction surveys will be performed by a qualified biologist at an appropriate interval prior to ground disturbance activities. Preconstruction surveys will consist of four separate site visits on different days in order to update the presence of plant and animal species located on or near the work sites. The USFWS and DTSC/CDFG will be contacted prior to conducting the surveys.

Work is expected to be performed during portions of the nesting season (February 1 to September 30). Before construction activities begin during the nesting season, a qualified biologist will conduct a focused survey for nesting birds within 14 days of construction activities. If work is already occurring when the nesting season begins, no additional surveys will be required; however, additional construction monitoring would be performed as per Section 6.3.6. If work is stopped more than 15 days during the nesting season, work areas and all natural habitat within 500 feet of work areas will be resurveyed. If an active nest (i.e., with viable eggs or chicks) is documented, a no-work buffer zone will be established around the nest by the site biologist, and will remain in place until the natural end of the nest is reached (i.e., no viable eggs or chicks are present).

Surveys for breeding amphibians in the seasonal, freshwater wetlands were performed in January of 2013. A single egg mass was found, and appears to have been deposited by a Pacific chorus frog *(Pseudacris regilla).* No evidence of special-status amphibians or their egg masses or larvae were identified in these wetlands, therefore additional surveys are not recommended.

Additional construction monitoring plans are discussed in Section 6.3.6.

The qualified biologist will provide a report to the DON on the results of the ecological survey and pre-construction surveys for IR Site 2 shortly after the surveys are complete. Reporting is further discussed in Section 6.3.4.

6.3.3 Compensatory Wetlands Mitigation

Tidal wetlands lost as a result of the required remedial design activities total approximately 0.89 acre and will be replaced with defined in-kind, on-site habitat. Low-quality seasonal wetlands lost as a result of the project total 2.27 acres and will be replaced on-site with higher quality freshwater open marsh and mudflat. A project-specific Wetland Mitigation Plan (Attachment 7) has been prepared to specify mitigation design and an implementation plan is to replace lost wetlands with habitat of the same or better quality. Compensatory wetlands will be created concurrently as the original wetlands are filled during remedial construction activities, at a projected 1:1 replacement ratio. The plan will specify mitigation goals, success criteria, implementation activities, and long-term monitoring and maintenance requirements.

6.3.4 Documentation and Reporting

A Preconstruction Survey Report including survey results from the Ecological Survey (i.e., findings from the four preconstruction site visits) will be prepared to include a written evaluation of lands proposed for grading/excavation, temporary structure installation, landfill cover placement, and revegetation before the onset of construction activities. Intermediate reports may also be prepared and submitted if appropriate. The Preconstruction Survey Report will include a full description of any sensitive biological resources that were documented and a clear directive for what was established to ensure their protection from construction activities. If no sensitive biological resources were documented, the report will include a clear statement to that effect.

An Initial Monitoring Report will be prepared, if monitoring construction monitoring is applicable, that details the results of routine biological inspections after the commencement of remedial construction. The report will document as-needed examination of the work activities and project areas including beginning and ending dates, impacts to resources, and when necessary, verify that selected protection measures are being implemented.

Incident Reports are required in the event of unauthorized "take" of special-status wildlife species. These reports are intended to convey specifics associated with any type of take-related incident which occurs within the Project Area, document that required notifications have been provided, and demonstrate that corrective actions have been proposed and taken.

A Final Mitigation and Monitoring Report will be prepared upon completion of project activities, and will summarize information detailed within all applicable previously prepared reports. The report will be prepared by the qualified biologist and will include, at a minimum:

- A description of when each of the mitigation measures was implemented
- All available information about project-related incidental "take" of special-status species, if appropriate
- Information about other project impacts on special-status species, if appropriate
- Construction dates
- An assessment of the effectiveness of the DON's conditions of approval in minimizing and compensating for project impacts
- Recommendations on how mitigation measures might be changed to more effectively minimize and mitigate the impacts of future projects
- Other pertinent information

If a special-status species is injured as a result of project related activities, the site biologist will coordinate with the appropriate agencies to have it immediately taken to an appropriate and approved facility. The site biologist will immediately notify appropriate agencies unless the incident occurs outside of normal business hours, in which case, notification will be made on the next business day via the DON and normal project communications channels. If a special-status species is killed by project-related activities during construction, or if such species is otherwise found dead on the project site, a written report will be sent to the appropriate agencies via the DON within 2 calendar days. The report will include the date, time of the finding or incident, location of the carcass, and the circumstances.

6.3.5 Construction Delineation

The area of disturbance will be confined to the smallest practical area, and use previously disturbed areas as much as practical. Project related personnel will access the project site during construction and development activities using existing routes and will not cross special-status species' habitat outside of the project site. To the extent possible, previously disturbed areas within the project site will be used for temporary storage areas, laydown sites, and any other surface-disturbing activities. The DON will post signs; place posting stakes, flags, and/or rope or cord; and place fencing as necessary to minimize the disturbance of special-status species' habitat. Vehicle speeds will not exceed 20 miles per hour in order to avoid these species on or traversing the roads during project-related construction and development activities. If construction of off-site routes of travel will be required, these will be coordinated in advance via the DON.

6.3.6 Construction Monitoring

If appropriate, a qualified biologist knowledgeable and experienced in the biology and natural history of protected biological resources will monitor construction activities in areas of suitable habitat to avoid the "take" of individual animals and to minimize habitat disturbance. Construction monitoring would be needed in the case that surveys described in Section 6.2 indicated the presence of special status species or active avian nests in or near the construction area.

A qualified biologist would need to have experience monitoring and identifying the special status species mentioned in the report, experience monitoring in tidal wetlands, and be able to set up a monitoring program. General construction monitoring will include the following activities:

- Clearance survey 1 to 7 days prior to the onset of each phase of construction activities
- Routine biological inspections after commencement of ground-disturbing activities
- As-needed examination of the project area to document activity beginning and ending dates, identify impacts to resources, and verify that protection measures are being employed appropriately.

Compliance inspections will be conducted by the qualified biologist at appropriate intervals during clear and grub activities, and periodically during grading and cover construction. The qualified biologist will thoroughly inspect work areas to determine presence of sensitive biological resources, will check for compliance with all mitigation/avoidance measures, and will check any established exclusion zones (if present) to ensure that signs, stakes, and fencing are intact and that human activities are restricted in these protective zones.

Any and all observations of sensitive biological resources will be documented and conveyed to the DON's designated representative or qualified biologist. Observations of all special status species will be fully documented.

If project activities are conducted during the nesting season (February 1 to September 30), additional surveys would be performed as discussed in Section 6.3.2 and a qualified biologist would monitor construction activities when appropriate to ensure no harm is incurred to nesting birds. If nesting birds are discovered (either during surveys or during monitoring), project activity will be restricted within no-work buffer zones established around each nest by the site biologist, and will be maintained until the natural end of the nest (i.e., when no viable eggs or chicks are present). Authorization to proceed will likely be obtained if it is determined that project activity would not likely adversely affect the nest. The qualified biologist will remain on-site to monitor the activity of the nesting birds during work activities. If the nesting birds change behavior due to work activities, buffer zone distances will be reevaluated.

The qualified biologist will have authority to immediately stop any activity that is not in compliance with these measures and to order any reasonable measure to avoid the "take" of any protected biological resource. If a special status species is observed in a project work area, increasing the potential for it to be harmed, an appropriate buffer will be established by the site biologist and coordination with the appropriate agencies via the DON will be initiated.

6.3.7 Hazardous Materials and Refuse

Any fuel or hazardous waste leaks or spills on the project site during construction and development activities will be stopped/repaired immediately and cleaned up at the time of occurrence. The storage and handling of hazardous materials will be excluded from the construction zone and any unused or leftover hazardous products will be properly disposed of off-site.

A trash abatement program will be initiated during preconstruction phases of the project and will continue throughout the duration of the project. Trash and food items will be secured in closed containers and removed regularly to avoid attracting opportunistic predators such as ravens, coyotes, and feral dogs. Upon project completion, all construction refuse, including, but not limited to, broken equipment parts, wrapping material, cords, cables, wire, rope, strapping, twine, buckets, metal or plastic containers, and boxes shall be removed from the site and disposed of properly.

6.3.8 Site Security and Access

The DON will provide regulatory agency representatives with reasonable access to the project site and mitigation lands under the control of the DON, and will otherwise fully cooperate with efforts to verify compliance with or effectiveness of the mitigation measures set forth herein.

6.3.9 Air Quality

The BAAQMD regulations specify standards for fugitive dust emissions and particulate matter emissions. Due to the nature of the remedial action, which involves significant earthmoving activities, it is probable that dust will be produced. The BAAQMD exempts certain operations, under Regulation 2, from obtaining air permits. In addition, dust control measures will be implemented within the landfill area throughout the field activities for alleviation or prevention of dust nuisance. A Dust Control and Air Monitoring Plan (DCAMP) is included as Attachment 9 to the RAWP.

6.3.10 Air Resources

Measures will be taken during removal activities to minimize the release of airborne particulates within and outside the boundaries of the work sites. Dust and particulates will be controlled to minimize contaminant spread and to protect human health and the environment. A DCAMP is included as Attachment 9 to the RAWP.

6.3.10.1 Dust and Particulate Control

Work procedures will be designed to control and minimize particulate emissions. Control of fugitive particulates will involve cleaning loose dirt from haul vehicles, enforcing speed limits on facility roads, watering down dry or barren work areas and roadways, and covering soil stockpiles at the end of every shift.

A decontamination pad will be constructed. All equipment will be inspected before leaving the project sites to ensure it is in an acceptable condition (e.g., free of dirt on the undercarriage, frame, tail gate, wheels, and axles) for site exit and decontaminated. Vehicles and/or equipment that cannot be easily cleaned by dry methods may be washed and air-dried before leaving the site(s). All wastewater will be captured for future disposal. Specific requirements and measures to be taken are detailed in the Stormwater Pollution Prevention Plan (SWPPP) (Attachment 8 to the RAWP).

6.3.11 Stormwater, Sediment, and Erosion Control

Because earthmoving activities will be conducted primarily during the dry season and on relatively flat terrain and because soil materials are well-drained, the potential for erosion is low. However, to prevent surface water runoff from impacting adjacent surface water features, various Best Management Practices will be implemented during the remedial action activities to minimize the potential for release of contaminants during construction. A site-specific SWPPP (Attachment 8 to the RAWP) has been prepared in order to address applicable and substantive requirements under the identified ARARs.

6.3.12 Soil and Construction Material Stockpiles

Soil stockpiles will be created through the periodic removal of existing soil cover materials. Soil and animal intrusion barrier construction material stockpiles will also be created from the import of materials from off-site. Stockpiles consisting of existing site materials will be staged on-site in inactive areas, and soil materials from off-site will be stored in staging areas located adjacent to the site.

7.0 REPORTING SPILLS AND RELEASES

The steps below outline the chain of communications that will be followed if a significant spill of any hazardous substance occurs. A significant spill will be considered any spill over the reportable quantity, as determinable by federal and/or state regulations, as well as any spill below the reportable quantity that is not properly contained and released into the environment.

1. Site personnel involved in the spill will immediately contact the TtEC Spill/Release On-site Coordinator, Site Superintendent, or Site Safety and Health Officer (SSHO), who will notify the PjM and the Project Environmental Safety Manager (PESM). At least one of the following individuals will be on-site during all remedial activities:

SSHO:	Mr. Keith Rademacher
Site Superintendent:	Mr. Larry Spencer

The TtEC SSHO or Site Superintendent will contact the Remedial Project Manager (RPM), Resident Officer in Charge of Construction (ROICC), Caretaker Site Office (CSO), and Radiological Affairs Support Office (RASO) individuals identified below:

RPM:	Mr. Jacques P. Lord
ROICC:	Mr. Gregory Grace
CSO:	Mr. Doug DeLong
RASO:	Mr. Matthew Slack

2. If a release of a waste or hazardous substance above the reportable quantity or a release of petroleum that causes a sheen to water occurs, the PjM will verify that the National Response Center (800-424-8802) and the local Emergency Response Coordinator (Fire Department) have been notified by the DON. Releases will be reported and written follow-up emergency notices will be submitted under the Superfund Amendments and Reauthorization Act, Title II requirements.
3. In concert with the above actions, the following persons will be contacted by the PjM or Site Superintendent:

TtEC Certified Industrial Hygienist/PESM:	Mr. Roger Margotto

In the event of a spill of radioactive material, TtEC will make appropriate notifications in accordance with its Nuclear Regulatory Commission license requirements. Notifications will also include the DON RPM, the RASO, and the subcontractor.

This page intentionally left blank.

8.0 TRAINING/CERTIFICATION REQUIREMENTS FOR PROJECT PERSONNEL

8.1 FEDERAL REQUIREMENTS

Occupational Safety and Health Administration and California Occupational Safety and Health Administration Health and Safety/Emergency Response/Hazardous Communication training requirements are specified in the Site Safety and Health Plan. All site personnel must have this training.

Specified site personnel must also be trained in Department of Transportation (DOT) standards. Only site personnel who have received this training are allowed to conduct DOT functions.

Specified site personnel that are handling Resource Conservation and Recovery Act or dangerous waste must be trained in waste management procedures under 40 C.F.R. Parts 262.11–265.16.

8.2 STATE REQUIREMENTS

A professional engineers' certification will be required to certify the adequacy of the landfill cap design and other specifications and drawings.

This page intentionally left blank.

9.0 INSPECTION AND AUDIT PROCEDURES

9.1 INSPECTION BY REGULATORY AGENCIES

Regulatory inspections will be coordinated by the DON. If contacted by a regulatory agency for a site inspection, site personnel or the PjM must notify the client (as described below).

9.1.1 Client Notification

The PjM or his alternative will notify the client if contacted by a regulatory agency for a site inspection.

Client Contact: Mr. Gregory Grace (ROICC)

9.1.2 Designated Representative for Inspections by Regulatory Agencies

The PjM will designate an on-site representative for inspections by regulatory agencies. The selected representative will have received training on this procedure by the Environmental Regulatory Compliance Manager and will be familiar with implementation of the procedure.

9.2 INSPECTIONS BY THIRD PARTIES

Any third party requesting access to inspect the site must be referred to the client for access. Contractors must not grant site access or answer questions for unauthorized personnel. Individuals requesting access must be told to contact the DON. Notify the PjM, or the designated Task Manager, and the client of any attempts to gain access to the site.

Client Contact: Mr. Gregory Grace (ROICC).

If members of the media ask questions or attempt to access the site, notify the RPM for the DON, Mr. Jacques P. Lord, at (619) 532-0902.

This page intentionally left blank.

10.0 DOCUMENTATION AND RECORDS RETENTION

Documentation of regulatory compliance issues and records retention will be conducted in accordance with the TtEC Compliance Procedure and the DON/Marine Corps Installation Restoration Manual (DON 2000).

10.1 RECORDS RETENTION

Under contract conditions, documents must be kept in the project files for a minimum of 10 years. In addition, compliance records will be maintained in accordance with the Compliance Procedure for Documentation and Records Retention.

This page intentionally left blank.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Chemical-Specific[a] Applicable or Relevant and Appropriate Requirements				
Requirement	**Prerequisite**	**Citation[b]**	**ARAR Determination**	**Comments**
		SOIL		
Federal Applicable or Relevant and Appropriate Requirements (ARARs) for Chemical Contamination				
Resource Conservation and Recovery Act (RCRA) (Title 42 United States Code [USC], ch. 82, §§ 6901 through 6991[i]) [c]				
Defines RCRA hazardous waste. A solid waste is characterized as toxic, based on the Toxicity Characteristic Leaching Procedure (TCLP), if the waste exceeds the TCLP maximum concentrations.	Waste	Cal. Code Regs. tit. 22, § 66261.21, 66261.22(a)(1), 66261.23, 66261.24(a)(1), and 66261.100	Applicable	Applicable for determining whether waste is hazardous.
Groundwater protection standards: requirements to ensure that hazardous constituents entering the groundwater from a regulated unit do not exceed the concentration limits for contaminants of concern in the uppermost aquifer underlying the waste management area of concern at the point of compliance.	A regulated unit that receives or has received hazardous waste before July 26, 1982, or regulated units that ceased receiving hazardous waste prior to July 26, 1982, where constituents in or derived from the waste may pose a threat to human health or the environment.	Cal. Code Regs. tit. 22, § 66264.94(a)(1) and (3), (c), (d), and (e)	Relevant and appropriate	While these standards are not applicable because Installation Restoration (IR) Site 2 does not contain an RCRA waste management unit, the Navy has determined that the substantive provisions are potentially relevant and appropriate ARARs for this response action because the wastes at the site are similar to RCRA hazardous waste constituents.
Uranium Mill Tailings Radiation Control Act [c]				
In any occupied or habitable building, the objective of remedial action shall be, and reasonable effort shall be made to achieve, an annual average (or equivalent) radon decay product concentration (including background) not to exceed 0.02 working level. In any case, the radon decay product concentration (including background) shall not exceed 0.03 working level. Provisions applicable to radon-222 shall also apply to radon-220.	Uranium Mill Tailings Radiation Control Act (UMTRCA) Sites	40 *Code of Federal Regulations* (CFR) § 192.12(b)(1) and 192.41(b)	Relevant and appropriate	These requirements are not applicable because IR Site 2 is not a UMTRCA site. The Navy has determined that these requirements are relevant and appropriate because radiological contamination may remain on IR Site 2. Currently, there are no buildings on IR Site 2 property and no buildings are planned in the future. However, because the ICs do not prohibit the construction of all new buildings (ICs prohibit construction of the buildings associated with the prohibited land uses listed in Table 2-12 of the ROD [Navy, 2010]), these requirements are necessary. If

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Chemical-Specific[a] Applicable or Relevant and Appropriate Requirements				
Requirement	**Prerequisite**	**Citation[b]**	**ARAR Determination**	**Comments**
				buildings are constructed on IR Site 2 in the future, the transferee will address these requirements in documents provided to the Federal Facilities Agreement (FFA) signatories and California Department of Public Health (CDPH) for approval of land disturbing activities.
Concentration limits for cleanup of gamma radiation in buildings at inactive uranium processing sites designated for remedial action. In any occupied or habitable building, the level of gamma radiation shall not exceed the background level by more than 20 microroentgens per hour.	UMTRCA sites	40 CFR § 192.12(b)(2)	Relevant and appropriate	These requirements are not applicable because IR Site 2 is not an UMTRCA site. The Navy has determined that these requirements are relevant and appropriate because radiological contamination may remain on IR Site 2. Currently there are no buildings on IR Site 2 property and no buildings are planned in the future. However, because the ICs do not prohibit the construction of all new buildings (ICs prohibit construction of the buildings associated with the prohibited land uses listed in Table 2-12 of the Record of Decision [ROD]), these requirements are necessary. If buildings are constructed on IR Site 2 in the future, the transferee will address these requirements in documents provided to the FFA signatories and CDPH for approval of land disturbing activities.
Standards for cleanup of land and buildings contaminated with radium-226 (Ra-226], radium-228, and thorium from inactive uranium processing sites. As a result of residual radiological materials from any designated processing site, the concentration of Ra-226 in land averaged over any area of 100 square meters shall not exceed the background level by more than (1) 5 picocuries per gram (pCi/g), averaged over the first 15 centimeters (cm) of soil below the surface, and (2) 15 pCi/g, averaged over 15-cm-thick layers of soil more than 15 cm below the surface.	UMTRCA Title 1 Sites	40 CFR § 192.12(a), 192.32(b)(2), and 192.41(a)	Not ARARs	These requirements are not ARARs for IR Site 2. They are not applicable because IR Site 2 is not an UMTRCA Title 1 site. They are not relevant and appropriate for sites like IR Site 2 that are remediated based upon restricted reuse. The Navy will place ICs to prohibit residential use of IR Site 2 because the level of contamination that will remain at IR Site 2 will be above unrestricted use levels.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Chemical-Specific[a] Applicable or Relevant and Appropriate Requirements

Requirement	Prerequisite	Citation[b]	ARAR Determination	Comments
Nuclear Regulatory Commission (NRC) Radiological Criteria				
Performance objectives for the land disposal of low-level radioactive waste. Concentrations of radioactive material that may be released to the general environment must not result in an annual dose exceeding 25 millirems to the body or any organ of a member of the general public.	Existing NRC-licensed low-level radioactive waste disposal site	10 CFR § 61.41	Relevant and appropriate	These requirements are not applicable because IR Site 2 is not an NRC-regulated site. The Navy has determined that these requirements are relevant and appropriate because radiological contamination may remain on IR Site 2. Implementation of the remedy selected in this ROD will result in concentrations of released radiological material less than an annual dose of 25 millirems to the body or any organ of a member of the general public. See Table 2-4 of the IR Site 2 ROD for remediation goals for Ra-226.
Requires that the total effective dose equivalent to individual members of the public not exceed 0.1 rem from licensed operation: construction, operation, and decommissioning of commercial reactors and fuel cycle facilities; possession, use, processing, exporting, and certain aspects of transporting nuclear materials and waste; and siting, design, construction, operations, and closure of waste disposal sites.	Existing NRC-licensed site	10 CFR § 20.1301	Relevant and appropriate	These requirements are not applicable because IR Site 2 is not an NRC-regulated site. The Navy has determined that these requirements are relevant and appropriate because radiological contamination may remain on IR Site 2.
A site will be considered acceptable for unrestricted use if the residual radioactivity that is distinguishable from background radiation results in total effective does equivalent to an average member of the critical group that does not exceed 25 millirem per year, including that from groundwater sources of drinking water, and that the residual radioactivity has been reduced to as low as reasonably achievable.	Existing NRC-licensed radiologically contaminated site.	10 CFR § 20.1402	Not an ARAR	These requirements are not applicable because IR Site 2 is not an NRC-regulated site. The Navy and USEPA have determined that this requirement is not relevant and appropriate because: (1) the regulation addresses circumstances that are not sufficiently similar to the remedial action selected, which includes a multilayer soil cover and ICs, and (2) the Alameda IR Site 2 remediation goals (RGs) are more protective.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Chemical-Specific[a] Applicable or Relevant and Appropriate Requirements				
Requirement	**Prerequisite**	**Citation**[b]	**ARAR Determination**	**Comments**
As a condition for license termination with restricted site use, the licensee must demonstrate that further reductions in residual radioactivity necessary to comply with the provisions of 10 CFR § 20.1402 would result in net public or environmental harm or were not being made because the residual levels associated with restricted conditions are as low as reasonably achievable.	Existing NRC-licensed radiologically contaminated site	10 CFR § 20.1403(a)	Not an ARAR	These requirements are not applicable because IR Site 2 is not an NRC-regulated site. These requirements are not relevant and appropriate because the RGs for IR Site 2 are protective of human health and the environment and are more stringent and protective than the criteria in 10 CFR § 20.1403.
As a condition for license termination with restricted site use, the licensee must make provisions for legally enforceable ICs that provide reasonable assurance that the total effective dose equivalent from residual radioactivity distinguishable from background to the average member of the critical group will not exceed 25 millirems per year.	Existing NRC-licensed radiologically contaminated site	10 CFR § 20.1403(b)	Not an ARAR	These requirements are not applicable because IR Site 2 is not an NRC-regulated site. These requirements are not relevant and appropriate because the RGs for IR Site 2 are protective of human health and the environment and are more stringent and protective than the criteria in 10 CFR § 20.1403.
State ARARs for Chemical Contamination				
California Environmental Protection Agency Department of Toxic Substances Control (DTSC)				
Definitions of designated waste, nonhazardous waste, and inert waste.	Waste	Cal. Code Regs. tit. 27, §§ 20210, 20220, and 20230	Applicable	Applicable for classifying waste and determining ARAR status of other requirements.
Definition of non-RCRA hazardous waste.	Waste	Cal. Code Regs. tit. 22, § 66261.3(a)(2) (C) or 66261.3(a)(2)(F), 66261.22(a)(3) and (4), 66261.24(a)(2)–(a)(8), 66261.101(a)(1) and (a)(2)	Applicable	Applicable for determining whether a waste is a non-RCRA hazardous waste.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Chemical-Specific[a] Applicable or Relevant and Appropriate Requirements				
Requirement	**Prerequisite**	**Citation[b]**	**ARAR Determination**	**Comments**
State ARARs for Radiological Contamination				
California Department of Public Health				
This regulation requires each person granted a specific license to do the following: • Keep records of information important to the decommissioning of a facility • Notify CDPH prior to vacating an installation that may have been contaminated with radioactive material • Complete certain activities if the person does not submit a specific license renewal application • Submit a decommissioning plan for approval by CDPH and, if approved, complete decommissioning The regulation also provides that if the information submitted does not adequately demonstrate that the premises are suitable for release for unrestricted use, CDPH shall inform the licensee of appropriate further actions and that specific licenses shall be terminated by written notice to the licensee when CDPH determines that: (1) radioactive material has been properly disposed; (2) reasonable effort has been made to eliminate residual radioactive contamination, if present; and (3) a radiation survey has been performed which demonstrates that the premises are suitable for release for unrestricted use; or other information submitted by the licensee is sufficient to demonstrate that the premises are suitable for release for unrestricted use.	A person with a specific license granted pursuant to Group 2 of Title 17, Division 1, Chapter 5, Subchapter 4	Cal. Code Regs. tit. 17, § 30256	Not an ARAR	<u>The State Regulation is not Applicable.</u> A Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) action must comply with promulgated state requirements, which are either “applicable” or “relevant and appropriate.” The Navy and USEPA assert that the provisions of Cal. Code Regs. tit. 17 §30256 are not “applicable” requirements because these regulations by their express terms apply to facilities licensed by the State of California that are undergoing a license termination process. The remediation of IR Site 2 under CERCLA is not part of a decommissioning or license termination procedure nor has any state license ever been issued for IR Site 2 because California laws and regulations regarding possession of radioactive materials do not apply to land possessed by the federal government. <u>The State Regulation is not Relevant and Appropriate.</u> The Navy and USEPA also assert that the provisions of this regulation are not “relevant and appropriate” because standards for decommissioning a licensed facility are not “appropriate” for this site because they do not address a set of circumstances similar to the remediation of IR Site 2. The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) specifies a series of factors to be used to compare the proposed CERCLA action with potential ARARs to determine if a requirement is both relevant and appropriate (40 CFR § 300.400[g][2]). CDPH regulation can be distinguished from the selected remedial action for IR Site 2 on a number of bases, including the

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Chemical-Specific[a] Applicable or Relevant and Appropriate Requirements				
Requirement	**Prerequisite**	**Citation[b]**	**ARAR Determination**	**Comments**
				medium addressed, type of action/activity regulated, and type of place regulated. More specifically, the license termination process described in the regulation appears to be intended to reach the conclusion that the facility is suitable for release for unrestricted use. This requirement is one among a detailed set of requirements for the “cradle-to-grave” management of licensed radiological material that were never applied to Alameda Point. The radionuclides addressed in IR Site 2 were not subject to such regulatory controls when they were used by the Navy or when they were released into the environment, and, hence, present very different issues; for example, very high volume of potentially impacted soil, low concentrations of radionuclides in soil, high cost of removal, etc. The remedial action selected in this ROD provides for a surface scan of the landfill to identify and address radiological contamination, which is accessible and acontainment remedy for residual radionuclides consisting of a multilayer soil cover and enforceable ICs that will ensure adequate protection of human health and the environment by preventing unauthorized disturbance of the cover and limiting use of the property. Containment remedies for sites potentially containing radionuclides consisting of remedial caps or covers supported by enforceable ICs have been accepted by USEPA and the California Environmental Protection Agency DTSC as compliant with CERCLA and the NCP (e.g., Marine Corps Air Station El Toro Operable Unit 2C [Site 3 and 5] ROD and Hunters Point Shipyard Amended Parcel B ROD). The state regulation is not more stringent than federal ARARs or risk-based cleanup levels. To qualify as a state ARAR under CERCLA and the NCP, a state regulation must be more stringent than federal laws

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Chemical-Specific[a] Applicable or Relevant and Appropriate Requirements				
Requirement	**Prerequisite**	**Citation[b]**	**ARAR Determination**	**Comments**
				and regulations. See 40 CFR §§ 300.400(g)(4) and 300.515(h)(2). The state is responsible for identifying potential state ARARs that it believes are more stringent than federal ARARs or risk-based cleanup levels and for demonstrating why they are more stringent. The remedy for IR Site 2 is based on a risk-based approach and the State has not demonstrated that the standards under § 30256(k) would be more stringent. The State has asserted that the phrase "eliminate residual radioactive contamination" in subsection 30256(k)(2) established a more-stringent standard because CERCLA does not require the elimination of residual radioactive contamination. The suggestion ignores the actual language of the regulation, which requires only "reasonable effort to eliminate residual radioactive contamination." This standard is by its terms flexible and cannot be assumed to require a more-stringent cleanup than the selected CERCLA remedial action. Subsection (k) neither contains a numerical standard nor describes a narrative standard, which would inform the question of whether (or what quantity of) radiological material can remain in the landfill. If there were a means to derive an objective standard from (k), that standard has not been identified by the State. Without an identified objective standard, there can be no basis for asserting that the requirement is more stringent than the CERCLA risk-based standards for the landfill. Although general goals can be considered state ARARs if they are directive in intent and enforceable (see the NCP preamble at 55 Fed. Reg. 8746, March 8, 1990), CDPH has stated that California laws concerning possession of radioactive materials do not apply to property that remains in the possession of the federal government. Therefore, these laws are not enforceable as required

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Chemical-Specific[a] Applicable or Relevant and Appropriate Requirements				
Requirement	**Prerequisite**	**Citation[b]**	**ARAR Determination**	**Comments**
				by CERCLA and the NCP. The State Regulation is not Substantive. A state regulation must be substantive rather than procedural to qualify as a state ARAR (see definitions of "applicable" and "relevant and appropriate" in the NCP at 40 CFR § 300.5). CDPH asserts that, in particular, subdivision (k) is a potential ARAR because it contains substantive requirements. Since these three criteria apply to decisions to terminate a specific license, the Navy and USEPA interpret them to be procedural and not substantive requirements. In summary, the Navy and USEPA have determined that the provisions of Cal. Code Regs. tit. 17 § 30256 do not constitute an ARAR because: (1) they are neither applicable" nor "relevant and appropriate", (2) they have not been demonstrated by the State to be more stringent than federal ARARs or risk-based cleanup levels, and (3) they are not substantive requirements.
GROUNDWATER				
Federal ARARs				
Resource Conservation and Recovery Act (Title 42 USC, ch. 82, §§ 6901 through 6991[i])[c]				
Defines RCRA hazardous waste. A solid waste is characterized as toxic based on the TCLP if the waste exceeds the TCLP maximum concentrations.	Waste	Cal. Code Regs. tit. 22, § 66261.21, 66261.22(a)(1), 66261.23, 66261.24(a)(1), and 66261.100	Applicable	Substantive provisions are applicable for determining whether waste is hazardous.
Owners/operators of RCRA treatment, storage, and disposal (TSD) facilities must comply with conditions designated to ensure that hazardous constituents entering groundwater from a regulated unit do not exceed concentration limits for chemicals	Waste	Cal. Code Regs., tit. 22, § 66264.94(a)(1), (a)(3), (b), (c), and (e)	Relevant and Appropriate	These requirements are not applicable because IR Site 2 was used for waste disposal before the RCRA waste management unit regulations were in place. However, substantive provisions of these requirements are relevant and appropriate for groundwater at IR Site 2 because the wastes at the

TABLE 5-1

Requirement	**Prerequisite**	**Citation[b]**	**ARAR Determination**	**Comments**
of concern set forth under Cal. Code Regs. tit. 22, § 66264.94 in the uppermost aquifer underlying the waste management area beyond the point of compliance.				site are similar to RCRA wastes, making this a chemical-specific ARAR for development of site RGs.
State ARARs				
California Environmental Protection Agency DTSC				
Definition of non-RCRA hazardous waste.	Waste	Cal. Code Regs. tit. 22, § 66261.3(a)(2) (C) or 66261.3(a)(2)(F), 66261.22(a)(3) and (4), 66261.24(a)(2)–(a)(8), 66261.101(a)(1) and (a)(2)	Applicable	Applicable for determining whether a waste is a non-RCRA hazardous waste.
State and Regional Water Quality Control Boards[c]				
Authorizes the State Water Resources Control Board (SWRCB) and San Francisco Bay Regional Water Quality Control Board (Water Board) to establish in water quality control (QC) plans beneficial uses and numerical and narrative standards to protect both surface water and groundwater quality. Authorizes regional water boards to issue permits for discharges to land or surface or groundwater that could affect water quality, including National Pollution Discharge Elimination System (NPDES) permits, and to take enforcement action to protect water quality.	Waters of the State	Cal. Water Code, div. 7, §§ 13241, 13243, 13263(a), 13269, and 13360 (Porter-Cologne Act)	Applicable	The Navy accepts the substantive provisions of §§ 13241, 13243, 13263(a), 13269, and 13360 of the Porter-Cologne Act enabling legislation, as implemented through the beneficial uses, water quality objectives, waste discharge requirements, and promulgated policies of the Basin Plan for the San Francisco Bay Region.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Chemical-Specific[a] Applicable or Relevant and Appropriate Requirements				
Requirement	**Prerequisite**	**Citation[b]**	**ARAR Determination**	**Comments**
Describes the water basins in the San Francisco Bay Region, establishes beneficial uses of groundwater and surface water, establishes water quality objectives, including narrative and numerical standards, and incorporates statewide water QC plans and policies.	Waters of the State	Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan) Chapter 2 and Chapter 3 (Cal. Water Code § 13240)	Applicable	Substantive provisions in Chapters 2 and 3 of the Water QC Plan for the San Francisco Bay are ARARs, except for the municipal beneficial use designation of the Basin Plan (see Section B2.2.1.2). The beneficial uses for the East Bay subbasin are agricultural supply, industrial service supply, and industrial process supply. These uses also apply to the shallow groundwater system at Alameda Point. The narrative standard requiring that all waters be maintained free of toxic substances in concentrations that are lethal to or that produce other harmful responses in aquatic organisms, and that there shall be no acute toxicity or chronic toxicity in ambient waters is an ARAR for groundwater.
Incorporated into all regional board basin plans. Designates all groundwater and surface waters of the state as drinking water except where the total dissolved solids exceed 3,000 milligrams per liter, and it is not reasonably expected by the Water Board to supply a public water system.	Waters of the State	SWRCB Resolution 88-63 (Sources of Drinking Water Policy)	Applicable	This resolution is an ARAR for the selected remedial alternative for groundwater.
Establishes the policy that high-quality waters of the State “shall be maintained to the maximum extent possible” consistent with the “maximum benefit to the people of the State.” It provides that whenever the existing quality of water is better than that required by applicable water quality policies, such existing high-quality water will be maintained until it has been demonstrated to the state that any change will be consistent with maximum benefit to the people of the state, will not unreasonably affect present and anticipated beneficial use of such water, and will not	Waters of the State	Statement of Policy With Respect to Maintaining High Quality of Waters in California, SWRCB Resolution 68-16	Not an ARAR	This policy is not a chemical-specific ARAR for determining RGs or for addressing any further migration of existing contamination at IR Site 2. The State does not agree. Whereas the Navy and State of California have not agreed on whether this resolution is an ARAR for this response action, the ROD documents each of the parties’ positions on the resolution but does not attempt to resolve the issue.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Chemical-Specific[a] Applicable or Relevant and Appropriate Requirements				
Requirement	**Prerequisite**	**Citation[b]**	**ARAR Determination**	**Comments**
result in water quality less than that prescribed in the policies. It also states that any activity that produces or may produce a waste or increased volume or concentration of waste and that discharges or proposes to discharge to existing high-quality waters will be required to meet waste-discharge requirements that will result in the best practicable treatment or control of the discharge.				
Describes requirements for Water Board oversight of investigation and cleanup and abatement activities resulting from discharges of hazardous substances. The Water Board may decide on cleanup and abatement goals and objectives for the protection of water quality and beneficial uses of water within each region. Establishes criteria for "containment zones" where cleanup to established water-quality goals is not economically or technically practicable.	Discharge of hazardous substances to waters of the State	Policies and procedures for investigation and cleanup and abatement of discharges under Cal. Water Code § 13304, SWRCB Resolution 92-49	Not an ARAR	This policy is not applicable because it is not more stringent than the federal ARAR at Cal. Code Regs. tit. 22, § 66264.94(a)(1), (a)(3), (b), (c), and (e). The State does not agree. Whereas the Navy and State of California have not agreed on whether this resolution is an ARAR for this response action, this ROD documents each of the parties' positions on the resolution but does not attempt to resolve the issue.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Chemical-Specific[a] Applicable or Relevant and Appropriate Requirements				
Requirement	**Prerequisite**	**Citation[b]**	**ARAR Determination**	**Comments**
		SURFACE WATER		
Federal ARARs				
Clean Water Act of 1977, as Amended (33 USC, ch. 26, §§ 1251–1387)[c]				
Water quality standards in the California Toxics Rule	Discharge to waters of the United States	40 CFR § 131.38	Applicable	The substantive numeric standards in the California Toxics Rule are ARARs for surface water and will be met in the surface water offshore of IR Site 2, at the interface of the groundwater and the Bay.
Water quality standards in the National Toxics Rule	Discharge to waters of the United States	40 CFR § 131.36(b)	Applicable	The substantive numeric standards in the National Toxics Rule are ARARs for surface water and will be met in the surface water offshore of IR Site 2, at the interface of the groundwater and the Bay.
Effluent limitations that meet technology-based requirements, including best conventional pollution-control technology and best available technology to the extent economically achievable.	Point source discharges to waters of the United States	33 USC, ch. 26, § 1311(b)(2) (CWA § 301[b])	Applicable	Substantive provisions are applicable for point source discharges of groundwater to surface water in San Francisco Bay associated with any dewatering activities associated with the implementation of the selected remedial alternative for soil.
State ARARs				
State and Regional Water Quality Control Boards[c]				
Authorizes the SWRCB and Water Board to establish in water QC plans beneficial uses and numerical and narrative standards to protect both surface water and groundwater quality. Authorizes regional water boards to issue permits for discharges to land or surface or groundwater that could affect water quality, including NPDES permits, and to take enforcement action to protect water quality.	Waters of the State	Cal. Water Code, div. 7, §§ 13241, 13243, 13263(a), 13269, and 13360 (Porter-Cologne Act)	Applicable	The Navy accepts the substantive provisions of §§ 13241, 13243, 13263(a), 13269, and 13360 of the Porter-Cologne Act enabling legislation, as implemented through the beneficial uses, water quality objectives, waste discharge requirements, promulgated policies of the Basin Plan for the San Francisco Bay Region.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Chemical-Specific[a] Applicable or Relevant and Appropriate Requirements				
Requirement	**Prerequisite**	**Citation[b]**	**ARAR Determination**	**Comments**
Describes the water basins in the San Francisco Bay Region, establishes beneficial uses of groundwater and surface water, establishes water quality objectives, including narrative and numerical standards, and incorporates statewide water QC plans and policies.	Waters of the State	Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan) Chapter 2 and Chapter 3 (Cal. Water Code §13240)	Applicable	Substantive provisions in Chapters 2 and 3 of the Water QC Plan for the San Francisco Bay are ARARs, except for the municipal beneficial use designation of the Basin Plan (see Section B2.2.1.2). The beneficial uses for the East Bay subbasin are agricultural supply, industrial service supply, and industrial process supply. These uses also apply to the shallow groundwater system at Alameda Point. The narrative standard requiring that all waters be maintained free of toxic substances in concentrations that are lethal to or that produce other harmful responses in aquatic organisms, and that there shall be no acute toxicity or chronic toxicity in ambient waters is an ARAR for surface water.
Requires analysis for each priority pollutant to determine if water-quality based effluent limitation is required. Provides effluent limitation development methodology.	Discharges of toxic priority pollutants into in land surface waters, bays, or estuaries	Policy for Implementation of Toxic Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (Inland Surface Waters Plan) (SWRCB 2000a), § 1.3 and 1.4	Applicable	The substantive provisions of this Plan are accepted as ARARs for implementing the California Toxics Rule and the National Toxics Rule, identified previously as federal ARARs, and for the point source discharge of groundwater to surface water that may be necessary in the implementation of the selected remedial alternative for soil.

Source: Final Record of Decision (DON 2010)

Notes:

[a] Chemical-specific concentrations used for FS evaluation may not be ARARs indicated in this table but may be based on other factors, including human health risk-based concentrations (40 CFR) § 300.430[e][2][i][A][1] and [2]), ecological risk-based concentrations (40 CFR § 300.430 [e][2][i][G]), or practical quantification limits of contaminants (40 CFR § 300.430[e][2][i][A][3]). Many action-specific ARARs contain chemical-specific limitations and are addressed in the action-specific ARAR tables. concentrations (40 CFR) § 300.430[e][2][i][A][1] and [2]), ecological risk-based concentrations (40 CFR § 300.430 [e][2][i][G]), or practical quantification limits of contaminants (40 CFR § 300.430[e][2][i][A][3]). Many action-specific ARARs contain chemical-specific limitations and are addressed in the action-specific ARAR tables.

[b] Only the substantive provisions of the requirement(s) cited in this table are ARARs.

[c] Statutes and policies, and their citations, are provided as headings to identify general categories of ARARs for the convenience of the reader; listing the statutes and policies does not indicate that the Navy accepts the entire statutes or policies as ARARs; specific ARARs are addressed in the table below each general heading; only pertinent substantive requirements of specific citations are considered ARARs.

CFR – *Code of Federal Regulations*
ch. – chapter
cm – centimeter
CWA – California Water Act
DTSC – (California) Department of Toxic Substances Control
Fed. Reg. – Federal Regulation
FFA – Federal Facility Agreement
FS – feasibility study
IC – institutional control
IR – Installation Restoration (Program)
NCP – National Oil and Hazardous Substances Pollution Contingency Plan
NPDES – National Pollutant Discharge Elimination System
NRC – Nuclear Regulatory Commission
pCi/g – picocuries per gram
QC – quality control
Ra-226 – radium-226
RCRA – Resource Conservation and Recovery Act
RG – remediation goal
ROD – Record of Decision
SWRCB – (California) State Water Resources Control Board
TCLP – toxicity characteristic leaching procedure
tit. – title
TSD – treatment, storage, and disposal
UMTRCA – Uranium Mill Tailings Radiation Control Act
USC – *United States Code*
USEPA – U.S. Environmental Protection Agency

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Location-Specific Applicable or Relevant and Appropriate Requirements					
Location	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
Federal ARARs					
Executive Order No. 11990, Protection of Wetlands[b]					
Wetland	Action to minimize the destruction, loss, or degradation of wetlands.	Wetland meeting definition of Section 7	40 CFR § 6.302(a)	Applicable	Substantive provisions are ARARs because wetlands are located within IR Site 2.
Clean Water Act of 1977, as Amended, Section 404 (33 USC § 1344)[b]					
Wetland	Action to prohibit discharge of dredged or fill material into wetland without permit.	Wetland as defined by Exec. Order No. 11990 Section 7	33 U.S.C § 1344	Applicable	Substantive provisions are ARARs because filling of some portions of the wetlands at IR Site 2 may be required to effectively implement the remedial alternative selected for the soil.
Migratory Bird Treaty Act of 1918 (16 USC § 703-712)[b]					
Migratory bird area	Protects almost all species of native birds in the U.S. from unregulated "take," which can include poisoning at hazardous waste sites.	Presence of migratory birds	16 U.S.C. § 703	Relevant and appropriate	Substantive provisions are ARARs because the wetlands at IR Site 2 could be used for nesting and foraging by many migratory bird species.
Habitat upon which endangered species or threatened species depend	Federal agencies may not jeopardize the continued existence of any listed species or cause the destruction or adverse modification of critical habitat. The Endangered Species Committee may grant an exemption for agency action if reasonable mitigation and enhancement measures such as propagation, transplantation, and habitat acquisition and improvement are implemented.	Determination of effect upon endangered or threatened species or its habitat. Critical habitat upon which endangered species or threatened species depend.	16 U.S.C. § 1536(a) and (h)(1)(B); 16 U.S.C. § 1538(a)(1)(B) and (G);	Applicable	The substantive provisions of these requirements are ARARs for IR Site 2 because the wetlands at IR Site 2 could be used by bird species that are listed as endangered or threatened. The selected remedy will prevent exposure of ecological receptors to contamination at IR Site 2 and will be implemented in a manner by which taking or adverse effects to threatened or endangered species does not occur.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Location-Specific Applicable or Relevant and Appropriate Requirements					
Location	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
Coastal Zone Management Act (16 USC §§ 1451 – 1464)[b]					
Within coastal zone	Conduct activities in a manner consistent with approved state management programs.	Activities affecting the coastal zone, including land under and adjacent to shore land	16 USC § 1456(c) 15 CFR § 930	Relevant and Appropriate	The CZMA specifically excludes federal lands from its jurisdiction; however, because IR Site 2 is adjacent to San Francisco Bay, the Navy has identified the CZMA as relevant and appropriate. The selected remedial alternatives for soil and groundwater at IR Site 2 will not result in filling in San Francisco Bay proper, but may entail some minor filling of the North Pond that is present in the wetlands portion of the site. To the extent that during the remedial design phase it is determined that some minor filling of the North Pond is required to place the multilayer soil cover, the Navy will ensure applicable substantive requirements are followed to protect the beneficial uses of San Francisco Bay in compliance with the CZMA by and the San Francisco Bay Plan (an approved state management program).
State ARARs					
California Endangered Species Act, California Fish & Game Code[b]					
State threatened or endangered species	No person shall import, export, take, possess, or sell any endangered or threatened species or part or product thereof.	Threatened or endangered species determination on or before January 1, 1985	Cal. Fish and Game Code § 2080	Relevant and Appropriate	Cal. Fish & Game Code § 2080 is not applicable because the United States of America has not waived sovereign immunity for this State of California requirement. The Savannah Sparrow is protected under Cal. Fish & Game Code § 2080. The substantive provisions of Cal. Fish & Game Code § 2080 appear to meet the criteria under 40 C.F.R. § 300.400(g)(2)(viii) and are potentially relevant and appropriate for this species. The DON is subject to the jurisdiction of the FESA. The substantive requirements of Cal. Fish & Game Code § 2080 that are more stringent than FESA are accepted by the DON as being relevant and appropriate. Thus, species that are listed under CESA, but not protected under FESA, will be addressed by the application of the substantive provisions of Cal. Fish & Game Code § 2080.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Location-Specific Applicable or Relevant and Appropriate Requirements					
Location	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
California Endangered Species Act, California Fish & Game Code[b]					
State threatened or endangered species (continued)	A take under Cal. Fish & Game Code § 2080 may be allowed if it is incidental to a response action and is fully mitigated.	Threatened or endangered species determination	Cal. Fish & Game Code § 2081(b)	Relevant and appropriate	The selected remedial alternatives do not include the intentional taking of species listed under the CESA. Cal. Fish & Game Code § 2081(b) allows for take incidental to otherwise lawful activities. The substantive provisions of Cal. Fish & Game Code § 2081(b) are integrally related to § 2080 and are also accepted as "relevant and appropriate" requirements consistent with 40 C.F.R. § 300.400(g)(2)(v). DON environmental restoration projects are exempt from procedural permitting processes under CERCLA Section 121(d)(2)(B)(i) (42 U.S.C. § 9621[d][2][B][i]).
Birds or mammals	It is unlawful to take birds or mammals with any net, pound, cage, trap, set line or wire, or poisonous substance, or to possess birds or mammals so taken, whether taken within or without this state.		Cal. Fish & Game Code § 3005(a) (Statute 1957, c. 456, p. 1353, Section 3005)	Not an ARAR	See June 16, 2009 letter from Department of Navy counsels Rex Callaway and Michael Waters to California Department of Fish and Game counsel Wendy Johnson for a more detailed explanation of the position set forth below. This section is not an environmental or facility siting law and is, therefore, not an ARAR (see CERCLA § 121(d) and 40 CFR § 300.5 of the NCP). The Navy further reviews below whether this requirement would otherwise qualify as a State ARAR if it were deemed to be an environmental requirement. Cal. Fish and Game Code § 3005(a) is not applicable because the United States of America has not waived sovereign immunity in the FESA for this State of California requirement. Pursuant to 40 CFR § 300.400(g)(2) of the NCP, the Navy has determined that this requirement is not "relevant and appropriate", because it does not address problems or situations sufficiently similar to the circumstances of the release or CERCLA response action and is not well-suited to the site based upon the pertinent provisions of Subsections 300.400(g)(2)(i) and (iv) of the NCP.2

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Location-Specific Applicable or Relevant and Appropriate Requirements					
Location	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
Birds or mammals (continued)					CERCLA response actions are intended to respond to releases of hazardous substances in order to protect human health and the environment including environmental receptors such as the species addressed in the statutory provisions and regulations cited by CDFG. In contrast, the purpose of this State requirement is to regulate and set forth conditions for the "taking" of the species addressed by those requirements. Moreover, that purpose is achieved through the regulation of intentional conduct directed at the species as opposed to incidental “take” (or possession, etc.) of species in the course of lawful activity such as CERCLA remedial action. The focus on intentional conduct is not well- suited to the circumstances at CERCLA sites. In summary, the purposes of this State requirement and the actions that it regulates do not include responding to releases of hazardous substances. Therefore, it is not “relevant and appropriate” based upon the pertinent provisions of Subsections 300.400(g)(2)(i) and (iv) of the NCP. The Navy’s ecological risk assessment process takes into account representative environmental receptors for the site and final remediation/cleanup goals will ensure that they are adequately protected from exposure to CERCLA hazardous substances that present unacceptable risk. In addition, any species that are present and are federal and/or state endangered, threatened, or fully protected species will be addressed by ARARs related to those designations. Although this requirement is not an ARAR, the Navy will coordinate with other natural resource trustees throughout the CERCLA remedial action process.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Location-Specific Applicable or Relevant and Appropriate Requirements					
Location	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
Bird nest or eggs	It is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto.	Bird nests or eggs on-site	Cal. Fish & Game Code § 3503 (Added by Statutes 1985, c. 1334, Section 6)	Not an ARAR	See June 16, 2009 letter from Department of Navy counsels Rex Callaway and Michael Waters to California Department of Fish and Game counsel Wendy Johnson for a more detailed explanation of the position set forth below. This section is not an environmental or facility siting law and is, therefore, not an ARAR (see Section 121(d) of CERCLA and 40 CFR Section 300.5 of the NCP). The Navy further reviews below whether this requirement would otherwise qualify as a State ARAR if it were deemed to be an environmental requirement. Cal. Fish and Game Code § 3503 is not applicable because the United States of America has not waived sovereign immunity in the FESA for this State of California requirement. Pursuant to 40 CFR § 300.400(g)(2) of the NCP, the Navy has determined that this requirement is not "relevant and appropriate", because it does not address problems or situations sufficiently similar to the circumstances of the release or CERCLA response action and is not well-suited to the site based upon the pertinent provisions of Subsections 300.400(g)(2)(i) and (iv) of the NCP.[3] CERCLA response actions are intended to respond to releases of hazardous substances in order to protect human health and the environment including environmental receptors such as the species addressed in the statutory provisions and regulations cited by CDFG. In contrast, the purpose of this State requirement is to regulate and set forth conditions for the "taking" of the species addressed by those requirements. Moreover, that purpose is achieved through the regulation of intentional conduct directed at the species as opposed to incidental “take” (or possession, etc.)

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Location-Specific Applicable or Relevant and Appropriate Requirements					
Location	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
Bird nest or eggs (continued)					of species in the course of lawful activity such as CERCLA remedial action. The focus on intentional conduct is not well- suited to the circumstances at CERCLA sites. In summary, the purposes of this State requirement and the actions that it regulates do not include responding to releases of hazardous substances. Therefore, it is not "relevant and appropriate" based upon the pertinent provisions of Subsections 300.400(g)(2)(i) and (iv) of the NCP. The Navy's ecological risk assessment process takes into account representative environmental receptors for the site and final remediation/cleanup goals will ensure that they are adequately protected from exposure to CERCLA hazardous substances that present unacceptable risk. Although this requirement is not an ARAR, the Navy will coordinate with other natural resource trustees throughout the CERCLA remedial action process.
Falconiformes or *Strigiformes*	It is unlawful to take, possess, or destroy any birds in the orders *Falconiformes* or *Strigiformes* (birds-of-prey) or to take, possess, or destroy the nest or eggs of any such bird.	*Falconiformes* or *Strigiformes* birds on-site	Cal. Fish & Game Code § 3503.5 (Added by Statutes 1985, c. 1334, Section 6)	Not an ARAR	The California Department of Fish and Game has withdrawn its identification of this requirement as a potential State ARAR (see December 3, 2009, letter from Department counsel Wendy Johnson to Navy counsels Rex Callaway and Mike Waters).

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Location-Specific Applicable or Relevant and Appropriate Requirements					
Location	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
Fully protected bird species/ habitat	Provides that it is unlawful to take or possess listed fully protected birds.	Taking of protected birds	Cal. Fish and Game Code § 3511	Relevant and Appropriate	Cal. Fish & Game Code § 3511 is not applicable because the United States of America has not waived sovereign immunity for this State of California requirement. The Savannah Sparrow is protected under Cal. Fish & Game Code § 3511. The substantive provisions of Cal. Fish & Game Code § 3511 appear to meet the criteria under 40 C.F.R. § 300.400(g)(2)(viii) and are potentially relevant and appropriate for these species. The DON is subject to the jurisdiction of the FESA. The substantive requirements of Cal. Fish & Game Code § 3511 that are more stringent than FESA are accepted by the DON as being relevant and appropriate.
Nongame birds	It is unlawful to take any nongame bird.	All birds occurring naturally in California that are not resident game birds, migratory game birds, or fully protected birds are nongame birds	Cal. Fish & Game Code § 3800(a) (Added by Statutes 1971, c. 1470, p. 2906, Section 13)	Not an ARAR	The California Department of Fish and Game has withdrawn its identification of this requirement as a potential State ARAR (see December 3, 2009, letter from Department counsel Wendy Johnson to Navy counsels Rex Callaway and Mike Waters).
Nongame mammals	All mammals occurring naturally in California that are not game mammals, fully protected mammals, or fur-bearing mammals, are nongame mammals. Nongame mammals or parts thereof may not be taken or possessed.	Response action may potentially take a nongame mammal	Cal. Fish & Game Code § 4150	Not an ARAR	The California Department of Fish and Game has withdrawn its identification of this requirement as a potential State ARAR (see December 3, 2009, letter from Department counsel Wendy Johnson to Navy counsels Rex Callaway and Mike Waters).

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Location-Specific Applicable or Relevant and Appropriate Requirements					
Location	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
Aquatic habitat	Action must be taken if toxic materials are placed where they can enter the waters of the state	Materials entering the waters of the state	Cal. Fish and Game Code § 5650(a), (b) and (f)	Relevant and Appropriate	California Fish and Game Code § 5650 is not applicable because the United States of America has not waived sovereign immunity in the FESA for this State of California requirement. While no direct deposition of material is expected to enter into or impact waters of the state, the substantive provisions of this standard will be complied with as an ARAR. Any removal action taking place in an area that may impact waters of the state will be conducted in such a way as to ensure that materials dug up will not be released into the water column.
Mollusks, crustaceans, or invertebrates	No mollusks, crustaceans, or other invertebrates may be taken, possessed aboard a boat, or landed for commercial purposes by any person in any tide pool or tidal area, including tide flats or other areas between the high tidemark and 1,000 feet beyond the low tidemark.	The taking and possession of fish for any commercial purpose	Cal. Fish & Game Code § 8500	Not an ARAR	The California Department of Fish and Game has withdrawn its identification of this requirement as a potential State ARAR (see December 3, 2009, letter from Department counsel Wendy Johnson to Navy counsels Rex Callaway and Mike Waters).
Reptiles and amphibians	It is unlawful to capture, collect, intentionally kill or injure, possess, purchase, propagate, sell, transport, import, or export any native reptile or amphibian, or part thereof.	Potentially affect native reptiles or amphibians	Cal. Code Regs. tit. 14 § 40	Not an ARAR	The California Department of Fish and Game has withdrawn its identification of this requirement as a potential State ARAR (see December 3, 2009, letter from Department counsel Wendy Johnson to Navy counsels Rex Callaway and Mike Waters).

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Location-Specific Applicable or Relevant and Appropriate Requirements					
Location	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
Nongame birds and mammals	Nongame birds and mammals may not be taken except as provided. (a) The following nongame birds and mammals may be taken at any time of the year and in any number except as prohibited: English sparrow, starling, coyote, weasels, skunks, opossum, moles, and rodents (excluding tree and flying squirrels, and those listed as furbearers, endangered, or threatened species). (b) Fallow, sambar, sika, and axis deer may be taken only concurrently with the general deer season. (c) Aoudad, mouflon, tahr, and feral goats may be taken all year. (d) American crows (*Corvus brachyrhynchos*) may be taken only under the provisions of Section 485 and by landowners or tenants, or by persons authorized in writing by such landowners or tenants, when American crows are committing or about to commit depredations upon ornamental or shade trees, agricultural crops, livestock, or wildlife, or when concentrated in such numbers and manner as to constitute a health hazard or other nuisance.	Taking of nongame birds and mammals	Cal. Code Regs. tit. 14, § 472	Not an ARAR	The California Department of Fish and Game has withdrawn its identification of this requirement as a potential State ARAR (see December 3, 2009, letter from Department counsel Wendy Johnson to Navy counsels Rex Callaway and Mike Waters).

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Location-Specific Applicable or Relevant and Appropriate Requirements					
Location	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
McAteer-Petris Act (California Government Code §§ 66600 through 66661)[b]					
Within the San Francisco Bay coastal zone	Reduce fill and disposal of dredged material in San Francisco Bay, maintain marshes and mudflats to the fullest extent possible to conserve wildlife, abate pollution, and protect the beneficial uses of the bay.	Activities affecting the San Francisco Bay and 100 feet landward of the shoreline	San Francisco Bay Plan at Cal. Code Regs. tit. 14, §§ 10110 through 11990	Relevant and appropriate	The Navy has determined that the substantive provisions of the CZMA are relevant and appropriate federal location-specific requirements of IR Site 2. The CZMA requires federal agency activity be conducted in a manner consistent with approved state management programs to the maximum extent practicable. The McAteer-Petris Act is enabling legislation for the San Francisco Bay Plan, an approved state management program for the San Francisco Bay. Substantive provisions of the McAteer-Petris Act and the San Francisco Bay Plan are relevant and appropriate because their authority is derived from the CZMA, a relevant and appropriate federal requirement. The Navy will conduct the selected remedial alternatives for soil and groundwater at IR Site 2 in accordance with the substantive provisions of the San Francisco Bay Plan.

Source: Final Record of Decision (DON 2010)

Notes:

a Only the substantive provisions of the requirements cited in this table are ARARs.

b Statutes and policies, and their citations, are provided as headings to identify general categories of ARARs for the convenience of the reader; listing the statutes and policies does not indicate that the Navy accepts the entire statutes or policies as ARARs; specific ARARs are addressed in the table below each general heading; only substantive requirements of the specific citations are considered ARARs.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Action-Specific Applicable or Relevant and Appropriate Requirements					
Action	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
EXCAVATION AND DISPOSAL OF WASTE					
FEDERAL ARARs					
Resource Conservation and Recovery Act (42 USC, Chapter 82, §§ 6901-6991[i])[a]					
On-site waste generation	Person who generates waste shall determine if that waste is a hazardous waste	Generator of waste	Cal. Code Regs., tit. 22, §§ 66262.10(a), 66262.11	Applicable	Applicable for characterization of waste generated during monitoring and construction of monitoring wells.
	Requirement for analyzing waste to determine whether waste is hazardous.	Generator of waste	Cal. Code Regs., tit. 22, § 66264.13(a) and (b)	Applicable	Applicable for characterization of waste generated during monitoring and construction of monitoring wells.
Hazardous waste accumulation	On-site hazardous waste accumulation is allowed for up to 90 days as long as the waste is stored in containers in accordance with § 66262.171–178 or in tanks, on drip pads, inside buildings, and is labeled and dated.	Accumulate hazardous waste	Cal. Code Regs. tit. 22, § 66262.34	Applicable	Applicable for characterization of waste generated during monitoring and construction of monitoring wells.
Container storage	Containers of RCRA hazardous waste must be: • maintained in good condition, • compatible with hazardous waste to be stored, and • closed during storage, except to add or remove waste.	Storage in a container of RCRA hazardous waste not meeting small quantity generator criteria before treatment, disposal, or storage elsewhere	Cal. Code Regs. tit. 22, § 66264.171, 66264.172, and 66264.173	Applicable and relevant and appropriate	The substantive provisions are ARARs for handling small amounts of waste generated in the implementation of the remedies (for example, the construction of new groundwater monitoring wells or other investigation derived waste). The requirements are applicable if waste is determined to be RCRA hazardous or non-RCRA, state- regulated hazardous waste. These requirements are relevant and appropriate for solid waste that is designated or nonhazardous solid waste.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Action-Specific Applicable or Relevant and Appropriate Requirements					
Action	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
Container storage (continued)	Inspect container storage areas weekly for deterioration.	Storage in a container of RCRA hazardous waste not meeting small-quantity generator criteria before treatment, disposal, or storage elsewhere	Cal. Code Regs. tit. 22, § 66264.174	Applicable and relevant and appropriate	The substantive provisions are ARARs for handling small amounts of waste generated in the implementation of the remedies (for example, the construction of new groundwater monitoring wells or other investigation derived waste). The requirements are applicable if waste is determined to be RCRA hazardous or non-RCRA, state- regulated hazardous waste. These requirements are relevant and appropriate for solid waste that is designated or nonhazardous solid waste.
	Place containers on a sloped, crack-free base, and protect from contact with accumulated liquid. Provide containment system with a capacity of 10 percent of the volume of containers of free liquids. Remove spilled or leaked waste in a timely manner to prevent overflow of the containment system.	Storage in a container of RCRA hazardous waste not meeting small- quantity generator criteria before treatment, disposal, or storage elsewhere	Cal. Code Regs. tit. 22, § 66264.175(a), (b)	Applicable and relevant and appropriate	The substantive provisions are ARARs for handling small amounts of waste generated in the implementation of the remedies (for example, the construction of new groundwater monitoring wells or other investigation derived waste). The requirements are applicable if waste is determined to be RCRA hazardous or non-RCRA, state- regulated hazardous waste. These requirements are relevant and appropriate for solid waste that is designated or nonhazardous solid waste.
	Keep incompatible materials separate. Separate incompatible materials stored near each other by a dike or other barrier.	Storage in a container of RCRA hazardous waste not meeting small- quantity generator criteria before treatment, disposal, or storage elsewhere	Cal. Code Regs. tit. 22, § 66264.177	Applicable and relevant and appropriate	The substantive provisions are ARARs for handling small amounts of waste generated in the implementation of the remedies (for example, the construction of new groundwater monitoring wells or other investigation derived waste). The requirements are applicable if waste is determined to be RCRA hazardous or non-RCRA, state- regulated hazardous waste. These requirements are relevant and appropriate for solid waste that is designated or nonhazardous solid waste.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Action-Specific Applicable or Relevant and Appropriate Requirements					
Action	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
Container storage (continued)	At closure, remove all hazardous waste and residues from the containment system, and decontaminate or remove all containers and liners.	Hazardous waste	Cal. Code Regs. tit. 22, § 66264.178	Applicable and relevant and appropriate	The substantive provisions are ARARs for handling small amounts of waste generated in the implementation of the remedies (for example, the construction of new groundwater monitoring wells or other investigation derived waste). The requirements are applicable if waste is determined to be RCRA hazardous or non-RCRA, state- regulated hazardous waste. These requirements are relevant and appropriate for solid waste that is designated or nonhazardous solid waste.
Waste Pile	Alternative requirements that are protective of human health or the environment may replace design, operating, or closure standards for temporary tanks and container storage areas.	Hazardous remediation waste temporarily stored in piles	Cal. Code Regs. tit. 22, § 66264.553(b),(d), (e), and (f)	Applicable and relevant and appropriate	The substantive provisions are applicable for temporarily storing excavated soil that is RCRA hazardous or non-RCRA, state regulated hazardous waste prior to on-site relocation or off-site disposal. The substantive provisions are relevant and appropriate for temporarily storing excavated soil that is designated or nonhazardous waste.
	Allows generators to accumulate solid remediation wastes during remedial operations in a U.S. EPA designated pile for storage only, up to 2 years, without triggering LDRs.	Hazardous remediation waste temporarily stored in piles	40 CFR§ 264.554(d)(1)(i–ii) and (d)(2),(e), (f), (h), (i),(j), and (k)	Applicable and relevant and appropriate	The substantive provisions are applicable for temporarily storing excavated soil that is RCRA hazardous or non-RCRA, state regulated hazardous waste prior to on-site relocation or off-site disposal. The substantive provisions are relevant and appropriate for temporarily storing excavated soil that is designated or nonhazardous waste.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Action-Specific Applicable or Relevant and Appropriate Requirements					
Action	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
Waste Pile (continued)	At closure, owner shall remove or decontaminate all waste residues, contaminated containment system components, contaminated subsoils, and structures and equipment contaminated with waste and leachate, and manage them as hazardous waste. If waste is left onsite, perform postclosure care in accordance with the closure and postclosure care requirements that apply to landfills.	Waste pile used to store hazardous waste	Cal. Code Regs. tit. 22, § 66264.258(a) and (b) except references to procedural requirements	Applicable and relevant and appropriate	The substantive provisions are applicable for temporarily storing excavated soil that is RCRA hazardous or non-RCRA, state regulated hazardous waste prior to on-site relocation or off-site disposal. The substantive provisions are relevant and appropriate for temporarily storing excavated soil that is designated or nonhazardous waste.
Military Munitions Rule (40 CFR part 266 subpart M)[a]					
Management of military munitions	Identification of hazardous waste munitions and treatment and storage requirements for hazardous waste munitions.	Presence of military munitions	40 CFR §§ 266.203, 266.205, and 266.206	Applicable	The substantive provisions of these requirements are applicable to any MPPEH found while implementing the remedy.
Clean Water Act of 1977 (33 USC § 1344)[a]					
Storm Water Discharge	General requirements for a storm water management plan and implementation of best management practices.	Construction involving one acre or more of soil disturbance	40 CFR § 122.44(k)(2) and (4)	Applicable	Substantive provisions are applicable for the selected remedial alternative for soil wherein an acre or more of soil disturbance is expected.
Clean Air Act (42 USC §§ 7401–7671)[a]					
Discharge to air	A person shall not emit from any source for a period or periods aggregating more than 3 minutes in any hour a visible emission which is as dark as or darker than No. 1 on the Ringelmann chart or of such opacity as to obscure an observer's view to an equivalent or greater degree. A person shall not emit for a period or periods aggregating more than 3 minutes in any hour, an emission equal to or greater than 20 percent opacity.	Emissions	BAAQMD Regulation 6, § 6-301 and 302	Applicable	Substantive provisions are applicable for the earthwork and soil excavation activities.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Action-Specific Applicable or Relevant and Appropriate Requirements					
Action	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
MULTILAYER SOIL COVER					
FEDERAL ARARs					
Resource Conservation and Recovery Act (42 USC, Chapter 82, §§ 6901-6991[i])a					
Site closure	Minimize the need for further maintenance controls and minimize or eliminate, to the extent necessary to protect human health and the environment, postclosure escape of hazardous waste, hazardous constituents, leachate, contaminated rainfall or runoff, or waste decomposition products to groundwater or surface water or to the atmosphere.	Hazardous waste management facility	Cal. Code Regs. tit. 22, § 66264.111(a) and (b)	Relevant and Appropriate	Substantive provisions are relevant and appropriate for the multilayer soil cover.
Clean closure	During the partial and final closure periods, all contaminated equipment, structures, and soils shall be properly disposed or decontaminated by removing all hazardous waste and residues.	Hazardous waste management facility	Cal. Code Regs. tit. 22, § 66264.114	Relevant and appropriate	Substantive provisions are relevant and appropriate for the multilayer soil cover.
Final cover	The final cover shall be designed and constructed to function with minimum maintenance.	Hazardous waste treatment, storage, or disposal facility	Cal. Code Regs. tit. 22 § 66264.310(a)(2)	Relevant and appropriate	Substantive provisions are relevant and appropriate for the multilayer soil cover.
	The final cover shall be designed and constructed to promote drainage and minimize erosion or abrasion of the cover.	Hazardous waste treatment, storage, or disposal facility	Cal. Code Regs. tit. 22 § 66264.310(a)(3)	Relevant and appropriate	Substantive provisions are relevant and appropriate for the multilayer soil cover.
	The final cover shall be designed and constructed to accommodate settling and subsidence so that the cover's integrity is maintained.	Hazardous waste treatment, storage, or disposal facility	Cal. Code Regs. tit. 22 § 66264.310(a)(4)	Relevant and appropriate	Substantive provisions are relevant and appropriate for the multilayer soil cover.
	Landfill cover design requirements.	Hazardous waste treatment, storage, or disposal facility	Cal. Code Regs. tit. 22, § 66264.228(e) through (r)	Relevant and appropriate	Substantive provisions are relevant and appropriate for the multilayer soil cover.
	The final cover shall be designed and constructed to accommodate lateral and vertical shear forces generated by the maximum credible earthquake so that the integrity of the cover is maintained.	Hazardous waste treatment, storage, or disposal facility	Cal. Code Regs. tit. 22, § 66264.310(a)(5)	Relevant and appropriate	Substantive provisions are relevant and appropriate for the multilayer soil cover.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Action-Specific Applicable or Relevant and Appropriate Requirements					
Action	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
Postclosure care	After closure, maintaining the integrity and effectiveness of the final cover, which includes making repairs to the cap as necessary to correct the effects of settling, subsidence, erosion, or other events throughout the postclosure period.	Hazardous waste treatment, storage, or disposal facility	Cal. Code Regs. tit. 22, § 66264.310(b)(1)	Relevant and appropriate	Substantive provisions are relevant and appropriate for the multilayer soil cover.
Site security	Prevent the unknowing entry, and minimize the possibility for the unauthorized entry of persons or livestock onto the active portion of the facility.	Hazardous waste treatment, storage, or disposal facility	Cal. Code Regs. tit. 22, § 66264.14(a)	Relevant and appropriate	Substantive provisions are relevant and appropriate for the multilayer soil cover.
Clean Water Act of 1977 (33 USC § 1344)[a]					
Storm Water Discharge	General requirements for a storm water management plan and implementation of best management practices.	Construction involving one acre or more of soil disturbance	40 CFR § 122.44(k)(2)and (4)	Applicable	Substantive provisions are applicable for constructing the multilayer soil cover.
Clean Air Act (42 USC § 7401-7671)[a]					
Discharge to air	Provisions of SIP approved by the U.S. EPA under Section 110 of the Clean Air Act.	Major sources of air pollutants	40 USC § 7410; portions of 40 CFR § 52.220	Applicable	Substantive provisions are applicable for constructing the multilayer soil cover but implemented through the SIP.
Landfill gas control	The operator shall ensure that landfill gases generated at a disposal site are controlled. Methane must not exceed 1.25 percent by volume in air within on- site structures, concentrations of methane gas migrating from the landfill must not exceed 5 percent by volume in air at the property boundary, and trace gases shall be controlled to prevent adverse acute and chronic exposure to toxic and/or carcinogenic compounds.	Cal. Code Regs. tit. 27 requirements are applicable only for waste discharged after July 18, 1997, unless otherwise noted	Cal. Code Regs. tit. 27, § 20921(a)(1),(2), and (3)	Relevant and appropriate	Substantive provisions are relevant and appropriate for the multilayer soil cover.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Action-Specific Applicable or Relevant and Appropriate Requirements					
Action	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
Erosion control	Diversion and drainage facilities shall be designed, constructed, and maintained to accommodate the anticipated volume of precipitation and peak flows. Collection and holding facilities associated with precipitation and drainage control systems shall be emptied immediately or otherwise managed to maintain system design capacity.	Cal. Code Regs. tit. 27 requirements are applicable only for waste discharged after July 18, 1997, unless otherwise noted	Cal. Code Regs. tit. 27, §§ 20365(c) and(d), 21090(c)(4),and 21150	Relevant and appropriate	Substantive provisions are relevant and appropriate for the multilayer soil cover.
Engineered alternatives to final cover standard	Alternatives to prescriptive standards may be considered provided the prescriptive standard is not feasible and there is a specific engineered alternative that is consistent with the performance goal and affords equivalent protection against water quality impairment. The Water Board can allow any alternative final cover that it finds will continue to isolate the waste and irrigation waters at least as well as a final cover built in accordance with applicable prescriptive standards.	Cal. Code Regs. tit. 27 requirements are applicable only for waste discharged after July 18, 1997, unless otherwise noted	Cal. Code Regs. tit. 27, §§ 20080(b) and(c) and 21090(a)	Relevant and appropriate	Substantive provisions are relevant and appropriate for the multilayer soil cover.
Vegetative layer	Closed landfills shall be provided with an uppermost cover layer consisting of either a vegetative layer consisting of not less than 1 foot of soil capable of sustaining native or other suitable plant growth or a mechanically erosion-resistant layer.	Cal. Code Regs. tit. 27 requirements are applicable only for waste discharged after July 18, 1997, unless otherwise noted	Cal. Code Regs. tit. 27, § 21090(a)(3)	Relevant and appropriate	Substantive provisions are relevant and appropriate for the multilayer soil cover.
Final grading	The final cover of closed landfills shall be designed, graded, and maintained to prevent ponding and to prevent site erosion due to high runoff velocities. Slopes should be at least 3 percent.	Cal. Code Regs. tit. 27 requirements are applicable only for waste discharged after July 18, 1997, unless otherwise noted	Cal. Code Regs. tit. 27, § 21090(b)(1)	Relevant and appropriate	Substantive provisions are relevant and appropriate for the multilayer soil cover.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Action-Specific Applicable or Relevant and Appropriate Requirements					
Action	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
RADIOLOGICAL SCREENING AND MPPEH SWEEP					
FEDERAL ARARs					
Atomic Energy Act of 1954 (42 U.S.C. ch. 23, § 2011 et seq.)a					
Temporary storage of radiologically contaminated soil	The licensee shall secure from unauthorized removal or access licensed materials that are stored in controlled or unrestricted areas.	Existing NRC-licensed site	10 CFR § 20.1801	Relevant and appropriate	This requirement is not applicable because IR Site 2 is not an NRC- licensed facility. The substantive provisions of this requirement are relevant and appropriate for staging excavated soil contaminated with ROCs at levels at or above remediation goals prior to off-site disposal.
	The licensee shall control and maintain constant surveillance of licensed material that is in a controlled or unrestricted area and that is not in storage.	Existing NRC-licensed site	10 CFR § 20.1802	Relevant and appropriate	This requirement is not applicable because IR Site 2 is not an NRC- licensed facility. The substantive provisions of this requirement are relevant and appropriate for staging excavated soil contaminated with ROCs at levels at or above remediation goals prior to off-site disposal.
WETLAND MITIGATION					
PLAN FEDERAL ARARs					
Clean Water Act of 1977 (33 USC § 1344)[a]					
Discharge of dredged material	U.S. Army Corps of Engineers requirements for permitting discharges of dredged material to waters of the United States.	Discharge of dredged material to waters of the United States, including adjacent wetlands	33 CFR § 320.4 40 CFR §§ 230.10, 230.11, 230.20-230.25, 230.31, 230.32, 230.41, 230.42 and 230.53	Applicable	Substantive provisions are applicable for the multilayer soil cover in the event that during the remedial design phase it is determined that dredged material needs to be discharged to waters of the United States to effectively implement the soil remedy.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Action-Specific Applicable or Relevant and Appropriate Requirements					
Action	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
REMOVAL OF RADIOLOGICALLY-IMPACTED WASTE					
FEDERAL ARARs					
Resource Conservation and Recovery Act (42 USC, Chapter 82, §§ 6901-6991[i])[a]					
On-site generation of waste	Person who generates waste shall determine if that waste is a hazardous waste.	Generator of waste	Cal. Code Regs., tit. 22, §§ 66262.10(a), 66262.11	Applicable	Applicable for characterization of waste generated during removal of radiological hot spots prior to placing the multilayer soil cover.
	Requirement for analyzing waste to determine whether waste is hazardous.	Generator of waste	Cal. Code Regs., tit. 22, § 66264.13(a) and (b)	Applicable	Applicable for characterization of waste generated during removal of radiological hot spots prior to placing the multilayer soil cover.
Temporary waste pile	Alternative requirements that are protective of human health or the environment may replace design, operating, or closure standards for temporary tanks and container storage areas.	Hazardous remediation waste temporarily stored in piles.	40 CFR§ 264.554(d)(1)(i–ii) and (d)(2),(e), (f), (h), (i),(j), and (k)	Applicable and relevant and appropriate	The substantive provisions are applicable for temporarily storing excavated soil that is RCRA hazardous or non-RCRA, state-regulated hazardous waste prior to on-site relocation or off-site disposal. The substantive provisions are relevant and appropriate for temporarily storing excavated soil that is designated or nonhazardous waste.
Clean Water Act of 1977 (33 USC § 1344)a					
Storm Water Discharge	General requirements for a storm water management plan and implementation of best management practices.	Construction involving one acre or more of soil disturbance	40 CFR § 122.44(k)(2) and (4)	Applicable	Substantive provisions are applicable for the excavation of waste during removal of radiological hot spots prior to placing the multilayer soil cover.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Action-Specific Applicable or Relevant and Appropriate Requirements					
Action	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
Atomic Energy Act of 1954 (42 U.S.C. ch. 23, § 2011 et seq.)[a]					
Temporary storage of radiologically contaminated soil	The licensee shall secure from unauthorized removal or access licensed materials that are stored in controlled or unrestricted areas.	Existing NRC-licensed site	10 CFR § 20.1801	Relevant and appropriate	This requirement is not applicable because IR Site 2 is not an NRC- licensed facility. The substantive provisions of this requirement are relevant and appropriate for staging excavated soil contaminated with ROCs at levels at or above remediation goals prior to off-site disposal.
	The licensee shall control and maintain constant surveillance of licensed material that is in a controlled or unrestricted area and that is not in storage.	Existing NRC-licensed site	10 CFR § 20.1802	Relevant and appropriate	This requirement is not applicable because IR Site 2 is not an NRC- licensed facility. The substantive provisions of this requirement are relevant and appropriate for staging excavated soil contaminated with ROCs at levels at or above remediation goals prior to off-site disposal.
GROUNDWATER MONITORING					
FEDERAL ARARs					
Resource Conservation and Recovery Act (42 USC, Chapter 82, §§ 6901-6991[i])[a]					
Groundwater monitoring	After final closure, maintain and monitor the groundwater monitoring system and comply with all other applicable requirements of article 6 of chapter 14.	Hazardous waste treatment, storage, or disposal facility	Cal. Code Regs. tit. 22, § 66264.310(b)(3)	Relevant and appropriate	The substantive provisions are relevant and appropriate for the groundwater monitoring associated with constructing the multilayer soil cover over the waste at IR Site 2. The specific provisions of chapter 14, article 6 that the Navy has identified as ARARs are discussed below.
Monitoring	The owner or operator shall establish and implement, in conjunction with the corrective action measures, a water quality monitoring program that will demonstrate the effectiveness of the corrective action program and be effective in determining compliance with the water quality protection standard and in determining the success of the corrective action measures under subsection (c) of this section.	Hazardous waste treatment, storage, or disposal facility	Cal. Code Regs. tit. 22, § 66264.100(d)	Relevant and Appropriate	The substantive provisions are relevant and appropriate for the selected remedial alternative for groundwater.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Action-Specific Applicable or Relevant and Appropriate Requirements					
Action	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
Completion of response action	The corrective action program is complete when compliance with the water quality standard is demonstrated based on the results of sampling and analysis for all constituents of concern for a period of 1 year.	Hazardous waste treatment, storage, or disposal facility	Cal. Code Regs. tit. 22, § 66264.100(g)(1)	Relevant and Appropriate	The substantive provisions are relevant and appropriate for the selected remedial alternative for groundwater.
Chemicals of concern	Identify constituents of concern including the waste constituents, reaction products, and hazardous constituents that are reasonably expected to be in or derived from waste contained in the regulated unit.	Hazardous waste treatment, storage, or disposal facility	Cal. Code Regs. tit. 22, § 66264.93	Relevant and Appropriate	The substantive provisions are relevant and appropriate for the selected remedial alternative for groundwater.
Resource Conservation and Recovery Act (42 USC, Chapter 82, §§ 6901-6991[i])[a] (continued)					
Monitoring	Requirements for monitoring groundwater, surface water, and the vadose zone.	Hazardous waste treatment, storage, or disposal facility	Cal. Code Regs. tit. 22, § 66264.97(b)(1)(A), (B) and (C), 66264.97(b)(1)(D)(1) and (2), 66264.97(b)(2), 66264.97(b)(4)-(7), 66264.97(e)(6), 66264.97(e)(12)(A) and (B), 66264.97(e)(13), and 66264.97(e)(15)	Relevant and Appropriate	The substantive provisions are relevant and appropriate for the selected remedial alternative for groundwater.
	Requirements for a detection monitoring program.	Hazardous waste treatment, storage, or disposal facility	Cal. Code Regs. tit. 22, § 66264.98(e)(1-5), (i), (j), (k)(1-3), (4)(A) and (D),(5), (7)(C) and (D),(n)(1),(2)(B), and (C)	Relevant and Appropriate	The substantive provisions are relevant and appropriate for the selected remedial alternative for groundwater.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Action-Specific Applicable or Relevant and Appropriate Requirements					
Action	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
Monitoring (continued)	Requirements for an evaluation monitoring program.	Hazardous waste treatment, storage, or disposal facility	Cal. Code Regs. tit. 22, § 66264.99(b), (e)(1)–(6), (f)(3), and (g)	Relevant and Appropriate	The substantive provisions are relevant and appropriate for the selected remedial alternative for groundwater.
	Requires continued monitoring until the regulated unit has been in compliance with the water quality protection standard for a period of three consecutive years and all waste, waste residues, contaminated subsoils and all other contaminated geologic materials are removed or decontaminated at closure.	Hazardous waste treatment, storage, or disposal facility	Cal. Code Regs. tit. 22, § 66264.90(c)(1) and (c)(2)	Relevant and Appropriate	The substantive provisions are relevant and appropriate for the selected remedial alternative for groundwater.
	For compliance demonstration each "must have remained at or below its respective concentration limit during a proof period of at least one year . . . and . . . (2) each Monitoring Point must have been evenly distributed throughout the proof period and have consisted of no less than eight sampling events per year per Monitoring Point."	Waste discharged after July 18, 1997	Cal. Code Regs. tit. 27, § 20430(g)(1)	Relevant and Appropriate	The substantive provisions are relevant and appropriate for the selected remedial alternative for groundwater.
INSTITUTIONAL CONTROLS					
State ARARs					
California Civil Code (Cal. Civil Code § 1471)[a]					
Land use controls	Provides conditions under which land use restrictions will apply to successive owners of land	Transfer property from the Navy to a nonfederal agency	Cal. Civil Code § 1471	Relevant and appropriate	Substantive provisions are the following general narrative standard: "to do or refrain from doing some act on his or her own land … where (c) Each such act relates to the use of land and each such act is reasonably necessary to protect present or future human health or safety of the environment as a result of the presence of hazardous materials, as defined in § 25260 of the Cal. Health & Safety Code." This narrative standard would be implemented through incorporation of restrictive covenants in the deed at the time of transfer.

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Action-Specific Applicable or Relevant and Appropriate Requirements

Action	Requirement	Prerequisite	Citation	ARAR Determination	Comments
California Health and Safety Code Land Use Controls (Cal. Health & Safety Code §§ 25202.5, 25222.1, 25232(b)(1)(A)(E), 25233(c), § 25234, § 25355.5)					
Land use controls	Allows DTSC to enter into an agreement with the owner of a hazardous waste facility to restrict present and future land uses.	Transfer property from the Navy to a nonfederal agency	Cal. Health & Safety Code § 25202.5	Relevant and appropriate	The substantive provisions of this section are the general narrative standards to restrict "present and future uses of all or part of the land on which the facility …is located."
	Provides a streamlined process to be used to enter into an agreement to restrict specific use of property in order to implement the substantive use restrictions.	Transfer property from the Navy to a nonfederal agency.	Cal. Health & Safety Code § 25222.1	Relevant and appropriate	Cal. Health & Safety Code § 25222.1 provides the authority for the state to enter into voluntary agreements to establish land use covenants with the owner of the property. The substantive provision of Cal. Health & Safety Code § 25222.1 is the general narrative standard: "restricting specified uses of the property."
California Health and Safety Code Land Use Controls (Cal. Health & Safety Code §§ 25202.5, 25222.1, 25233(c), § 25234, § 25355.5)					
Land use controls	Provides a process for obtaining a written variance from a land use restriction.	Transfer property from the Navy to a nonfederal entity.	Cal. Health & Safety Code § 25233(c)	Relevant and appropriate	Cal. Health & Safety Code § 25233(c) sets forth substantive criteria for granting variances from the uses prohibited in § 25232(b)(1)(A)- (E) based on specific environmental and health criteria.
	Provides a process by which DTSC can remove land use restrictions	Transfer property from the Navy to a nonfederal entity	Cal. Health & Safety Code § 25234	Relevant and appropriate	Cal. Health & Safety Code § 25234 sets forth the following "relevant and appropriate" substantive criteria for the removal of a land-use restriction on the grounds that "…the waste no longer creates a significant existing or potential hazard to present or future public health or safety."
	Authorizes DTSC to enter into an enforceable agreement that imposes restrictions on present and future uses of the property	Transfer property from the Navy to a nonfederal entity	Cal. Health & Safety Code § 25355.5(a)(1)(C)	Relevant and appropriate	The substantive requirements of the following Cal. Health & Safety Code §25355.5(a)(1)(C) provisions are "relevant and appropriate": "…execution and recording of a written instrument that imposes an easement, covenant, restriction, or servitude, or combination thereof , as appropriate, upon the present and future uses of the site."

TABLE 5-1

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS SUMMARY

Action-Specific Applicable or Relevant and Appropriate Requirements					
Action	**Requirement**	**Prerequisite**	**Citation**	**ARAR Determination**	**Comments**
Cal/EPA Department of Toxic Substances Control (Cal. Code Regs., tit. 22, § 67391.1)[a]					
Land use covenants	A land use covenant imposing appropriate limitations on land use shall be executed and recorded when facility closure, corrective action, remedial or removal action, or other response actions are undertaken and hazardous materials, hazardous wastes or constituents, or hazardous substances will remain at the property at levels which are not suitable for unrestricted use of the land.	Property transfer by federal government to nonfederal entity.	Cal. Code Regs., tit. 22, § 67391.1	Relevant and appropriate	Relevant and appropriate when the Navy is transferring property to a nonfederal agency. EPA considers the following portions of 22 CCR 67391.1 to be relevant and appropriate for this ROD: (a)(1), (a)(2), (d), (e)(1) and (e)(2). The Navy has selected ICs as part of the remedies for soil and groundwater. These requirements are ARARs for those ICs. EPA agrees that the substantive portions of the regulations referenced are ARARs. EPA specifically considers sections (a), (b), (d), and (e) of Cal. Code Regs. tit. 22 § 67391.1, to be ARARs for this ROD. DTSC's position is that all of the state regulation is an ARAR.

Citation	Requirement	Information in Support of Evaluation
McAteer-Petris Act (California Government Code §§ 66600 through 66661)		
Bay Plan at Cal. Code Regs, tit. 14, §§ 10110 through 11990	Reduce fill and disposal of dredged material in San Francisco Bay, maintain marshes and mudflats to the fullest extent possible to conserve wildlife, abate pollution, and protect the beneficial uses of the San Francisco Bay.	The Bay Plan, developed under the authority of the McAteer-Petris Act, is an approved state coastal zone management program. The remedial alternative for Installation Restoration (IR) Site 2, the former landfill, as selected in the record of decision (ROD) and addressed in the Remedial Action Work Plan (RAWP), is consistent with the substantive policies of the Bay Plan to the extent practicable. The remainder of this table addresses the specific substantive relevant and appropriate provisions of the McAteer-Petris Act and the Bay Plan and presents specific information to support this consistency evaluation. See also Navy response to BCDC comments on the RAWP for further information (Attachment 13).
Part III of Bay Plan (Findings and Policies Concerning Fish, Other Aquatic Organisms and Wildlife in the Bay, Policy 1)	The Bay's tidal marshes, tidal flats, and subtidal habitat should be conserved, restored and increased to assure the benefits of fish, other aquatic organisms and wildlife for future generations, to the greatest extent feasible. Specific habitats that are needed to conserve, increase or prevent the extinction of any native species, species threatened or endangered, species that the California Department of Fish and Game has determined are candidates for listing as endangered or threatened under the California Endangered Species Act, or any species that provides substantial public benefits, should be protected.	Implementation of the remedy will comply with the substantive provisions of this policy. The remedy is designed to minimize damage to the tidal marshes, tidal flats, and subtidal habitat and to protect fish, other aquatic organisms, and wildlife. The wetland areas at Site 2 do not support a high diversity or density of invertebrates or mammals, and although the wetland ponds may be used by a variety of avian species, they do not support aquatic vegetation or significant invertebrate and fish populations. However, the DON (Department of Navy) will implement reasonable measures to ensure adequate protection of ecological receptors during excavation and cover placement, and the remedy will ultimately result in improved habitat. The DON will also comply with the additional Fish, Other Aquatic Organisms and Wildlife. Policy No. 2 states that specific habitats that are needed to conserve, increase or prevent the extinction of any native species, species threatened or endangered, species that the California Department of Fish and Game has determined are candidates for listing as endangered or threatened under the California Endangered Species Act, or any species that provides substantial public benefits, should be protected. The DON has identified the substantive provisions of the federal and California Endangered Species Act as applicable or relevant and appropriate requirements (ARARs) and will comply with the substantive provisions of the requirements identified. The habitats of listed species will be protected during remediation and upon completion through the mitigation measures identified in Attachment 7. The DON will coordinate with the U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Game during remedial design construction activities to ensure compliance with the substantive provisions of these ARARs. As described in Attachment 6, the DON will implement measures to avoid, minimize, and mitigate for potential impacts from remedial activities.

Table 5-2 CERCLA Substantive BCDC Bay Plan Consistency Evaluation for IR Site2, Former Landfill, Alameda Point California (Remedial Design/Remedial Action Work Plan, IR Site 2 Former Landfill, Alameda Point, California)

Citation	Requirement	Information in Support of Evaluation
Part III of Bay Plan (Findings and Policies Concerning Tidal Marshes and Tidal Flats around the Bay, Policy 1)	Tidal marshes and tidal flats should be conserved to the fullest possible extent. Projects harming tidal marshes and tidal flats should be allowed only for purposes providing substantial public benefits and only if there is no feasible alternative. Restoration projects should include a monitoring program with biological and physical goals and success criteria.	Tidal marshes and tidal flats will be conserved to the fullest possible extent and the filling of 0.89 acre of tidal wetland will provide substantial public benefits as explained below. The evaluation presented in Section 5.6.6.1, and Attachment 1, and Section 3, Attachment 7, of the Remedial Design/Remedial Action Work Plan (RAWP) establishes that there is no feasible alternative to installing the soil cover that will anchor into the margin of the intertidal zones and wetlands at IR Site 2. Bulldozing the landfill back from the wetland margin in an effort to consolidate the footprint eliminates destruction of the wetland margin, in theory, but the re-grading and placement of contaminated material creates unnecessary risk for releases, the larger mass being moved during consolidation has a similar potential to disturb the surrounding wetlands, there is unnecessary potential for worker exposures, and the consolidation approach had significant cost and schedule increases. The approved remedy incorporates appropriate actions to minimize adverse impacts to San Francisco Bay such as erosion controls (Attachment 8), and on-site mitigation of lost wetlands with equal or better value. Total affected wetland area is 0.89 acre of tidal wetland. The success criteria are outlined in Section 11 of Attachment 7. The remedy also complies with the other Tidal Marshes and Tidal Flats policies, which include: • Thoroughly evaluating any proposed filling, diking or dredging project to determine the effect of the project on tidal marshes and tidal flats, and designing projects to minimize, and if feasible, avoid any harmful effects • Designing projects to avoid, or minimize adverse impacts on any transition zone present between tidal and upland habitats • Including clear long- and short-term biological and physical goals, success criteria and monitoring of ecosystem restoration projects Through the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) process, and particularly through the Feasibility Study, the DON thoroughly evaluated the remedy and considered the impact on tidal areas. The DON, with the approval of the regulatory agencies, selected this remedy which has been designed to minimize any harmful effects. In addition, the DON will monitor the success of the mitigation as outlined in Attachment 7, Section 11.

Citation	Requirement	Information in Support of Evaluation
McAteer-Petris Act (California Government Code §§ 66600 through 66661) [b] *(continued)*		
Part IV of Bay Plan (Findings and Policies Concerning Mitigation, Policies 1 through 8)	Policy No. 1: Projects should be designed to avoid adverse environmental impacts to Bay natural resources such as to water surface area, volume, or circulation and to plants, fish other aquatic organisms and wildlife habitat, subtidal areas, or tidal marshes or tidal flats. Whenever adverse impacts cannot be avoided, they should be minimized to the greatest extent practicable. Finally, measures to compensate for unavoidable adverse impacts to the natural resources of the Bay should be required. Mitigation is not a substitute for meeting the other requirements of the McAteer-Petris Act.	The evaluation presented in the ROD verifies that there is no practicable alternative to addressing site contaminants within the intertidal zones and wetlands at IR Site 2 in a manner that avoids disturbance. The Navy proposed on-site mitigation for the tidal marshes in the IR Site 2 ROD. Damage to other natural resources of the bay, including on-site tidal flats, would be avoided because excavation would not extend into shoreline areas located below mean sea level. The Navy will perform mitigation in accordance with the substantive provisions of 40 Code of Federal Regulations (CFR) Part 230, 33 CFR Part 320, and Part IV of the San Francisco Bay Plan. Included in the RAWP as Attachment 7 is a detailed wetlands mitigation program intended to address any adverse impacts. Approximately 2.27 acres of seasonal wetland and 0.89 acre of tidal wetland will be filled during construction and will be replaced with an equivalent area of similar or higher-quality wetlands outside of the landfill cover but within the Site 2 boundary. The wetlands have been avoided to the extent possible, but given the capacity and design requirements of the landfill, the remaining wetland impacts are considered unavoidable. In addition, Attachment 6, Section 6.3 sets forth additional project mitigation measures, which include: • Training all personnel who will work at the site during construction • Ecological surveys that will be conducted by a qualified biologists • Documentation and reporting including a preconstruction survey report
	Policy No. 2: Individual compensatory mitigation projects should be sited and designed within a Bay-wide ecological context, as close to the impact site as practicable to: (1) compensate for the adverse impacts; (2) ensure a high likelihood of long-term ecological success; and (3) support the improved health of the Bay ecological system. Determination of the suitability of proposed mitigation locations should be guided in part by the information provided in the Baylands Ecosystem Habitat Goals report.	The compensatory mitigation is sited within Site 2 in an area as close as practicable to the impact area. The mitigation will compensate for adverse impacts and monitoring will be implemented to ensure a high likelihood of long-term ecological success (see Attachment 7, Section 11).
	Policy No. 3: When determining the appropriate location and design of compensatory mitigation, the Commission should also consider potential effects on benefits	The remedy has been designed to address erosion control (see Attachment 8) and to accommodate potential recreational uses of the site as a trail.

Table 5-2 CERCLA Substantive BCDC Bay Plan Consistency Evaluation for IR Site2, Former Landfill, Alameda Point California (Remedial Design/Remedial Action Work Plan, IR Site 2 Former Landfill, Alameda Point, California)

Citation	Requirement	Information in Support of Evaluation
	provided to humans from Bay natural resources, including economic (e.g., flood protection, erosion control) and social e.g. aesthetic benefits, recreational opportunities.	
	Policy No. 4: The amount and type of compensatory mitigation should be determined for each mitigation project based on a clearly identified rationale that includes an analysis of the probability of success of the mitigation project; the expected time delay between the impact and the functioning of the mitigation site; and the type and quality of the ecological functions of the proposed mitigation site as compared to the impacted site.	Section 11 of Attachment 7 addresses this policy.
	Policy No. 5: To increase the potential for the ecological success and long-term sustainability of compensatory mitigation projects, resource restoration should be selected over creation where practicable, and transition zones and buffers should be included in mitigation projects where feasible and appropriate. In addition, mitigation site selection should consider site-specific factors that will increase the likelihood of long-term ecological success, such as existing hydrological conditions, soil type, adjacent land uses, and connections to other habitats.	Section 11 of Attachment 7 addresses this policy.
	Policy No. 6: Mitigation should, to the extent practicable, be provided prior to, or concurrently with those parts of the project causing adverse impacts.	Mitigation will be conducted as part of the remediation process and is expected to be conducted concurrently.
	Policy No. 7: When compensatory mitigation is necessary, a mitigation program should be reviewed and approved by or on behalf of the Commission as part of the project. Where appropriate, the mitigation program should describe the proposed design, construction and management of mitigation areas and	Attachment 7 complies with the substantive provisions of this policy. Because the DON is not required to comply with the procedural requirements under CERCLA, the DON is not required to obtain formal approval of the mitigation plan.

Table 5-2 CERCLA Substantive BCDC Bay Plan Consistency Evaluation for IR Site2, Former Landfill, Alameda Point California (Remedial Design/Remedial Action Work Plan, IR Site 2 Former Landfill, Alameda Point, California)

Citation	Requirement	Information in Support of Evaluation
	include: (a) Clear mitigation project goals (b) Clear and measurable performance standards for evaluating the success of the mitigation project, based on measures of both composition and function, and including the use of reference sites (c) A monitoring plan designed to identify potential problems early and determine appropriate remedial actions. Monitoring and reporting should be of adequate frequency and duration to measure specific performance standards and to assure long-term success of the stated goals of the mitigation project (d) A contingency plan to ensure the success of the mitigation project, or provide measure to ensure alternative appropriate measures are implemented if the identified mitigation cannot be modified to achieve success. The Commission may require financial assurances, such as performance bonds or letters of credit, to cover the cost of mitigation actions based on the nature, extent and duration of the impact and/or the risk of the mitigation plan not achieving the mitigation goals (e) Provisions for the long-term maintenance, management and protection of the mitigation site, such as a conservation easement, cash endowment, and transfer of title.	

Table 5-2 CERCLA Substantive BCDC Bay Plan Consistency Evaluation for IR Site2, Former Landfill, Alameda Point California (Remedial Design/Remedial Action Work Plan, IR Site 2 Former Landfill, Alameda Point, California)

Citation	Requirement	Information in Support of Evaluation
	Policy No. 8: Mitigation programs should be coordinated with all affected local, state and federal agencies having jurisdiction or mitigation expertise to ensure, to the maximum practicable extent, a single mitigation program that satisfies the policies of all the affected agencies.	The mitigation program has been coordinated with all appropriate local, state, and federal agencies through the CERLCA process.
Part IV of Bay Plan (Findings and Policies Concerning Appearance, Design and Scenic Views Policy No.2)	All bayfront development should be designed to enhance the pleasure of the user or viewer of the Bay. Maximum efforts should be made to provide, enhance, or preserve views of the Bay and shoreline, especially from public areas, from the Bay itself, and from the opposite shore. To this end, planning of waterfront development should include participation by professionals who are knowledgeable of the Commission's concerns, such as landscape architects, urban designers, or architects, working in conjunction with engineers and professionals in other fields.	The proposed future use at IR Site 2 includes low-impact recreational uses such as a recreational trail around the site. However, the redevelopment plans are not finalized, and the DON will not be constructing the recreational trail. All development, including the future shoreline trail, will be conducted by the transferee. Therefore, this policy does not apply and is not "relevant and appropriate" to the DON's implementation of the remedy.
Part IV of Bay Plan (Findings and Policies Concerning Public Access Policy Nos. 4 and 5)	Policy No. 4: Public access should be sited, designed and managed to prevent significant adverse effects on wildlife. To the extent necessary to understand the potential effects of public access on wildlife, information on the species and habitats of a proposed project site should be provided, and the likely human use of the access area analyzed. In determining the potential for significant adverse effects (such as impacts on endangered species, impacts on breeding and foraging areas, or fragmentation of wildlife corridors), site specific information provided by the project applicant, the best available scientific evidence, and expert advice should be used. In addition, the determination of significant adverse effects may also be considered within a regional context. Siting, design and management strategies should be employed to avoid or minimize adverse effects on wildlife, informed by the advisory principles in the Public Access Design Guidelines. If significant adverse effects cannot be avoided or reduced to a level below significance through siting, design and management strategies, then in lieu public access	The proposed future use at IR Site 2 includes low-impact recreational uses such as a recreational trail around the site. However, the redevelopment plans are not finalized, and the DON will not be constructing the recreational trail. All development, including the future shoreline trail, will be conducted by the transferee. Therefore, this policy does not apply and is not "relevant and appropriate" to the DON's implementation of the remedy.

Table 5-2 CERCLA Substantive BCDC Bay Plan Consistency Evaluation for IR Site2, Former Landfill, Alameda Point California (Remedial Design/Remedial Action Work Plan, IR Site 2 Former Landfill, Alameda Point, California)

Citation	Requirement	Information in Support of Evaluation
	should be provided, consistent with the project and providing public access benefits equivalent to those that would have been achieved from on-site access. Where appropriate, effects of public access on wildlife should be monitored over time to determine whether revisions of management strategies are needed.	
	Policy No. 5: Public access should be sited, designed, managed and maintained to avoid significant adverse impacts from sea level rise and shoreline flooding.	The proposed future use at IR Site 2 includes low-impact recreational uses such as a recreational trail around the site. However, the redevelopment plans are not finalized, and the DON will not be constructing the recreational trail. All development, including the future shoreline trail, will be conducted by the transferee. Therefore, this policy does not apply and is not "relevant or appropriate" to the DON's implementation of the remedy.
California Government Code Section 66605(a), (c) and (d) (McAteer-Petris Act)	The Legislature further finds and declares: (a) That further filling of San Francisco Bay and certain waterways specified in subdivision (e) of Section 66610 should be authorized only when public benefits from fill clearly exceed public detriment from the loss of the water areas and should be limited to water-oriented uses (such as ports, water-related industry, airports, bridges, wildlife refuges, water-oriented recreation, and public assembly, water intake and discharge lines for desalinization plants and power generating plants requiring large amounts of water for cooling purposes) or minor fill for improving shoreline appearance or public access to the bay; (c) That the water area authorized to be filled should be the minimum necessary to achieve the purpose of the fill; (d) That the nature, location, and extent of any fill should be such that it will minimize harmful effects to the bay area, such as, the reduction or impairment of the volume surface area or circulation of water, water quality, fertility of marshes or fish or wildlife resources, or other conditions impacting the environment, as defined in Section 21060.5 of the Public Resources Code	Attachment 7 explains in detail the wetlands mitigation program. It explains that the wetlands that will be filled during the project total 0.89 acre and will be replaced with an equivalent area of similar or higher-quality wetlands. The justification for filling the wetlands has been documented throughout the CERCLA process and has been approved by the regulatory agencies. The filling of the 0.89 acre satisfies the substantive requirements of Section 66605(a) and (d) and is necessary to implement the remedy. Ultimately, the fill will result in increased protection of human health and the environment because the site will be remediated and the wetlands will be of higher quality. The fill is necessary to implement the remedy. Remediating the contamination at the site is a public benefit that exceeds the public detriment from the loss of water. The DON has considered the McAteer-Petris Act as an applicable or relevant and appropriate requirement (ARAR) throughout the CERCLA process, and the remedy was designed to comply with the substantive requirements. The selected remedy was developed and selected with the approval of the regulatory agencies and, at this time, the DON does not plan to develop an alternative cover approach.

California Government Code Section 66632(f)(1) (McAteer-Petris Act)	(f) The commission shall take action upon an application for a permit, either denying or granting the permit, within 90 days after it files the application. The permit shall be automatically granted if the commission shall fail to take specific action either denying or granting the permit within the time period specified in this section. A permit shall be granted for a project if the commission finds and declares that the project is either (1) necessary to the health, safety or welfare of the public in the entire bay area, or (2) of such a nature that it will be consistent with the provisions of this title and with the provisions of the San Francisco Bay Plan then in effect.	Because permits are not required for CERCLA actions, the DON does not need to comply with the permit requirement of this section. The DON recognizes that the public health, safety, or welfare is one of the statutory justifications for fill placement. The DON believes that it has established through the CERCLA process the justification for the remedy.

APPENDICES

1.0 INTRODUCTION

This Wetland Mitigation Plan for IR Site 2 has been developed to support implementation of the remedial action at IR Site 2, Alameda Point, Alameda, California (Figure 1). Landfill construction will require the fill of intermittent, seasonal wetland and tidal wetland, for which the Navy proposes to mitigate on-site. Tetra Tech EC, Inc. (TtEC) was contracted by the Department of the Navy (DON) to prepare the Remedial Action Work Plan (RAWP) under Contract Task Order (CTO) 0009, Contract No. N62473-10-D-0809 for the Base Realignment and Closure (BRAC) Program Management Office (PMO) West under Naval Facilities Engineering Command Southwest (NAVFAC SW). The selected remedy for soil, as outlined in the Record of Decision (ROD) for IR Site 2, is the installation of a multilayer soil cover, engineering and institutional controls (ICs), and monitoring (DON, 2010). The selected remedy for groundwater is natural attenuation and monitoring. The RAWP in conjunction with the Remedial Design (Attachment 1 to the RAWP) provides details, specifications, and design drawings for the construction of the multilayer soil cover.

2.0 PROJECT LOCATION AND DESCRIPTION

Alameda Point is located on the western end of Alameda Island, California (Figure 1). IR Site 2 is approximately 110 acres located at the southwestern end of Alameda Point, with land areas in Alameda and San Francisco Counties. IR Site 2 consists of the landfill, which covers approximately 60 acres; the wetlands, which cover the area immediately south and west of the landfill; and 17 acres referred to as the interior and coastal margin (this area is primarily the levee that surrounds the landfill and wetlands). IR Site 2 is bounded to the south and west by San Francisco Bay and to the east and north by runways, tarmacs, and related features (KCH 2011).

This page intentionally left blank.

3.0 BRIEF SUMMARY OF PROJECT

The IR Site 2 landfill cover at Alameda Point is a design/build project to cover an existing Navy landfill with soil to isolate buried waste and soil contaminants, and discourage animal burrowing pursuant to the Final ROD. Since monitored natural attenuation is the groundwater remedy, placement of a hydrogeological membrane or liner is not required. Historical documents indicate that the landfill accepted up to 1.6 million tons of waste from 1956 to 1978.

The 78.8-acre landfill cover will comprise a HDPE geonet animal intrusion barrier placed over the subgrade, a 1.5-foot thick foundation layer of soil, and a 0.5-foot thick vegetative layer on top seeded with native species. After the surface of the subgrade is scanned for radiological hotspots and hotspot material is removed, it will be graded to provide 1.5 percent slopes, and a 2-foot-thick soil cover will be constructed. After the cover construction is complete, the area will be radiologically re-scanned to confirm that the cover is acting as an effective barrier to isotopes in the landfill. Fencing, monitoring wells, settlement monuments, and other ancillary features will also be installed.

Although most of the wetland area in the southwest corner of the site will not be disturbed, approximately 2.27 acres of seasonal wetland and 0.89 acre of tidal wetland will be filled during construction, and will be replaced with an equivalent area of similar or higher quality wetlands outside of the landfill cover but within the IR Site 2 boundary. The wetlands have been avoided to the extent possible, but given the capacity and design requirements of the landfill cover, the remaining wetland impacts are considered to be unavoidable.

This page intentionally left blank.

4.0 RESPONSIBLE PARTY AND OWNERSHIP

The U.S. Navy is the property owner and is solely responsible for the proposed project as well as the wetlands mitigation area, including the culvert (Figure 2).

This page intentionally left blank.

5.0 HABITAT TYPES AND VALUES

Existing habitat types in the proposed wetland mitigation area are displayed in Figure 2. A wetland delineation report was prepared under separate contract, and is attached as Appendix A (KCH 2011). This report identified three distinct wetland and water features:

- **Open Water/Mudflat:** Open water/mudflat is found in two large ponds in the southwest corner of the landfill area (Figure 2). Both of the ponds have been identified as Palustrine Unconsolidated Bottom, Semipermanently Flooded, Diked/Impounded (PUBFh) by the NWI (USFWS 2010), a classification that appeared to be accurate based on field observations made by Tetra Tech staff on October 26, 2011. The North Pond, referred to as WTR-1 in the wetland delineation report (Appendix B, Photo 1) is hydrologically connected to San Francisco Bay by a 36-inch-diameter culvert that penetrates the perimeter berm and seawall. The culvert appears to be appropriately sized to allow full tidal exchange on a diurnal basis, as the tidal wetland drains and fills completely twice a day.

  The South Pond (Appendix B, Photos 2 and 4), referred to as WTR-2 in the wetland delineation report (Appendix A) was created as a borrow pit, and fills with groundwater and precipitation for all or most of the year. This area is not tidally connected, and surface water levels do not appear to be influenced by tidal elevations. A full hydrologic analysis of this pond was not prepared, but photos from July 2010 show a mix of standing water and mudflats - conditions that were also found in this pond in late October, 2011 - and the delineation report (Appendix A) also concluded that this area was not tidally influenced. Most of this pond is either shallow standing water or mudflats, with a fringe of pickleweed (*Salicornia virginica*) forming the transitional plant community between the mudflats and nearby uplands. Freshwater seasonal pond and transitional mudflat habitats such as this have been identified in the Baylands Ecosystem Habitat Goals Project (SFEI 2001) as rare and important habitat components.

  The South Pond and mudflat matrix is high-value habitat in that it offers high tide refugia for wading shorebirds, and low tide refugia for ducks and geese. Because pond water surface elevations in this area are maintained by groundwater and precipitation, they do not fluctuate on a diurnal basis as they do in the northern (tidal) pond. Since this area normally has both mudflats and open water, it is available as foraging habitat year-round. At the time of the reconnaissance survey in late October, an estimated 500 birds representing at least eight species were observed foraging in this pond and mudflat.

- **Seasonal wetland:** Seasonal wetland is found in numerous small patches in the northwest corner of IR Site 2 and near the South Pond (Figure 2). A large, contiguous area of seasonal wetland is also found along the south edge of the site.

  The seasonal wetlands in the north and northeast corner of the site, which are the seasonal wetlands that would be filled, appear to be hydrologically disconnected from other wetlands or water bodies (Appendix B, Photo 3). Moisture in these wetlands appears to derive from direct precipitation and rainfall runoff from the nearby airstrip, which ponds temporarily at the toe of the adjacent levee, or in runoff swales. Dominant species in these wetlands are pickleweed and saltgrass (*Distichlis spicata*). Curly dock (*Rumex crispus*), sweetclover (*Melilotus indicus*), and spear saltbush (*Atriplex patula*) were also present. Due to their patchy and isolated nature, the seasonal wetlands at the north end of the site, which are the seasonal wetlands that would be filled, offer minimal habitat value. These wetlands may offer habitat for small mammals that could escape to nearby uplands when the wetlands are inundated, and occasional foraging birds, but because these wetlands are surrounded by either highly developed areas or the open water of the bay, access to them by small mammals is very restricted; therefore their value as habitat is similarly restricted.

  The large seasonal wetland on the south edge of the site (Appendix B, Photo 4) is composed primarily of dense pickleweed, with sparse saltgrass and some rabbitsfoot grass (*Polypogon monspeliensis*). This type of wetland could offer marginal habitat for the endangered salt-marsh harvest mouse (*Reithrodontomys raviventris*) and the clapper rail (*Rallus longirostris*) but these species have not been reported at this site. Due to this site's isolation from other populations of these species, the seasonal nature of this wetland, and the relatively small area of pickleweed marsh found at the site, the salt marsh harvest mouse and clapper rail are not likely to be present.

- **Tidal wetland:** Tidal wetlands were found surrounding the tidal open water North Pond. These wetlands are characterized by dense pickleweed with small amounts of saltgrass and spear saltbush mixed in. Although extensive pickleweed habitat was found at the site and was not identified as wetland, the areas identified as tidal wetlands in the wetland delineation report appear to be those areas that receive frequent tidal inundation. All other pickleweed habitat does not meet hydrology criteria needed for a wetland designation to be applied. The tidal wetland portion of the proposed project area, which comprises part of the area that would be filled, does not support waterfowl and shorebirds breeding requirements, nor is pickleweed their primary choice for foraging habitat. However, this habitat may offer good foraging habitat for raptors, and by providing detritus to the tidal mudflat area that it is adjacent to, supports the food web that sustains waterfowl and shorebirds. Various bird species observed in the area include waterfowl such as Canada goose (*Branta* *canadensis*), mallard (*Anas platyrhynchos*), and American coot (*Fulica americana*) which forage in open water and nest in dense patches of adjacent floating or upland vegetation (field observations; CDFG 2011; Cornell Lab of Ornithology 2011). Common shorebird species such as killdeer (*Charadrius vociferus*), least sandpiper (*Calidris minutilla*), dowitcher (*Limnodromus* sp.*)*, western sandpiper (*Calidris mauri*), black-necked stilt (*Himantopus mexicanus*), and American avocet (*Recurvirostra americana*) typically forage or loaf in shallow water and on mudflats (field observations; CDFG 2011; Cornell Lab of Ornithology 2011) and nest in open areas on bare ground (CDFG 2011; Cornell Lab of Ornithology 2011). Gulls such as western gull (*Larus occidentalis*) and ringed-billed gull (*Larus delawarensis*) winter in the area and are associated to mudflats and open water (field observations; CDFG 2011; Cornell Lab of Ornithology 2011). Two raptor species were also observed in the IR Site 2 area; northern harrier (*Circus cyaneus*) and red-tailed hawk (*Buteo jamaicensis*), which hunt in the area either on the wing or from perch sites. Various passerines may forage in the pickleweed marsh at times.

- **Uplands:** The upland plant communities (Appendix B, Photo 5) in the vicinity of the wetlands are composed almost entirely of noxious invasive species including iceplant (*Carpobrorus edulis*), Pampas grass (*Cortaderia jubata*), sweet fennel (*Foeniculus vulgarum*), surrounded by less noxious ruderal species including black mustard (*Brassica negra*), Italian thistle (*Carduus pycnocephalus*) and wild radish (*Raphanus raphanistrum*). A small patch (approximately 1 acre) of good quality coyote brush (*Baccharis pilularis*) and grassland habitat is found near the South Pond.

This page intentionally left blank.

6.0 HABITAT AND SPECIES VALUE

6.1 SPECIAL STATUS SPECIES

Surveys for avian species and wildlife were conducted at IR Site 2 in 1998 (TtEMI 1998). Three endangered or threatened bird species may occur in the general area. These include the endangered California clapper rail (*Rallus longirostris obsoletus*), the endangered California least tern (*Sterna antillarum browni*), and the threatened western snowy plover (*Charadrius alexandrinus nivosus*) (Shuford et al. 2008). A single listed mammal species, the endangered salt-marsh harvest mouse, is also found in pickleweed habitats in San Francisco Bay. Species identified in the area during previous surveys (please see Tables 6-1 and 6-2 of the Environmental Protection Plan, included as Attachment 6) including the California brown pelican (*Pelecanus occidentalis californicus*) and the American peregrine (*Falco peregrinus anatum*) have been delisted in recent years.

6.1.1 California Clapper Rail

The clapper rail, which is normally found in pickleweed marsh wetland, could occur; however, due to the marsh's relatively small size and isolation from known populations of clapper rails, it is unlikely to be inhabited by clapper rails. Clapper rails prefer to forage along dendritic tidal channels, a habitat feature not found in this location

6.1.2 Western Snowy Plover

The western snowy plover is generally found on barren or sparsely vegetated sand beaches along the coast, and on alkaline flats and river bars farther inland; therefore it is not considered likely to occur at this site.

6.1.3 California Least Tern

The least tern is also not generally found in pickleweed marshes, preferring instead to nest in sandy or gravely flats and to forage over open estuarine or lagoon areas. Although it is found on the abandoned runway of NAS Alameda, it is considered unlikely to occur in this marsh.

6.1.4 Salt-marsh Harvest Mouse

The salt-marsh harvest mouse (*Reithrodontomys raviventris*) is dependent on dense pickleweed for most of its habitat needs but also uses adjacent mid- to high-marsh habitat for high-tide refugia. Because this site is small, isolated from other habitat areas that contain populations of salt-marsh harvest mice, and there is no overland connection to other populations, the salt-marsh harvest mouse is considered unlikely to occur here.

6.1.5 Amphibians

Amphibians are likely to occur in the seasonal wetlands in the north and northeast parts of the proposed landfill area. Frogs and salamanders may breed and forage in these areas. However, there are no sensitive or protected amphibian species that are likely to occur in the project area.

7.0 HYDROLOGY

IR Site 2 is situated in an area that was originally open water of San Francisco Bay. In 1956, a seawall was constructed along the southern and western shorelines of IR Site 2, and dredged fill was hydraulically placed inside the seawall. The seawall crest elevation is currently about 15 feet. A National Oceanic and Atmospheric Administration (NOAA) tidal station (Station ID: 9414750) was established in 1939, and the present installation along the eastern edge of the seaplane port was completed in November 1991. This gage is located about 2.5 miles from the North Pond culvert connection to the bay. The mean tide level of this gage is about 4.2 feet NGVD29 (determined by subtracting the mean tide level of 6.9 feet NAVD88 by the local conversion of -2.7 feet to convert from NAVD88 to NGVD29), and the mean tidal range (the difference in height between mean high water and mean low water) is 4.84 feet. The highest observed water level at this location was 12.98 feet in December 1983, and the lowest observed water level was 0.76 feet in January 2009.

The only input of fresh water to IR Site 2 is direct rainfall and runoff on the 110-acre area. The area that is ringed by the seawall and adjacent levee contains a capped landfill that is gently sloped, typically less than 2 percent (KCH 2011). About a third of the 60 acres of landfill and 17 acres of uplands drain to the wetlands. The North Pond is connected to the San Francisco Bay by a 36-inch corrugated metal pipe which allows tidal exchange between the pond and the bay.

At this stage of the design, groundwater elevations have not been studied in the southwest section of IR Site 2. A 90 percent design assumption is that the underlying soils of the mitigation areas will retain water at the same rate as the adjacent existing wetland areas. Before construction, soil borings and groundwater piezometer studies are recommended to determine the similarities of the soil and groundwater characteristics of the existing and proposed wetland areas. The hydrologic performance criteria for the wetland mitigation areas are set forth in Section 11.1.

This page intentionally left blank.

8.0 SOILS

IR Site 2 was originally a part of San Francisco Bay. A seawall was constructed in 1956 and sand dredged from beach areas was hydraulically pumped behind the seawall to establish the land area of IR Site 2. The soils of IR Site 2 are mapped as Xeropsamments fill (USDA 2010), with about 10 percent of the area underlain by strongly alkaline clay to a depth of 36 to 48 inches (KCH 2011).

This page intentionally left blank.

9.0 PROJECT GOAL

The overall goal of this mitigation plan is to replace lost wetland and functional values with habitat of the same or better quality. Tidal wetlands that will be filled during the project total 0.89 acre and will be replaced in-kind, on-site. Seasonal wetlands that will be filled total 2.27 acres and will be replaced on-site with freshwater open marsh and mudflat. Although it is understood that in-kind replacement is generally preferred, in this case out-of-kind mitigation is considered appropriate since the transitional mudflat-pickleweed habitat is preferred.

Because mitigation wetlands will be created at the same time that the original wetlands are filled, and because the new wetland and open water/mudflat habitat will be of higher value than the filled seasonal wetlands, this plan assumes a 1:1 replacement ratio in accordance with the ROD (DON 2010) at a minimum. Extent of pickleweed in proposed mitigation areas A and B was examined during the preconstruction ecological surveys conducted on January 30–31, 2013, during which the percent of pickleweed-dominated habitat was estimated to be approximately 2 percent of Mitigation Area A and approximately 5 percent of Mitigation Area B. Due to construction efficiencies and to compensate for the 2 percent to 5 percent pickleweed that currently exists in the seasonal mitigation areas, actual mitigation acreage is more than 1:1.

Habitat Type	Area Affected	Minimum Proposed Area to be Created
Seasonal Wetland	2.27 acres	3.4 acres
Tidal Wetland	0.89 acre	1.4 acres

This page intentionally left blank.

10.0 IMPLEMENTATION

The goal of this mitigation plan is to replace lost wetlands with habitat of the same or better quality. This process is described below, and the conceptual mitigation plan is shown in Figure 3.

10.1 TIDAL WETLAND MITIGATION

To mitigate for the lost tidal wetlands, which are found on the north and east sides of the tidal pond, a new pickleweed marsh (labeled "Tidal Wetland Mitigation Area" in Figure 3) will be constructed at the south side of the North Pond. This will be accomplished by grading upland habitat to the average elevation of 2 feet NGVD29 found in the adjacent pickleweed wetland and allowing tidal inflow to this area. The newly graded marsh plain will tie into the edge of existing tidal wetland and will have similar hydrologic features. It is expected that, like the rest of the pickleweed wetlands in the area, this area will be tidally-inundated and drained on a diurnal basis. Revegetation is not proposed in this area, since the dense pickleweed marsh that surrounds it will provide plentiful propagules, and the site is expected to revegetate naturally very quickly. Similar projects across the bay, at Piers 94 and 98 in San Francisco, were similarly excavated and allowed to revegetate naturally, and showed abundant pickleweed seedlings within a single season (Port of San Francisco 2008).

No cordgrass (*Spartina sp.*) or pepperweed (*Lepidium latifolium*) specimens were identified in the mitigation area, therefore the threat of invasion of these species in the new tidal marsh area is considered to be relatively low. Extensive iceplant was identified in the upland portions of the proposed mitigation area, but it does not appear to grow lower than the high-tide line. Other non-native species identified in the area included sparse bindweed (*Convulvulus sepium*), Mediterranean saltwort (*Salsola soda*), pampas grass, and New Zealand spinach (*Tetragonia tetragonioides*). Pampas grass and bindweed would not normally be found in the same tidal zone as pickleweed, and saltwort and New Zealand spinach do not compete well with dense pickleweed.

10.2 SEASONAL WETLAND MITIGATION

Seasonal wetland will be mitigated for on-site, out-of-kind. The reason for mitigating out-of-kind is that the open water/mudflat/pickleweed habitat matrix proposed to be developed will offer improved foraging habitat and tidal refugia for shorebirds and waterfowl.

The area proposed to mitigate for lost seasonal wetland is also shown in Figure 3. The existing freshwater South Pond is roughly shaped like an unfinished "A". Under this plan, a portion of the upland component of the crosspiece of the "A" (labeled as "Seasonal Wetland Mitigation Area A" in Figure 3), as well as a larger area west of the crosspiece (labeled as "Seasonal Wetland Mitigation Area B" in Figure 3), would be excavated to match the existing grade of the adjacent open water/mudflat/pickleweed matrix. The two areas would be separated by a pickleweed corridor to allow escape cover for shorebirds that might forage there. These areas have been specifically chosen as the mitigation sites for two reasons: 1) They are adjacent to coyote brush *(Baccharis pilularis)* and grassland habitat that offers high quality nesting habitat for songbirds, and 2) the proposed excavation areas are currently infested with Pampas grass, and excavating these areas will offer a good opportunity to eradicate at least part of the population of this noxious invasive species at IR Site 2.

A detailed grading plan was developed to allow construction of these features. The CAD drawings show plans and cross sections for the two areas, featuring a gradient starting at the same elevation as existing open water and mudflat habitat (approximately -0.4 feet NGVD29), grading gently through pickleweed marsh habitat found at approximately 0.3 to 0.8 feet NGVD29, and then tying into upland habitat starting at elevations around 3 to 4 feet NGVD29. Topography is shown with 1-foot contours and was based on a recent topographic survey conducted specifically for the purposes of identifying the elevations of vegetative breaks, low-, mid- and high-marsh elevations, and gradient of the marsh plain.

IR Site 2 mitigation activity by the Navy will be respectful of existing stands of pickleweed, and avoid to the maximum extent practicable damaging established stands of pickleweed in and around the areas to be mitigated.

11.0 MONITORING AND MAINTENANCE

A baseline vegetation and wildlife survey that will occur immediately prior to construction will establish overall percent cover and document the composition of the vegetative community, and establish average daily use of the reference areas by shorebirds and waterfowl. Hydrologic success will also be considered.

11.1 SUCCESS CRITERIA FOR VEGETATION

During the vegetation survey, permanent 1-meter-square reference plots will be established on transects running through the entire mitigation sites. These transects and monitoring plots will be assessed on a yearly basis using the same criteria as those used to establish baseline conditions. The survey will document mortality, weed invasion, and rate of colonization. Success criteria for vegetation are as follows:

- In the tidal marsh area, existing conditions show a pickleweed community cover density of approximately 75 to 100 percent in the wetland areas that will be affected. The 5-year monitoring goal is to attain this same density and the same plant community composition as under existing conditions. The Year 1 goal is to show 10 percent pickleweed cover, increasing to 25 percent at Year 2, 50 percent in Year 3, and 75 percent in Year 4. If these goals are not met, the restored area will be assessed to determine if site conditions are not conducive to plant growth. If needed, corrective actions including planting pickleweed plugs taken from a nearby location will be implemented. Corrective actions would be implemented in Year 2 and beyond if needed.
- There is no invasive cordgrass or pepperweed in the tidal marsh at this time. Success criteria require that this state be attained and maintained in the mitigation area for the duration of the 5-year monitoring period.
- In the open water/mudflat habitat, there will be little to no vegetation in the low-marsh (mudflat) areas, and the mid- and high-marsh areas are projected to be vegetated almost exclusively with pickleweed to reflect current conditions. Success criteria are such that the mudflat area will have less than 10 percent vegetation below -0.2 feet NGVD29, and this vegetation will be a minimum of 80 percent pickleweed. Above -0.2 feet, pickleweed will increase in density to 75 to 100 percent over 5 years. The pickleweed fringe will be maintained by work crews who will remove cordgrass and pepperweed by hand or other approved method to ensure no encroachment of these weed species.
- If success criteria are not met, corrective action will be taken. For vegetation establishment, this means that pickleweed plugs will be planted in quantities needed

to attain goals if goals are not met at Years 2 and beyond. For invasive species, this means that all invasive cordgrass or pepperweed will be removed on a yearly basis, on a date preceding normal seedset.

11.2 SUCCESS CRITERIA FOR WILDLIFE

For wildlife, bird counts will occur at the appropriate time of year and will occur over successive tidal cycles. Bird usage of the tidal pond, the mudflats, and freshwater pond will be documented, and used to create the baseline conditions against which to measure success. Success criteria for bird use of the mitigation sites is such that bird use would increase incrementally over a 5-year period as the invertebrate community in the substrate increased, and would match the rate of bird use in the reference (adjacent) areas at the end of the 5-year monitoring period.

11.3 SUCCESS CRITERIA FOR HYDROLOGY

Although a detailed hydrologic study of the site has not been completed, success criteria are such that hydrological features found at the reference areas (meaning wetlands directly adjacent to the mitigation areas) will be found in the mitigation areas as well. In the tidal areas, this means that the constructed wetlands will be tidally inundated and drained on a diurnal basis on the same intervals as the reference area. The Navy recognizes that the existing culvert (Figure 2) is critical to the life of these IR Site 2 tidal wetlands, as without the culvert, there would be no tidal circulation. As a part of defining successful hydrology for the tidal wetlands, the Navy will perform a qualified structural engineering evaluation of the culvert (as it is known to be significantly rusted and damaged) as soon as is practical during cover construction activities. Further, the Navy will make necessary repairs, modifications or replacement to maintain tidal circulation as recommended by the structural assessment of the culvert, and do so during remedy construction if warranted. In the potential event that tidal circulation is inhibited or blocked due to culvert failure, the Navy will restore tidal circulation within 7 days.

In the open water/mudflat/pickleweed freshwater areas near the South Pond, the mitigation wetlands will have been graded to the same elevation as the reference habitat;-, therefore, success criteria are such that surface water levels and mudflats will mimic conditions found in the surrounding areas that have the same surface elevation. In general, this means that surface water levels will be highest in the period from December through April, and will diminish thereafter. In dry years, the freshwater open water area and mudflat may dry completely in late summer.

Hydrologic features of the site will not be manipulated during construction; however, if after project implementation hydrological features do not appear to be operating as planned, a hydrologic assessment of the area will be performed by a hydrologist and recommendations for further grading will be made.

12.0 LONG-TERM MANAGEMENT PLAN

The U.S. Navy is developing a long-term Operations and Maintenance Plan for the IR Site 2 area. This management plan will include maintenance and monitoring of the wetland area in accordance with the monitoring plan outlined above. Management items will include access to the wetland area, invasive species management, native species maintenance, maintenance of hydrologic features, including the culvert, and wildlife monitoring.

Executive Summary

A wetland delineation was conducted at Installation Restoration (IR) Site 2 Alameda Point, Alameda, California. This work was performed in accordance with Naval Facilities Engineering Command Southwest Contract No. N62473-09-D-2622, Modification 1, under Contract Task Order No: 0006 for the U.S. Department of the Navy, Base Realignment and Closure Program Management Office West. Field surveys were completed by CH2M HILL Kleinfelder, A Joint Venture (KCH) biologist on July 27, 2010, and March 31, 2011. The results of the wetland delineation identified the presence of 9.40 acres of open waters including 4.41 acres of tidal waters, and 11.91 acres of wetlands, including 3.22 acres of tidal wetlands, within the boundaries of the 110-acre IR Site 2. All of these waters and wetlands were considered to be adjacent to San Francisco Bay and were therefore considered potential jurisdictional waters of the United States subject to regulation under the federal Clean Water Act. The results and conclusions of this delineation are preliminary pending verification by the United States Army Corps of Engineers.

1.0 Introduction

CH2M HILL Kleinfelder, A Joint Venture (KCH), has prepared this Wetland Delineation report to provide information regarding the location and extent of wetlands and other waters within the 110-acre Installation Restoration (IR) Site 2 located on the Former Naval Air Station (NAS) Alameda, Alameda Point, Alameda, California. This work was performed in accordance with Naval Facilities Engineering Command Southwest Contract No. N62473-09-D-2622, Modification 1, under Contract Task Order No: 0006 for the United States Department of the Navy (Navy), Base Realignment and Closure (BRAC) Program Management Office West.

A general description of the project and the environmental setting follows. Study methods and the survey results are provided in Sections 2 and 3, respectively.

1.1 Project Description

IR Site 2 is located on the southwest corner of Alameda Point and is approximately 110 acres (Figure 1). The area of present-day IR Site 2 was originally open water. In 1956, a seawall was constructed along the southern and western shorelines of IR Site 2 to confine and protect the area. Dredged fill of varying origins was hydraulically placed inside the seawall, essentially creating IR Site 2.

The site consists of the former West Beach Landfill, which occupies approximately 60 acres. Approximately 33 acres immediately south and west of the landfill are characterized by a mosaic of open water, wetlands, and upland habitat. The remaining 17 acres within the IR Site 2 boundary are represented by areas known as the interior margin and the coastal margin.

The former landfill was reportedly used for disposal of wastes generated by former NAS Alameda activities from 1956 through early 1978. After landfill operations ceased in 1978, an earthen berm was constructed around the perimeter of the landfill site.

In 1978, the Navy developed plans to close the landfill in accordance with the requirements of the San Francisco Regional Water Quality Control Board (RWQCB) Minimum Criteria for Proper Closure of Class II Solid Waste Disposal Sites (Resolution No. 77-7). In 1983, the RWQCB issued Order No. 83-35 not only to implement final cover, a leachate cutoff barrier, methane gas control, earthquake damage control, drainage control, and erosion control, but also to generate compliance reports for the landfill. The Navy complied between 1983 and 1985 by placing a partial clay-soil cover, installing an 820-foot-long, 2-foot-wide, 20- to 30-foot-deep, slurry wall to restrict potential contaminant migration to San Francisco Bay. The Navy also installed a gas venting system and completed repairs to the seawall at that time. Closure activities were discontinued in 1984 because the RWQCB required that the Navy first complete a solid waste assessment test. In 1986, the Navy spread 20,000 cubic yards (yd^3) of imported soil material on the landfill and later graded the material to eliminate depressions that could result in ponding. That volume represented a shortfall of

55,000 yd^3 to achieve a uniform cover layer of appropriate thickness over the landfill area. In August 1999, IR Site 2 (along with other sites at the former NAS) was officially added to United States Environmental Protection Agency's (USEPA) National Priority List of Superfund sites and assigned Comprehensive Environmental Response, Compensation, and Liability (CERCLA) Information System Identification CA2170023236. Several investigations and removal actions have taken place since the listing.

The final Proposed Plan prepared by the Navy includes the following cleanup approaches to address contaminants in soil and groundwater at IR Site 2:

- Install a multilayer soil cover to isolate buried waste and soil contaminants and to prevent animal burrowing; implement engineering and institutional controls to protect human health and the soil remedy; mitigate wetlands; and monitor the soil cleanup action and wetlands mitigation to ensure its proper construction and long-term effectiveness. Conduct methane gas monitoring, as appropriate.
- Conduct monitored natural attenuation for site groundwater by regularly monitoring groundwater quality using a network of shoreline groundwater monitoring wells, and implement engineering controls to protect human health and the groundwater remedy.

1.2 Project Location

IR Site 2 is located at the southwestern end of the Alameda Point on the east side of San Francisco Bay in Alameda County, California. The site is bound to the south and west by San Francisco Bay and to the east and north by runways and tarmacs (Figure 1). IR Site 2 is in Section 05 Township 02 south, Range 04 west (Mt. Diablo Meridian), in the Oakland West United States Geological Survey (USGS) 7.5-minute topographic quadrangle. The approximate center of the site is at 37.78484 degrees north latitude and -122.32856 degrees west longitude.

1.3 Environmental Setting

Alameda Point is located at the western edge of the East Bay Terraces and Alluvium ecological subsection of the Central California Coast subregion (Miles and Gouday, 1998). This subsection is generally characterized by the alluvial plain between the east bay hills and San Francisco Bay. Descriptions of the terrestrial habitats, climate, hydrology and soils associated with IR Site 2 are provided below. Descriptions of wetlands and waters are provided in the results section of this report.

1.3.1 Terrestrial Vegetation

Terrestrial vegetation associated with IR Site 2 is characterized by a variety of weedy native and naturalized grasses and forbs that reflect the historical origins and disturbance history of the site. Common species observed on the levee, landfill, and other upland areas include rip-gut brome (*Bromus diandrus*), wild oat (*Avena barbata*), rat-tail fescue (*Vulpia myuros*), Italian thistle (*Carduus pycnocephalus*), field mustard (*Hirschfeldia incana*), wild radish (*Raphanus sativus*), tarweeds (*Madia gracilis* and *Centromadia fitchii*), fennel (*Foeniculum vulgare*), and yellow star-thistle (*Centaurea solstitialis*). A small dense patch of tall fescue

(*Festuca arundinacea*) is present in the northern part of the site, and dense patches of ice plant (*Carpobrotus edulis*) are common to the southwest and northeast of the landfill area. Coyote bush (*Baccharis pilularis*) shrubs and pampas grass (*Cortaderia jubata*) occur in scattered locations across the site. A small clump of trees, including black wood acacia (*Acacia melanoxylon*) and arroyo willow (*Salix lasiolepis*), is present near the northeastern corner of the site.

1.3.2 Climate and Hydrology

The regional climate is moderated by maritime influences and is characterized by mild temperatures with generally wet winters and dry summers with a year-round growing season. Average temperatures range from a low of 44 degrees Fahrenheit (°F) in December and January to a high of 75°F in September. Average annual precipitation is 23.10 inches, most of which occurs between November and March (United States Department of Agriculture [USDA], 2002). IR Site 2 is located in the East Bay Cities Hydrologic Area, which has a drainage area of 83,633 acres (California Interagency Watershed Map, 2004), and is in the San Francisco Bay Hydrologic Unit (Hydrologic Unit Code 18050004).

1.3.3 Soils

Soils associated with IR Site 2 are mapped as Xeropsamments fill (USDA, 2010) as shown in the soil maps included in Appendix A. This unit consists of sandy material that was dredged from old beach areas. Elevation ranges from near sea level to 10 feet above sea level with slopes of less than 2 percent. Approximately 10 percent of the map area consists of areas that are underlain by strongly alkaline clay to a depth of 36 to 48 inches. An additional approximately 5 percent of the map area includes concave areas that have a shallow water table (approximately 36 inches) and may be ponded during the winter. These soils are rapidly permeable, but the root zone is restricted to a depth of 40 to 60 inches for water-sensitive plants (USDA, 1981).

This page intentionally left blank.

2.0 Methods

The United States Army Corps of Engineers (USACE) defines wetlands as areas that are "inundated by surface water or groundwater with a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas" (Title 40 Code of Federal Regulations [CFR] Section 230.3 and Title 33 CFR Section 238). The survey methodology followed USACE's 1987 *Wetland Delineation Manual* (Environmental Laboratory, 1987) and the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE, 2008).

USACE uses a three-criteria approach (vegetation, soils, and hydrology) to determine the presence of wetlands. As a general rule, under this method, evidence of a minimum of one positive indicator for each criterion must be found (under normal circumstances and in nonproblem areas) to make a positive wetland determination. In general, wetlands will meet the following criteria:

Hydrophytic Vegetation: More than 50 percent of the dominant vegetation is composed of plant species that are adapted to survive and grow in hydrophytic (wet) conditions. The *National List of Plants that Occur in Wetlands* (Reed, 1988) was originally developed as an appendix to the *Classification of Wetlands and Deepwater Habitats of the United States* (Cowardin et al., 1979) to aid in the consistent application of this classification system for wetlands in the field. The list assigns a wetland indicator value to a particular plant species based on the probability of the species occurring in a wetland. An obligate wetland plant species (OBL), occurs almost always (estimated probability over 99 percent) under natural conditions in wetlands. A plant species listed as a facultative wetland (FACW) usually occurs in wetlands (estimated probability 67 to 99 percent), but is occasionally found in nonwetlands. A facultative (FAC) plant species is considered equally likely to occur in wetlands or nonwetlands.

Hydric Soils: The Natural Resources Conservation Service (NRCS) defines hydric soil as "soil that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part" (Federal Register, July 13, 1994). The criteria for establishing the presence of hydric soils vary among soil types, drainage classes, and land resource regions. The USDA (2006) field indicators for identification of hydric soils have been included in the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE, 2008). These indicators rely on soil characteristics such as texture, color, and the presence of redoximorphic features to determine if soils are hydric.

Wetland Hydrology: Areas with wetland hydrology are defined as "inundated either permanently or periodically at mean water depths less than 2 meters (6.6 feet), or the soil is saturated to the surface at some time during the growing season" (Environmental Laboratory, 1987). This saturation or inundation must be present for at least 5 percent of the growing season for an area to meet the minimum wetland hydrology criterion.

2.1 Pre-Field Investigation

Prior to conducting the field surveys, existing available information pertaining to potential wetlands and waters located at IR Site 2, including the Oakland West USGS topographic map, the Alameda County Soil Survey (USDA, 1981) and aerial photographs, were reviewed. Information from the National Wetlands Inventory (NWI) was also reviewed prior to the field survey. The NWI is maintained by The U.S. Fish and Wildlife Service and is intended to provide information on the extent and status of the nation's wetlands.

2.1.1 Field Survey

Pedestrian surveys were conducted throughout the 110–acre wetland survey area on July 27, 2010, by Russell Huddleston and Holly Barbare to determine if wetland or other water features were present on IR Site 2. Because the July 2010 field surveys were completed during the dry part of the year and potential radiological contamination precluded collection of soil information, Mr. Huddleston conducted an additional field survey on March 31, 2011. The purpose of the March 2011 field survey was to collect supplemental information on wet season hydrological conditions, as well as collect soil information while radiological monitoring staff was onsite. Some additional upland and wetland data points also were collected during the March 2011 survey.

A total of 37 sample points were established in potential wetland areas and in adjacent upland habitats (Figure 2). Vegetation, soils, and hydrology observations at each sample point were recorded on standard USACE wetland determination data sheets. The wetland determination data sheets are included in Appendix B, and representative site photographs are included in Appendix C.

At each sample point, the dominant plant species were identified, and the percent cover was visually estimated and recorded. All taxonomic designations adhere to the *Jepson Manual of Higher Plants of California* (Hickman, 1993) or the updated taxonomy per the *Jepson Online Interchange for California Floristics* (University of California, 2011). The wetland indicator status was determined using the *National List of Plant Species that Occur in Wetlands* (Reed, 1988). Dominant species within each vegetation strata (tree, shrub, and herb) included the most abundant species whose cumulative cover accounted for at least 50 percent of the total cover, as well as any single species that accounted for at least 20 percent of the total vegetative cover. Strata that contained less than 5 percent total cover were not considered in the dominance test. The sample area for herbaceous species generally included a 5-foot radius from the sample point. A list of plant species observed at the sample locations is provided in Appendix D.

During the March 31, 2011, field survey soil morphological features, such as texture, color, and redoximorphic features (if present), were logged at several hand-augered soil borings, between 6 to 12 inches deep. Soils texture was estimated in the field by feel (Thein, 1979), and moist soil colors were determined using Munsell® color charts. In some situations, where saturated soils were present, alpha alpha-Dipyridyl (a chemical dye) was used to test for the presence of reduced iron (Childs, 1981). Hydric soils were assumed present in wetland areas that lacked hydric indicators where the dominant vegetation consisted entirely of OBL and FACW plant species. There was evidence of seasonal wetland hydrology, and there was a notable difference between the wetland and adjacent upland habitat (Environmental Laboratory, 1987).

Wetland hydrology was determined in the field based on observations made both during the dry season (July 2010) survey, as well as the wet season (March 31, 2011) survey. Dry season observations included indicators of wetland hydrology, such as algal matting and soil cracks, while the wet season observations included surface inundation, soil saturation and aquatic invertebrates such as seed shrimp (*Ostracods*).

Wetland boundaries were determined in the field based on changes in plant species composition and cover, the presence or absence of hydric soil, hydrologic indicators and local micro-topography. The wetland boundaries were mapped in the field using a Trimble® Geo-XT global position system device.

This page intentionally left blank.

3.0 Results and Discussion

A total of 9.40 acres of open water, including 4.41 acres of tidal waters, and 11.91 acres of wetlands, including 3.22 acres of tidal wetlands, were identified within the 110-acres IR Site 2 wetland study area (Table 1, Figure 2). General descriptions of these features are provided in the following sections. Data sheets and representative photographs are provided in Appendix B and C, respectively.

3.1 Open Waters

Two large open water features are located to the southwest of the landfill area (Figure 2). Both of these surface water features have been identified as Palustrine Unconsolidated Bottom, Semipermanently Flooded, Diked/Impounded (PUBFh) wetlands by the NWI (Appendix E) and are identified as open water features on the Oakland West USGS quadrangle (Appendix F). The northernmost of the two ponds (WTR-1) is hydrologically connected to San Francisco Bay through a 36-inch-diameter culvert that penetrates the perimeter berm and seawall. This tidal pond area appears to contain water year-round. The southern pond (WTR-2) was created by excavating soil for use as landfill cover, and it appears to be dry during the late summer months then subsequently filled with fresh water via precipitation during the winter and early spring. In July 2010 the area mapped as WTR - 2 was largely characterized by exposed soils and areas of shallow inundation. In contrast, the entire basin was completely inundated during the March 2011 survey. There is no direct surface connection between WTR-2 and the San Francisco Bay.

3.2 Wetlands

Wetlands are present in the southwest part of IR Site 2 in the vicinity of the open water habitats, as well as in the northern part of the site (Figure 2). Three of the wetland areas (W-1, W-2, and W-12) generally correspond with areas included in the NWI (Figure 2 and Appendix E).

The NWI includes a Palustrine, Emergent, Temporarily Flooded (PEMA) wetland along the north side of the IR Site 2 that generally corresponds to wetlands W-1 and W-2 (Appendix E and Figure 2). Wetland W-1 is characterized by a mixture of pickleweed (*Salicornia virginica*) and saltgrass (*Distichlis spicata*) with sparse rabbitsfoot grass (*Polypogon monspeliensis*), spear saltbush (*Atriplex patula*), and brass buttons (*Cotula coronopifolia*). Algal matting was observed in this area during the July 2010 field survey and 6 inches of ponded water was present in March 2011. Soils in this area are a dark grayish-brown (10 YR 4/2) sand with no redoximorphic features. No reaction to alpha alpha-Dipyridyl was observed during the March 2011 field survey (see Section 3.5 for a discussion of problem soils). Hydric soils were assumed present at this location based on the abundance of OBL and FACW vegetation, evidence of seasonal wetland hydrology, and notable absence of upland plant species in this area.

Wetland W-2 is characterized by a mixture of FACW and FAC plant species, including saltgrass, spear saltbush, and yellow sweetclover (*Melilotus indicus*). Other plants observed in this area included bird's-foot trefoil (*Lotus corniculatus*), curly dock (*Rumex crispus*), and sparse pickleweed. Algal matting was observed in this area in July 2010, and 6 inches of ponded water covered the area during the March 2011 field survey. Soils are a very dark gray (10YR 3/2) sandy clay loam with less than 2 percent strong brown (7.5YR 4/6) concentrations present in the upper 12 inches. The soil in this area does not meet any hydric criteria, and no reaction to alpha alpha-Dipyridyl was observed during the March 2011 field survey. Hydric conditions were assumed present based on the presence of wetland vegetation and observations of seasonal hydrology indicators observed during both the July 2010 and March 2011 field surveys and the absence of upland plant species.

The NWI also includes a large Palustrine, Unconsolidated Shore, Seasonally Flooded, Diked/Impounded (PUSCh) wetland along the southeastern edge of the southern open water pond. This feature generally corresponds to the large area mapped as wetland W-12 (Appendix E and Figure 2). Vegetation in this area is characterized by dense pickleweed with sparse saltgrass and rabbitsfoot grass in some areas. Areas of dense algal matting were observed in the northeastern part of this area during the July 2010 surveys and extensive inundation was observed through the entire wetland during the March 2011 surveys. During the March 31, 2011, field surveys this area was inundated with 9 to 15 inches of standing water. Surface soils include a dark grayish-brown (2.5 Y 4/2) sand in the southwestern part of the wetlands, along with mixed dark grayish-brown (10 YR 4/2) clay, light brownish-gray (2.5 Y 6/2) silty clay, and dark gray (10 YR 4/1) sandy clay in the northeast part of the wetland. No hydric soil indicators were observed, and there was no reaction to alpha alpha-Dipyridyl in March 2011. Hydric soils were assumed present based on the abundance of OBL plant species, evidence of wetland hydrology, and absence of upland plants.

Wetland W-12 also includes a narrow, nearly continuous fringe of pickleweed along the banks and outer edges of the open water area WTR-2. In July 2010, this area was above the water line, but the entire fringe wetland area was inundated with up to 3 inches of water during the March 2011 survey. The upper 12 inches of soil in this area is a dark grayish-brown (10 YR 4/2) sandy clay loam. No hydric indicators were observed, and there was no reaction to alpha alpha-Dipyridyl. Hydric soils were assumed present based on the abundance, evidence of wetland hydrology, and absence of upland plants.

In addition to the wetland areas included in the NWI, several other wetland features were identified within the boundaries of IR Site 2. These additional wetland areas include an adjacent wetland around the tidal open water pond (wetland W-11), as well as numerous linear swale-like wetlands and small depressional wetlands (Figure 2). The wetland (W-11) associated with the tidal open water area (WTR-1) is characterized by dense pickleweed with small amounts of saltgrass and spear saltbush also present. Soils were moist but not saturated at the outer extent of this wetland area in July 2010, and the entire area was inundated with between 1.5 and 3.5 inches of water during the March 2011 survey. This wetland is contiguous with the tidally connected open water area WTR-1; therefore, the extent of saturation and inundation is likely variable with changing tidal elevations. The surface soil in the northwest part of the wetland is a dark grayish-brown (10 YR 4/2) sandy clay loam. Soil in the southeast corner consists of mixed grayish-brown (2.5 Y 5/2) and dark grayish-brown (2.5 Y 4/2) clay with over 2 percent strong brown (7.5 YR 4/6) concentrations in the in the matrix below 5 inches. The mixed-clay soil in the southeast corner meets the criteria for a depleted matrix. No reaction to alpha alpha-Dipyridyl was observed at either soil sample location during the March 2011 survey. Soils throughout this area were considered to be hydric based on the abundance of OBL vegetation, observations of wetland hydrology, and absence of upland plant species.

Three linear, swale-like wetlands are present along the western side of the site (W-8, W-9, and W-10) as shown in Figure 2. Wetland W-8 is located on the west side of the levee that surrounds the landfill. Wetlands W-9 and W-10 are located immediately east (inside) of the landfill levee along the western side of IR Site 2. All three of these wetlands are characterized by pickleweed. These wetland areas were all dry during the July 2010 field survey, but they were all were inundated with several inches of water during the March 2011 field survey. Based on the presence of driftwood and other debris along the base of the outer landfill levee, it appears that wetland W-8 may be subject to sea waves during heavy storm events and extreme high tides; however, the wetland hydrology appears to be due to seasonal rainwater perched above a restrictive clay layer. The surface soil in this area is a dark gray (2.5 Y 4/1) sandy clay loam to a depth of 5 inches that was saturated at the time of the March survey. Below 5 inches the soil is a dark grayish-brown (2.5 Y 4/2) heavy clay. While the wetland feature contained several inches of standing water in some areas and had saturated surface soils at the outer edges, the interior of the clay soil below 5 inches was only slightly moist during the March 2011 survey, suggesting that water is not percolating through this dense clay layer. No hydric soil indicators were observed in this area, but a faint reaction to alpha alpha-Dipyridyl was noted in the upper 5 inches of saturated soil.

Wetlands W-9 and W-10, on the east side of the levee, were inundated with 6 and 11 inches of water, respectively, on March 31, 2011. Soils associated with wetland W-9 are a dark grayish-brown (10 TR 4/2) sandy clay loam. No redoximorphic features or other hydric soil indicators were observed, and there was no reaction to alpha alpha-Dipyridyl at this location in March 2011. Hydric soils were assumed present based on the abundance of OBL wetland vegetation, observations of seasonal wetland hydrology and absence of upland plants. Soil associated with wetland W-10 is a dark gray (2.5 Y 4/1) sandy clay loam with approximately 2 percent strong brown (7.5 YR 4/6) concentrations in the upper 6 inches. This soil meets the criteria for a depleted matrix, and hydric conditions are likely present based on abundance of OBL vegetation, observation of seasonal ponding during the March 2011 survey, and absence of upland plants in this area.

Three smaller depressional wetland features (W-13, W-14, and W-15) were identified in the southwest part of IR Site 2 (Figure 2). All three of these areas are characterized by abundant pickleweed and were inundated with 11 to 19 inches of water on March 31, 2011. Other wetland vegetation associated with these areas included scattered spear saltbush and curly dock. Surface soils in all three locations are characterized by dark grayish-brown (10 YR 4/2) sand to sandy clay loam. None of the soils had a reaction to alpha alpha-Dipyridyl in March 2011 and no other hydric soil indicators were observed. Hydric soils were assumed present in all three of these areas based on the abundance of OBL wetland vegetation, observations of seasonal wetland hydrology, and notable lack of upland vegetation.

Several depressional wetlands (W-3 through W-7) are present in the northeastern corner of IR Site 2 (Figure 2). With the exception of wetland W-13 which was characterized by dense saltgrass with scattered curly dock, birds-foot trefoil, and spear saltbush, all of these wetlands are characterized by pickleweed. Other species present in the pickleweed wetlands areas include saltgrass, brass buttons, and rabbitsfoot grass. All of these areas were dry during the July 2010 survey. On March 31, 2011, these areas were inundated with between 4 and 10 inches of standing water. Surface soils associated with these wetlands included very dark grayish-brown (10 YR 3/2) sand and sandy clay loams, dark gray (2.5 Y 4/1) sand, and mixed dark gray (2.5 Y 4/1) and dark grayish-brown (2.5 Y 4/2) sand. No hydric indicators were observed in any of the soils, and none of the sample locations had a reaction to alpha alpha-Dipyridyl during the March 2011 survey. Hydric soils were assumed to be present in these areas based on the abundance of FACW and OBL vegetation, observations of seasonal wetland hydrology, and absence of upland plants.

3.3 Adjacent Upland Sample Points

A total of 18 sample points were established in uplands adjacent to the wetland areas (Figure 2). Common plant species in the adjacent uplands included ice plant, rip-gut brome, foxtail fescue, soft chess, Italian thistle, wild oat, and tall fescue. Common wetland species, including pickleweed and saltgrass, were observed in a number of upland areas, but generally the areas have low cover or were intermixed with abundant nonwetland plants (see Section 3.5 for additional discussion on vegetation). No evidence of inundation or saturation in the upper part of the soils was observed in these areas during either the July 2010 or March 2011 field surveys. As with the wetland sample points, surface soils were highly variable from one location to the next and often were similar to soils observed in the wetland areas adjacent to the upland sample point. The variability of the soils is typical for areas where the substrate consists of dredged fill material.

3.4 Nonwetland Constructed Drainage

A concrete-lined drainage channel is present along the southeast side of the landfill area (Figure 2). A large semicircular corrugated metal pipe stand with a 26-inch-diameter culvert passing through the eastern levee wall drains into a concrete-lined channel that runs approximately 1,370 feet to the south. The channel terminates at the southeast corner of the landfill site where it flows into a 36-inch-diameter culvert that appears to discharge into San Francisco Bay. At the time of the survey, there was no evidence of recent flow through the channel, and upland vegetation, including ice plant, rip-gut brome, wild oat, and Italian thistle, all of which are common throughout portions of the channel sediment, had accumulated.

3.5 Survey Conditions and Problem Soils and Vegetation

No significant recent disturbance was observed at IR Site 2, and the overall seasonal conditions were considered to be within the normal range, although the monthly rainfall in March 2011 was higher than average. Soils throughout IR Site 2 consist of dredged fill material and were considered to be problematic. While the *Wetland Delineation Manual* (Environmental Laboratory, 1987) and the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE, 2008) provide useful guidance, the determination of wetland and nonwetland areas was, in many cases, based on best professional judgment. The following sections provide addition discussion of the survey conditions and problems encountered within IR Site 2 during the wetland delineation surveys.

3.5.1 Rainfall and Hydrology

With the exception of the open water area WTR-1 and contiguous wetland area W-11, which are hydrologically connected to the San Francisco Bay through a culvert, the hydrology of the wetlands identified within IR Site 2 appears to be influenced by direct precipitation and localized runoff during the winter and early spring months.

During the July 2010 surveys, surface water was absent from most of the wetlands as a result of normal seasonal conditions. In contrast, surface saturation and/or inundation was observed in all of the wetland areas during the March 2011 survey. The total rainfall during the month of March 2011 was 4.94 inches, compared to a monthly average of 3.56 inches (University of California Statewide Integrated Pest Management Program [UCIPMP], 2011). A total of 0.67 inches of rainfall was recorded in West Oakland the week immediately preceding the March 31, 2011, survey (UCIPMP, 2011). The higher-than-average rainfall in March 2011, as well as a relatively significant amount of precipitation immediately preceding the survey, likely resulted in an increased extent and depth of ponding in some areas. However, the total seasonal rainfall between November 1, 2010, and March 31, 2011, was 17.24 inches—slightly below an average of 19.18 inches for this period (UCIPMP, 2011). Therefore, the overall wet season conditions were considered to be within the range of normal circumstances.

One of the primary purposes of the March 2011 survey was to document the wet season conditions of areas that were identified as potential wetlands during the July 2010 field survey. Taking into consideration both the monthly rainfall conditions and overall seasonal precipitation, the observations of seasonal ponding during the March 2011 survey confirmed the presence of wetland hydrology in areas that were mapped as potential wetlands during the July 2010 dry season field survey.

3.5.2 Problematic Soils

Because soils throughout IR Site 2 originated from dredged fill material and are described as being moderately alkaline (USDA, 1981), soils were considered to be problematic. Common hydric soil indicators are frequently absent in wetlands with coarse textured soils (sand), and/or wetlands that have soils with a high pH (USACE, 2008; NRCS, 2010). Redoximorphic features (and the presence of reduced iron as detected with alpha alpha-Dipyridyl) are also not found in soils where there are low amounts of soluble carbon and iron, or where there are other chemical and/or physical constraints on microbial processes that result in the reduction of iron under saturated soil conditions (Vepraskas, 1999; Richardson and Vepraskas, 2001; Childs, 1981).

While no data were collected on soil salinity, the fact that the soils are derived from dredged material (USDA, 1981), the fact that IR Site-2 is located in an area that was originally part of San Francisco Bay, and the dominant vegetation associated with the wetlands consists of salt tolerant plants, it is likely the soils are at least partly saline. Saline soils that become anaerobic in the upper 12 inches often do not exhibit redoximorphic features even though the soils are anaerobic for long periods of time (Richardson and Vepraskas, 2001).

Hydric soil indicators, such as the presence of a depleted matrix or the presence of reduced iron (a positive reaction to alpha alpha-Dipyridyl), confirm that hydric conditions either have been or are currently present in a given location. However, some hydric soils lack any of the currently identified indicators, and the lack of an indicator does not prevent classification of the soil as hydric (NRCS, 2010). As previously mentioned, areas that were characterized by wetland vegetation, exhibited seasonal wetland hydrology, and had a notable absence of upland plant species were considered to also have hydric soils present (Environmental Laboratory 1987).

3.5.3 Problematic Vegetation

Two relatively common plants observed at IR Site 2 are pickleweed and salt grass. Pickleweed is listed as an OBL, and saltgrass is listed as FACW in the *National List of Plants that Occur in Wetlands* (Reed, 1988). Both of these species are commonly dominant in coastal salt marshes around the San Francisco Bay region and were the most abundant species observed in wetland areas within IR Site 2. Both pickleweed and salt grass were also observed in nonwetland habitats associated with plant species that are intolerant of prolonged inundation and saturation, such as ice plant, rip-gut brome, and coyote. Both pickleweed and saltgrass can spread extensively from wetland areas into adjacent uplands by a long-reaching system of rhizomes. For the purpose of this delineation, areas that were characterized by hydrophytic vegetation intermixed with plants commonly found only in upland areas were not considered to be wetlands.

This page intentionally left blank.

4.0 Preliminary Jurisdictional Determination

USACE and USEPA are ultimately responsible for making the determination regarding the limits of waters of the United States subject to regulation under the federal Clean Water Act. The results and conclusions presented in this wetland delineation are intended to assist the USACE with its determination of jurisdictional waters of the United States (including wetlands), and the results and conclusions presented in this report are preliminary, pending verification and subsequent approval by the USACE.

According to the federal Clean Water Act, wetlands that are adjacent to traditional navigable waters are *per se* jurisdictional and therefore do not require a significant nexus, such as a continuous surface water connection (33 CFR 328.3). According to the Clean Water Act, the term adjacent means "bordering, contiguous, or neighboring." Wetlands separated from other waters of the United States by man-made dikes or barriers, natural river berms, beach dunes and the like are "adjacent wetlands" (33 CFR 328.3). The USACE considers wetlands to be bordering, contiguous, or neighboring, and therefore "adjacent" if at least one of the following three criteria is satisfied:

1. There is an unbroken surface or shallow subsurface hydrologic connection between the wetland and jurisdictional waters.
2. The wetlands are physically separated from jurisdictional waters by "man-made dikes or barriers, natural river berms, beach dunes, and the like."
3. Where a wetland's physical proximity to a jurisdictional body of water is reasonably close, that wetland is "neighboring" and thus adjacent.

Proposed guidance issued by the USEPA (2011) states that one test for determining if a wetland is sufficiently proximate to be considered "neighboring" is whether there is a demonstrable ecological interconnection between the wetland and the jurisdictional body of water. For example, if resident aquatic species (e.g., amphibians, aquatic turtles, fish, or ducks) rely on both the wetland and the jurisdictional body of water for all or part of their life cycles (e.g., nesting, rearing, or feeding), that may demonstrate that the wetland is neighboring and thus adjacent" (Federal Register Volume 79, Number 84).

Although only one of the open waters (WTR-1) and associated wetland area (9W-11) identified at IR Site 2 has a direct surface connection to San Francisco Bay, all of the wetland features are located on lands that were created by the historical filling of a portion of the San Francisco Bay, and all are located within approximately 150 to 1,600 feet of the bay. They are likely to be considered adjacent wetlands by the USACE and, therefore, were considered to be potential jurisdictional wetlands.

Additionally, 33 CFR 329 defines navigable waters of the United States as "those waters that are subject to the ebb and flow of the tide and/or are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce."
A determination of navigation, once made, applies laterally over the entire surface of the body of water and is not extinguished by later actions or events that impede or destroy

navigable capacity. Given the fact that the entire area included within IR Site 2 was historically part of the San Francisco Bay, it is likely that the USCAE would consider all of the wetlands identified in IR Site 2 as potential jurisdictional Waters of the United States.

5.0 Summary and Conclusions

The results of the wetland delineation identified the presence of 9.40 acres of open water, including 4.41 acres of tidal waters, and 11.91 acres of wetlands, including 3.22 acres of tidal wetlands, within the 110-acre IR Site 2 survey area. Additional field surveys conducted in March 2011 confirmed the presence of seasonal wetland hydrology in areas previously identified as wetlands during the July 2010 field surveys. Soils throughout IR Site 2 are derived from dredged fill material and were considered problematic. While hydric soil indicators were not observed in most of the wetland areas, hydric soils were assumed to be present based on abundance of OBL wetland plants, observations of seasonal hydrology, and absence of upland plants per the *1987 Wetland Delineation Manual* (Environmental Laboratory 1987).

Based on USEPA and USACE guidance, as well as on the definition of Waters of the United States in the Federal Clean Water Act, all of the waters and wetlands identified at IR Site 2 were considered adjacent to San Francisco Bay and, therefore, would be jurisdictional under Section 404 of the Clean Water Act. The results and conclusions presented in this report, as well as the jurisdictional determination, are preliminary, pending verification by USACE.

MAP INFORMATION

Map Scale: 1:5,780 if printed on A size (8.5" × 11") sheet.

The soil surveys that comprise your AOI were mapped at 1:24,000.

Please rely on the bar scale on each map sheet for accurate map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: http://websoilsurvey.nrcs.usda.gov
Coordinate System: UTM Zone 10N NAD83

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Alameda County, California, Western Part
Survey Area Data: Version 7, Jul 27, 2010

Soil Survey Area: San Mateo County, Eastern Part, and San Francisco County, California
Survey Area Data: Version 7, Jul 27, 2010

Your area of interest (AOI) includes more than one soil survey area. These survey areas may have been mapped at different scales, with a different land use in mind, at different times, or at different levels of detail. This may result in map unit symbols, soil properties, and interpretations that do not completely agree across soil survey area boundaries.

Date(s) aerial images were photographed: 6/12/2005

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

high shrink-swell potential and low strength affect the construction of roads and streets. Suitable base material is needed.

The water intake rate and permeability are slow; therefore, lawns should be watered slowly to reduce runoff. Shrubs can be drip irrigated to encourage deep rooting. Lawn grasses grow best if 1 pound of elemental nitrogen per 1,000 square feet is applied every 8 weeks, from April through October. Some ornamental plants respond to sulfur and to iron and aluminum chelates. Adding organic matter to the soil can improve the rate of water intake, aeration, and tilth.

Capability classification not assigned.

156—Xeropsamments, fill. This unit consists of sandy material that was dredged from old beach areas. Slopes are less than 2 percent. Elevation ranges from near sea level to 10 feet. The average annual precipitation is 17 inches, and the mean annual temperature is 57 degrees F. The average frost-free season ranges from 300 to 320 days.

Included in mapping, and making up about 10 percent of the map unit, are a few areas that are underlain by strongly alkaline clay at a depth of 36 to 48 inches. Also included, and making up about 5 percent of the map unit, are concave areas that have a water table within a depth of 36 inches and can be ponded in winter.

Typically, Xeropsamments are moderately alkaline sands that extend to a depth of 60 inches. In a few areas they are as much as 5 percent, by volume, shells that are less than one inch in diameter.

These soils are rapidly permeable. The root zone for water-tolerant plants is 60 inches deep; the water table restricts the root zone for water-sensitive plants to a depth of 40 to 60 inches. The available water capacity is 3 to 4 inches. Runoff is slow, and the hazard of erosion is slight. Soil blowing is a serious hazard.

These soils are used mainly for urban and industrial development and as airfields. A few areas are used for small grain. Levees prevent erosion of this fill material.

Frequent and light applications of irrigation water and fertilizer are needed to establish a vegetative cover. Most plants respond to nitrogen and phosphate fertilizer. Iron and aluminum chelates are needed for some ornamental plants.

Capability classification not assigned.

157—Xerorthents-Altamont complex, 30 to 50 percent slopes. This complex consists of soils on foothills adjacent to the bay. The elevation ranges from 200 to 1,500 feet. The average annual precipitation is 16 inches, and the mean annual temperature is 57 degrees F. The average frost-free season ranges from 300 to 320 days. Xerorthents, clayey, make up about 75 percent of this complex; Altamont clay, 20 percent.

Xerorthents consist of soil material that resulted from cutting or filling for urban development; therefore, the soil characteristics are variable. Fill areas consist of heavy clay loam, silty clay, and clay and are as much as 20 percent angular fragments of shale and sandstone. Colors are variable. Reaction is mildly alkaline or moderately alkaline, and these soils are calcareous throughout the profile. Cut areas consist of interbedded shale and fine-grained sandstone. The bedrock dips between 50 and 80 degrees.

Permeability is slow or very slow, depending on the soil texture and on the amount of compaction that takes place during construction.

The Altamont soil is deep and well drained. It formed in the material that weathered from soft, interbedded sedimentary rock and makes up most of the undisturbed areas of this complex. Typically, the surface layer is dark brown, slightly acid to mildly alkaline clay about 28 inches thick. The next layer is finely mixed dark brown and dark yellowish brown, calcareous clay about 9 inches thick. The underlying material extends to a depth of 50 inches. It is yellowish brown, calcareous clay. Below that is highly fractured and weathered fine-grained sandstone and shale.

Permeability is slow. The available water capacity is 5.0 to 9.5 inches. The root zone is 40 to 60 inches deep. Runoff is rapid, and the hazard of erosion is high.

Areas of this complex are used mainly for residential developments that have a density of two to four single family dwellings per acre. Approximately 25 percent of the area is covered by buildings or other urban related structures.

Certain limitations should be overcome before construction is feasible. The shrink-swell potential is high; as a result, foundations can shift and crack. Building pads should be shaped so that water is drained away from the building site, thus keeping the soil beneath the foundation dry and reducing the hazards of differential settlement and shrink-swell. The high shrink-swell potential and low strength affect the construction of roads and streets. Suitable base material is needed. In sloping areas, intercepting drains should be provided to keep moisture from beneath the roads.

Steep banks that result from reshaping these soils for use as building sites are highly erodible. These soils should be seeded to a fast-growing cover as soon as possible to reduce the hazard of erosion. Using straw mulch or jute netting helps to reduce the hazard of erosion during establishment of the grass cover. If runoff from higher areas is a problem, diversions may be needed at the head of these slopes.

The water intake rate and permeability are slow; therefore, lawns should be watered slowly to reduce runoff. Shrubs and trees can be drip irrigated to encourage deep rooting. Lawn grasses grow best if 1 pound of nitrogen per 1,000 square feet is applied every 8 weeks, from April through October. Some ornamental plants respond to sulfur and to iron and aluminum chelates.

Indicators for Problematic Hydric Soils[c]:

- ___ 1 cm Muck (A9) (**LRR C**)
- ___ 2 cm Muck (A10) (**LRR B**)
- ___ Reduced Vertic (F18)
- ___ Red Parent Material (TF2)
- X Other (Explain in Remarks)

[c] Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: None Encountered

Depth (inches): ______

Hydric Soil Present? **Yes** X **No** ___

Remarks: No evidence of hydric soil at this location; no reaction to alpha alpha-Dipyridyl during the March 2011 survey. Area is characterized exclusively by hydrophytic vegetation and appears to support seasonal inundation; therefore hydric soils are presumed to be present in this location.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- X Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- X Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Plowed Soils (C6)
- ___ Other (Explain in Remarks)

Secondary Indicators (two or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Thin Muck Surface (C7)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes X No ___ Depth (inches): 6

Water Table Present? Yes ___ No ___ Depth (inches): N/A

Saturation Present? (includes capillary fringe) Yes ___ No ___ Depth (inches): N/A

Wetland Hydrology Present? **Yes** X **No** ___

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks: Area was dry at the time of the July 2010 field surveys with scattered dried algal matting observed throughout the topographic basin. The entire area was inundated with approximately 6 inches of standing water on March 31, 2011.

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Alameda Point IR Site 2 City/County: Alameda County Date: July 27, 2010

Applicant/Owner: U.S. Navy State: CA Sampling Point: SP-2

Investigator(s): Russell Huddleston and Holly Barbare Section, Township, Range: 05 02S 04W (Mt. Diablo Meridian)

Landform (hillslope, terrace, etc.): Fill Terrace Local relief (concave, convex, none): None Slope (%): 0-1

Subregion (LRR): C-14 Lat: 37.78807 North Long: -122.32897 West Datum: WGS84

Soil Map Unit Name: Xeropsaments, Fill NWI classification: PEMA

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No ___ (If no, explain in Remarks.)

Are Vegetation ___, Soil ___, or Hydrology ___ significantly disturbed? Are "Normal Circumstances" present? Yes X No ___

Are Vegetation ___, Soil X, or Hydrology ___ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes X No ___	**Is the Sampled Area within a Wetland?** Yes ___ No X
Hydric Soil Present?	Yes ___ No X	
Wetland Hydrology Present?	Yes ___ No X	

Remarks: Grassland habitat at the north end of IR Site 2 south of taxiway adjacent to Wetland W-1. Soils considered problematic as they are derived from dredged fill materials. This area is included in an area mapped as a PEMA by the National Wetlands Inverntoy, but does not appear to support wetland hydrology and is characterized by marginal vegetation consisting largely of facultative species with upland planst also present.

___ Redox Depressions (F8)
___ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[c]:

___ 1 cm Muck (A9) (**LRR C**)
___ 2 cm Muck (A10) (**LRR B**)
___ Reduced Vertic (F18)
___ Red Parent Material (TF2)
X Other (Explain in Remarks)

[c] Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: None Encountered

Depth (inches): ___

Hydric Soil Present? Yes X **No** ___

Remarks: This soil in this area does not meet any of the hydric indictors and no reaction to alpha alpha-Dipyridyl was observed during the March 2011 survey. Area is characterized exclusively by hydrophytic vegetation and supports seasonal wetland hydrology; therefore hydric soil conditions were assumed to be present at this location.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

X Surface Water (A1)
___ High Water Table (A2)
___ Saturation (A3)
___ Water Marks (B1) (**Nonriverine**)
___ Sediment Deposits (B2) (**Nonriverine**)
___ Drift Deposits (B3) (**Nonriverine**)
___ Surface Soil Cracks (B6)
___ Inundation Visible on Aerial Imagery (B7)
___ Water-Stained Leaves (B9)
___ Salt Crust (B11)
___ Biotic Crust (B12)
X Aquatic Invertebrates (B13)
___ Hydrogen Sulfide Odor (C1)
___ Oxidized Rhizospheres along Living Roots (C3)
___ Presence of Reduced Iron (C4)
___ Recent Iron Reduction in Plowed Soils (C6)
X Other (Explain in Remarks)

Secondary Indicators (two or more required)

___ Water Marks (B1) (**Riverine**)
___ Sediment Deposits (B2) (**Riverine**)
___ Drift Deposits (B3) (**Riverine**)
___ Drainage Patterns (B10)
___ Dry-Season Water Table (C2)
___ Thin Muck Surface (C7)
___ Crayfish Burrows (C8)
___ Saturation Visible on Aerial Imagery (C9)
___ Shallow Aquitard (D3)
X FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes X No ___ Depth (inches): 10
Water Table Present? Yes ___ No ___ Depth (inches): ___
Saturation Present? Yes ___ No ___ Depth (inches): ___
(includes capillary fringe)

Wetland Hydrology Present? Yes X **No** ___

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks: Area was dry at the time of the July 2010 surveys. Several inches of ponding water as well as aquatic invertebrates (Ostracods) were observed in this location on March 31, 2011.

WETLAND DETERMINATION DATA FORM – Arid West Region

Hydrophytic Vegetation Indicators:

X Dominance Test is >50%

X Prevalence Index is ≤3.0*

___ Morphological Adaptations* (Provide supporting data in Remarks or on a separate sheet)

___ Problematic Hydrophytic Vegetation* (Explain)

* Indicators of hydric soil and wetland hydrology must be present.

Hydrophytic Vegetation Present? **Yes** X **No** ___

Remarks: Shallow linear swale feature with *Salicornia* primarily found along the edges, center part of the swale is devoid of vegetation.

SOIL

Sampling Point SP-9

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix Color (moist)	Matrix %	Redox Features Color (moist)	Redox Features %	Type[a]	Loc[b]	Texture	Remarks
0-12	2.5 Y 4/1	100	--	--	--	--	Sand	Soil consists of dredged fill material

[a] Type: C=Concentration, D=Depletion, RM=Reduced Matrix. [b] Location: PL=Pore Lining, RC=Root Channel, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

___ Histosol (A1)
___ Histic Epipedon (A2)
___ Black Histic (A3)
___ Hydrogen Sulfide (A4)
___ Stratified Layers (A5) (**LRR C**)
___ 1 cm Muck (A9) (**LRR D**)
___ Depleted Below Dark Surface (A11)
___ Thick Dark Surface (A12)
___ Sandy Mucky Mineral (S1)
___ Sandy Gleyed Matrix (S4)
___ Sandy Redox (S5)
___ Stripped Matrix (S6)
___ Loamy Mucky Mineral (F1)
___ Loamy Gleyed Matrix (F2)
___ Depleted Matrix (F3)
___ Redox Dark Surface (F6)
___ Depleted Dark Surface (F7)
___ Redox Depressions (F8)
___ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[c]:

___ 1 cm Muck (A9) (**LRR C**)
___ 2 cm Muck (A10) (**LRR B**)
___ Reduced Vertic (F18)
___ Red Parent Material (TF2)
X Other (Explain in Remarks)

[c] Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: None Encountered

Depth (inches): ______

Hydric Soil Present? **Yes** X **No** ___

Remarks: No indicators of hydric soil observed and there was no reaction to alpha alpha-Dipyridyl during the March 2011 survey. Area is characterized exclusively by hydrophytic vegetation and supports seasonal wetland hydrology; therefore hydric conditions were assumed to be present at this location.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

X Surface Water (A1)
___ High Water Table (A2)
___ Saturation (A3)
___ Water Marks (B1) (**Nonriverine**)
___ Sediment Deposits (B2) (**Nonriverine**)
___ Drift Deposits (B3) (**Nonriverine**)
X Surface Soil Cracks (B6)
___ Inundation Visible on Aerial Imagery (B7)
___ Water-Stained Leaves (B9)
___ Salt Crust (B11)
___ Biotic Crust (B12)
___ Aquatic Invertebrates (B13)
___ Hydrogen Sulfide Odor (C1)
___ Oxidized Rhizospheres along Living Roots (C3)
___ Presence of Reduced Iron (C4)
___ Recent Iron Reduction in Plowed Soils (C6)
___ Other (Explain in Remarks)

Secondary Indicators (two or more required)

___ Water Marks (B1) (**Riverine**)
___ Sediment Deposits (B2) (**Riverine**)
___ Drift Deposits (B3) (**Riverine**)
___ Drainage Patterns (B10)
___ Dry-Season Water Table (C2)
___ Thin Muck Surface (C7)
___ Crayfish Burrows (C8)
___ Saturation Visible on Aerial Imagery (C9)
___ Shallow Aquitard (D3)
X FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes X No ___ Depth (inches): 8
Water Table Present? Yes ___ No ___ Depth (inches): ___
Saturation Present? (includes capillary fringe) Yes ___ No ___ Depth (inches): ___

Wetland Hydrology Present? **Yes** X **No** ___

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks: Area was dry at the time of the July 2010 surveys - shallow open depressional swale with soil cracks indicative of seasonal inundation were observed within the sale feature on July 27, 2010. Entire swale area was inundated with several inches of water on March 31, 2011.

- X Depleted Matrix (F3)
- ___ Redox Dark Surface (F6)
- ___ Depleted Dark Surface (F7)
- ___ Redox Depressions (F8)
- ___ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[c]:

- ___ 1 cm Muck (A9) (**LRR C**)
- ___ 2 cm Muck (A10) (**LRR B**)
- ___ Reduced Vertic (F18)
- ___ Red Parent Material (TF2)
- X Other (Explain in Remarks)

[c] Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: None Encountered

Depth (inches): ______

Hydric Soil Present? Yes X **No** ___

Remarks: Soils in this area are derived from fill material andshow evidence of reducing conditions. Unknow if these redox features are due to current hydric conditions; howverer, the abundance of OBL plants in this area as well as observation of seasonal inundation suggest that reducing conditions are likely present in this location.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- X Surface Water (A1)

Are Vegetation ____, Soil ____, or Hydrology ____ significantly disturbed? Are "Normal Circumstances" present? Yes X No ____

Are Vegetation ____, Soil X, or Hydrology ____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ____ No X	**Is the Sampled Area within a Wetland?**	**Yes** ____ **No** X
Hydric Soil Present?	Yes X No ____		
Wetland Hydrology Present?	Yes ____ No X		

Remarks: Grassland habitat in southwestern part of IR Site 2 adjacent to W-14. Soils considered problematic as they are derived from dredged fill materials.

___ Sandy Redox (S5)
___ Stripped Matrix (S6)
___ Loamy Mucky Mineral (F1)
___ Loamy Gleyed Matrix (F2)
X Depleted Matrix (F3)
___ Redox Dark Surface (F6)
___ Depleted Dark Surface (F7)
___ Redox Depressions (F8)
___ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[c]:

___ 1 cm Muck (A9) (**LRR C**)
___ 2 cm Muck (A10) (**LRR B**)
___ Reduced Vertic (F18)
___ Red Parent Material (TF2)
___ Other (Explain in Remarks)

[c] Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: None Encountered

Depth (inches): ___

Hydric Soil Present? Yes X **No** ___

Remarks: Soil with low chroma matrix and at least 2 percent redoximorphic concentrations present- this soil meets the criteria for depleted matrix; however, these indicators appear to be the result of the conditions under which the fill material formed and not indicative of current wetland hydrological conditions based on abundance of non-wetland plants and lack of wetland hydrology.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

___ Surface Water (A1)
___ High Water Table (A2)
___ Saturation (A3)
___ Water Marks (B1) (**Nonriverine**)
___ Sediment Deposits (B2) (**Nonriverine**)
___ Drift Deposits (B3) (**Nonriverine**)
___ Surface Soil Cracks (B6)
___ Inundation Visible on Aerial Imagery (B7)
___ Water-Stained Leaves (B9)
___ Salt Crust (B11)
___ Biotic Crust (B12)
___ Aquatic Invertebrates (B13)
___ Hydrogen Sulfide Odor (C1)
___ Oxidized Rhizospheres along Living Roots (C3)
___ Presence of Reduced Iron (C4)
___ Recent Iron Reduction in Plowed Soils (C6)
___ Other (Explain in Remarks)

Secondary Indicators (two or more required)

___ Water Marks (B1) (**Riverine**)
___ Sediment Deposits (B2) (**Riverine**)
___ Drift Deposits (B3) (**Riverine**)
___ Drainage Patterns (B10)
___ Dry-Season Water Table (C2)
___ Thin Muck Surface (C7)
___ Crayfish Burrows (C8)
___ Saturation Visible on Aerial Imagery (C9)
___ Shallow Aquitard (D3)
___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ___ No X Depth (inches): ___

Water Table Present? Yes ___ No X Depth (inches): >12

Saturation Present? (includes capillary fringe) Yes ___ No X Depth (inches): >12

Wetland Hydrology Present? Yes ___ **No** X

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks: No evidence to suggest seasonal saturation or inundation at this location.

Saturation Present? (includes capillary fringe) Yes ___ No ___ Depth (inches): ___

Wetland Hydrology Present? Yes X **No** ___

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks: Large wetland area characterized by OBL and FACW plant species – algal matting observed t in some areas during the July 2010 survey. No surface water or saturation noted at the time of the July 2010 survey, but this area was inundated with 9 inches of ponded water on March 31, 2011 and extensive inundation was noted throughout the entire wetland area. Aquatic invertebrates (Ostracods) were also present in this area during the March 2011 survey.

List of Plant Species Observed

This page intentionally left blank.

Table D-1. List of Plant Species Observed IR-Site 2

Scientific Name[1]	Common Name	Wetland Indicator[2]	Growth Habit
Acacia melanoxylon	Black-wood acacia	NL	Tree
Atriplex patula	spear saltbush	FACW	Annual Herb
Avena barbata	Wild oat	NL	Annual Grass
Baccharis pilularis	Coyote bush	NL	Shrub
Bellardia trixago	Mediterranean lineseed	NL	Annual Herb
Bromus diandrus	Rip-gut brome	NL	Annual Grass
Carduus pycnocephalus	Italian thistle	NL	Annual Herb
Carpobrotus edulis	Ice-plant	NL	Shrub
Centaurea solstitialis	Yellow star-thistle	NL	Annual Herb
Centromadia fitchii	Fitch's tarweed	NL	Annual Herb
Cirsium vulgare	Bull thistle	FACU	Biennial Herb
Cortaderia jubata	Pampas grass	NL	Perennial Grass
Cotula coronopifolia	Brass buttons	FACW+	Perennial Herb
Distichlis spicata	saltgrass	FACW	Perennial Grass
Festuca arundinacea	Tall fescue	FAC-	Perennial Grass
Foeniculum vulgare	Fennel	FACU	Perennial Herb
Geranium dissectum	Cut-leaf geranium	NL	Annual Herb
Helminthotheca echioides	Bristly ox-tongue	FAC*	Annual Herb
Hirschfeldia incana	Field mustard	NL	Annual Herb
Holcus lanatus	Velvet grass	FAC	Perennial Grass
Hordeum marinum	Mediterranean barley	FAC	Annual Grass
Lepidium latifolium	Perennial pepperweed	FACW	Perennial Herb
Lotus corniculatus	Birds-foot trefoil	FAC	Perennial Herb
Madia gracilis	Slender tarweed	NL	Annual Herb
Medicago polymorpha	Burclover	NL	Annual Herb
Melilotus indicus	Yellow sweetclover	FAC	Annual Herb
Polypogon monspeliensis	rabbitsfoot grass	FACW+	Annual Grass
Raphanus sativus	Wild radish	NL	Annual Herb
Rumex crispus	Curly dock	FACW-	Perennial Herb
Salicornia virginica	Pickleweed	OBL	Perennial Herb
Salix lasiolepis	Arroyo willow	FACW	Tree
Vicia sp.	Vetch	NL	Annual Herb

Table D-1. List of Plant Species Observed IR-Site 2

Scientific Name[1]	Common Name	Wetland Indicator[2]	Growth Habit
Vulpia myuros	Rat-tail-fescue	FACU*	Annual Grass
Xanthium strumarium	Cocklebur	FAC+	Annual Herb

Notes:

This list only includes plant species observed at wetland and upland sample point locations during the July 27, 2010 and March 31, 2011 field surveys as well as common upland plant species mentioned in the text. It is not intended to be a comprehensive plant list for the 110-acre IR Site 2.

[1] All taxonomic names are based on the *Jepson Manual* (Hickman 1993) or the most current taxonomic nomenclature per the *Jepson on-line Interchange for California Floristics* (University of California, 2011).

[2] Plant Indicator status is based on the *National List of Plants that Occur in Wetlands: Region 0.* (Reed, 1988)

NL - Not listed

FACU - Facultative Upland; Usually occurs in non-wetlands (estimated probability 67%-99%), but occasionally found on wetlands (estimated probability 1%-33%).

FAC - Facultative; Equally likely to occur in wetlands or non-wetlands (estimated probability 34%-66%).

FACW - Facultative Wetland; Usually occurs in wetlands (estimated probability 67%-99%), but occasionally found in non-wetlands.

OBL - Obligate ; Occurs almost always (estimated probability 99%) under natural conditions in wetlands>

* Indicates a tentative indicator status assignment
\+ Indicates a frequency toward the higher end of the category (more frequently found in wetlands)
\- Indicates a frequency toward the lower end of the category (less frequently found in wetlands)

1.0 STORMWATER PROGRAM INFORMATION

This Stormwater Pollution Prevention Plan (SWPPP) has been prepared to support the Tetra Tech EC, Inc. (TtEC) remedial action at Installation Restoration (IR) Site 2 at Alameda Point, Alameda, California. TtEC has been contracted by the Department of the Navy (DON) to develop and implement the remedial action for IR Site 2 for the Base Realignment and Closure Program Management Office West under Naval Facilities Engineering Command Southwest Contract No. N62473-10-D-0809. The DON is directing the remedial action in accordance with the requirements of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and the National Oil and Hazardous Substances Pollution Contingency Plan.

This SWPPP has been prepared for the DON to comply with the substantive requirements of the National Pollutant Discharge Elimination System program, specifically the General Construction Activity Stormwater Permit program as set forth by the California Regional Water Quality Control Board General Permit No. CAS000002, "Water Discharge Requirements for Discharges of Storm Water Runoff Associated with Construction and Land Disturbance Activities." This permit is hereafter referred to as the "General Permit" and is included as Appendix A.

Effective July 1, 2010, the General Permit requirements under Water Quality Order 99-08-DWQ were superseded by new legislation under Water Quality Order 2009-0009-DWQ. These new, more stringent permit requirements of Water Quality Order 2009-0009-DWQ will be enforced over the course of this removal action. The Best Management Practices (BMPs) and monitoring requirements identified in this SWPPP will meet the requirements under Water Quality Order 2009-0009-DWQ.

Management and monitoring requirements under the new permit are based on a risk level assessment. The remedial action at IR Site 2 was determined to be Risk Level 2. The basis for this determination is explained in Section 4.1. Appendix B provides the stormwater management requirements for Risk Level 2 sites.

SWPPPs and a Notice of Intent (NOI) are generally required for regulated sites, including site disturbance over 1 acre. However, an NOI is not required because ground disturbance associated with the remedial action at IR Site 2 will be performed as part of an on-site response action defined by CERCLA.

1.1 CONTACT INFORMATION

Table 1-1 lists the Qualified SWPPP Developer (QSD) and the primary Qualified SWPPP Practitioner (QSP) for implementation of this SWPPP. Table 1-2 provides a list of subcontractors who will be directed, if required, by the QSP.

1.2 INSPECTION, SAMPLING, AND NONCOMPLIANCE DOCUMENTATION

Before, during, and after storm events as discussed in Section 4.3, stormwater pollution prevention measures and BMPs will be inspected. The inspections will be documented on a form included in Appendix C; completed inspection forms will be inserted at the end of Appendix C of IR Site 2 SWPPP Master Copy to be located in the Field Engineer's office, where they will be retained for the duration of the removal actions. Effluent will also be sampled during qualified rain events as discussed in Sections 4.5. The effluent sampling will be documented on a form included in Appendix D; completed effluent sampling forms will be inserted at the end of Appendix D of IR Site 2 SWPPP Master Copy to be located in the Field Engineer's office. If applicable during this removal action, the Noncompliance Documentation Form included in Appendix C of this SWPPP can be used to document any instances of noncompliance with the General Permit or with this plan. Completed Noncompliance Documentation Forms will be inserted at the end of Appendix C of the IR Site 2 SWPPP Master Copy to be located in the Field Engineer's office.

2.0 PROJECT INFORMATION

2.1 PROJECT INFORMATION

The location and general site features of IR Site 2 are described in Section 2.0 of the Remedial Action Work Plan (RAWP), to which this SWPPP is attached. The activities to implement the remedial action are included in Section 5.0 of the RAWP. The site location is shown in Figure 1-1 of the RAWP. The Site Plan and Grading Plan are included as Attachments 1 and 2, respectively.

2.1.1 Existing Site Topography and Stormwater Flows

Inside the bermed area, IR Site 2 topography gently slopes overall from the north and east toward the south and west, in the direction of San Francisco Bay. The topography of the landfill is graded to promote surface drainage and consists predominantly of upland habitat. Visual observations of the site do not suggest the presence of significant erosion channels or areas that retain standing water following precipitation.

The upland area is covered predominantly with grasses, shrubs, trees, and roads that traverse the landfill. Miscellaneous landfill waste and debris have become exposed through the landfill cover over the course of time or may not have been properly covered during historical closure activities. The wetlands are covered by salt-tolerant wetland plant species and pockets of grasses, shrubs, and small trees. There is an existing weir structure that connects to the existing drainage channel through the berm at the eastern side of the landfill. This weir will be removed during the remedial action.

2.1.2 Construction Schedule

The schedule for the remedial action to be performed at IR Site is included as Figure 1-3 of the RAWP. Any updates to schedule will be provided during the project quality control meetings during construction activities.

This page intentionally left blank.

3.0 POLLUTANT SOURCES AND BEST MANAGEMENT PRACTICES

This section identifies the materials and activities that may contaminate stormwater (Section 3.1) and discusses implementation of BMPs for stormwater, where applicable, during and after construction (Sections 3.2 through 3.6). Fact sheets for BMPs that may be used at the site are in Appendix F.

3.1 INVENTORY OF MATERIALS AND ACTIVITIES THAT MAY CONTAMINATE STORMWATER

The BMPs for construction activities that may pollute stormwater focus on the following potential pollutant sources:

- Contaminated fine-grained soil (silt) from the excavation that can be suspended in stormwater runoff
- Contamination of stormwater with radionuclides, metals, or other chemicals of concern
- Trackout of soil and sediment from trucks leaving the sites
- Hazardous materials, including spills of fuel, oil, and lubricant
- Wind erosion of stockpiles of soil built during construction
- Solid waste (asphalt, concrete, metal, etc.) from grading activities

3.2 BMPs TO BE IMPLEMENTED FOR CONSTRUCTION ACTIVITIES

Good housekeeping and maintenance practices are key factors in reducing potential off-site migration of pollution. These practices shall include elimination of brush, litter, or other items, including solid waste that may clog drainage pathways or enter the stormwater flow within the grading areas. The achievement of good housekeeping and maintenance also requires employee participation and requires specific training and control systems. The following BMPs that will be implemented are essential to maintaining control of potential pollution sources.

Stormwater control structures will be inspected weekly and at least once each 24-hour period during extended storm events (a storm that lasts longer than 24 hours). Any authorized or unauthorized non-stormwater discharges, if observed, will be documented on the site inspection and monitoring forms in Appendix C. Instructions for completing the forms are provided in Section 4.3.

3.2.1 Spill Prevention and Control

The remedial action at IR Site 2 will be conducted in accordance with the RAWP, Radiological Work Plan (Attachment 2 to the RAWP), Radiation Protection Plan (Attachment 3 to the RAWP), Environmental Protection Plan (Attachment 6 to the RAWP), the Dust Control and Air Monitoring Plan (Attachment 9 to the RAWP), and the project-specific Accident Prevention Plan/Site Safety and Health Plan. These documents will be maintained on-site and outline the specific steps to be followed if a spill or release occurs. If changes or revisions to these documents are made, the most recent version will supersede the previous iteration.

3.2.2 Management of Solid Waste

All construction waste shall be disposed of in dumpsters, roll-off bins, or other similarly approved containers in designated areas located throughout the site. Specific procedures to handle all types of waste expected are included in the Radiological Work Plan, Environmental Protection Plan, and Waste Management Plan (included as Attachments 2, 6, and 10 to the RAWP, respectively).

3.2.3 Management of Contaminated Soil

Radiologically contaminated soil will be placed directly in lined and covered bins. Stockpiled soil will be treated with a soil tackifier to provide dust control and prevent runoff.

3.2.4 Trackout of Material

Based on the requirements of working at a radiological materials area, trackout of loose materials will be controlled by use of a vehicle and equipment decontamination pad for tire cleaning at the access point to the project site from the paved road to prevent trackout of mud or loose soils onto roadways.

Any visible trackout onto a paved road where vehicles exit the work site will be removed by sweeping immediately.

3.2.5 Vehicle and Heavy Equipment Fueling

3.2.5.1 Diesel Fuel

During construction, diesel fuel will be delivered and pumped directly into various pieces of equipment. Fueling will occur in designated areas on the pavement within the radiological control area, which will be located away from drainage courses to prevent run-on of stormwater and runoff of spills (see Figure 5-1 of the main RAWP). If a spill occurs as equipment is fueled, the spill will be immediately contained with an earthen berm constructed of import fill material and an excavation retention trap will be provided. The individual noting the spill will be responsible for contacting the Site Superintendent, who will notify the DON, who in turn is responsible for notifying the regulatory agencies, as necessary, and managing cleanup and removal of contaminated soils in accordance with regulations.

3.2.5.2 Fuels for Passenger Vehicles and Trucks and Vehicle-Related Lubricants

Passenger vehicles and trucks fueled on-site will occur in designated areas located away from drainage courses to prevent the run-on of stormwater and the runoffs of spills. If a spill occurs as equipment is fueled, the spill will be immediately contained with an earthen berm constructed of import cover material and an excavation retention trap will be provided. The individual noting the spill will be responsible for contacting the Site Superintendent, who will notify the DON, who in turn is responsible for notifying the regulatory agencies, as necessary, and managing cleanup and removal of contaminated soils in accordance with regulations.

3.2.6 Equipment and Vehicle Maintenance

3.2.6.1 Heavy Equipment and Vehicle-Related Lubricants

All heavy equipment and vehicles will be inspected prior to use on-site and at the beginning of each workday for oil, lubricant, and hydraulic leaks. Leaking equipment will be repaired or removed from service, and small leaks will be cleaned up immediately. Excessive greasing of components will be avoided, and accumulated grease will be wiped off and contaminated rags properly disposed of off-site. All oil and lubricant supplies will be securely stored in drums or bins to prevent an uncontrolled discharge of spilled materials.

Heavy equipment oil changes and maintenance may be performed on-site. If a spill associated with heavy equipment/vehicles (e.g., diesel, gasoline, hydraulic fluid, or lubricant leak) occurs, containment will be provided, the Site Superintendent will be notified, the spill area will be absorbed or excavated, and the material will be containerized and stored in accordance with the Waste Management Plan (Attachment 10 to the RAWP) until proper off-site disposal.

3.2.6.2 Passenger Vehicles and Trucks

Passenger vehicles and trucks will be inspected daily for possible leaks, but any service will be performed off-site at commercial facilities.

3.2.7 Employee and Subcontractor Training

Primary work policies will be centered on requiring extensive training for employees and any subcontractor working on-site. Each employee is required to be current with appropriate federal hazardous waste training requirements and other training programs, as defined in the Site Safety and Health Plan prepared for the project. Each subcontractor will be required to attend daily safety meetings at the worksite, and each work phase is reviewed during project orientation meetings. During the meetings, potential problems, including weather conditions and stormwater control, will be discussed and the response actions that will be implemented if a particular spill or pollution situation occurs will be reviewed.

3.3 BMPs TO BE IMPLEMENTED FOR EROSION AND SEDIMENT CONTROL

BMPs for erosion and sediment control will be implemented, as necessary, during construction activities. Erosion and sediment control structures will be inspected weekly and at least once each 24-hour period during extended storm events (a storm that lasts longer than 24 hours). Any authorized or unauthorized non-stormwater discharges, if observed, will be documented on the site inspection and monitoring forms in Appendix C. Instructions for completing the forms are provided in Section 4.3. The following sections identify BMPs that will or may be implemented to prevent erosion of sediment. The BMPs are shown on the Sediment and Erosion Control Plan (Attachment 3).

3.3.1 Construction Sequence and Scheduling

Grading activities will be sequenced to minimize the amount and duration of soil exposed to erosion by wind, rain, runoff, and vehicle tracking.

3.3.2 Dust Controls

Dust control will be implemented in accordance with the Dust Control and Air Monitoring Plan (Attachment 9) but will generally include wetting active haul routes every 2 hours (or more frequent based on weather conditions), limiting vehicle speeds to under 15 miles per hour, wetting soil prior to excavation, trackout control (as discussed in Section 3.2.4), and stockpile management (as discussed in Sections 3.2.3 and 3.3.4).

3.3.3 Sodding or Other Groundcover

The site will be graded to match the grade specified in the Grading Plan (Attachment 2). After the grading activities are complete, the entire site will be hydroseeded as shown on the Sediment and Erosion Control Plan (Attachment 3).

3.3.4 Soil Stockpile Areas

During grading, soils may be stockpiled in areas adjacent to that activity. The soil will be stockpiled in a generally uncompacted condition at the angle of repose; thus it is subject to erosion. In addressing stockpiling, BMPs may include diversion of drainage from the stockpiles, installation of silt fencing/straw bale filter barriers on the downgradient toe of stockpile slope, and dust control. A soil tackifier will also be applied, as needed, to the stockpiles to prevent erosion. Plastic sheeting will not be used on any stockpile due to health and safety concerns.

3.3.5 Temporary Swales or Berms

Swales and berms may need to be cut to divert and control stormwater runoff during excavation. They can be used to divert sheet flow over slopes, prevent run-on into open excavations or active construction zones, and control erosion along with transport of sediment.

3.3.6 Silt Fence and Sandbags

Silt fencing may be used as a temporary sediment trapping and filtering device downgradient of all disturbed areas where sheet flow might occur. Alternatively, straw bale filter barriers, described in Section 3.3.7, may be used to perform the same function. Silt fences will be installed on a level contour receiving no more than 1 acre of runoff per 100 linear feet or 0.5 cubic foot per second of concentrated flow draining to any point along the silt fence.

Sandbags will be used as a drainage diversion and for sediment trapping and stormwater velocity and erosion control. The sandbags will be installed on level contours up to 1 acre and in areas of concentrated flows and drainage courses.

Silt fences and sandbags will be used at the following locations at the site:

- Silt fencing or sandbags around and along the downgradient toe of all soil stockpiles
- Silt fencing or sandbags below active construction areas
- Silt fencing along the downgradient toe of any work performed on the shoreline or adjacent steeply sloping bank
- Sandbags in concentrated drainage flow course and in areas downgradient of active work areas, as needed
- Sandbags as a diversion berm to stormwater run-on upgradient of active work areas and excavations

3.3.7 Straw Bale Filter Barrier

Straw bale filter barriers consist of a series of secured, anchored straw bales or wattles placed to intercept and filter sediment-laden runoff from small areas of disturbed soil. Straw bale filter barriers may be used on-site in place of silt fencing and sandbags around stockpile areas and downgradient of any active areas where excess sediment or soil may be expected. Straw bales may be required along the shoreline if the silt fencing does not provide adequate sediment filtration as determined by the field engineer.

3.4 OFF-SITE RUN-ON TO THE CONSTRUCTION SITE

Run-on to IR Site 2 is currently prevented by the presence of a perimeter earthen berm. The earthen berm is approximately 10 to 15 feet high. During site grading activities, the berm will be removed along the north and east sides of the landfill and a new drainage channel will be constructed along the north side. The existing drainage channel along the eastern side will be utilized for drainage along the eastern side of the landfill. Two existing storm drain manholes located along the eastern side of the landfill will also be converted to drain inlets and ultimately drain to San Francisco Bay through Outfall U (Attachment 1).

3.5 NON-STORMWATER MANAGEMENT

Inspections to identify any non-stormwater discharges will be performed quarterly. Any authorized or unauthorized non-stormwater discharges, if observed, will be documented on the site inspection and monitoring forms in Appendix C. Instructions for completing the forms are provided in Section 4.3.

3.5.1 Spill Prevention and Control

The BMPs for spill prevention and control include the following controls:

- Train employees and subcontractors in proper spill response procedures.
- Stop the source of a spill immediately, if it is safe to do so.
- If safe to do so, contain and clean up spills immediately and notify TtEC's Site Superintendent immediately.
- Spills of hazardous materials that cannot be cleaned up or that have resulted in a release should be immediately reported to TtEC's Site Superintendent, who will immediately notify the DON, who in turn will be responsible for notifying the regulatory agencies, as necessary, and managing cleanup.

3.6 POST-CONSTRUCTION BMPs

Final graded slopes for the landfill cover are presented in Attachment 2. The grading and drainage plans will be designed to maintain sheet flow of stormwater over the site to minimize ponding of water and infiltration.

Upon completion of the remedial action, drainage swales will be established throughout the affected sites to direct flow to previously constructed swale systems, still active drainage systems, and existing outfalls.

Once soil stockpiles have been removed, stockpile areas will be swept clean. No permanent post-construction BMPs will be required.

4.0 MONITORING PROGRAM

Monitoring requirements are assessed based on a calculated risk level. Section 4.1 describes how the stormwater monitoring requirements were determined for the various TtEC work areas at IR Site 2. The pollutant source assessment of the historical, current, and proposed site activities is presented in Section 4.2. Site inspections and the monitoring program for the project are discussed in Sections 4.3, 4.4, 4.5 and 4.6.

4.1 SEDIMENT RISK LEVEL DETERMINATION

Sediment risk determination was performed using the procedure outlined in Appendix 1 of the 2009-0009-DWQ permit. The procedure to calculate the sediment risk determination factor involves two steps: 1) evaluating the project sediment risk and 2) evaluating the receiving water risk. Risk level is then determined using the table in the Risk Determination Worksheet provided in Appendix 1 of the permit.

Sediment risk was evaluated for the IR Site 2 project. The watershed erosion estimate for the anticipated duration of the project was calculated to be 1.99 tons/acre (based on fieldwork completion in November 2013). Details of the evaluation are presented in Appendix G.

Since the watershed erosion estimate was below 15 tons/acre, the IR Site 2 work area was assigned a low Site Sediment Risk Factor. If TtEC conducts work outside the IR Site 2 work area, additional risk evaluations will be required. If the duration of the fieldwork extends beyond the above completion dates, the QSD will reevaluate the sediment risk to ensure the work area(s) still maintain a low Site Sediment Risk Factor. If it is determined that the Site Sediment Risk Factor changes, revisions to this SWPPP will be required. Any updated or new risk calculations will be kept on-site with the IR Site 2 SWPPP Master Copy to be located in the Field Engineer's office.

Receiving water risk was determined to be high because the receiving water body adjacent to IR Site 2 (i.e., San Francisco Bay) was listed as having beneficial uses of fish spawning, fish migration, and cold freshwater habitat.

Based on this risk evaluation, stormwater monitoring and management requirements fall into the Risk Level 2 category and will be based on the Risk Level 2 requirements. Stormwater management and monitoring requirements for Risk Level 2 sites can be found in Attachment D of the General Permit, a copy of which is provided in Appendix B.

4.2 POLLUTANT SOURCE ASSESSMENT

In accordance with the Risk Level 2 requirements included in Attachment D of the General Permit, a pollutant source assessment was conducted to identify any areas of the site where additional BMPs are necessary to reduce or prevent pollutants in stormwater and non-stormwater discharges. The following is a general description of the construction activities to be performed during the remedial action and the stormwater management control systems to be implemented. These controls will also minimize the risk of discharging pollutants that are not visually detectable to the waters of San Francisco Bay. If there is a breach, malfunction, leakage, or spill from a BMP that could result in the discharge of pollutants, the monitoring procedures detailed in Section 4.6 will be implemented.

Mobilization activities will include site preparation, moving equipment and materials to the site, establishing a laydown area, installing security fencing and stormwater runoff controls, and protection or proper abandonment of utilities within the grading footprint.

Prior to beginning the grading activities, sandbag or straw bale berms will be installed downgradient and upgradient of any areas where the runoff may lead to open storm drains or the San Francisco Bay, as well as to prevent stormwater run-on from areas outside the grading limits. Any storm drains located within 50 feet of grading limits and not a part of the remedial action will be surrounded with wattles, and the storm drain will be covered with filter fabric.

Open storm drain lines left in place during the remedial action will be plugged to prevent water from entering or exiting the lines and to eliminate the release of any contamination that may be present in the lines.

To protect areas along the waterfront, silt fencing may be used if no asphalt is present. Sandbags and/or straw bale berms will be used in asphalt areas, where silt fencing is not possible. If needed, sandbags will be placed in drainage control swales and at drainage control discharge points or areas with high probability of erosion. Stormwater coming into contact with the disturbed areas will be collected to prevent any uncontrolled discharge.

To stabilize and minimize wind dispersion of particulate matter from stockpiled soil, soil tackifier will be utilized.

To prevent chemical pollutants from entering the environment, hazardous materials will be stored in a central area at least 50 feet from surface waters. Containers will be stored properly when not in use and will be placed in the appropriate storage cabinet or secondary containment structure to reduce the risks of fire and releases. In addition, refueling operations for construction equipment will be conducted at least 50 feet from surface water bodies. Vehicle/equipment refueling operations will be supervised and appropriate spill control equipment will be available on-site in the event of a release. Proximal storm sewer inlets will also be covered during refueling or hazardous material transfer operations.

4.3 SITE INSPECTIONS

In addition to the weekly inspections mentioned previously, all stormwater pollution prevention measures and BMPs will also be inspected in accordance with the Risk Level 2 monitoring requirement presented in Appendix B. All stormwater pollution prevention measures and BMPs will be inspected 48 hours before (prediction of) and following (measurement of) each qualifying rain event, defined as 0.5 inch or more of precipitation with a 48 hour or greater period between rain events. This inspection will allow for evaluation of the BMPs to prevent the release of potential pollutants. The TtEC work areas at IR Site 2 and BMPs will be inspected during construction by trained personnel, and the appropriate forms will be filled out. These visual inspection field forms are provided in Appendix C. Completed forms will be inserted at the end of Appendix C of the IR Site 2 SWPPP Master Copy to be located in the Field Engineer's office. The following instructions apply to the forms that will be used to document these inspections:

- Use the visual inspection field form for inspecting the BMPs described in Section 3.0 before, during, and after wet weather events.
- Include in the weather information the best estimate of when (time) the storm event began, the duration of the event, the time elapsed since the last storm, and the approximate amount of rainfall.
- List observations of all BMPs: temporary erosion controls, temporary sediment controls, wind erosion controls, non-stormwater controls, and waste management and materials pollution controls.
- Evaluate BMPs for adequacy and proper implementation and whether additional BMPs are required in accordance with the terms of the General Permit.
- Inspect one-time discharges of non-stormwater when such discharges occur.
- Describe any inadequate BMPs.
- Note the corrective actions required, including any changes to the SWPPP and implementation dates.
- Visual observations (inspections) shall be conducted during normal business hours. Inspections will not be performed during dangerous weather conditions such as flooding and electrical storms. Inspections not performed as a result of weather conditions or outside of scheduled site business hours will be documented on the inspection form.

4.4 RAIN EVENT ACTION PLAN

A Rain Event Action Plan (REAP) will be prepared 48 hours prior to any likely precipitation event. A likely precipitation event is any weather pattern that is forecast to have a 50 percent or greater probability of producing precipitation in the project area. The REAP will be prepared by the QSP. The REAP will include a printed copy of the precipitation forecast information from the National Weather Service Forecast (e.g., by entering the zip code of the project location at http://www.srh.noaa.gov/forecast). The REAP form is provided in Appendix E. Completed REAP forms will be inserted at the end of Appendix E of the IR Site 2 SWPPP Master Copy to be located in the Field Engineer's office.

4.5 WATER QUALITY SAMPLING AND ANALYSIS

Effluent sampling will be performed during each qualifying rain event (i.e., at least 0.5 inch of rain or more within a 48-hour or greater period). Prior to collecting samples for measurement, the hand-held field meter will be calibrated in accordance with manufacturer's instructions, and the calibration information will be recorded on the effluent sampling field form provided in Appendix D. A sample will then be collected at each location where storm water is discharged off-site. A minimum of three samples will be collected per day during each qualifying rain event. An 8-ounce glass jar or equivalent will be used to collect a sample at each location. The jar will be filled with water at least ¾ full. The samples will then be measured for pH and turbidity using the calibrated hand-held field meter by inserting the meter probe into the water container. The readings will be recorded on the same effluent sampling field form that the calibration information was recorded on. The numeric action level (NAL) for pH is lower than 6.5 pH units or greater than 8.5 pH units, and the NAL for turbidity is greater than 250 nephelometric turbidity units. Section I.15 of Attachment D in Appendix B describes actions to take in the event a measurement exceeds these NALs. Completed effluent sampling field forms will be inserted at the end of Appendix D of the IR Site 2 SWPPP Master Copy to be located in the Field Engineer's office.

4.6 MONITORING FOR POLLUTANTS NOT VISUALLY DETECTABLE IN STORMWATER

Water samples will be collected and analyzed should visual monitoring indicate that there has been a breach, malfunction, leakage, or spill from a BMP that could result in the discharge of pollutants. If a point discharge were to occur as a result of a breach of a BMP along the border during construction activities, the monitoring point would be designated as the point closest to where the breach occurred, if water is present at the time of observation. The shoreline is another susceptible location. Should a BMP near the shoreline fail, the monitoring and sampling location would be nearest to the point where the BMP failed. The water samples will be analyzed for the radionuclides of concern (cobalt-60, radium-226, strontium-90, cesium-137, thorium-232, uranium-238, uranium dioxide, and depleted uranium) and the contaminants of concern listed in the ROD (DON 2010), which include cadmium, chromium, lead, molybdenum, total DDx (represented by the sum of the 4,4′-isomers of dichlorodiphenyltrichloroethane [DDT], dichlorodiphenyldichloroethane [DDD], and dichlorodiphenyldichloroethene [DDE]), polychlorinated biphenyls (PCBs), zinc, and benzo(a)pyrene.

This stormwater monitoring program will be amended if conditions at the TtEC work areas at IR Site 2 or the scope of the remedial action changes. Any such amendments will be documented using the Amendment Summary Form that is provided as Appendix H of this SWPPP, and any completed forms will be inserted at the end Appendix H of the IR Site 2 SWPPP Master Copy to be located in the Field Engineer's office.

This page intentionally left blank.

5.0 RECORDS

No later than August 25 of each year, TtEC will provide the DON the information specified in Section XVI, Annual Reporting Requirements, of the General Permit for inclusion in their Annual Report.

Records of all monitoring information and copies of all reports required by the General Permit will be retained in the project files for a period of at least 3 years from the date generated or date submitted, whichever is last.

Copies of the monitoring information and reports will be placed in the San Diego project files on a monthly basis.

This page intentionally left blank.

6.0 TRAINING AND CERTIFICATION REQUIREMENTS

To ensure that water quality is being protected, the General Permit requires that all SWPPPs be written, amended, and certified by a QSD. The General Permit also requires that all BMPs required by the General Permit are implemented by a QSP. The QSP is responsible for non-stormwater and stormwater visual observations/inspections, and sampling and analysis, if required. Table 6-1 outlines the required certifications and training for both the QSD and QSP. The QSD and QSPs for the removal actions are provided in Table 1-1. Certificates documenting the formal and informal training received for the primary project team members listed in Table 1-1 are provided in Appendix I. Additionally, certificates for alternate QSPs have also been included in Appendix I.

As IR Site 2 is in a Risk Level 2 category, the QSP may delegate the inspection, maintenance, repair, and sampling activities to an employee trained to perform these tasks appropriately, but shall ensure adequate deployment. Copies of training documentation for others delegated to perform the QSP tasks will be inserted into Appendix I of the IR Site 2 SWPPP Master Copy to be located in the Field Engineer's office.

BASIS OF SURVEY:

THIS MAP WAS PREPARED USING COMPUTER ASSISTED, PHOTOGRAMMETRIC METHODS BY HJW GEOSPATIAL, INC. IN OAKLAND, CALIFORNIA. CONTROL SURVEY PERFORMED BY KISTER, SAVIO & REI, RICHMOND, CA. IN AREAS OF DENSE VEGETATION, ACCURACY OF CONTOURS MAY DEVIATE FROM ACCEPTED ACCURACY STANDARDS.

SURVEY CONTROL IS BASED ON THE MONUMENT DESIGNATED "MAIN/ATL" AS DESCRIBED BY THE NATIONAL GEODETIC SURVEY. THE MONUMENT IS LOCATED AT THE NORTHWEST CORNER OF MAIN STREET AND ATLANTIC AVENUE.

COORDINATES ARE BASED ON THE CALIFORNIA COORDINATE SYSTEM ZONE III NORTH AMERICAN DATUM OF 1927. THE NAD27 VALUE FOR "MAIN/ATL" WAS DERIVED FROM THE NADCON CONVERSION OF THE PUBLISHED NAD83 COORDINATES. THE COMPUTED NAD27 COORDINATES ARE:
NORTH 471,068.97'
EAST 1,482,604.56'
ELEVATIONS ARE BASED THE NATIONAL GEODETIC VERTICAL DATUM OF 1929. THE PUBLISHED ELEVATION OF "MIN/ATL" = 6.69' NGVD29.

COORDINATES AND ELEVATIONS WERE OBTAINED USING RTK GPS TECHNIQUES AND CONVENTIONAL GROUND CONTROL SURVEY METHODS.

EROSION CONTROL NOTES

1. CONTRACTOR SHALL COMPLY WITH PROVISIONS AND BEST MANAGEMENT PRACTICES INCLUDED IN THE STORMWATER POLLUTION PREVENTION PLAN (SWPPP) PREPARED BY THE CONTRACTOR.
2. BEST MANAGEMENT PRACTICES (BMP) REFERENCE NUMBERS REFER TO CALIFORNIA STORMWATER BMP HANDBOOK—CONSTRUCTION BY THE CALIFORNIA STORMWATER QUALITY ASSOCIATION (CASQA), DATED NOVEMBER, 2009.
3. ALL EROSION CONTROLS WILL BE INSTALLED AS NECESSARY PRIOR TO THE BEGINNING OF WORK AND BE MAINTAINED THROUGHOUT CONSTRUCTION IN ACCORDANCE WITH THE SWPPP.
4. CONTROL OFF SITE RUN-ON BY DIVERTING STORMWATER FLOWS AWAY FROM SITE TO EXISTING STORM DRAIN SEWERS AND DRAINAGE CHANNELS.
5. CONTROL SITE RUN-OFF FROM ACTIVE AREA USING FIBER ROLLS AND GRAVEL BAG BERMS AT DOWN GRADIENT AREAS.
6. ONLY ESSENTIAL VEHICLES SHOULD ENTER SOIL EXCAVATION AND FILL AREAS.
7. VEHICLES WILL ENTER AND LEAVE SITE ONLY THROUGH DESIGNATED LOCATIONS.
8. VEHICLES WILL BE INSPECTED FOR SOIL ON TIRES AT THE VEHICLE INSPECTION AREA. SOIL WILL BE BRUSHED CLEAN TO PREVENT TRACKING ONTO PUBLIC ROADS. RADIATION CONTROLS IN EFFECT, SEE RPP ATTACHMENTS 2 AND 3.
9. TRASH CONTAINERS WILL BE PROVIDED ON SITE, ALL TRASH WILL BE PLACED INTO APPROPRIATE WASTE CONTAINERS. THE SITE WILL BE KEPT CLEAR OF TRASH AND DEBRIS.

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES)
GENERAL PERMIT FOR
STORM WATER DISCHARGES
ASSOCIATED WITH CONSTRUCTION AND LAND DISTURBANCE
ACTIVITIES

ORDER NO. 2009-0009-DWQ
NPDES NO. **CAS000002**

This Order was adopted by the State Water Resources Control Board on:	**September 2, 2009**
This Order shall become effective on:	**July 1, 2010**
This Order shall expire on:	**September 2, 2014**

IT IS HEREBY ORDERED, that this Order supersedes Order No. 99-08-DWQ except for enforcement purposes. The Discharger shall comply with the requirements in this Order to meet the provisions contained in Division 7 of the California Water Code (commencing with section 13000) and regulations adopted thereunder, and the provisions of the federal Clean Water Act and regulations and guidelines adopted thereunder.

I, Jeanine Townsend, Clerk to the Board, do hereby certify that this Order with all attachments is a full, true, and correct copy of an Order adopted by the State Water Resources Control Board, on September 2, 2009.

AYE: Vice Chair Frances Spivy-Weber
Board Member Arthur G. Baggett, Jr.
Board Member Tam M. Doduc

STATE WATER RESOURCES CONTROL BOARD
ORDER NO. 2009-0009-DWQ
NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM
GENERAL PERMIT NO. CAS000002

WASTE DISCHARGE REQUIREMENTS
FOR
DISCHARGES OF STORM WATER RUNOFF ASSOCIATED WITH CONSTRUCTION AND LAND DISTURBANCE ACTIVITIES

I. FINDINGS

A. General Findings

The State Water Resources Control Board (State Water Board) finds that:

1. The federal Clean Water Act (CWA) prohibits certain discharges of storm water containing pollutants except in compliance with a National Pollutant Discharge Elimination System (NPDES) permit (Title 33 United States Code (U.S.C.) §§ 1311 and 1342(p); also referred to as Clean Water Act (CWA) §§ 301 and 402(p)). The U.S. Environmental Protection Agency (U.S. EPA) promulgates federal regulations to implement the CWA's mandate to control pollutants in storm water runoff discharges. (Title 40 Code of Federal Regulations (C.F.R.) Parts 122, 123, and 124). The federal statutes and regulations require discharges to surface waters comprised of storm water associated with construction activity, including demolition, clearing, grading, and excavation, and other land disturbance activities (except operations that result in disturbance of less than one acre of total land area and which are not part of a larger common plan of development or sale), to obtain coverage under an NPDES permit. The NPDES permit must require implementation of Best Available Technology Economically Achievable (BAT) and Best Conventional Pollutant Control Technology (BCT) to reduce or eliminate pollutants in storm water runoff. The NPDES permit must also include additional requirements necessary to implement applicable water quality standards.

2. This General Permit authorizes discharges of storm water associated with construction activity so long as the dischargers comply with all requirements, provisions, limitations and prohibitions in the permit. In addition, this General Permit regulates the discharges of storm water associated with construction activities from all Linear Underground/Overhead Projects resulting in the disturbance of greater than or equal to one acre (Attachment A).

3. This General Permit regulates discharges of pollutants in storm water associated with construction activity (storm water discharges) to waters of the United States from construction sites that disturb one or more acres of land surface, or that are part of a common plan of development or sale that disturbs more than one acre of land surface.

4. This General Permit does not preempt or supersede the authority of local storm water management agencies to prohibit, restrict, or control storm water discharges to municipal separate storm sewer systems or other watercourses within their jurisdictions.

5. This action to adopt a general NPDES permit is exempt from the provisions of Chapter 3 of the California Environmental Quality Act (CEQA) (Public Resources Code Section 21100, et seq.), pursuant to Section 13389 of the California Water Code.

6. Pursuant to 40 C.F.R. § 131.12 and State Water Board Resolution No. 68-16,[1] which incorporates the requirements of § 131.12 where applicable, the State Water Board finds that discharges in compliance with this General Permit will not result in the lowering of water quality standards, and are therefore consistent with those provisions. Compliance with this General Permit will result in improvements in water quality.

7. This General Permit serves as an NPDES permit in compliance with CWA § 402 and will take effect on July 1, 2010 by the State Water Board provided the Regional Administrator of the U.S. EPA has no objection. If the U.S. EPA Regional Administrator objects to its issuance, the General Permit will not become effective until such objection is withdrawn.

8. Following adoption and upon the effective date of this General Permit, the Regional Water Quality Control Boards (Regional Water Boards) shall enforce the provisions herein.

9. Regional Water Boards establish water quality standards in Basin Plans. The State Water Board establishes water quality standards in various statewide plans, including the California Ocean Plan. U.S. EPA establishes water quality standards in the National Toxic Rule (NTR) and the California Toxic Rule (CTR).

[1] Resolution No. 68-16 generally requires that existing water quality be maintained unless degradation is justified based on specific findings.

10. This General Permit does not authorize discharges of fill or dredged material regulated by the U.S. Army Corps of Engineers under CWA § 404 and does not constitute a waiver of water quality certification under CWA § 401.

11. The primary storm water pollutant at construction sites is excess sediment. Excess sediment can cloud the water, which reduces the amount of sunlight reaching aquatic plants, clog fish gills, smother aquatic habitat and spawning areas, and impede navigation in our waterways. Sediment also transports other pollutants such as nutrients, metals, and oils and greases.

12. Construction activities can impact a construction site's runoff sediment supply and transport characteristics. These modifications, which can occur both during and after the construction phase, are a significant cause of degradation of the beneficial uses established for water bodies in California. Dischargers can avoid these effects through better construction site design and activity practices.

13. This General Permit recognizes four distinct phases of construction activities. The phases are Grading and Land Development Phase, Streets and Utilities Phase, Vertical Construction Phase, and Final Landscaping and Site Stabilization Phase. Each phase has activities that can result in different water quality effects from different water quality pollutants. This General Permit also recognizes inactive construction as a category of construction site type.

14. Compliance with any specific limits or requirements contained in this General Permit does not constitute compliance with any other applicable requirements.

15. Following public notice in accordance with State and Federal laws and regulations, the State Water Board heard and considered all comments and testimony in a public hearing on 06/03/2009. The State Water Board has prepared written responses to all significant comments.

16. Construction activities obtaining coverage under the General Permit may have multiple discharges subject to requirements that are specific to general, linear, and/or active treatment system discharge types.

17. The State Water Board may reopen the permit if the U.S. EPA adopts a final effluent limitation guideline for construction activities.

B. Activities Covered Under the General Permit

18. Any construction or demolition activity, including, but not limited to, clearing, grading, grubbing, or excavation, or any other activity that results in a land disturbance of equal to or greater than one acre.

19. Construction activity that results in land surface disturbances of less than one acre if the construction activity is part of a larger common plan of development or the sale of one or more acres of disturbed land surface.

20. Construction activity related to residential, commercial, or industrial development on lands currently used for agriculture including, but not limited to, the construction of buildings related to agriculture that are considered industrial pursuant to U.S. EPA regulations, such as dairy barns or food processing facilities.

21. Construction activity associated with Linear Underground/Overhead Utility Projects (LUPs) including, but not limited to, those activities necessary for the installation of underground and overhead linear facilities (e.g., conduits, substructures, pipelines, towers, poles, cables, wires, connectors, switching, regulating and transforming equipment and associated ancillary facilities) and include, but are not limited to, underground utility mark-out, potholing, concrete and asphalt cutting and removal, trenching, excavation, boring and drilling, access road and pole/tower pad and cable/wire pull station, substation construction, substructure installation, construction of tower footings and/or foundations, pole and tower installations, pipeline installations, welding, concrete and/or pavement repair or replacement, and stockpile/borrow locations.

22. Discharges of sediment from construction activities associated with oil and gas exploration, production, processing, or treatment operations or transmission facilities.[2]

23. Storm water discharges from dredge spoil placement that occur outside of U.S. Army Corps of Engineers jurisdiction (upland sites) and that disturb one or more acres of land surface from construction activity are covered by this General Permit. Construction sites that intend to disturb one or more acres of land within the jurisdictional boundaries of a CWA § 404 permit should contact the appropriate Regional Water Board to determine whether this permit applies to the site.

---

[2] Pursuant to the Ninth Circuit Court of Appeals' decision in *NRDC v. EPA* (9th Cir. 2008) 526 F.3d 591, and subsequent denial of the U.S. EPA's petition for reconsideration in November 2008, oil and gas construction activities discharging storm water contaminated only with sediment are no longer exempt from the NPDES program.

C. Activities Not Covered Under the General Permit

24. Routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of the facility.

25. Disturbances to land surfaces solely related to agricultural operations such as disking, harrowing, terracing and leveling, and soil preparation.

26. Discharges of storm water from areas on tribal lands; construction on tribal lands is regulated by a federal permit.

27. Construction activity and land disturbance involving discharges of storm water within the Lake Tahoe Hydrologic Unit. The Lahontan Regional Water Board has adopted its own permit to regulate storm water discharges from construction activity in the Lake Tahoe Hydrologic Unit (Regional Water Board 6SLT). Owners of construction sites in this watershed must apply for the Lahontan Regional Water Board permit rather than the statewide Construction General Permit.

28. Construction activity that disturbs less than one acre of land surface, and that is not part of a larger common plan of development or the sale of one or more acres of disturbed land surface.

29. Construction activity covered by an individual NPDES Permit for storm water discharges.

30. Discharges from small (1 to 5 acre) construction activities with an approved Rainfall Erosivity Waiver authorized by U.S. EPA Phase II regulations certifying to the State Board that small construction activity will occur only when the Rainfall Erosivity Factor is less than 5 (“R” in the Revised Universal Soil Loss Equation).

31. Landfill construction activity that is subject to the Industrial General Permit.

32. Construction activity that discharges to Combined Sewer Systems.

33. Conveyances that discharge storm water runoff combined with municipal sewage.

34. Discharges of storm water identified in CWA § 402(*l*)(2), 33 U.S.C. § 1342(*l*)(2).

35. Discharges occurring in basins that are not tributary or hydrologically connected to waters of the United States (for more information contact your Regional Water Board).

D. Obtaining and Modifying General Permit Coverage

36. This General Permit requires all dischargers to electronically file all Permit Registration Documents (PRDs), Notices of Termination (NOT), changes of information, annual reporting, and other compliance documents required by this General Permit through the State Water Board's Storm water Multi-Application and Report Tracking System (SMARTS) website.

37. Any information provided to the Regional Water Board shall comply with the Homeland Security Act and any other federal law that concerns security in the United States; any information that does not comply should not be submitted.

38. This General Permit grants an exception from the Risk Determination requirements for existing sites covered under Water Quality Orders No. 99-08-DWQ, and No. 2003-0007-DWQ. For certain sites, adding additional requirements may not be cost effective. Construction sites covered under Water Quality Order No. 99-08-DWQ shall obtain permit coverage at the Risk Level 1. LUPs covered under Water Quality Order No. 2003-0007-DWQ shall obtain permit coverage as a Type 1 LUP. The Regional Water Boards have the authority to require Risk Determination to be performed on sites currently covered under Water Quality Orders No. 99-08-DWQ and No. 2003-0007-DWQ where they deem it necessary. The State Water Board finds that there are two circumstances when it may be appropriate for the Regional Water Boards to require a discharger that had filed an NOI under State Water Board Order No. 99-08-DWQ to recalculate the site's risk level. These circumstances are: (1) when the discharger has a demonstrated history of noncompliance with State Water Board Order No. 99-08-DWQ or; (2) when the discharger's site poses a significant risk of causing or contributing to an exceedance of a water quality standard without the implementation of the additional Risk Level 2 or 3 requirements.

E. Prohibitions

39. All discharges are prohibited except for the storm water and non-storm water discharges specifically authorized by this General Permit or another NPDES permit. Non-storm water discharges include a wide variety of sources, including improper dumping, spills, or leakage from storage tanks or transfer areas. Non-storm water discharges may

contribute significant pollutant loads to receiving waters. Measures to control spills, leakage, and dumping, and to prevent illicit connections during construction must be addressed through structural as well as non-structural Best Management Practices (BMPs)[3]. The State Water Board recognizes, however, that certain non-storm water discharges may be necessary for the completion of construction.

40. This General Permit prohibits all discharges which contain a hazardous substance in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

41. This General Permit incorporates discharge prohibitions contained in water quality control plans, as implemented by the State Water Board and the nine Regional Water Boards.

42. Pursuant to the Ocean Plan, discharges to Areas of Special Biological Significance (ASBS) are prohibited unless covered by an exception that the State Water Board has approved.

43. This General Permit prohibits the discharge of any debris[4] from construction sites. Plastic and other trash materials can cause negative impacts to receiving water beneficial uses. The State Water Board encourages the use of more environmentally safe, biodegradable materials on construction sites to minimize the potential risk to water quality.

F. Training

44. In order to improve compliance with and to maintain consistent enforcement of this General Permit, all dischargers are required to appoint two positions - the Qualified SWPPP Developer (QSD) and the Qualified SWPPP Practitioner (QSP) - who must obtain appropriate training. Together with the key stakeholders, the State and Regional Water Boards are leading the development of this curriculum through a collaborative organization called The Construction General Permit (CGP) Training Team.

45. The Professional Engineers Act (Bus. & Prof. Code section 6700, et seq.) requires that all engineering work must be performed by a California licensed engineer.

[3] BMPs are scheduling of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the discharge of pollutants to waters of the United States. BMPs also include treatment requirements, operating procedures, and practice to control site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

[4] Litter, rubble, discarded refuse, and remains of destroyed inorganic anthropogenic waste.

G. Determining and Reducing Risk

46. The risk of accelerated erosion and sedimentation from wind and water depends on a number of factors, including proximity to receiving water bodies, climate, topography, and soil type.

47. This General Permit requires dischargers to assess the risk level of a site based on both sediment transport and receiving water risk. This General Permit contains requirements for Risk Levels 1, 2 and 3, and LUP Risk Type 1, 2, and 3 (Attachment A). Risk levels are established by determining two factors: first, calculating the site's sediment risk; and second, receiving water risk during periods of soil exposure (i.e. grading and site stabilization). Both factors are used to determine the site-specific Risk Level(s). LUPs can be determined to be Type 1 based on the flowchart in Attachment A.1.

48. Although this General Permit does not mandate specific setback distances, dischargers are encouraged to set back their construction activities from streams and wetlands whenever feasible to reduce the risk of impacting water quality (e.g., natural stream stability and habitat function). Because there is a reduced risk to receiving waters when setbacks are used, this General Permit gives credit to setbacks in the risk determination and post-construction storm water performance standards. The risk calculation and runoff reduction mechanisms in this General Permit are expected to facilitate compliance with any Regional Water Board and local agency setback requirements, and to encourage voluntary setbacks wherever practicable.

49. Rain events can occur at any time of the year in California. Therefore, a Rain Event Action Plan (REAP) is necessary for Risk Level 2 and 3 traditional construction projects (LUPs exempt) to ensure that active construction sites have adequate erosion and sediment controls implemented prior to the onset of a storm event, even if construction is planned only during the dry season.

50. Soil particles smaller than 0.02 millimeters (mm) (i.e., finer than medium silt) do not settle easily using conventional measures for sediment control (i.e., sediment basins). Given their long settling time, dislodging these soils results in a significant risk that fine particles will be released into surface waters and cause unacceptable downstream impacts. If operated correctly, an Active Treatment System (ATS[5]) can prevent or reduce the release of fine particles from construction sites.

[5] An ATS is a treatment system that employs chemical coagulation, chemical flocculation, or electro coagulation in order to reduce turbidity caused by fine suspended sediment.

Use of an ATS can effectively reduce a site's risk of impacting receiving waters.

51. Dischargers located in a watershed area where a Total Maximum Daily Load (TMDL) has been adopted or approved by the Regional Water Board or U.S. EPA may be required by a separate Regional Water Board action to implement additional BMPs, conduct additional monitoring activities, and/or comply with an applicable waste load allocation and implementation schedule. Such dischargers may also be required to obtain an individual Regional Water Board permit specific to the area.

H. Effluent Standards

52. The State Water Board convened a blue ribbon panel of storm water experts that submitted a report entitled, "The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities," dated June 19, 2006. The panel concluded that numeric limits or action levels are technically feasible to control construction storm water discharges, provided that certain conditions are considered. The panel also concluded that numeric effluent limitations (NELs) are feasible for discharges from construction sites that utilize an ATS. The State Water Board has incorporated the expert panel's suggestions into this General Permit, which includes both numeric action levels (NALs) and NELs for pH and turbidity, and special numeric limits for ATS discharges.

Numeric Effluent Limitations

53. Discharges of storm water from construction activities may become contaminated from alkaline construction materials resulting in high pH (greater than pH 7). Alkaline construction materials include, but are not limited to, hydrated lime, concrete, mortar, cement kiln dust (CKD), Portland cement treated base (CTB), fly ash, recycled concrete, and masonry work. This General Permit includes an NEL for pH (6.0-9.0) that applies only at sites that exhibit a "high risk of high pH discharge." A "high risk of high pH discharge" can occur during the complete utilities phase, the complete vertical build phase, and any portion of any phase where significant amounts of materials are placed directly on the land at the site in a manner that could result in significant alterations to the background pH of any discharges.

54. For Risk Level 3 discharges, this General Permit establishes technology-based, numeric effluent limitations (NELs) for turbidity of 500 NTU. Exceedances of the turbidity NEL constitutes a violation of this General Permit.

55. This General Permit establishes a 5 year, 24 hour (expressed in inches of rainfall) Compliance Storm Event exemption from the technology-based NELs for Risk Level 3 dischargers.

Determining Compliance with Numeric Limitations

56. This General Permit sets a pH NAL of 6.5 to 8.5, and a turbidity NAL of 250 NTU. The purpose of the NAL and its associated monitoring requirement is to provide operational information regarding the performance of the measures used at the site to minimize the discharge of pollutants and to protect beneficial uses and receiving waters from the adverse effects of construction-related storm water discharges. The NALs in this General Permit for pH and turbidity are not directly enforceable and do not constitute NELs.

57. This General Permit requires dischargers with NAL exceedances to immediately implement additional BMPs and revise their Storm Water Pollution Prevention Plans (SWPPPs) accordingly to either prevent pollutants and authorized non-storm water discharges from contaminating storm water, or to substantially reduce the pollutants to levels consistently below the NALs. NAL exceedances are reported in the State Water Boards SMARTS system, and the discharger is required to provide an NAL Exceedance Report when requested by a Regional Water Board.

58. If run-on is caused by a forest fire or any other natural disaster, then NELs do not apply.

59. Exceedances of the NELs are a violation of this Permit. This General Permit requires dischargers with NEL exceedances to implement additional monitoring, BMPs, and revise their SWPPPs accordingly. Dischargers are required to notify the State and Regional Water Boards of the violation through the State Water Boards SMARTs system, and provide an NEL Violation Report sharing additional information concerning the NEL exceedance.

I. Receiving Water Limitations

60. This General Permit requires all enrolled dischargers to determine the receiving waters potentially affected by their discharges and to comply with all applicable water quality standards, including any more stringent standards applicable to a water body.

J. Sampling, Monitoring, Reporting and Record Keeping

61. Visual monitoring of storm water and non-storm water discharges is required for all sites subject to this General Permit.

62. Records of all visual monitoring inspections are required to remain on-site during the construction period and for a minimum of three years.

63. For all Risk Level 3 and Risk Level 2 sites, this General Permit requires effluent monitoring for pH and turbidity. Sampling, analysis and monitoring requirements for effluent monitoring for pH and turbidity are contained in this General Permit.

64. Risk Level 3 sites in violation of the Numeric Effluent Limitations contained in this General Permit and with direct discharges to receiving water are required to conduct receiving water monitoring.

65. For Risk Level 3 sites larger than 30 acres and with direct discharges to receiving waters, this General Permit requires bioassessment sampling before and after site completion to determine if significant degradation to the receiving water's biota has occurred. Bioassessment sampling guidelines are contained in this General Permit.

66. A summary and evaluation of the sampling and analysis results will be submitted in the Annual Reports.

67. This General Permit contains sampling, analysis and monitoring requirements for non-visible pollutants at all sites subject to this General Permit.

68. Compliance with the General Permit relies upon dischargers to electronically self-report any discharge violations and to comply with any Regional Water Board enforcement actions.

69. This General Permit requires that all dischargers maintain a paper or electronic copy of all required records for three years from the date generated or date submitted, whichever is last. These records must be available at the construction site until construction is completed. For LUPs, these documents may be retained in a crew member's vehicle and made available upon request.

K. Active Treatment System (ATS) Requirements

70. Active treatment systems add chemicals to facilitate flocculation, coagulation and filtration of suspended sediment particles. The uncontrolled release of these chemicals to the environment can negatively affect the beneficial uses of receiving waters and/or degrade water quality (e.g., acute and chronic toxicity). Additionally, the batch storage and treatment of storm water through an ATS' can potentially

cause physical impacts on receiving waters if storage volume is inadequate or due to sudden releases of the ATS batches and improperly designed outfalls.

71. If designed, operated and maintained properly an ATS can achieve very high removal rates of suspended sediment (measured as turbidity), albeit at sometimes significantly higher costs than traditional erosion/sediment control practices. As a result, this General Permit establishes NELs consistent with the expected level of typical ATS performance.

72. This General Permit requires discharges of storm water associated with construction activity that undergo active treatment to comply with special operational and effluent limitations to ensure that these discharges do not adversely affect the beneficial uses of the receiving waters or cause degradation of their water quality.

73. For ATS discharges, this General Permit establishes technology-based NELs for turbidity.

74. This General Permit establishes a 10 year, 24 hour (expressed in inches of rainfall) Compliance Storm Event exemption from the technology-based numeric effluent limitations for ATS discharges. Exceedances of the ATS turbidity NEL constitutes a violation of this General Permit.

L. Post-Construction Requirements

75. This General Permit includes performance standards for post-construction that are consistent with State Water Board Resolution No. 2005-0006, "Resolution Adopting the Concept of Sustainability as a Core Value for State Water Board Programs and Directing Its Incorporation," and 2008-0030, “Requiring Sustainable Water Resources Management.“ The requirement for all construction sites to match pre-project hydrology will help ensure that the physical and biological integrity of aquatic ecosystems are sustained. This “runoff reduction” approach is analogous in principle to Low Impact Development (LID) and will serve to protect related watersheds and waterbodies from both hydrologic-based and pollution impacts associated with the post-construction landscape.

76. LUP projects are not subject to post-construction requirements due to the nature of their construction to return project sites to pre-construction conditions.

M. Storm Water Pollution Prevention Plan Requirements

77. This General Permit requires the development of a site-specific SWPPP. The SWPPP must include the information needed to demonstrate compliance with all requirements of this General Permit, and must be kept on the construction site and be available for review. The discharger shall ensure that a QSD develops the SWPPP.

78. To ensure proper site oversight, this General Permit requires a Qualified SWPPP Practitioner to oversee implementation of the BMPs required to comply with this General Permit.

N. Regional Water Board Authorities

79. Regional Water Boards are responsible for implementation and enforcement of this General Permit. A general approach to permitting is not always suitable for every construction site and environmental circumstances. Therefore, this General Permit recognizes that Regional Water Boards must have some flexibility and authority to alter, approve, exempt, or rescind permit authority granted under this General Permit in order to protect the beneficial uses of our receiving waters and prevent degradation of water quality.

IT IS HEREBY ORDERED that all dischargers subject to this General Permit shall comply with the following conditions and requirements (including all conditions and requirements as set forth in Attachments A, B, C, D, E and F)[6]:

II. CONDITIONS FOR PERMIT COVERAGE

A. Linear Underground/Overhead Projects (LUPs)

1. Linear Underground/Overhead Projects (LUPs) include, but are not limited to, any conveyance, pipe, or pipeline for the transportation of any gaseous, liquid (including water and wastewater for domestic municipal services), liquescent, or slurry substance; any cable line or wire for the transmission of electrical energy; any cable line or wire for communications (e.g. telephone, telegraph, radio or television messages); and associated ancillary facilities. Construction activities associated with LUPs include, but are not limited to, (a) those activities necessary for the installation of underground and overhead linear facilities (e.g., conduits, substructures, pipelines, towers, poles, cables, wires, connectors, switching, regulating and transforming equipment, and associated ancillary facilities); and include, but are not limited to, (b) underground utility mark-out, potholing, concrete and asphalt cutting and removal, trenching, excavation, boring and drilling, access road and pole/tower pad and cable/wire pull station, substation construction, substructure installation, construction of tower footings and/or foundations, pole and tower installations, pipeline installations, welding, concrete and/ or pavement repair or replacement, and stockpile/borrow locations.

2. The utility company, municipality, or other public or private company or agency that owns or operates the linear underground/overhead project is responsible for obtaining coverage under the General Permit where the construction of pipelines, utility lines, fiber-optic cables, or other linear underground/overhead projects will occur across several properties unless the LUP construction activities are covered under another construction storm water permit.

3. Only LUPs shall comply with the conditions and requirements in Attachment A, A.1 & A.2 of this Order. The balance of this Order is not applicable to LUPs except as indicated in Attachment A.

B. Obtaining Permit Coverage Traditional Construction Sites

[6] These attachments are part of the General Permit itself and are not separate documents that are capable of being updated independently by the State Water Board.

1. The Legally Responsible Person (LRP) (see Special Provisions, Electronic Signature and Certification Requirements, Section IV.I.1) must obtain coverage under this General Permit.

2. To obtain coverage, the LRP must electronically file Permit Registration Documents (PRDs) prior to the commencement of construction activity. Failure to obtain coverage under this General Permit for storm water discharges to waters of the United States is a violation of the CWA and the California Water Code.

3. PRDs shall consist of:

   a. Notice of Intent (NOI)
   b. Risk Assessment (Section VIII)
   c. Site Map
   d. Storm Water Pollution Prevention Plan (Section XIV)
   e. Annual Fee
   f. Signed Certification Statement

   Any information provided to the Regional Water Board shall comply with the Homeland Security Act and any other federal law that concerns security in the United States; any information that does not comply should not be submitted.

   Attachment B contains additional PRD information. Dischargers must electronically file the PRDs, and mail the appropriate annual fee to the State Water Board.

4. This permit is effective on July 1, 2010.

   a. **Dischargers Obtaining Coverage On or After July 1, 2010:** All dischargers requiring coverage on or after July 1, 2010, shall electronically file their PRDs prior to the commencement of construction activities, and mail the appropriate annual fee no later than seven days prior to the commencement of construction activities. Permit coverage shall not commence until the PRDs and the annual fee are received by the State Water Board, and a WDID number is assigned and sent by SMARTS.

   b. **Dischargers Covered Under 99-08-DWQ and 2003-0007-DWQ:** Existing dischargers subject to State Water Board Order No. 99-08-DWQ (existing dischargers) will continue coverage under 99-08-DWQ until July 1, 2010. After July 1, 2010, all NOIs subject to State Water Board Order No. 99-08-DWQ will be terminated. Existing dischargers shall electronically file their PRDs no later than

July 1, 2010. If an existing discharger's site acreage subject to the annual fee has changed, it shall mail a revised annual fee no less than seven days after receiving the revised annual fee notification, **or else lose permit coverage**. All existing dischargers shall be exempt from the risk determination requirements in Section VIII of this General Permit until two years after permit adoption. All existing dischargers are therefore subject to Risk Level 1 requirements regardless of their site's sediment and receiving water risks. However, a Regional Board retains the authority to require an existing discharger to comply with the Section VIII risk determination requirements.

5. The discharger is only considered covered by this General Permit upon receipt of a Waste Discharger Identification (WDID) number assigned and sent by the State Water Board Storm water Multi-Application and Report Tracking System (SMARTS). In order to demonstrate compliance with this General Permit, the discharger must obtain a WDID number and must present documentation of a valid WDID upon demand.

6. During the period this permit is subject to review by the U.S. EPA, the prior permit (State Water Board Order No. 99-08-DWQ) remains in effect. Existing dischargers under the prior permit will continue to have coverage under State Water Board Order No. 99-08-DWQ until this General Permit takes effect on July 1, 2010. Dischargers who complete their projects and electronically file an NOT prior to July 1, 2010, are not required to obtain coverage under this General Permit.

7. Small Construction Rainfall Erosivity Waiver

   EPA's Small Construction Erosivity Waiver applies to sites between one and five acres demonstrating that there are no adverse water quality impacts.

   Dischargers eligible for a Rainfall Erosivity Waiver based on low erosivity potential shall complete the electronic Notice of Intent (NOI) and Sediment Risk form through the State Water Board's SMARTS system, certifying that the construction activity will take place during a period when the value of the rainfall erosivity factor is less than five. Where the LRP changes or another LRP is added during construction, the new LRP must also submit a waiver certification through the SMARTS system.

   If a small construction site continues beyond the projected completion date given on the waiver certification, the LRP shall recalculate the rainfall erosivity factor for the new project duration and submit this information through the SMARTS system. If the new R factor is below five (5), the discharger shall update through SMARTS all applicable information on the waiver certification and retain a copy of the revised waiver onsite. The LRP shall submit the new waiver certification 30 days prior to the projected completion date listed on the original waiver form to assure exemption from permitting requirements is uninterrupted. If the new R factor is five (5) or above, the LRP shall be required to apply for coverage under this Order.

8. In the case of a public emergency that requires immediate construction activities, a discharger shall submit a brief description of the emergency construction activity within five days of the onset of construction, and then shall submit all PRDs within thirty days.

C. Revising Permit Coverage for Change of Acreage or New Ownership

1. The discharger may reduce or increase the total acreage covered under this General Permit when a portion of the site is complete and/or conditions for termination of coverage have been met (See Section II.D Conditions for Termination of Coverage); when ownership of a portion of the site is sold to a different entity; or when new acreage, subject to this General Permit, is added to the site.

2. Within 30 days of a reduction or increase in total disturbed acreage, the discharger shall electronically file revisions to the PRDs that include:

   a. A revised NOI indicating the new project size;

   b. A revised site map showing the acreage of the site completed, acreage currently under construction, acreage sold/transferred or added, and acreage currently stabilized in accordance with the Conditions for Termination of Coverage in Section II.D below.

   c. SWPPP revisions, as appropriate; and

   d. Certification that any new landowners have been notified of applicable requirements to obtain General Permit coverage. The certification shall include the name, address, telephone number, and e-mail address of the new landowner.

   e. If the project acreage has increased, dischargers shall mail payment of revised annual fees within 14 days of receiving the revised annual fee notification.

3. The discharger shall continue coverage under the General Permit for any parcel that has not achieved “Final Stabilization” as defined in Section II.D.

4. When an LRP owns property with active General Permit coverage, and the LRP sells the property, or a parcel thereof, to another person, that person shall become an LRP with respect to whatever parcel was sold. The existing LRP shall inform the new LRP of the General Permit’s requirements. In order for the new LRP to continue the construction activity on its parcel of property, the new LRP, or the new LRP’s approved signatory, must submit PRDs in accordance with this General Permit’s requirements.

D. Conditions for Termination of Coverage

1. Within 90 days of when construction is complete or ownership has been transferred, the discharger shall electronically file a Notice of Termination (NOT), a final site map, and photos through the State Water Boards SMARTS system. Filing a NOT certifies that all General Permit requirements have been met. The Regional Water Board will consider a construction site complete only when all portions of the site have been transferred to a new owner, or all of the following conditions have been met:

   a. For purposes of “final stabilization,” the site will not pose any additional sediment discharge risk than it did prior to the commencement of construction activity;

   b. There is no potential for construction-related storm water pollutants to be discharged into site runoff;

   c. Final stabilization has been reached;

   d. Construction materials and wastes have been disposed of properly;

   e. Compliance with the Post-Construction Standards in Section XIII of this General Permit has been demonstrated;

   f. Post-construction storm water management measures have been installed and a long-term maintenance plan[7] has been established; and

[7] For the purposes of this requirement a long-term maintenance plan will be designed for a minimum of five years, and will describe the procedures to ensure that the post-construction storm water management measures are adequately maintained.

g. All construction-related equipment, materials and any temporary BMPs no longer needed are removed from the site.

2. The discharger shall certify that final stabilization conditions are satisfied in their NOT. Failure to certify shall result in continuation of permit coverage and annual billing.

3. The NOT must demonstrate through photos, RUSLE or RUSLE2, or results of testing and analysis that the site meets all of the conditions above (Section II.D.1) and the final stabilization condition (Section II.D.1.a) is attained by one of the following methods:

   a. “70% final cover method,” no computational proof required

      OR:

   b. “RUSLE or RUSLE2 method,” computational proof required

      OR:

   c. “Custom method”, the discharger shall demonstrate in some other manner than a or b, above, that the site complies with the “final stabilization” requirement in Section II.D.1.a.

III. DISCHARGE PROHIBITIONS

A. Dischargers shall not violate any discharge prohibitions contained in applicable Basin Plans or statewide water quality control plans. Waste discharges to Areas of Special Biological Significance (ASBS) are prohibited by the California Ocean Plan, unless granted an exception issued by the State Water Board.

B. All discharges are prohibited except for the storm water and non-storm water discharges specifically authorized by this General Permit or another NPDES permit.

C. Authorized non-storm water discharges may include those from de-chlorinated potable water sources such as: fire hydrant flushing, irrigation of vegetative erosion control measures, pipe flushing and testing, water to control dust, uncontaminated ground water from dewatering, and other discharges not subject to a separate general NPDES permit adopted by a Regional Water Board. The discharge of non-storm water is authorized under the following conditions:

1. The discharge does not cause or contribute to a violation of any water quality standard;

2. The discharge does not violate any other provision of this General Permit;

3. The discharge is not prohibited by the applicable Basin Plan;

4. The discharger has included and implemented specific BMPs required by this General Permit to prevent or reduce the contact of the non-storm water discharge with construction materials or equipment.

5. The discharge does not contain toxic constituents in toxic amounts or (other) significant quantities of pollutants;

6. The discharge is monitored and meets the applicable NALs and NELs; and

7. The discharger reports the sampling information in the Annual Report.

If any of the above conditions are not satisfied, the discharge is not authorized by this General Permit. The discharger shall notify the Regional Water Board of any anticipated non-storm water discharges not already authorized by this General Permit or another NPDES permit, to determine whether a separate NPDES permit is necessary.

D. Debris resulting from construction activities are prohibited from being discharged from construction sites.

E. When soil contamination is found or suspected and a responsible party is not identified, or the responsible party fails to promptly take the appropriate action, the discharger shall have those soils sampled and tested to ensure proper handling and public safety measures are implemented. The discharger shall notify the appropriate local, State, and federal agency(ies) when contaminated soil is found at a construction site, and will notify the appropriate Regional Water Board.

IV. SPECIAL PROVISIONS

A. Duty to Comply

1. The discharger shall comply with all of the conditions of this General Permit. Any permit noncompliance constitutes a violation of the Clean Water Act (CWA) and the Porter-Cologne Water Quality Control Act and is grounds for enforcement action and/or removal from General Permit coverage.

2. The discharger shall comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants within the time provided in the regulations that establish these standards or prohibitions, even if this General Permit has not yet been modified to incorporate the requirement.

B. General Permit Actions

1. This General Permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the discharger for a General Permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not annul any General Permit condition.

2. If any toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under Section 307(a) of the CWA for a toxic pollutant which is present in the discharge and that standard or prohibition is more stringent than any limitation on the pollutant in this General Permit, this General Permit shall be modified or revoked and reissued to conform to the toxic effluent standard or prohibition and the dischargers so notified.

C. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this General Permit.

D. Duty to Mitigate

The discharger shall take all responsible steps to minimize or prevent any discharge in violation of this General Permit, which has a reasonable likelihood of adversely affecting human health or the environment.

E. Proper Operation and Maintenance

The discharger shall at all times properly operate and maintain any facilities and systems of treatment and control (and related appurtenances) which are installed or used by the discharger to achieve compliance with the conditions of this General Permit. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. Proper operation and maintenance may require the operation of backup or auxiliary facilities or similar systems installed by a discharger when necessary to achieve compliance with the conditions of this General Permit.

F. Property Rights

This General Permit does not convey any property rights of any sort or any exclusive privileges, nor does it authorize any injury to private property or any invasion of personal rights, nor does it authorize any infringement of Federal, State, or local laws or regulations.

G. Duty to Maintain Records and Provide Information

1. The discharger shall maintain a paper or electronic copy of all required records, including a copy of this General Permit, for three years from the date generated or date submitted, whichever is last. These records shall be available at the construction site until construction is completed.

2. The discharger shall furnish the Regional Water Board, State Water Board, or U.S. EPA, within a reasonable time, any requested information to determine compliance with this General Permit. The discharger shall also furnish, upon request, copies of records that are required to be kept by this General Permit.

H. Inspection and Entry

The discharger shall allow the Regional Water Board, State Water Board, U.S. EPA, and/or, in the case of construction sites which discharge through a municipal separate storm sewer, an authorized representative of the municipal operator of the separate storm sewer system receiving the discharge, upon the presentation of credentials and other documents as may be required by law, to:

1. Enter upon the discharger’s premises at reasonable times where a regulated construction activity is being conducted or where records must be kept under the conditions of this General Permit;

2. Access and copy at reasonable times any records that must be kept under the conditions of this General Permit;

3. Inspect at reasonable times the complete construction site, including any off-site staging areas or material storage areas, and the erosion/sediment controls; and

4. Sample or monitor at reasonable times for the purpose of ensuring General Permit compliance.

I. Electronic Signature and Certification Requirements

1. All Permit Registration Documents (PRDs) and Notice of Terminations (NOTs) shall be electronically signed, certified, and submitted via SMARTS to the State Water Board. Either the Legally Responsible Person (LRP) or a person legally authorized to sign and certify PRDs and NOTs on behalf of the LRP (the LRP's Approved Signatory) must submit all information electronically via SMARTS.

    a. The LRP's Approved Signatory must be one of the following:

        i. For a corporation: a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (a) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation; or (b) the manager of the facility if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures;

        ii. For a partnership or sole proprietorship: a general partner or the proprietor, respectively;

        iii. For a municipality, State, Federal, or other public agency: either a principal executive officer or ranking elected official. The principal executive officer of a Federal agency includes the chief executive officer of the agency or the senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of U.S. EPA);

        iv. For the military: Any military officer who has been designated.

        v. For a public university: An authorized university official

b. Changes to Authorization. If an approved signatory's authorization is no longer accurate, a new authorization satisfying the requirements of paragraph (a) of this section must be submitted via SMARTS prior to or together with any reports, information or applications to be signed by an approved signatory.

2. All Annual Reports, or other information required by the General Permit (other than PRDs and NOTs) or requested by the Regional Water Board, State Water Board, U.S. EPA, or local storm water management agency shall be certified and submitted by the LRP or the LRP's approved signatory as described above.

J. Certification

Any person signing documents under Section IV.I above, shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, to the best of my knowledge and belief, the information submitted is, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

K. Anticipated Noncompliance

The discharger shall give advance notice to the Regional Water Board and local storm water management agency of any planned changes in the construction activity, which may result in noncompliance with General Permit requirements.

L. Bypass

Bypass[8] is prohibited. The Regional Water Board may take enforcement action against the discharger for bypass unless:

1. Bypass was unavoidable to prevent loss of life, personal injury or severe property damage;[9]

[8] The intentional diversion of waste streams from any portion of a treatment facility

[9] Severe property damage means substantial physical damage to property, damage to the treatment facilities that causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.

2. There were no feasible alternatives to bypass, such as the use of auxiliary treatment facilities, retention of untreated waste, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that could occur during normal periods of equipment downtime or preventative maintenance;

3. The discharger submitted a notice at least ten days in advance of the need for a bypass to the Regional Water Board; or

4. The discharger may allow a bypass to occur that does not cause effluent limitations to be exceeded, but only if it is for essential maintenance to assure efficient operation. In such a case, the above bypass conditions are not applicable. The discharger shall submit notice of an unanticipated bypass as required.

M. Upset

1. A discharger that wishes to establish the affirmative defense of an upset[10] in an action brought for noncompliance shall demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that:

    a. An upset occurred and that the discharger can identify the cause(s) of the upset

    b. The treatment facility was being properly operated by the time of the upset

    c. The discharger submitted notice of the upset as required; and

    d. The discharger complied with any remedial measures required

2. No determination made before an action of noncompliance occurs, such as during administrative review of claims that noncompliance was caused by an upset, is final administrative action subject to judicial review.

3. In any enforcement proceeding, the discharger seeking to establish the occurrence of an upset has the burden of proof

[10] An exceptional incident in which there is unintentional and temporary noncompliance the technology based numeric effluent limitations because of factors beyond the reasonable control of the discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventative maintenance, or careless or improper operation.

N. Penalties for Falsification of Reports

Section 309(c)(4) of the CWA provides that any person who knowingly makes any false material statement, representation, or certification in any record or other document submitted or required to be maintained under this General Permit, including reports of compliance or noncompliance shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than two years or by both.

O. Oil and Hazardous Substance Liability

Nothing in this General Permit shall be construed to preclude the institution of any legal action or relieve the discharger from any responsibilities, liabilities, or penalties to which the discharger is or may be subject to under Section 311 of the CWA.

P. Severability

The provisions of this General Permit are severable; and, if any provision of this General Permit or the application of any provision of this General Permit to any circumstance is held invalid, the application of such provision to other circumstances and the remainder of this General Permit shall not be affected thereby.

Q. Reopener Clause

This General Permit may be modified, revoked and reissued, or terminated for cause due to promulgation of amended regulations, receipt of U.S. EPA guidance concerning regulated activities, judicial decision, or in accordance with 40 Code of Federal Regulations (CFR) 122.62, 122.63, 122.64, and 124.5.

R. Penalties for Violations of Permit Conditions

1. Section 309 of the CWA provides significant penalties for any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the CWA or any permit condition or limitation implementing any such section in a permit issued under Section 402. Any person who violates any permit condition of this General Permit is subject to a civil penalty not to exceed $37,500[11] per calendar day of such violation, as well as any other appropriate sanction provided by Section 309 of the CWA.

[11] May be further adjusted in accordance with the Federal Civil Penalties Inflation Adjustment Act.

2. The Porter-Cologne Water Quality Control Act also provides for civil and criminal penalties, which in some cases are greater than those under the CWA.

S. Transfers

This General Permit is not transferable.

T. Continuation of Expired Permit

This General Permit continues in force and effect until a new General Permit is issued or the SWRCB rescinds this General Permit. Only those dischargers authorized to discharge under the expiring General Permit are covered by the continued General Permit.

V. EFFLUENT STANDARDS

A. Narrative Effluent Limitations

1. Storm water discharges and authorized non-storm water discharges regulated by this General Permit shall not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

2. Dischargers shall minimize or prevent pollutants in storm water discharges and authorized non-storm water discharges through the use of controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.

B. Numeric Effluent Limitations (NELs)

Table 1- Numeric Effluent Limitations, Numeric Action Levels, Test Methods, Detection Limits, and Reporting Units

Parameter	Test Method	Discharge Type	Min. Detection Limit	Units	Numeric Action Level	Numeric Effluent Limitation
pH	Field test with calibrated portable instrument	Risk Level 2	0.2	pH units	lower NAL = 6.5 upper NAL = 8.5	N/A
		Risk Level 3			lower NAL = 6.5 upper NAL = 8.5	lower NEL = 6.0 upper NEL = 9.0
Turbidity	EPA 0180.1 and/or field test with calibrated portable instrument	Risk Level 2	1	NTU	250 NTU	N/A
		Risk Level 3			250 NTU	500 NTU

1. Numeric Effluent Limitations (NELs):

   a. **Storm Event, Daily Average pH Limits –** For Risk Level 3 dischargers, the pH of storm water and non-storm water discharges shall be within the ranges specified in Table 1 during any site phase where there is a "high risk of pH discharge."[12]

b. **Storm Event Daily Average Turbidity Limit –** For Risk Level 3 dischargers, the turbidity of storm water and non-storm water discharges shall not exceed 500 NTU.

2. If daily average sampling results are outside the range of pH NELs (i.e., is below the lower NEL for pH or exceeds the upper NEL for pH) or exceeds the turbidity NEL (as listed in Table 1), the discharger is in violation of this General Permit and shall electronically file monitoring results in violation within 5 business days of obtaining the results.

3. **Compliance Storm Event**:

   Discharges of storm water from Risk Level 3 sites shall comply with applicable NELs (above) unless the storm event causing the discharges is determined after the fact to be equal to or larger than the Compliance Storm Event (expressed in inches of rainfall). The Compliance Storm Event for Risk Level 3 discharges is the 5 year, 24 hour storm (expressed in tenths of an inch of rainfall), as determined by using these maps:

   http://www.wrcc.dri.edu/pcpnfreq/nca5y24.gif
   http://www.wrcc.dri.edu/pcpnfreq/sca5y24.gif

   Compliance storm event verification shall be done by reporting on-site rain gauge readings as well as nearby governmental rain gauge readings.

4. Dischargers shall not be required to comply with NELs if the site receives run-on from a forest fire or any other natural disaster.

C. Numeric Action Levels (NALs)

1. For Risk Level 2 and 3 dischargers, the lower storm event average NAL for pH is 6.5 pH units and the upper storm event average NAL for pH is 8.5 pH units. The discharger shall take actions as described below if the discharge is outside of this range of pH values.

[12] A period of high risk of pH discharge is defined as a project's complete utilities phase, complete vertical build phase, and any portion of any phase where significant amounts of materials are placed directly on the land at the site in a manner that could result in significant alterations of the background pH of the discharges.

2. For Risk Level 2 and 3 dischargers, the NAL storm event daily average for turbidity is 250 NTU. The discharger shall take actions as described below if the discharge is outside of this range of turbidity values.

3. Whenever the results from a storm event daily average indicate that the discharge is below the lower NAL for pH, exceeds the upper NAL for pH, or exceeds the turbidity NAL (as listed in Table 1), the discharger shall conduct a construction site and run-on evaluation to determine whether pollutant source(s) associated with the site's construction activity may have caused or contributed to the NAL exceedance and shall immediately implement corrective actions if they are needed.

4. The site evaluation shall be documented in the SWPPP and specifically address whether the source(s) of the pollutants causing the exceedance of the NAL:

    a. Are related to the construction activities and whether additional BMPs are required to (1) meet BAT/BCT requirements; (2) reduce or prevent pollutants in storm water discharges from causing exceedances of receiving water objectives; and (3) determine what corrective action(s) were taken or will be taken and with a description of the schedule for completion.

    AND/OR:

    b. Are related to the run-on associated with the construction site location and whether additional BMPs measures are required to (1) meet BAT/BCT requirements; (2) reduce or prevent pollutants in storm water discharges from causing exceedances of receiving water objectives; and (3) what corrective action(s) were taken or will be taken with a description of the schedule for completion.

VI. RECEIVING WATER LIMITATIONS

A. The discharger shall ensure that storm water discharges and authorized non-storm water discharges to any surface or ground water will not adversely affect human health or the environment.

B. The discharger shall ensure that storm water discharges and authorized non-storm water discharges will not contain pollutants in quantities that threaten to cause pollution or a public nuisance.

C. The discharger shall ensure that storm water discharges and authorized non-storm water discharges will not contain pollutants that cause or contribute to an exceedance of any applicable water quality objectives or water quality standards (collectively, WQS) contained in a Statewide Water Quality Control Plan, the California Toxics Rule, the National Toxics Rule, or the applicable Regional Water Board's Water Quality Control Plan (Basin Plan).

D. Dischargers located within the watershed of a CWA § 303(d) impaired water body, for which a TMDL has been approved by the U.S. EPA, shall comply with the approved TMDL if it identifies "construction activity" or land disturbance as a source of the pollution.

VII. TRAINING QUALIFICATIONS AND CERTIFICATION REQUIREMENTS

A. General

The discharger shall ensure that all persons responsible for implementing requirements of this General Permit shall be appropriately trained in accordance with this Section. Training should be both formal and informal, occur on an ongoing basis, and should include training offered by recognized governmental agencies or professional organizations. Those responsible for preparing and amending SWPPPs shall comply with the requirements in this Section VII.

The discharger shall provide documentation of all training for persons responsible for implementing the requirements of this General Permit in the Annual Reports.

B. SWPPP Certification Requirements

1. **Qualified SWPPP Developer:** The discharger shall ensure that SWPPPs are written, amended and certified by a Qualified SWPPP Developer (QSD). A QSD shall have one of the following registrations or certifications, and appropriate experience, as required for:

   a. A California registered professional civil engineer;

   b. A California registered professional geologist or engineering geologist;

   c. A California registered landscape architect;

   d. A professional hydrologist registered through the American Institute of Hydrology;

   e. A Certified Professional in Erosion and Sediment Control (CPESC) ™ registered through Enviro Cert International, Inc.;

   f. A Certified Professional in Storm Water Quality (CPSWQ) ™ registered through Enviro Cert International, Inc.; or

   g. A professional in erosion and sediment control registered through the National Institute for Certification in Engineering Technologies (NICET);

Effective two years after the adoption date of this General Permit, a QSD shall have attended a State Water Board-sponsored or approved QSD training course.

2. The discharger shall list the name and telephone number of the currently designated Qualified SWPPP Developer(s) in the SWPPP.

3. **Qualified SWPPP Practitioner:** The discharger shall ensure that all BMPs required by this General Permit are implemented by a Qualified SWPPP Practitioner (QSP). A QSP is a person responsible for non-storm water and storm water visual observations, sampling and analysis. Effective two years from the date of adoption of this General Permit, a QSP shall be either a QSD or have one of the following certifications:

   a. A certified erosion, sediment and storm water inspector registered through Enviro Cert International, Inc.; or

   b. A certified inspector of sediment and erosion control registered through Certified Inspector of Sediment and Erosion Control, Inc.

   Effective two years after the adoption date of this General Permit, a QSP shall have attended a State Water Board-sponsored or approved QSP training course.

4. The LRP shall list in the SWPPP, the name of any Approved Signatory, and provide a copy of the written agreement or other mechanism that provides this authority from the LRP in the SWPPP.

5. The discharger shall include, in the SWPPP, a list of names of all contractors, subcontractors, and individuals who will be directed by the Qualified SWPPP Practitioner. This list shall include telephone numbers and work addresses. Specific areas of responsibility of each subcontractor and emergency contact numbers shall also be included.

6. The discharger shall ensure that the SWPPP and each amendment will be signed by the Qualified SWPPP Developer. The discharger shall include a listing of the date of initial preparation and the date of each amendment in the SWPPP.

VIII. RISK DETERMINATION

The discharger shall calculate the site's sediment risk and receiving water risk during periods of soil exposure (i.e. grading and site stabilization) and use the calculated risks to determine a Risk Level(s) using the methodology in

Appendix 1. For any site that spans two or more planning watersheds,[13] the discharger shall calculate a separate Risk Level for each planning watershed. The discharger shall notify the State Water Board of the site's Risk Level determination(s) and shall include this determination as a part of submitting the PRDs. If a discharger ends up with more than one Risk Level determination, the Regional Water Board may choose to break the project into separate levels of implementation.

IX. RISK LEVEL 1 REQUIREMENTS

Risk Level 1 Dischargers shall comply with the requirements included in Attachment C of this General Permit.

X. RISK LEVEL 2 REQUIREMENTS

Risk Level 2 Dischargers shall comply with the requirements included in Attachment D of this General Permit.

XI. RISK LEVEL 3 REQUIREMENTS

Risk Level 3 Dischargers shall comply with the requirements included in Attachment E of this General Permit.

XII. ACTIVE TREATMENT SYSTEMS (ATS)

Dischargers choosing to implement an ATS on their site shall comply with all of the requirements in Attachment F of this General Permit.

[13] Planning watershed: defined by the Calwater Watershed documents as a watershed that ranges in size from approximately 3,000 to 10,000 acres http://cain.ice.ucdavis.edu/calwater/calwfaq.html, http://gis.ca.gov/catalog/BrowseRecord.epl?id=22175 .

XIII. POST-CONSTRUCTION STANDARDS

A. All dischargers shall comply with the following runoff reduction requirements unless they are located within an area subject to post-construction standards of an active Phase I or II municipal separate storm sewer system (MS4) permit that has an approved Storm Water Management Plan.

1. This provision shall take effect three years from the adoption date of this permit, or later at the discretion of the Executive Officer of the Regional Board.

2. The discharger shall demonstrate compliance with the requirements of this section by submitting with their NOI a map and worksheets in accordance with the instructions in Appendix 2. The discharger shall use non-structural controls unless the discharger demonstrates that non-structural controls are infeasible or that structural controls will produce greater reduction in water quality impacts.

3. The discharger shall, through the use of non-structural and structural measures as described in Appendix 2, replicate the pre-project water balance (for this permit, defined as the volume of rainfall that ends up as runoff) for the smallest storms up to the 85^{th} percentile storm event (or the smallest storm event that generates runoff, whichever is larger). Dischargers shall inform Regional Water Board staff at least 30 days prior to the use of any structural control measure used to comply with this requirement. Volume that cannot be addressed using non-structural practices shall be captured in structural practices and approved by the Regional Water Board. When seeking Regional Board approval for the use of structural practices, dischargers shall document the infeasibility of using non-structural practices on the project site, or document that there will be fewer water quality impacts through the use of structural practices.

4. For sites whose disturbed area exceeds two acres, the discharger shall preserve the pre-construction drainage density (miles of stream length per square mile of drainage area) for all drainage areas within the area serving a first order stream[14] or larger stream and ensure that post-project time of runoff concentration is equal or greater than pre-project time of concentration.

[14] A first order stream is defined as a stream with no tributaries.

B. All dischargers shall implement BMPs to reduce pollutants in storm water discharges that are reasonably foreseeable after all construction phases have been completed at the site (Post-construction BMPs).

XIV. SWPPP REQUIREMENTS

A. The discharger shall ensure that the Storm Water Pollution Prevention Plans (SWPPPs) for all traditional project sites are developed and amended or revised by a QSD. The SWPPP shall be designed to address the following objectives:

1. All pollutants and their sources, including sources of sediment associated with construction, construction site erosion and all other activities associated with construction activity are controlled;

2. Where not otherwise required to be under a Regional Water Board permit, all non-storm water discharges are identified and either eliminated, controlled, or treated;

3. Site BMPs are effective and result in the reduction or elimination of pollutants in storm water discharges and authorized non-storm water discharges from construction activity to the BAT/BCT standard;

4. Calculations and design details as well as BMP controls for site run-on are complete and correct, and

5. Stabilization BMPs installed to reduce or eliminate pollutants after construction are completed.

B. To demonstrate compliance with requirements of this General Permit, the QSD shall include information in the SWPPP that supports the conclusions, selections, use, and maintenance of BMPs.

C. The discharger shall make the SWPPP available at the construction site during working hours while construction is occurring and shall be made available upon request by a State or Municipal inspector. When the original SWPPP is retained by a crewmember in a construction vehicle and is not currently at the construction site, current copies of the BMPs and map/drawing will be left with the field crew and the original SWPPP shall be made available via a request by radio/telephone.

XV. REGIONAL WATER BOARD AUTHORITIES

A. In the case where the Regional Water Board does not agree with the discharger's self-reported risk level (e.g., they determine themselves to be a Level 1 Risk when they are actually a Level 2 Risk site), Regional Water Boards may either direct the discharger to reevaluate the Risk Level(s) for their site or terminate coverage under this General Permit.

B. Regional Water Boards may terminate coverage under this General Permit for dischargers who fail to comply with its requirements or where they determine that an individual NPDES permit is appropriate.

C. Regional Water Boards may require dischargers to submit a Report of Waste Discharge / NPDES permit application for Regional Water Board consideration of individual requirements.

D. Regional Water Boards may require additional Monitoring and Reporting Program Requirements, including sampling and analysis of discharges to sediment-impaired water bodies.

E. Regional Water Boards may require dischargers to retain records for more than the three years required by this General Permit.

XVI. ANNUAL REPORTING REQUIREMENTS

A. All dischargers shall prepare and electronically submit an Annual Report no later than September 1 of each year.

B. The discharger shall certify each Annual Report in accordance with the Special Provisions.

C. The discharger shall retain an electronic or paper copy of each Annual Report for a minimum of three years after the date the annual report is filed.

D. The discharger shall include storm water monitoring information in the Annual Report consisting of:

1. a summary and evaluation of all sampling and analysis results, including copies of laboratory reports;

2. the analytical method(s), method reporting unit(s), and method detection limit(s) of each analytical parameter (analytical results that are less than the method detection limit shall be reported as "less than the method detection limit");

3. a summary of all corrective actions taken during the compliance year;

4. identification of any compliance activities or corrective actions that were not implemented;

5. a summary of all violations of the General Permit;

6. the names of individual(s) who performed the facility inspections, sampling, visual observation (inspections), and/or measurements;

7. the date, place, time of facility inspections, sampling, visual observation (inspections), and/or measurements, including precipitation (rain gauge); and

8. the visual observation and sample collection exception records and reports specified in Attachments C, D, and E.

E. The discharger shall provide training information in the Annual Report consisting of:

1. documentation of all training for individuals responsible for all activities associated with compliance with this General Permit;

2. documentation of all training for individuals responsible for BMP installation, inspection, maintenance, and repair; and

3. documentation of all training for individuals responsible for overseeing, revising, and amending the SWPPP.

APPENDIX B

RISK LEVEL 2 STORMWATER MANAGEMENT REQUIREMENTS (on CD only)

This page intentionally left blank.

ATTACHMENT D
RISK LEVEL 2 REQUIREMENTS

A. Effluent Standards

[These requirements are the same as those in the General Permit order.]

1. Narrative – Risk Level 2 dischargers shall comply with the narrative effluent standards listed below:

   a. Storm water discharges and authorized non-storm water discharges regulated by this General Permit shall not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

   b. Dischargers shall minimize or prevent pollutants in storm water discharges and authorized non-storm water discharges through the use of controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.

2. Numeric – Risk level 2 dischargers are subject to a pH NAL of 6.5-8.5, and a turbidity NAL of 250 NTU.

B. Good Site Management "Housekeeping"

1. Risk Level 2 dischargers shall implement good site management (i.e., "housekeeping") measures for construction materials that could potentially be a threat to water quality if discharged. At a minimum, Risk Level 2 dischargers shall implement the following good housekeeping measures:

   a. Conduct an inventory of the products used and/or expected to be used and the end products that are produced and/or expected to be produced. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e. poles, equipment pads, cabinets, conductors, insulators, bricks, etc.).

   b. Cover and berm loose stockpiled construction materials that are not actively being used (i.e. soil, spoils, aggregate, fly-ash, stucco, hydrated lime, etc.).

c. Store chemicals in watertight containers (with appropriate secondary containment to prevent any spillage or leakage) or in a storage shed (completely enclosed).

d. Minimize exposure of construction materials to precipitation. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e. poles, equipment pads, cabinets, conductors, insulators, bricks, etc.).

e. Implement BMPs to prevent the off-site tracking of loose construction and landscape materials.

2. Risk Level 2 dischargers shall implement good housekeeping measures for waste management, which, at a minimum, shall consist of the following:

a. Prevent disposal of any rinse or wash waters or materials on impervious or pervious site surfaces or into the storm drain system.

b. Ensure the containment of sanitation facilities (e.g., portable toilets) to prevent discharges of pollutants to the storm water drainage system or receiving water.

c. Clean or replace sanitation facilities and inspecting them regularly for leaks and spills.

d. Cover waste disposal containers at the end of every business day and during a rain event.

e. Prevent discharges from waste disposal containers to the storm water drainage system or receiving water.

f. Contain and securely protect stockpiled waste material from wind and rain at all times unless actively being used.

g. Implement procedures that effectively address hazardous and non-hazardous spills.

h. Develop a spill response and implementation element of the SWPPP prior to commencement of construction activities. The SWPPP shall require:

i. Equipment and materials for cleanup of spills shall be available on site and that spills and leaks shall be cleaned up immediately and disposed of properly.

ii. Appropriate spill response personnel are assigned and trained.

i. Ensure the containment of concrete washout areas and other washout areas that may contain additional pollutants so there is no discharge into the underlying soil and onto the surrounding areas.

3. Risk Level 2 dischargers shall implement good housekeeping for vehicle storage and maintenance, which, at a minimum, shall consist of the following:

   a. Prevent oil, grease, or fuel to leak in to the ground, storm drains or surface waters.

   b. Place all equipment or vehicles, which are to be fueled, maintained and stored in a designated area fitted with appropriate BMPs.

   c. Clean leaks immediately and disposing of leaked materials properly.

4. Risk Level 2 dischargers shall implement good housekeeping for landscape materials, which, at a minimum, shall consist of the following:

   a. Contain stockpiled materials such as mulches and topsoil when they are not actively being used.

   b. Contain all fertilizers and other landscape materials when they are not actively being used.

   c. Discontinue the application of any erodible landscape material within 2 days before a forecasted rain event or during periods of precipitation.

   d. Apply erodible landscape material at quantities and application rates according to manufacture recommendations or based on written specifications by knowledgeable and experienced field personnel.

   e. Stack erodible landscape material on pallets and covering or storing such materials when not being used or applied.

5. Risk Level 2 dischargers shall conduct an assessment and create a list of potential pollutant sources and identify any areas of the site where additional BMPs are necessary to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. This potential pollutant list shall be kept with the SWPPP and shall identify

all non-visible pollutants which are known, or should be known, to occur on the construction site. At a minimum, when developing BMPs, Risk Level 2 dischargers shall do the following:

a. Consider the quantity, physical characteristics (e.g., liquid, powder, solid), and locations of each potential pollutant source handled, produced, stored, recycled, or disposed of at the site.

b. Consider the degree to which pollutants associated with those materials may be exposed to and mobilized by contact with storm water.

c. Consider the direct and indirect pathways that pollutants may be exposed to storm water or authorized non-storm water discharges. This shall include an assessment of past spills or leaks, non-storm water discharges, and discharges from adjoining areas.

d. Ensure retention of sampling, visual observation, and inspection records.

e. Ensure effectiveness of existing BMPs to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges.

6. Risk Level 2 dischargers shall implement good housekeeping measures on the construction site to control the air deposition of site materials and from site operations. Such particulates can include, but are not limited to, sediment, nutrients, trash, metals, bacteria, oil and grease and organics.

7. **Additional Risk Level 2 Requirement:** Risk Level 2 dischargers shall document all housekeeping BMPs in the SWPPP and REAP(s) in accordance with the nature and phase of the construction project. Construction phases at traditional land development projects include Grading and Land Development Phase, Streets and Utilities, or Vertical Construction for traditional land development projects.

C. Non-Storm Water Management

1. Risk Level 2 dischargers shall implement measures to control all non-storm water discharges during construction.

2. Risk Level 2 dischargers shall wash vehicles in such a manner as to prevent non-storm water discharges to surface waters or MS4 drainage systems.

3. Risk Level 2 dischargers shall clean streets in such a manner as to prevent unauthorized non-storm water discharges from reaching surface water or MS4 drainage systems.

D. Erosion Control

1. Risk Level 2 dischargers shall implement effective wind erosion control.

2. Risk Level 2 dischargers shall provide effective soil cover for inactive[1] areas and all finished slopes, open space, utility backfill, and completed lots.

3. Risk Level 2 dischargers shall limit the use of plastic materials when more sustainable, environmentally friendly alternatives exist. Where plastic materials are deemed necessary, the discharger shall consider the use of plastic materials resistant to solar degradation.

E. Sediment Controls

1. Risk Level 2 dischargers shall establish and maintain effective perimeter controls and stabilize all construction entrances and exits to sufficiently control erosion and sediment discharges from the site.

2. On sites where sediment basins are to be used, Risk Level 2 dischargers shall, at minimum, design sediment basins according to the method provided in CASQA's Construction BMP Guidance Handbook.

3. **Additional Risk Level 2 Requirement:** Risk Level 2 dischargers shall implement appropriate erosion control BMPs (runoff control and soil stabilization) in conjunction with sediment control BMPs for areas under active[2] construction.

4. **Additional Risk Level 2 Requirement:** Risk Level 2 dischargers shall apply linear sediment controls along the toe of the slope, face of the slope, and at the grade breaks of exposed slopes to comply with sheet flow lengths[3] in accordance with Table 1.

Table 1 - Critical Slope/Sheet Flow Length Combinations

Slope Percentage	Sheet flow length not

[1] Inactive areas of construction are areas of construction activity that have been disturbed and are not scheduled to be re-disturbed for at least 14 days.
[2] Active areas of construction are areas undergoing land surface disturbance. This includes construction activity during the preliminary stage, mass grading stage, streets and utilities stage and the vertical construction stage.
[3] Sheet flow length is the length that shallow, low velocity flow travels across a site.

	to exceed
0-25% 20	feet
25-50% 15	feet
Over 50%	10 feet

5. **Additional Risk Level 2 Requirement:** Risk Level 2 dischargers shall ensure that construction activity traffic to and from the project is limited to entrances and exits that employ effective controls to prevent offsite tracking of sediment.

6. **Additional Risk Level 2 Requirement:** Risk Level 2 dischargers shall ensure that all storm drain inlets and perimeter controls, runoff control BMPs, and pollutant controls at entrances and exits (e.g. tire washoff locations) are maintained and protected from activities that reduce their effectiveness.

7. **Additional Risk Level 2 Requirement:** Risk Level 2 dischargers shall inspect on a daily basis all immediate access roads daily. At a minimum daily (when necessary) and prior to any rain event, the discharger shall remove any sediment or other construction activity-related materials that are deposited on the roads (by vacuuming or sweeping).

F. Run-on and Run-off Controls

Risk Level 2 dischargers shall effectively manage all run-on, all runoff within the site and all runoff that discharges off the site. Run-on from off site shall be directed away from all disturbed areas or shall collectively be in compliance with the effluent limitations in this General Permit.

G. Inspection, Maintenance and Repair

1. Risk Level 2 dischargers shall ensure that all inspection, maintenance repair and sampling activities at the project location shall be performed or supervised by a Qualified SWPPP Practitioner (QSP) representing the discharger. The QSP may delegate any or all of these activities to an employee appropriately trained to do the task(s).

2. Risk Level 2 dischargers shall perform weekly inspections and observations, and at least once each 24-hour period during extended storm events, to identify and record BMPs that need maintenance to operate effectively, that have failed, or that could fail to operate as intended. Inspectors shall be the QSP or be trained by the QSP.

3. Upon identifying failures or other shortcomings, as directed by the QSP, Risk Level 2 dischargers shall begin implementing repairs or

design changes to BMPs within 72 hours of identification and complete the changes as soon as possible.

4. For each inspection required, Risk Level 2 dischargers shall complete an inspection checklist, using a form provided by the State Water Board or Regional Water Board or in an alternative format.

5. Risk Level 2 dischargers shall ensure that checklists shall remain onsite with the SWPPP and at a minimum, shall include:

   a. Inspection date and date the inspection report was written.

   b. Weather information, including presence or absence of precipitation, estimate of beginning of qualifying storm event, duration of event, time elapsed since last storm, and approximate amount of rainfall in inches.

   c. Site information, including stage of construction, activities completed, and approximate area of the site exposed.

   d. A description of any BMPs evaluated and any deficiencies noted.

   e. If the construction site is safely accessible during inclement weather, list the observations of all BMPs: erosion controls, sediment controls, chemical and waste controls, and non-storm water controls. Otherwise, list the results of visual inspections at all relevant outfalls, discharge points, downstream locations and any projected maintenance activities.

   f. Report the presence of noticeable odors or of any visible sheen on the surface of any discharges.

   g. Any corrective actions required, including any necessary changes to the SWPPP and the associated implementation dates.

   h. Photographs taken during the inspection, if any.

   i. Inspector's name, title, and signature.

H. Rain Event Action Plan

1. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP develop a Rain Event Action Plan (REAP) 48 hours prior to any likely precipitation event. A likely precipitation event is any weather pattern that is forecast to have a 50% or greater probability of producing precipitation in the project area. The discharger shall

ensure a QSP obtain a printed copy of precipitation forecast information from the National Weather Service Forecast Office (e.g., by entering the zip code of the project's location at http://www.srh.noaa.gov/forecast).

2. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP develop the REAPs for all phases of construction (i.e., Grading and Land Development, Streets and Utilities, Vertical Construction, Final Landscaping and Site Stabilization).

3. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP ensure that the REAP include, at a minimum, the following site information:

   a. Site Address
   b. Calculated Risk Level (2 or 3)
   c. Site Storm Water Manager Information including the name, company, and 24-hour emergency telephone number
   d. Erosion and Sediment Control Provider information including the name, company, and 24-hour emergency telephone number
   e. Storm Water Sampling Agent information including the name, company, and 24-hour emergency telephone number

4. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP include in the REAP, at a minimum, the following project phase information:

   a. Activities associated with each construction phase
   b. Trades active on the construction site during each construction phase
   c. Trade contractor information
   d. Suggested actions for each project phase

5. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP develop additional REAPs for project sites where construction activities are indefinitely halted or postponed (Inactive Construction). At a minimum, Inactive Construction REAPs must include:

   a. Site Address
   b. Calculated Risk Level (2 or 3)
   c. Site Storm Water Manager Information including the name, company, and 24-hour emergency telephone number
   d. Erosion and Sediment Control Provider information including the name, company, and 24-hour emergency telephone number
   e. Storm Water Sampling Agent information including the name, company, and 24-hour emergency telephone number

f. Trades active on site during Inactive Construction
g. Trade contractor information
h. Suggested actions for inactive construction sites

6. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP begin implementation and make the REAP available onsite no later than 24 hours prior to the likely precipitation event.

7. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP maintain onsite a paper copy of each REAP onsite in compliance with the record retention requirements of the Special Provisions in this General Permit.

I. Risk Level 2 Monitoring and Reporting Requirements

Table 2- Summary of Monitoring Requirements

Risk Level	Visual Inspections					Sample Collection	
	Quarterly Non-storm Water Discharge	Pre-storm Event		Daily Storm BMP	Post Storm	Storm Water Discharge	Receiving Water
		Baseline	REAP				
2	X	X	X	X	X	X	

1. Construction Site Monitoring Program Requirements

   a. Pursuant to Water Code Sections 13383 and 13267, all dischargers subject to this General Permit shall develop and implement a written site-specific Construction Site Monitoring Program (CSMP) in accordance with the requirements of this Section. The CSMP shall include all monitoring procedures and instructions, location maps, forms, and checklists as required in this section. The CSMP shall be developed prior to the commencement of construction activities, and revised as necessary to reflect project revisions. The CSMP shall be a part of the Storm Water Pollution Prevention Plan (SWPPP), included as an appendix or separate SWPPP chapter.

   b. Existing dischargers registered under the State Water Board Order No. 99-08-DWQ shall make and implement necessary revisions to their Monitoring Program to reflect the changes in this General Permit in a timely manner, but no later than July 1, 2010. Existing dischargers shall continue to implement their existing Monitoring Programs in compliance with State Water Board Order No. 99-08-DWQ until the necessary revisions are completed according to the schedule above.

   c. When a change of ownership occurs for all or any portion of the construction site prior to completion or final stabilization, the new discharger shall comply with these requirements as of the date the ownership change occurs.

2. **Objectives**

   The CSMP shall be developed and implemented to address the following objectives:

a. To demonstrate that the site is in compliance with the Discharge Prohibitions and applicable Numeric Action Levels (NALs)/Numeric Effluent Limitations (NELs) of this General Permit.

b. To determine whether non-visible pollutants are present at the construction site and are causing or contributing to exceedances of water quality objectives.

c. To determine whether immediate corrective actions, additional Best Management Practice (BMP) implementation, or SWPPP revisions are necessary to reduce pollutants in storm water discharges and authorized non-storm water discharges.

d. To determine whether BMPs included in the SWPPP/Rain Event Action Plan (REAP) are effective in preventing or reducing pollutants in storm water discharges and authorized non-storm water discharges.

3. **Risk Level 2 – Visual Monitoring (Inspection) Requirements for Qualifying Rain Events**

a. Risk Level 2 dischargers shall visually observe (inspect) storm water discharges at all discharge locations within two business days (48 hours) after each qualifying rain event.

b. Risk Level 2 dischargers shall visually observe (inspect) the discharge of stored or contained storm water that is derived from and discharged subsequent to a qualifying rain event producing precipitation of ½ inch or more at the time of discharge. Stored or contained storm water that will likely discharge after operating hours due to anticipated precipitation shall be observed prior to the discharge during operating hours.

c. Risk Level 2 dischargers shall conduct visual observations (inspections) during business hours only.

d. Risk Level 2 dischargers shall record the time, date and rain gauge reading of all qualifying rain events.

e. Within 2 business days (48 hours) prior to each qualifying rain event, Risk Level 2 dischargers shall visually observe (inspect):

i. all storm water drainage areas to identify any spills, leaks, or uncontrolled pollutant sources. If needed, the discharger shall implement appropriate corrective actions.

ii. all BMPs to identify whether they have been properly implemented in accordance with the SWPPP/REAP. If needed, the discharger shall implement appropriate corrective actions.

iii. any storm water storage and containment areas to detect leaks and ensure maintenance of adequate freeboard.

f. For the visual observations (inspections) described in c.i and c.iii above, Risk Level 2 dischargers shall observe the presence or absence of floating and suspended materials, a sheen on the surface, discolorations, turbidity, odors, and source(s) of any observed pollutants.

g. Within two business days (48 hours) after each qualifying rain event, Risk Level 2 dischargers shall conduct post rain event visual observations (inspections) to (1) identify whether BMPs were adequately designed, implemented, and effective, and (2) identify additional BMPs and revise the SWPPP accordingly.

h. Risk Level 2 dischargers shall maintain on-site records of all visual observations (inspections), personnel performing the observations, observation dates, weather conditions, locations observed, and corrective actions taken in response to the observations.

4. **Risk Level 2 – Water Quality Sampling and Analysis**

a. Risk Level 2 dischargers shall collect storm water grab samples from sampling locations, as defined in Section I.5. The storm water grab sample(s) obtained shall be representative of the flow and characteristics of the discharge.

b. At minimum, Risk Level 2 dischargers shall collect 3 samples per day of the qualifying event.

c. Risk Level 2 dischargers shall ensure that the grab samples collected of stored or contained storm water are from discharges subsequent to a qualifying rain event (producing precipitation of ½ inch or more at the time of discharge).

Storm Water Effluent Monitoring Requirements

d. Risk Level 2 dischargers shall analyze their effluent samples for:

i. pH and turbidity.

ii. Any additional parameters for which monitoring is required by the Regional Water Board.

5. **Risk Level 2 – Storm Water Discharge Water Quality Sampling Locations**

Effluent Sampling Locations

a. Risk Level 2 dischargers shall perform sampling and analysis of storm water discharges to characterize discharges associated with construction activity from the entire project disturbed area.

b. Risk Level 2 dischargers shall collect effluent samples at all discharge points where storm water is discharged off-site.

c. Risk Level 2 dischargers shall ensure that storm water discharge collected and observed represent[4] the effluent in each drainage area based on visual observation of the water and upstream conditions.

d. Risk Level 2 dischargers shall monitor and report site run-on from surrounding areas if there is reason to believe run-on may contribute to an exceedance of NALs or NELs.

e. Risk Level 2 dischargers who deploy an ATS on their site, or a portion on their site, shall collect ATS effluent samples and measurements from the discharge pipe or another location representative of the nature of the discharge.

f. Risk Level 2 dischargers shall select analytical test methods from the list provided in Table 3 below.

g. All storm water sample collection preservation and handling shall be conducted in accordance with Section I.7 “Storm Water Sample Collection and Handling Instructions” below.

6. **Risk Level 2 – Visual Observation and Sample Collection Exemptions**

a. Risk Level 2 dischargers shall be prepared to collect samples and conduct visual observation (inspections) until the minimum requirements of Sections I.3 and I.4 above are completed. Risk

[4] For example, if there has been concrete work recently in an area, or drywall scrap is exposed to the rain, a pH sample shall be taken of drainage from the relevant work area. Similarly, if sediment laden water is flowing through some parts of a silt fence, samples shall be taken of the sediment-laden water even if most water flowing through the fence is clear.

Level 2 dischargers are not required to physically collect samples or conduct visual observation (inspections) under the following conditions:

i. During dangerous weather conditions such as flooding and electrical storms.

ii. Outside of scheduled site business hours.

b. If no required samples or visual observation (inspections) are collected due to these exceptions, Risk Level 2 dischargers shall include an explanation in their SWPPP and in the Annual Report documenting why the sampling or visual observation (inspections) were not conducted.

7. **Risk Level 2 – Storm Water Sample Collection and Handling Instructions**

a. Risk Level 2 dischargers shall refer to Table 3 below for test methods, detection limits, and reporting units.

b. Risk Level 2 dischargers shall ensure that testing laboratories will receive samples within 48 hours of the physical sampling (unless otherwise required by the laboratory), and shall use only the sample containers provided by the laboratory to collect and store samples.

c. Risk Level 2 dischargers shall designate and train personnel to collect, maintain, and ship samples in accordance with the Surface Water Ambient Monitoring Program's (SWAMP) 2008 Quality Assurance Program Plan (QAPrP).[5]

8. **Risk Level 2 – Monitoring Methods**

a. Risk Level 2 dischargers shall include a description of the following items in the CSMP:

i. Visual observation locations, visual observation procedures, and visual observation follow-up and tracking procedures.

ii. Sampling locations, and sample collection and handling procedures. This shall include detailed procedures for sample

[5] Additional information regarding SWAMP's QAPrP and QAMP can be found at http://www.waterboards.ca.gov/water_issues/programs/swamp/.
QAPrP:http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/qapp/swamp_qapp_master090108a.pdf.
QAMP: http://www.waterboards.ca.gov/water_issues/programs/swamp/qamp.shtml.

collection, storage, preservation, and shipping to the testing lab to assure that consistent quality control and quality assurance is maintained. Dischargers shall attach to the monitoring program an example Chain of Custody form used when handling and shipping samples.

iii. Identification of the analytical methods and related method detection limits (if applicable) for each parameter required in Section I.4 above.

b. Risk Level 2 dischargers shall ensure that all sampling and sample preservation are in accordance with the current edition of "Standard Methods for the Examination of Water and Wastewater" (American Public Health Association). All monitoring instruments and equipment (including a discharger's own field instruments for measuring pH and turbidity) should be calibrated and maintained in accordance with manufacturers' specifications to ensure accurate measurements. Risk Level 2 dischargers shall ensure that all laboratory analyses are conducted according to test procedures under 40 CFR Part 136, unless other test procedures have been specified in this General Permit or by the Regional Water Board. With the exception of field analysis conducted by the discharger for turbidity and pH, all analyses should be sent to and conducted at a laboratory certified for such analyses by the State Department of Health Services. Risk Level 2 dischargers shall conduct their own field analysis of pH and may conduct their own field analysis of turbidity if the discharger has sufficient capability (qualified and trained employees, properly calibrated and maintained field instruments, etc.) to adequately perform the field analysis.

9. **Risk Level 2 – Analytical Methods**

a. Risk Level 2 dischargers shall refer to Table 3 below for test methods, detection limits, and reporting units.

b. **pH**: Risk Level 2 dischargers shall perform pH analysis on-site with a calibrated pH meter or a pH test kit. Risk Level 2 dischargers shall record pH monitoring results on paper and retain these records in accordance with Section I.14, below.

c. **Turbidity**: Risk Level 2 dischargers shall perform turbidity analysis using a calibrated turbidity meter (turbidimeter), either on-site or at an accredited lab. Acceptable test methods include Standard Method 2130 or USEPA Method 180.1. The results will be recorded in the site log book in Nephelometric Turbidity Units (NTU).

10. **Risk Level 2 - Non-Storm Water Discharge Monitoring Requirements**

   a. Visual Monitoring Requirements:

      i. Risk Level 2 dischargers shall visually observe (inspect) each drainage area for the presence of (or indications of prior) unauthorized and authorized non-storm water discharges and their sources.

      ii. Risk Level 2 dischargers shall conduct one visual observation (inspection) quarterly in each of the following periods: January-March, April-June, July-September, and October-December. Visual observation (inspections) are only required during daylight hours (sunrise to sunset).

      iii. Risk Level 2 dischargers shall ensure that visual observations (inspections) document the presence or evidence of any non-storm water discharge (authorized or unauthorized), pollutant characteristics (floating and suspended material, sheen, discoloration, turbidity, odor, etc.), and source. Risk Level 2 dischargers shall maintain on-site records indicating the personnel performing the visual observation (inspections), the dates and approximate time each drainage area and non-storm water discharge was observed, and the response taken to eliminate unauthorized non-storm water discharges and to reduce or prevent pollutants from contacting non-storm water discharges.

   b. Effluent Sampling Locations:

      i. Risk Level 2 dischargers shall sample effluent at all discharge points where non-storm water and/or authorized non-storm water is discharged off-site.

      ii. Risk Level 2 dischargers shall send all non-storm water sample analyses to a laboratory certified for such analyses by the State Department of Health Services.

      iii. Risk Level 2 dischargers shall monitor and report run-on from surrounding areas if there is reason to believe run-on may contribute to an exceedance of NALs.

11. **Risk Level 2 – Non-Visible Pollutant Monitoring Requirements**

a. Risk Level 2 dischargers shall collect one or more samples during any breach, malfunction, leakage, or spill observed during a visual inspection which could result in the discharge of pollutants to surface waters that would not be visually detectable in storm water.

b. Risk Level 2 dischargers shall ensure that water samples are large enough to characterize the site conditions.

c. Risk Level 2 dischargers shall collect samples at all discharge locations that can be safely accessed.

d. Risk Level 2 dischargers shall collect samples during the first two hours of discharge from rain events that occur during business hours and which generate runoff.

e. Risk Level 2 dischargers shall analyze samples for all non-visible pollutant parameters (if applicable) - parameters indicating the presence of pollutants identified in the pollutant source assessment required (Risk Level 2 dischargers shall modify their CSMPs to address these additional parameters in accordance with any updated SWPPP pollutant source assessment).

f. Risk Level 2 dischargers shall collect a sample of storm water that has not come in contact with the disturbed soil or the materials stored or used on-site (uncontaminated sample) for comparison with the discharge sample.

g. Risk Level 2 dischargers shall compare the uncontaminated sample to the samples of discharge using field analysis or through laboratory analysis.[6]

h. Risk Level 2 dischargers shall keep all field /or analytical data in the SWPPP document.

12. **Risk Level 2 – Watershed Monitoring Option**

Risk Level 2 dischargers who are part of a qualified regional watershed-based monitoring program may be eligible for relief from the requirements in Sections I.5. The Regional Water Board may approve proposals to substitute an acceptable watershed-based monitoring program by determining if the watershed-based monitoring program

[6] For laboratory analysis, all sampling, sample preservation, and analyses must be conducted according to test procedures under 40 CFR Part 136. Field discharge samples shall be collected and analyzed according to the specifications of the manufacturer of the sampling devices employed.

will provide substantially similar monitoring information in evaluating discharger compliance with the requirements of this General Permit.

13. **Risk Level 2 – Particle Size Analysis for Project Risk Justification**

Risk Level 2 dischargers justifying an alternative project risk shall report a soil particle size analysis used to determine the RUSLE K-Factor. ASTM D-422 (Standard Test Method for Particle-Size Analysis of Soils), as revised, shall be used to determine the percentages of sand, very fine sand, silt, and clay on the site.

14. **Risk Level 2 – Records**

Risk Level 2 dischargers shall retain records of all storm water monitoring information and copies of all reports (including Annual Reports) for a period of at least three years. Risk Level 2 dischargers shall retain all records on-site while construction is ongoing. These records include:

a. The date, place, time of facility inspections, sampling, visual observation (inspections), and/or measurements, including precipitation.

b. The individual(s) who performed the facility inspections, sampling, visual observation (inspections), and or measurements.

c. The date and approximate time of analyses.

d. The individual(s) who performed the analyses.

e. A summary of all analytical results from the last three years, the method detection limits and reporting units, the analytical techniques or methods used, and the chain of custody forms.

f. Rain gauge readings from site inspections;

g. Quality assurance/quality control records and results.

h. Non-storm water discharge inspections and visual observation (inspections) and storm water discharge visual observation records (see Sections I.3 and I.10 above).

i. Visual observation and sample collection exception records (see Section I.6 above).

j. The records of any corrective actions and follow-up activities that resulted from analytical results, visual observation (inspections), or inspections.

15. **Risk Level 2 – NAL Exceedance Report**

a. In the event that any effluent sample exceeds an applicable NAL, Risk Level 2 dischargers shall electronically submit all storm event sampling results to the State Water Board no later than 10 days after the conclusion of the storm event. The Regional Boards have the authority to require the submittal of an NAL Exceedance Report.

b. Risk Level 2 dischargers shall certify each NAL Exceedance Report in accordance with the Special Provisions for Construction Activity.

c. Risk Level 2 dischargers shall retain an electronic or paper copy of each NAL Exceedance Report for a minimum of three years after the date the annual report is filed.

d. Risk Level 2 dischargers shall include in the NAL Exceedance Report:

i. The analytical method(s), method reporting unit(s), and method detection limit(s) of each analytical parameter (analytical results that are less than the method detection limit shall be reported as "less than the method detection limit").

ii. The date, place, time of sampling, visual observation (inspections), and/or measurements, including precipitation.

iii. A description of the current BMPs associated with the effluent sample that exceeded the NAL and the proposed corrective actions taken.

Table 3 – Risk Level 2 Test Methods, Detection Limits, Reporting Units and Applicable NALs/NELs

Parameter	Test Method / Protocol	Discharge Type	Min. Detection Limit	Reporting Units	Numeric Action Level
pH	Field test with calibrated portable instrument	Risk Level 2 Discharges	0.2 pH	units	lower NAL = 6.5 upper NAL = 8.5
Turbidity EPA	0180.1 and/or field test with calibrated portable instrument	Risk Level 2 Discharges other than ATS	1 NTU		250 NTU
		For ATS discharges	1 NTU		N/A

Potential Alternatives

None

Description and Purpose

Scheduling is the development of a written plan that includes sequencing of construction activities and the implementation of BMPs such as erosion control and sediment control while taking local climate (rainfall, wind, etc.) into consideration. The purpose is to reduce the amount and duration of soil exposed to erosion by wind, rain, runoff, and vehicle tracking, and to perform the construction activities and control practices in accordance with the planned schedule.

Suitable Applications

Proper sequencing of construction activities to reduce erosion potential should be incorporated into the schedule of every construction project especially during rainy season. Use of other, more costly yet less effective, erosion and sediment control BMPs may often be reduced through proper construction sequencing.

Limitations

- Environmental constraints such as nesting season prohibitions reduce the full capabilities of this BMP.

Implementation

- Avoid rainy periods. Schedule major grading operations during dry months when practical. Allow enough time before rainfall begins to stabilize the soil with vegetation or physical means or to install sediment trapping devices.

- Plan the project and develop a schedule showing each phase

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

of construction. Clearly show how the rainy season relates to soil disturbing and re-stabilization activities. Incorporate the construction schedule into the SWPPP.

- Include on the schedule, details on the rainy season implementation and deployment of:
  - Erosion control BMPs
  - Sediment control BMPs
  - Tracking control BMPs
  - Wind erosion control BMPs
  - Non-stormwater BMPs
  - Waste management and materials pollution control BMPs
- Include dates for activities that may require non-stormwater discharges such as dewatering, sawcutting, grinding, drilling, boring, crushing, blasting, painting, hydro-demolition, mortar mixing, pavement cleaning, etc.
- Work out the sequencing and timetable for the start and completion of each item such as site clearing and grubbing, grading, excavation, paving, foundation pouring utilities installation, etc., to minimize the active construction area during the rainy season.
  - Sequence trenching activities so that most open portions are closed before new trenching begins.
  - Incorporate staged seeding and re-vegetation of graded slopes as work progresses.
  - Schedule establishment of permanent vegetation during appropriate planting time for specified vegetation.
- Non-active areas should be stabilized as soon as practical after the cessation of soil disturbing activities or one day prior to the onset of precipitation.
- Monitor the weather forecast for rainfall.
- When rainfall is predicted, adjust the construction schedule to allow the implementation of soil stabilization and sediment treatment controls on all disturbed areas prior to the onset of rain.
- Be prepared year round to deploy erosion control and sediment control BMPs. Erosion may be caused during dry seasons by un-seasonal rainfall, wind, and vehicle tracking. Keep the site stabilized year round, and retain and maintain rainy season sediment trapping devices in operational condition.
- Apply permanent erosion control to areas deemed substantially complete during the project's defined seeding window.

Costs

Construction scheduling to reduce erosion may increase other construction costs due to reduced economies of scale in performing site grading. The cost effectiveness of scheduling techniques should be compared with the other less effective erosion and sedimentation controls to achieve a cost effective balance.

Inspection and Maintenance

- Verify that work is progressing in accordance with the schedule. If progress deviates, take corrective actions.
- Amend the schedule when changes are warranted.
- Amend the schedule prior to the rainy season to show updated information on the deployment and implementation of construction site BMPs.

EC-3 Hydraulic Mulch

EC-5 Soil Binders

EC-6 Straw Mulch

EC-7 Geotextiles and Mats

EC-8 Wood Mulching

EC-14 Compost Blanket

EC-16 Non-Vegetative Stabilization

Description and Purpose

Hydroseeding typically consists of applying a mixture of a hydraulic mulch, seed, fertilizer, and stabilizing emulsion with a hydraulic mulcher, to temporarily protect exposed soils from erosion by water and wind. Hydraulic seeding, or hydroseeding, is simply the method by which temporary or permanent seed is applied to the soil surface.

Suitable Applications

Hydroseeding is suitable for disturbed areas requiring temporary protection until permanent stabilization is established, for disturbed areas that will be re-disturbed following an extended period of inactivity, or to apply permanent stabilization measures. Hydroseeding without mulch or other cover (e.g. EC-7, Erosion Control Blanket) is not a stand-alone erosion control BMP and should be combined with additional measures until vegetation establishment.

Typical applications for hydroseeding include:

- Disturbed soil/graded areas where permanent stabilization or continued earthwork is not anticipated prior to seed germination.
- Cleared and graded areas exposed to seasonal rains or temporary irrigation.
- Areas not subject to heavy wear by construction equipment or high traffic.

CASQA

CALIFORNIA STORMWATER QUALITY ASSOCIATION

Limitations

- Availability of hydroseeding equipment may be limited just prior to the rainy season and prior to storms due to high demand.
- Hydraulic seed should be applied with hydraulic mulch or a stand-alone hydroseed application should be followed by one of the following:
  - Straw mulch (see Straw Mulch EC-6)
  - Rolled erosion control products (see Geotextiles and Mats EC-7)
  - Application of Compost Blanket (see Compost Blanket EC-14)

  Hydraulic seed may be used alone only on small flat surfaces when there is sufficient time in the season to ensure adequate vegetation establishment and coverage to provide adequate erosion control.
- Hydraulic seed without mulch does not provide immediate erosion control.
- Temporary seeding may not be appropriate for steep slopes (i.e., slopes readily prone to rill erosion or without sufficient topsoil).
- Temporary seeding may not be appropriate in dry periods without supplemental irrigation.
- Temporary vegetation may have to be removed before permanent vegetation is applied.
- Temporary vegetation may not be appropriate for short term inactivity (i.e. less than 3-6 months).

Implementation

In order to select appropriate hydraulic seed mixtures, an evaluation of site conditions should be performed with respect to:

- Soil conditions
- Site topography and exposure (sun/wind)
- Season and climate
- Vegetation types
- Maintenance requirements
- Sensitive adjacent areas
- Water availability
- Plans for permanent vegetation

The local office of the U.S.D.A. Natural Resources Conservation Service (NRCS) is an excellent source of information on appropriate seed mixes.

The following steps should be followed for implementation:

- Where appropriate or feasible, soil should be prepared to receive the seed by disking or otherwise scarifying (See EC-15, Soil Preparation) the surface to eliminate crust, improve air and water infiltration and create a more favorable environment for germination and growth.

- Avoid use of hydraulic seed in areas where the BMP would be incompatible with future earthwork activities.
- Hydraulic seed can be applied using a multiple step or one step process.
  - In a multiple step process, hydraulic seed is applied first, followed by mulch or a Rolled Erosion Control Product (RECP).
  - In the one step process, hydraulic seed is applied with hydraulic mulch in a hydraulic matrix. When the one step process is used to apply the mixture of fiber, seed, etc., the seed rate should be increased to compensate for all seeds not having direct contact with the soil.
- All hydraulically seeded areas should have mulch, or alternate erosion control cover to keep seeds in place and to moderate soil moisture and temperature until the seeds germinate and grow.
- All seeds should be in conformance with the California State Seed Law of the Department of Agriculture. Each seed bag should be delivered to the site sealed and clearly marked as to species, purity, percent germination, dealer's guarantee, and dates of test. The container should be labeled to clearly reflect the amount of Pure Live Seed (PLS) contained. All legume seed should be pellet inoculated. Inoculant sources should be species specific and should be applied at a rate of 2 lb of inoculant per 100 lb seed.
- Commercial fertilizer should conform to the requirements of the California Food and Agricultural Code, which can be found at http://www.leginfo.ca.gov/.html/fac_table_of_contents.html. Fertilizer should be pelleted or granular form.
- Follow up applications should be made as needed to cover areas of poor coverage or germination/vegetation establishment and to maintain adequate soil protection.
- Avoid over spray onto roads, sidewalks, drainage channels, existing vegetation, etc.
- Additional guidance on the comparison and selection of temporary slope stabilization methods is provided in Appendix F of the Handbook.

Costs

Average cost for installation and maintenance may vary from as low as $1,900 per acre for flat slopes and stable soils, to $4,000 per acre for moderate to steep slopes and/or erosive soils. Cost of seed mixtures vary based on types of required vegetation.

BMP	Installed Cost per Acre
Hydraulic Seed	$1,900-$4,000

Source: Caltrans Soil Stabilization BMP Research for Erosion and Sediment Controls, July 2007

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Areas where erosion is evident should be repaired and BMPs re-applied as soon as possible. Care should be exercised to minimize the damage to protected areas while making repairs, as any area damaged will require re-application of BMPs.
- Where seeds fail to germinate, or they germinate and die, the area must be re-seeded, fertilized, and mulched within the planting season, using not less than half the original application rates.
- Irrigation systems, if applicable, should be inspected daily while in use to identify system malfunctions and line breaks. When line breaks are detected, the system must be shut down immediately and breaks repaired before the system is put back into operation.
- Irrigation systems should be inspected for complete coverage and adjusted as needed to maintain complete coverage.

Description and Purpose

Vehicle and equipment cleaning procedures and practices eliminate or reduce the discharge of pollutants to stormwater from vehicle and equipment cleaning operations. Procedures and practices include but are not limited to: using offsite facilities; washing in designated, contained areas only; eliminating discharges to the storm drain by infiltrating the wash water; and training employees and subcontractors in proper cleaning procedures.

Suitable Applications

These procedures are suitable on all construction sites where vehicle and equipment cleaning is performed.

Limitations

Even phosphate-free, biodegradable soaps have been shown to be toxic to fish before the soap degrades. Sending vehicles/equipment offsite should be done in conjunction with TC-1, Stabilized Construction Entrance/Exit.

Implementation

Other options to washing equipment onsite include contracting with either an offsite or mobile commercial washing business. These businesses may be better equipped to handle and dispose of the wash waters properly. Performing this work offsite can also be economical by eliminating the need for a separate washing operation onsite.

If washing operations are to take place onsite, then:

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Use phosphate-free, biodegradable soaps.
- Educate employees and subcontractors on pollution prevention measures.
- Do not permit steam cleaning onsite. Steam cleaning can generate significant pollutant concentrates.
- Cleaning of vehicles and equipment with soap, solvents or steam should not occur on the project site unless resulting wastes are fully contained and disposed of. Resulting wastes should not be discharged or buried, and must be captured and recycled or disposed according to the requirements of WM-10, Liquid Waste Management or WM-6, Hazardous Waste Management, depending on the waste characteristics. Minimize use of solvents. Use of diesel for vehicle and equipment cleaning is prohibited.
- All vehicles and equipment that regularly enter and leave the construction site must be cleaned offsite.
- When vehicle and equipment washing and cleaning must occur onsite, and the operation cannot be located within a structure or building equipped with appropriate disposal facilities, the outside cleaning area should have the following characteristics:
  - Located away from storm drain inlets, drainage facilities, or watercourses
  - Paved with concrete or asphalt and bermed to contain wash waters and to prevent runon and runoff
  - Configured with a sump to allow collection and disposal of wash water
  - No discharge of wash waters to storm drains or watercourses
  - Used only when necessary
- When cleaning vehicles and equipment with water:
  - Use as little water as possible. High-pressure sprayers may use less water than a hose and should be considered
  - Use positive shutoff valve to minimize water usage
  - Facility wash racks should discharge to a sanitary sewer, recycle system or other approved discharge system and must not discharge to the storm drainage system, watercourses, or to groundwater

Costs

Cleaning vehicles and equipment at an offsite facility may reduce overall costs for vehicle and equipment cleaning by eliminating the need to provide similar services onsite. When onsite cleaning is needed, the cost to establish appropriate facilities is relatively low on larger, long-duration projects, and moderate to high on small, short-duration projects.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.

- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.

- Inspection and maintenance is minimal, although some berm repair may be necessary.

- Monitor employees and subcontractors throughout the duration of the construction project to ensure appropriate practices are being implemented.

- Inspect sump regularly and remove liquids and sediment as needed.

- Prohibit employees and subcontractors from washing personal vehicles and equipment on the construction site.

Description and Purpose

Vehicle equipment fueling procedures and practices are designed to prevent fuel spills and leaks, and reduce or eliminate contamination of stormwater. This can be accomplished by using offsite facilities, fueling in designated areas only, enclosing or covering stored fuel, implementing spill controls, and training employees and subcontractors in proper fueling procedures.

Suitable Applications

These procedures are suitable on all construction sites where vehicle and equipment fueling takes place.

Limitations

Onsite vehicle and equipment fueling should only be used where it is impractical to send vehicles and equipment offsite for fueling. Sending vehicles and equipment offsite should be done in conjunction with TC-1, Stabilized Construction Entrance/ Exit.

Implementation

- Use offsite fueling stations as much as possible. These businesses are better equipped to handle fuel and spills properly. Performing this work offsite can also be economical by eliminating the need for a separate fueling area at a site.
- Discourage "topping-off" of fuel tanks. 90% Fill
- Absorbent spill cleanup materials and spill kits should be available in fueling areas and on fueling trucks, and should

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

Vehicle and Equipment Fueling

Categories

Targeted Constituents

Suitable Applications

Limitations

Implementation

be disposed of properly after use.

- Drip pans or absorbent pads should be used during vehicle and equipment fueling, unless the fueling is performed over an impermeable surface in a dedicated fueling area.
- Use absorbent materials on small spills. Do not hose down or bury the spill. Remove the adsorbent materials promptly and dispose of properly.
- Avoid mobile fueling of mobile construction equipment around the site; rather, transport the equipment to designated fueling areas. With the exception of tracked equipment such as bulldozers and large excavators, most vehicles should be able to travel to a designated area with little lost time.
- Train employees and subcontractors in proper fueling and cleanup procedures.
- When fueling must take place onsite, designate an area away from drainage courses to be used. Fueling areas should be identified in the SWPPP.
- Dedicated fueling areas should be protected from stormwater runon and runoff, and should be located at least 50 ft away from downstream drainage facilities and watercourses. Fueling must be performed on level-grade areas.
- Protect fueling areas with berms and dikes to prevent runon, runoff, and to contain spills.
- Nozzles used in vehicle and equipment fueling should be equipped with an automatic shutoff to control drips. Fueling operations should not be left unattended.
- Use vapor recovery nozzles to help control drips as well as air pollution where required by Air Quality Management Districts (AQMD).
- Federal, state, and local requirements should be observed for any stationary above ground storage tanks.

Costs

- All of the above measures are low cost except for the capital costs of above ground tanks that meet all local environmental, zoning, and fire codes.

Inspection and Maintenance

- Inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Vehicles and equipment should be inspected each day of use for leaks. Leaks should be repaired immediately or problem vehicles or equipment should be removed from the project site.
- Keep ample supplies of spill cleanup materials onsite.

- Immediately clean up spills and properly dispose of contaminated soil and cleanup materials.

Organics	☑

Potential Alternatives

None

Description and Purpose

Prevent or reduce the contamination of stormwater resulting from vehicle and equipment maintenance by running a "dry and clean site". The best option would be to perform maintenance activities at an offsite facility. If this option is not available then work should be performed in designated areas only, while providing cover for materials stored outside, checking for leaks and spills, and containing and cleaning up spills immediately. Employees and subcontractors must be trained in proper procedures.

Suitable Applications

These procedures are suitable on all construction projects where an onsite yard area is necessary for storage and maintenance of heavy equipment and vehicles.

Limitations

Onsite vehicle and equipment maintenance should only be used where it is impractical to send vehicles and equipment offsite for maintenance and repair. Sending vehicles/equipment offsite should be done in conjunction with TC-1, Stabilized Construction Entrance/Exit.

Outdoor vehicle or equipment maintenance is a potentially significant source of stormwater pollution. Activities that can contaminate stormwater include engine repair and service, changing or replacement of fluids, and outdoor equipment storage and parking (engine fluid leaks). For further information on vehicle or equipment servicing, see NS-8, Vehicle and Equipment Cleaning, and NS-9, Vehicle and

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

Equipment Fueling.

Implementation

- Use offsite repair shops as much as possible. These businesses are better equipped to handle vehicle fluids and spills properly. Performing this work offsite can also be economical by eliminating the need for a separate maintenance area.
- If maintenance must occur onsite, use designated areas, located away from drainage courses. Dedicated maintenance areas should be protected from stormwater runon and runoff, and should be located at least 50 ft from downstream drainage facilities and watercourses.
- Drip pans or absorbent pads should be used during vehicle and equipment maintenance work that involves fluids, unless the maintenance work is performed over an impermeable surface in a dedicated maintenance area.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- All fueling trucks and fueling areas are required to have spill kits and/or use other spill protection devices.
- Use adsorbent materials on small spills. Remove the absorbent materials promptly and dispose of properly.
- Inspect onsite vehicles and equipment daily at startup for leaks, and repair immediately.
- Keep vehicles and equipment clean; do not allow excessive build-up of oil and grease.
- Segregate and recycle wastes, such as greases, used oil or oil filters, antifreeze, cleaning solutions, automotive batteries, hydraulic and transmission fluids. Provide secondary containment and covers for these materials if stored onsite.
- Train employees and subcontractors in proper maintenance and spill cleanup procedures.
- Drip pans or plastic sheeting should be placed under all vehicles and equipment placed on docks, barges, or other structures over water bodies when the vehicle or equipment is planned to be idle for more than 1 hour.
- For long-term projects, consider using portable tents or covers over maintenance areas if maintenance cannot be performed offsite.
- Consider use of new, alternative greases and lubricants, such as adhesive greases, for chassis lubrication and fifth-wheel lubrication.
- Properly dispose of used oils, fluids, lubricants, and spill cleanup materials.
- Do not place used oil in a dumpster or pour into a storm drain or watercourse.
- Properly dispose of or recycle used batteries.
- Do not bury used tires.

- Repair leaks of fluids and oil immediately.

Listed below is further information if you must perform vehicle or equipment maintenance onsite.

Safer Alternative Products

- Consider products that are less toxic or hazardous than regular products. These products are often sold under an "environmentally friendly" label.
- Consider use of grease substitutes for lubrication of truck fifth-wheels. Follow manufacturers label for details on specific uses.
- Consider use of plastic friction plates on truck fifth-wheels in lieu of grease. Follow manufacturers label for details on specific uses.

Waste Reduction

Parts are often cleaned using solvents such as trichloroethylene, trichloroethane, or methylene chloride. Many of these cleaners are listed in California Toxic Rule as priority pollutants. These materials are harmful and must not contaminate stormwater. They must be disposed of as a hazardous waste. Reducing the number of solvents makes recycling easier and reduces hazardous waste management costs. Often, one solvent can perform a job as well as two different solvents. Also, if possible, eliminate or reduce the amount of hazardous materials and waste by substituting non-hazardous or less hazardous materials. For example, replace chlorinated organic solvents with non-chlorinated solvents. Non-chlorinated solvents like kerosene or mineral spirits are less toxic and less expensive to dispose of properly. Check the list of active ingredients to see whether it contains chlorinated solvents. The "chlor" term indicates that the solvent is chlorinated. Also, try substituting a wire brush for solvents to clean parts.

Recycling and Disposal

Separating wastes allows for easier recycling and may reduce disposal costs. Keep hazardous wastes separate, do not mix used oil solvents, and keep chlorinated solvents (like,-trichloroethane) separate from non-chlorinated solvents (like kerosene and mineral spirits). Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around. Provide cover and secondary containment until these materials can be removed from the site.

Oil filters can be recycled. Ask your oil supplier or recycler about recycling oil filters.

Do not dispose of extra paints and coatings by dumping liquid onto the ground or throwing it into dumpsters. Allow coatings to dry or harden before disposal into covered dumpsters.

Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries, even if you think all the acid has drained out. If you drop a battery, treat it as if it is cracked. Put it into the containment area until you are sure it is not leaking.

Costs

All of the above are low cost measures. Higher costs are incurred to setup and maintain onsite maintenance areas.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Keep ample supplies of spill cleanup materials onsite.
- Maintain waste fluid containers in leak proof condition.
- Vehicles and equipment should be inspected on each day of use. Leaks should be repaired immediately or the problem vehicle(s) or equipment should be removed from the project site.
- Inspect equipment for damaged hoses and leaky gaskets routinely. Repair or replace as needed.

SE-5 Fiber Rolls

SE-6 Gravel Bag Berm

SE-8 Sandbag Barrier

SE-10 Storm Drain Inlet Protection

SE-12 Temporary Silt Dike

SE-14 Biofilter Bags

Description and Purpose

A silt fence is made of a woven geotextile that has been entrenched, attached to supporting poles, and sometimes backed by a plastic or wire mesh for support. The silt fence detains sediment-laden water, promoting sedimentation behind the fence.

Suitable Applications

Silt fences are suitable for perimeter control, placed below areas where sheet flows discharge from the site. They could also be used as interior controls below disturbed areas where runoff may occur in the form of sheet and rill erosion and around inlets within disturbed areas (SE-10). Silt fences are generally ineffective in locations where the flow is concentrated and are only applicable for sheet or overland flows. Silt fences are most effective when used in combination with erosion controls. Suitable applications include:

- Along the perimeter of a project.
- Below the toe or down slope of exposed and erodible slopes.
- Along streams and channels.
- Around temporary spoil areas and stockpiles.
- Around inlets.
- Below other small cleared areas.

CASQA

CALIFORNIA STORMWATER QUALITY ASSOCIATION

Limitations

- Do not use in streams, channels, drain inlets, or anywhere flow is concentrated.
- Do not use in locations where ponded water may cause a flooding hazard. Runoff typically ponds temporarily on the upstream side of silt fence.
- Do not use silt fence to divert water flows or place across any contour line. Fences not constructed on a level contour, or fences used to divert flow will concentrate flows resulting in additional erosion and possibly overtopping or failure of the silt fence.
- Improperly installed fences are subject to failure from undercutting, overtopping, or collapsing.
- Not effective unless trenched and keyed in.
- Not intended for use as mid-slope protection on slopes greater than 4:1 (H:V).
- Do not use on slopes subject to creeping, slumping, or landslides.

Implementation

General

A silt fence is a temporary sediment barrier consisting of woven geotextile stretched across and attached to supporting posts, trenched-in, and, depending upon the strength of fabric used, supported with plastic or wire mesh fence. Silt fences trap sediment by intercepting and detaining small amounts of sediment-laden runoff from disturbed areas in order to promote sedimentation behind the fence.

The following layout and installation guidance can improve performance and should be followed:

- Use principally in areas where sheet flow occurs.
- Install along a level contour, so water does not pond more than 1.5 ft at any point along the silt fence.
- The maximum length of slope draining to any point along the silt fence should be 200 ft or less.
- The maximum slope perpendicular to the fence line should be 1:1.
- Provide sufficient room for runoff to pond behind the fence and to allow sediment removal equipment to pass between the silt fence and toes of slopes or other obstructions. About 1200 ft^2 of ponding area should be provided for every acre draining to the fence.
- Turn the ends of the filter fence uphill to prevent stormwater from flowing around the fence.
- Leave an undisturbed or stabilized area immediately down slope from the fence where feasible.

- Silt fences should remain in place until the disturbed area is permanently stabilized, after which, the silt fence should be removed and properly disposed.
- Silt fence should be used in combination with erosion source controls up slope in order to provide the most effective sediment control.
- Be aware of local regulations regarding the type and installation requirements of silt fence, which may differ from those presented in this fact sheet.

Design and Layout

The fence should be supported by a plastic or wire mesh if the fabric selected does not have sufficient strength and bursting strength characteristics for the planned application (as recommended by the fabric manufacturer). Woven geotextile material should contain ultraviolet inhibitors and stabilizers to provide a minimum of six months of expected usable construction life at a temperature range of 0 °F to 120 °F.

- Layout in accordance with attached figures.
- For slopes steeper than 2:1 (H:V) and that contain a high number of rocks or large dirt clods that tend to dislodge, it may be necessary to install additional protection immediately adjacent to the bottom of the slope, prior to installing silt fence. Additional protection may be a chain link fence or a cable fence.
- For slopes adjacent to sensitive receiving waters or Environmentally Sensitive Areas (ESAs), silt fence should be used in conjunction with erosion control BMPs.

Standard vs. Heavy Duty Silt Fence

Standard Silt Fence

- Generally applicable in cases where the slope of area draining to the silt fence is 4:1 (H:V) or less.
- Used for shorter durations, typically 5 months or less
- Area draining to fence produces moderate sediment loads.

Heavy Duty Silt Fence

- Use is generally limited to 8 months or less.
- Area draining to fence produces moderate sediment loads.
- Heavy duty silt fence usually has 1 or more of the following characteristics, not possessed by standard silt fence.
  - Fence fabric has higher tensile strength.
  - Fabric is reinforced with wire backing or additional support.
  - Posts are spaced closer than pre-manufactured, standard silt fence products.
  - Posts are metal (steel or aluminum)

Materials

Standard Silt Fence

- Silt fence material should be woven geotextile with a minimum width of 36 in. and a minimum tensile strength of 100 lb force. The fabric should conform to the requirements in ASTM designation D4632 and should have an integral reinforcement layer. The reinforcement layer should be a polypropylene, or equivalent, net provided by the manufacturer. The permittivity of the fabric should be between 0.1 sec^{-1} and 0.15 sec^{-1} in conformance with the requirements in ASTM designation D4491.

- Wood stakes should be commercial quality lumber of the size and shape shown on the plans. Each stake should be free from decay, splits or cracks longer than the thickness of the stake or other defects that would weaken the stakes and cause the stakes to be structurally unsuitable.

- Staples used to fasten the fence fabric to the stakes should be not less than 1.75 in. long and should be fabricated from 15 gauge or heavier wire. The wire used to fasten the tops of the stakes together when joining two sections of fence should be 9 gauge or heavier wire. Galvanizing of the fastening wire will not be required.

Heavy-Duty Silt Fence

- Some silt fence has a wire backing to provide additional support, and there are products that may use prefabricated plastic holders for the silt fence and use metal posts or bar reinforcement instead of wood stakes. If bar reinforcement is used in lieu of wood stakes, use number four or greater bar. Provide end protection for any exposed bar reinforcement for health and safety purposes.

Installation Guidelines – Traditional Method

Silt fences are to be constructed on a level contour. Sufficient area should exist behind the fence for ponding to occur without flooding or overtopping the fence.

- A trench should be excavated approximately 6 in. wide and 6 in. deep along the line of the proposed silt fence (trenches should not be excavated wider or deeper than necessary for proper silt fence installation).

- Bottom of the silt fence should be keyed-in a minimum of 12 in.

- Posts should be spaced a maximum of 6 ft apart and driven securely into the ground a minimum of 18 in. or 12 in. below the bottom of the trench.

- When standard strength geotextile is used, a plastic or wire mesh support fence should be fastened securely to the upslope side of posts using heavy–duty wire staples at least 1 in. long. The mesh should extend into the trench.

- When extra-strength geotextile and closer post spacing are used, the mesh support fence may be eliminated.

- Woven geotextile should be purchased in a long roll, then cut to the length of the barrier. When joints are necessary, geotextile should be spliced together only at a support post, with a minimum 6 in. overlap and both ends securely fastened to the post.

- The trench should be backfilled with native material and compacted.

- Construct silt fences with a setback of at least 3 ft from the toe of a slope. Where, due to specific site conditions, a 3 ft setback is not available, the silt fence may be constructed at the toe of the slope, but should be constructed as far from the toe of the slope as practicable. Silt fences close to the toe of the slope will be less effective and more difficult to maintain.

- Construct the length of each reach so that the change in base elevation along the reach does not exceed 1/3 the height of the barrier; in no case should the reach exceed 500 ft.
- Cross barriers should be a minimum of 1/3 and a maximum of ½ the height of the linear barrier.
- See typical installation details at the end of this fact sheet.

Installation Guidelines - Static Slicing Method

- Static Slicing is defined as insertion of a narrow blade pulled behind a tractor, similar to a plow blade, at least 10 inches into the soil while at the same time pulling silt geotextile fabric into the ground through the opening created by the blade to the depth of the blade. Once the gerotextile is installed, the soil is compacted using tractor tires.
- This method will not work with pre-fabricated, wire backed silt fence.
- Benefits:
  - Ease of installation (most often done with a 2 person crew). In addition, installation using static slicing has been found to be more efficient on slopes, in rocky soils, and in saturated soils.
  - Minimal soil disturbance.
  - Greater level of compaction along fence, leading to higher performance (i.e. greater sediment retention).
  - Uniform installation.
  - Less susceptible to undercutting/undermining.

Costs

- It should be noted that costs vary greatly across regions due to available supplies and labor costs.
- Average annual cost for installation using the traditional silt fence installation method (assumes 6 month useful life) is $7 per linear foot based on vendor research. Range of cost is $3.50 - $9.10 per linear foot.
- In tests, the slicing method required 0.33 man hours per 100 linear feet, while the trenched based systems required as much as 1.01 man hours per linear foot.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Repair undercut silt fences.

- Repair or replace split, torn, slumping, or weathered fabric. The lifespan of silt fence fabric is generally 5 to 8 months.
- Silt fences that are damaged and become unsuitable for the intended purpose should be removed from the site of work, disposed, and replaced with new silt fence barriers.
- Sediment that accumulates in the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when the sediment accumulation reaches one-third of the barrier height.
- Silt fences should be left in place until the upstream area is permanently stabilized. Until then, the silt fence should be inspected and maintained regularly.
- Remove silt fence when upgradient areas are stabilized. Fill and compact post holes and anchor trench, remove sediment accumulation, grade fence alignment to blend with adjacent ground, and stabilize disturbed area.

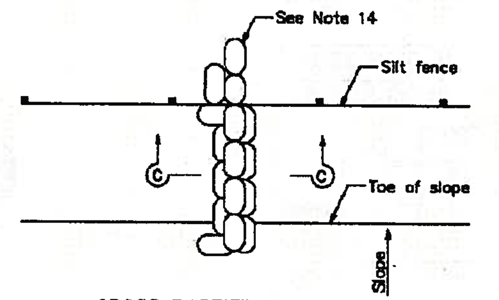
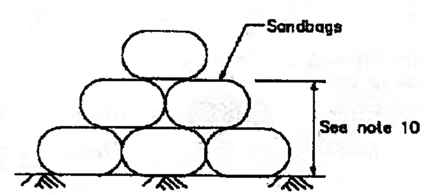
PLAN

SILT FENCE



CROSS BARRIER DETAIL



SECTION C–C

NOTES

1. Construct the length of each reach so that the change in base elevation along the reach does not exceed 1/3 the height of the linear barrier. In no case shall the reach length exceed 500'.
2. The last 8'–0" of fence shall be turned up slope.
3. Stake dimensions are nominal.
4. Dimension may vary to fit field condition.
5. Stakes shall be spaced at 8'–0" maximum and shall be positioned on downstream side of fence.
6. Stakes to overlap and fence fabric to fold around each stake one full turn. Secure fabric to stake with 4 staples.
7. Stakes shall be driven tightly together to prevent potential flow–through of sediment at joint. The tops of the stakes shall be secured with wire.
8. For end stake, fence fabric shall be folded around two stakes one full turn and secured with 4 staples.
9. Minimum 4 staples per stake. Dimensions shown are typical.
10. Cross barriers shall be a minimum of 1/3 and a maximum of 1/2 the height of the linear barrier.
11. Maintenance openings shall be constructed in a manner to ensure sediment remains behind silt fence.
12. Joining sections shall not be placed at sump locations.
13. Sandbag rows and layers shall be offset to eliminate gaps.
14. Add 3–4 bags to cross barrier on downgradient side of silt fence as needed to prevent bypass or undermining and as allowable based on site limits of disturbance.

SE-1 Silt Fence

SE-6 Gravel Bag Berm

SE-8 Sandbag Barrier

SE-12 Temporary Silt Dike

SE-14 Biofilter Bags

Description and Purpose

A fiber roll consists of straw, coir, or other biodegradable materials bound into a tight tubular roll wrapped by netting, which can be photodegradable or natural. Additionally, gravel core fiber rolls are available, which contain an imbedded ballast material such as gravel or sand for additional weight when staking the rolls are not feasible (such as use as inlet protection). When fiber rolls are placed at the toe and on the face of slopes along the contours, they intercept runoff, reduce its flow velocity, release the runoff as sheet flow, and provide removal of sediment from the runoff (through sedimentation). By interrupting the length of a slope, fiber rolls can also reduce sheet and rill erosion until vegetation is established.

Suitable Applications

Fiber rolls may be suitable:

- Along the toe, top, face, and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow.
- At the end of a downward slope where it transitions to a steeper slope.
- Along the perimeter of a project.
- As check dams in unlined ditches with minimal grade.
- Down-slope of exposed soil areas.
- At operational storm drains as a form of inlet protection.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Around temporary stockpiles.

Limitations

- Fiber rolls are not effective unless trenched in and staked.
- Not intended for use in high flow situations.
- Difficult to move once saturated.
- If not properly staked and trenched in, fiber rolls could be transported by high flows.
- Fiber rolls have a very limited sediment capture zone.
- Fiber rolls should not be used on slopes subject to creep, slumping, or landslide.
- Rolls typically function for 12-24 months depending upon local conditions.

Implementation

Fiber Roll Materials

- Fiber rolls should be prefabricated.
- Fiber rolls may come manufactured containing polyacrylamide (PAM), a flocculating agent within the roll. Fiber rolls impregnated with PAM provide additional sediment removal capabilities and should be used in areas with fine, clayey or silty soils to provide additional sediment removal capabilities. Monitoring may be required for these installations.
- Fiber rolls are made from weed free rice straw, flax, or a similar agricultural material bound into a tight tubular roll by netting.
- Typical fiber rolls vary in diameter from 9 in. to 20 in. Larger diameter rolls are available as well.

Installation

- Locate fiber rolls on level contours spaced as follows:
  - Slope inclination of 4:1 (H:V) or flatter: Fiber rolls should be placed at a maximum interval of 20 ft.
  - Slope inclination between 4:1 and 2:1 (H:V): Fiber Rolls should be placed at a maximum interval of 15 ft. (a closer spacing is more effective).
  - Slope inclination 2:1 (H:V) or greater: Fiber Rolls should be placed at a maximum interval of 10 ft. (a closer spacing is more effective).
- Prepare the slope before beginning installation.
- Dig small trenches across the slope on the contour. The trench depth should be ¼ to 1/3 of the thickness of the roll, and the width should equal the roll diameter, in order to provide area to backfill the trench.

- It is critical that rolls are installed perpendicular to water movement, and parallel to the slope contour.

- Start building trenches and installing rolls from the bottom of the slope and work up.

- It is recommended that pilot holes be driven through the fiber roll. Use a straight bar to drive holes through the roll and into the soil for the wooden stakes.

- Turn the ends of the fiber roll up slope to prevent runoff from going around the roll.

- Stake fiber rolls into the trench.

  - Drive stakes at the end of each fiber roll and spaced 4 ft maximum on center.

  - Use wood stakes with a nominal classification of 0.75 by 0.75 in. and minimum length of 24 in.

- If more than one fiber roll is placed in a row, the rolls should be overlapped, not abutted.

- See typical fiber roll installation details at the end of this fact sheet.

Removal

- Fiber rolls can be left in place or removed depending on the type of fiber roll and application (temporary vs. permanent installation). Typically, fiber rolls encased with plastic netting are used for a temporary application because the netting does not biodegrade. Fiber rolls used in a permanent application are typically encased with a biodegradeable material and are left in place. Removal of a fiber roll used in a permanent application can result in greater disturbance.

- Temporary installations should only be removed when up gradient areas are stabilized per General Permit requirements, and/or pollutant sources no longer present a hazard. But, they should also be removed before vegetation becomes too mature so that the removal process does not disturb more soil and vegetation than is necessary.

Costs

Material costs for regular fiber rolls range from $20 - $30 per 25 ft roll.

Material costs for PAM impregnated fiber rolls range between 7.00-$9.00 per linear foot, based upon vendor research.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.

- Repair or replace split, torn, unraveling, or slumping fiber rolls.

- If the fiber roll is used as a sediment capture device, or as an erosion control device to maintain sheet flows, sediment that accumulates in the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when sediment accumulation reaches one-third the designated sediment storage depth.

- If fiber rolls are used for erosion control, such as in a check dam, sediment removal should not be required as long as the system continues to control the grade. Sediment control BMPs will likely be required in conjunction with this type of application.

- Repair any rills or gullies promptly.

SE-14 Biofilter Bags

Description and Purpose

A gravel bag berm is a series of gravel-filled bags placed on a level contour to intercept sheet flows. Gravel bags pond sheet flow runoff, allowing sediment to settle out, and release runoff slowly as sheet flow, preventing erosion.

Suitable Applications

Gravel bag berms may be suitable:

- As a linear sediment control measure:
  - Below the toe of slopes and erodible slopes
  - As sediment traps at culvert/pipe outlets
  - Below other small cleared areas
  - Along the perimeter of a site
  - Down slope of exposed soil areas
  - Around temporary stockpiles and spoil areas
  - Parallel to a roadway to keep sediment off paved areas
  - Along streams and channels
- As a linear erosion control measure:
  - Along the face and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- At the top of slopes to divert runoff away from disturbed slopes.
- As chevrons (small check dams) across mildly sloped construction roads. For use check dam use in channels, see SE-4, Check Dams.

Limitations

- Gravel berms may be difficult to remove.
- Removal problems limit their usefulness in landscaped areas.
- Gravel bag berm may not be appropriate for drainage areas greater than 5 acres.
- Runoff will pond upstream of the berm, possibly causing flooding if sufficient space does not exist.
- Degraded gravel bags may rupture when removed, spilling contents.
- Installation can be labor intensive.
- Durability of gravel bags is somewhat limited and bags may need to be replaced when installation is required for longer than 6 months.
- Easily damaged by construction equipment.
- When used to detain concentrated flows, maintenance requirements increase.

Implementation

General

A gravel bag berm consists of a row of open graded gravel-filled bags placed on a level contour. When appropriately placed, a gravel bag berm intercepts and slows sheet flow runoff, causing temporary ponding. The temporary ponding allows sediment to settle. The open graded gravel in the bags is porous, which allows the ponded runoff to flow slowly through the bags, releasing the runoff as sheet flows. Gravel bag berms also interrupt the slope length and thereby reduce erosion by reducing the tendency of sheet flows to concentrate into rivulets, which erode rills, and ultimately gullies, into disturbed, sloped soils. Gravel bag berms are similar to sand bag barriers, but are more porous. Generally, gravel bag berms should be used in conjunction with temporary soil stabilization controls up slope to provide effective erosion and sediment control.

Design and Layout

- Locate gravel bag berms on level contours.
- When used for slope interruption, the following slope/sheet flow length combinations apply:
  - Slope inclination of 4:1 (H:V) or flatter: Gravel bags should be placed at a maximum interval of 20 ft, with the first row near the slope toe.
  - Slope inclination between 4:1 and 2:1 (H:V): Gravel bags should be placed at a maximum interval of 15 ft. (a closer spacing is more effective), with the first row near the slope toe.

Slope inclination 2:1 (H:V) or greater: Gravel bags should be placed at a maximum interval of 10 ft. (a closer spacing is more effective), with the first row near the slope toe.

- Turn the ends of the gravel bag barriers up slope to prevent runoff from going around the berm.
- Allow sufficient space up slope from the gravel bag berm to allow ponding, and to provide room for sediment storage.
- For installation near the toe of the slope, gravel bag barriers should be set back from the slope toe to facilitate cleaning. Where specific site conditions do not allow for a set-back, the gravel bag barrier may be constructed on the toe of the slope. To prevent flows behind the barrier, bags can be placed perpendicular to a berm to serve as cross barriers.
- Drainage area should not exceed 5 acres.
- In Non-Traffic Areas:
  - Height = 18 in. maximum
  - Top width = 24 in. minimum for three or more layer construction
  - Top width = 12 in. minimum for one or two layer construction
  - Side slopes = 2:1 (H:V) or flatter
- In Construction Traffic Areas:
  - Height = 12 in. maximum
  - Top width = 24 in. minimum for three or more layer construction.
  - Top width = 12 in. minimum for one or two layer construction.
  - Side slopes = 2:1 (H:V) or flatter.
- Butt ends of bags tightly.
- On multiple row, or multiple layer construction, overlap butt joints of adjacent row and row beneath.
- Use a pyramid approach when stacking bags.

Materials

- ***Bag Material:*** Bags should be woven polypropylene, polyethylene or polyamide fabric or burlap, minimum unit weight of 4 ounces/yd^2, Mullen burst strength exceeding 300 lb/in^2 in conformance with the requirements in ASTM designation D3786, and ultraviolet stability exceeding 70% in conformance with the requirements in ASTM designation D4355.

- ***Bag Size:*** Each gravel-filled bag should have a length of 18 in., width of 12 in., thickness of 3 in., and mass of approximately 33 lbs. Bag dimensions are nominal, and may vary based on locally available materials.

- ***Fill Material:*** Fill material should be 0.5 to 1 in. crushed rock, clean and free from clay, organic matter, and other deleterious material, or other suitable open graded, non-cohesive, porous gravel.

Costs
Material costs for gravel bags are average and are dependent upon material availability. $2.50-3.00 per filled gravel bag is standard based upon vendor research.

Inspection and Maintenance
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.

- Gravel bags exposed to sunlight will need to be replaced every two to three months due to degrading of the bags.

- Reshape or replace gravel bags as needed.

- Repair washouts or other damage as needed.

- Sediment that accumulates in the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when the sediment accumulation reaches one-third of the barrier height.

- Remove gravel bag berms when no longer needed and recycle gravel fill whenever possible and properly dispose of bag material. Remove sediment accumulation and clean, re-grade, and stabilize the area.

Description and Purpose

A straw bale barrier is a series of straw bales placed on a level contour to intercept sheet flows. Straw bale barriers pond sheet-flow runoff, allowing sediment to settle out.

Suitable Applications

Straw bale barriers may be suitable:

- As a linear sediment control measure:
  - Below the toe of slopes and erodible slopes
  - As sediment traps at culvert/pipe outlets
  - Below other small cleared areas
  - Along the perimeter of a site
  - Down slope of exposed soil areas
  - Around temporary stockpiles and spoil areas
  - Parallel to a roadway to keep sediment off paved areas
  - Along streams and channels
- As linear erosion control measure:
  - Along the face and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION®

- At the top of slopes to divert runoff away from disturbed slopes
- As check dams across mildly sloped construction roads

Limitations

Straw bale barriers:

- Are not to be used for extended periods of time because they tend to rot and fall apart
- Are suitable only for sheet flow on slopes of 10 % or flatter
- Are not appropriate for large drainage areas, limit to one acre or less
- May require constant maintenance due to rotting
- Are not recommended for concentrated flow, inlet protection, channel flow, and live streams
- Cannot be made of bale bindings of jute or cotton
- Require labor-intensive installation and maintenance
- Cannot be used on paved surfaces
- Should not to be used for drain inlet protection
- Should not be used on lined ditches
- May introduce undesirable non-native plants to the area

Implementation

General

A straw bale barrier consists of a row of straw bales placed on a level contour. When appropriately placed, a straw bale barrier intercepts and slows sheet flow runoff, causing temporary ponding. The temporary ponding provides quiescent conditions allowing sediment to settle. Straw bale barriers also interrupt the slope length and thereby reduce erosion by reducing the tendency of sheet flows to concentrate into rivulets, which erode rills, and ultimately gullies, into disturbed, sloped soils.

Straw bale barriers have not been as effective as expected due to improper use. These barriers have been placed in streams and drainage ways where runoff volumes and velocities have caused the barriers to wash out. In addition, failure to stake and entrench the straw bale has allowed undercutting and end flow. Use of straw bale barriers in accordance with this BMP should produce acceptable results.

Design and Layout

- Locate straw bale barriers on a level contour.
  - Slopes up to 10:1 (H:V): Straw bales should be placed at a maximum interval of 50 ft (a closer spacing is more effective), with the first row near the toe of slope.
  - Slopes greater than 10:1 (H:V): Not recommended.

- Turn the ends of the straw bale barrier up slope to prevent runoff from going around the barrier.
- Allow sufficient space up slope from the barrier to allow ponding, and to provide room for sediment storage.
- For installation near the toe of the slope, consider moving the barrier away from the slope toe to facilitate cleaning. To prevent flow behind the barrier, sand bags can be placed perpendicular to the barrier to serve as cross barriers.
- Drainage area should not exceed 1 acre, or 0.25 acre per 100 ft of barrier.
- Maximum flow path to the barrier should be limited to 100 ft.
- Straw bale barriers should consist of two parallel rows.
  - Butt ends of bales tightly
  - Stagger butt joints between front and back row
  - Each row of bales must be trenched in and firmly staked
- Straw bale barriers are limited in height to one bale laid on its side.
- Anchor bales with either two wood stakes or four bars driven through the bale and into the soil. Drive the first stake towards the butt joint with the adjacent bale to force the bales together.
- See attached figure for installation details.

Materials

- ***Straw Bale Size:*** Each straw bale should be a minimum of 14 in. wide, 18 in. in height, 36 in. in length and should have a minimum mass of 50 lbs. The straw bale should be composed entirely of vegetative matter, except for the binding material.
- ***Bale Bindings:*** Bales should be bound by steel wire, nylon or polypropylene string placed horizontally. Jute and cotton binding should not be used. Baling wire should be a minimum diameter of 14 gauge. Nylon or polypropylene string should be approximately 12 gauge in diameter with a breaking strength of 80 lbs force.
- ***Stakes:*** Wood stakes should be commercial quality lumber of the size and shape shown on the plans. Each stake should be free from decay, splits or cracks longer than the thickness of the stake, or other defects that would weaken the stakes and cause the stakes to be structurally unsuitable. Steel bar reinforcement should be equal to a #4 designation or greater. End protection should be provided for any exposed bar reinforcement.

Costs

Straw bales cost $5 - $7 each. Adequate labor should be budgeted for installation and maintenance.

Inspection and Maintenance

Maintenance

- Inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.

- Straw bales degrade, especially when exposed to moisture. Rotting bales will need to be replaced on a regular basis.

- Replace or repair damaged bales as needed.

- Repair washouts or other damages as needed.

- Sediment that accumulates in the BMP must be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when the sediment accumulation reaches one-third of the barrier height. Sediment removed during maintenance may be incorporated into earthwork on the site or disposed at an appropriate location.

- Remove straw bales when no longer needed. Remove sediment accumulation, and clean, re-grade, and stabilize the area. Removed sediment should be incorporated in the project or disposed of.

PLAN

STRAW BALE BARRIER

NOTES

1. Construct the length of each reach so that the change in base elevation along the reach does not exceed 1/2 the height of the linear barrier. In no case shall the reach length exceed 500'.
2. The end of barrier shall be turned up slope.
3. Dimension may vary to fit field condition.
4. Stake dimensions are nominal.
5. Place straw bales tightly together.
6. Tamp embedment spoils against sides of installed bales.
7. Drive angled wood stake before vertical stake to ensure tight abutment to adjacent bale.
8. Sandbag cross barriers should be a min of 1/2 and a max of 2/3 the height of the linear barrier.
9. Sandbag rows and layers should be offset to eliminate gaps.

SANDBAG CROSS BARRIER

- Construction vehicle traffic on unpaved roads
- Drilling and blasting activities
- Soils and debris storage piles
- Batch drop from front-end loaders
- Areas with unstabilized soil
- Final grading/site stabilization

Limitations

- Watering prevents dust only for a short period (generally less than a few hours) and should be applied daily (or more often) to be effective.
- Over watering may cause erosion and track-out.
- Oil or oil-treated subgrade should not be used for dust control because the oil may migrate into drainageways and/or seep into the soil.
- Chemical dust suppression agents may have potential environmental impacts. Selected chemical dust control agents should be environmentally benign.
- Effectiveness of controls depends on soil, temperature, humidity, wind velocity and traffic.
- Chemical dust suppression agents should not be used within 100 feet of wetlands or water bodies.
- Chemically treated subgrades may make the soil water repellant, interfering with long-term infiltration and the vegetation/re-vegetation of the site. Some chemical dust suppressants may be subject to freezing and may contain solvents and should be handled properly.
- In compacted areas, watering and other liquid dust control measures may wash sediment or other constituents into the drainage system.
- If the soil surface has minimal natural moisture, the affected area may need to be pre-wetted so that chemical dust control agents can uniformly penetrate the soil surface.

Implementation

Dust Control Practices

Dust control BMPs generally stabilize exposed surfaces and minimize activities that suspend or track dust particles. The following table presents dust control practices that can be applied to varying site conditions that could potentially cause dust. For heavily traveled and disturbed areas, wet suppression (watering), chemical dust suppression, gravel asphalt surfacing, temporary gravel construction entrances, equipment wash-out areas, and haul truck covers can be employed as dust control applications. Permanent or temporary vegetation and mulching can be employed for areas of occasional or no construction traffic. Preventive measures include minimizing surface areas to be disturbed, limiting onsite vehicle traffic to 15 mph or less, and controlling the number and activity of vehicles on a site at any given time.

Chemical dust suppressants include: mulch and fiber based dust palliatives (e.g. paper mulch with gypsum binder), salts and brines (e.g. calcium chloride, magnesium chloride), non-petroleum based organics (e.g. vegetable oil, lignosulfonate), petroleum based organics (e.g. asphalt emulsion, dust oils, petroleum resins), synthetic polymers (e.g. polyvinyl acetate, vinyls, acrylic), clay additives (e.g. bentonite, montimorillonite) and electrochemical products (e.g. enzymes, ionic products).

Site Condition	Dust Control Practices							
	Permanent Vegetation	Mulching	Wet Suppression (Watering)	Chemical Dust Suppression	Gravel or Asphalt	Temporary Gravel Construction Entrances/Equipment Wash Down	Synthetic Covers	Minimize Extent of Disturbed Area
Disturbed Areas not Subject to Traffic	x	x	x	x	x			x
Disturbed Areas Subject to Traffic			x	x	x	x		x
Material Stockpiles		x	x	x			x	x
Demolition			x			x	x	
Clearing/ Excavation			x	x				x
Truck Traffic on Unpaved Roads			x	x	x	x	x	
Tracking					x	x		

Additional preventive measures include:

- Schedule construction activities to minimize exposed area (see EC-1, Scheduling).
- Quickly treat exposed soils using water, mulching, chemical dust suppressants, or stone/gravel layering.
- Identify and stabilize key access points prior to commencement of construction.
- Minimize the impact of dust by anticipating the direction of prevailing winds.
- Restrict construction traffic to stabilized roadways within the project site, as practicable.
- Water should be applied by means of pressure-type distributors or pipelines equipped with a spray system or hoses and nozzles that will ensure even distribution.
- All distribution equipment should be equipped with a positive means of shutoff.
- Unless water is applied by means of pipelines, at least one mobile unit should be available at all times to apply water or dust palliative to the project.
- If reclaimed waste water is used, the sources and discharge must meet California Department of Health Services water reclamation criteria and the Regional Water Quality

Control Board (RWQCB) requirements. Non-potable water should not be conveyed in tanks or drain pipes that will be used to convey potable water and there should be no connection between potable and non-potable supplies. Non-potable tanks, pipes, and other conveyances should be marked, "NON-POTABLE WATER - DO NOT DRINK."

- Pave or chemically stabilize access points where unpaved traffic surfaces adjoin paved roads.
- Provide covers for haul trucks transporting materials that contribute to dust.
- Provide for rapid clean up of sediments deposited on paved roads. Furnish stabilized construction road entrances and wheel wash areas.
- Stabilize inactive areas of construction sites using temporary vegetation or chemical stabilization methods.

For chemical stabilization, there are many products available for chemically stabilizing gravel roadways and stockpiles. If chemical stabilization is used, the chemicals should not create any adverse effects on stormwater, plant life, or groundwater and should meet all applicable regulatory requirements.

Costs

Installation costs for water and chemical dust suppression vary based on the method used and the length of effectiveness. Annual costs may be high since some of these measures are effective for only a few hours to a few days.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Check areas protected to ensure coverage.
- Most water-based dust control measures require frequent application, often daily or even multiple times per day. Obtain vendor or independent information on longevity of chemical dust suppressants.

☒ **Secondary Category**

Targeted Constituents

Sediment	☑
Nutrients	☑
Trash	☑
Metals	☑
Bacteria	
Oil and Grease	☑
Organics	☑

Potential Alternatives

None

Description and Purpose

Stockpile management procedures and practices are designed to reduce or eliminate air and stormwater pollution from stockpiles of soil, soil amendments, sand, paving materials such as portland cement concrete (PCC) rubble, asphalt concrete (AC), asphalt concrete rubble, aggregate base, aggregate sub base or pre-mixed aggregate, asphalt minder (so called "cold mix" asphalt), and pressure treated wood.

Suitable Applications

Implement in all projects that stockpile soil and other loose materials.

Limitations

- Plastic sheeting as a stockpile protection is temporary and hard to manage in windy conditions. Where plastic is used, consider use of plastic tarps with nylon reinforcement which may be more durable than standard sheeting.
- Plastic sheeting can increase runoff volume due to lack of infiltration and potentially cause perimeter control failure.
- Plastic sheeting breaks down faster in sunlight.
- The use of plastic materials should be avoided when feasible and photodegradable plastics should not be used.

Implementation

Protection of stockpiles is a year-round requirement. To properly manage stockpiles:

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- On larger sites, a minimum of 50 ft separation from concentrated flows of stormwater, drainage courses, and inlets is recommended.

- All stockpiles are required to be protected immediately if they are not scheduled to be used within 14 days.

- Protect all stockpiles from stormwater run-on using temporary perimeter sediment barriers such as compost berms (SE-13), temporary silt dikes (SE-12), fiber rolls (SE-5), silt fences (SE-1), sandbags (SE-8), gravel bags (SE-6), or biofilter bags (SE-14). Refer to the individual fact sheet for each of these controls for installation information.

- Implement wind erosion control practices as appropriate on all stockpiled material. For specific information, see WE-1, Wind Erosion Control.

- Manage stockpiles of contaminated soil in accordance with WM-7, Contaminated Soil Management.

- Place bagged materials on pallets and under cover.

- Ensure that stockpile coverings are installed securely to protect from wind and rain.

- Some plastic covers withstand weather and sunlight better than others. Select cover materials or methods based on anticipated duration of use.

Protection of Non-Active Stockpiles

Non-active stockpiles of the identified materials should be protected further as follows:

Soil stockpiles

- Cover and project soil stockpiles with soil stabilization measures and a temporary perimeter sediment barrier at all times.

- Consider temporary vegetation for topsoil piles that will be stockpiled for extended periods.

Stockpiles of Portland cement concrete rubble, asphalt concrete, asphalt concrete rubble, aggregate base, or aggregate sub base

- Provide covers and protect these stockpiles with a temporary perimeter sediment barrier at all times.

Stockpiles of "cold mix"

- Cover cold mix stockpiles and place them on plastic sheeting (or comparable material) and surround the stockpiles with a berm all times.

Stockpiles of fly ash, stucco, hydrated lime

- Cover stockpiles of materials that may raise the pH of runoff (i.e., basic materials) with plastic and surround the stockpiles with a berm at all times.

Stockpiles/Storage of wood (Pressure treated with chromated copper arsenate or ammoniacal copper zinc arsenate)

- Cover treated wood with plastic sheeting (or comparable material) and surround with a berm at all times.

Protection of Active Stockpiles

Active stockpiles of the identified materials should be protected as follows:

- All stockpiles should be covered and protected with a temporary linear sediment barrier prior to the onset of precipitation.
- Stockpiles of "cold mix" and treated wood, and basic materials should be placed on and covered with plastic sheeting or comparable material and surrounded by a berm prior to the onset of precipitation.
- The downstream perimeter of an active stockpile should be protected with a linear sediment barrier or berm and runoff should be diverted around or away from the stockpile on the upstream perimeter.

Costs

For cost information associated with stockpile protection refer to the individual erosion or sediment control BMP fact sheet considered for implementation (For example, refer to SE-1 Silt Fence for installation of silt fence around the perimeter of a stockpile.)

Inspection and Maintenance

- Stockpiles must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- It may be necessary to inspect stockpiles covered with plastic sheeting more frequently during certain conditions (for example, high winds or extreme heat).
- Repair and/or replace perimeter controls and covers as needed to keep them functioning properly.
- Sediment shall be removed when it reaches one-third of the barrier height.

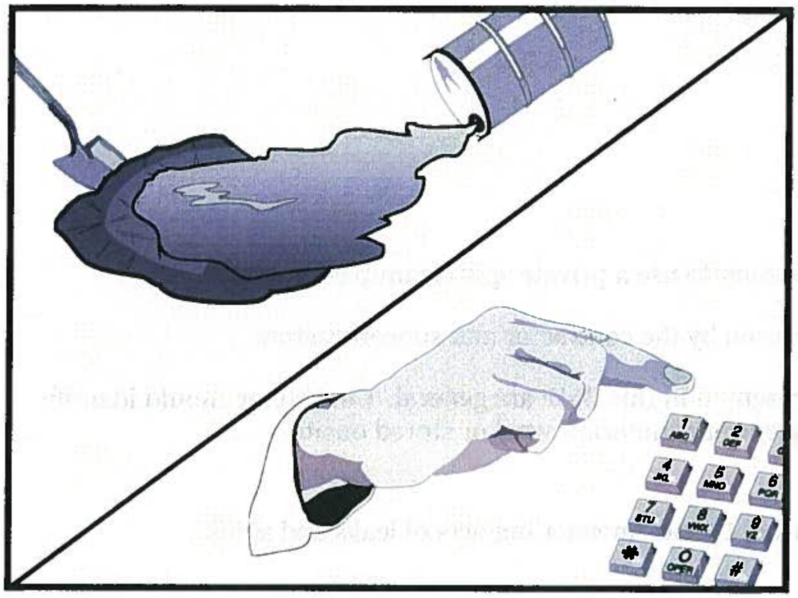
Spill Prevention and Control WM-4



Categories

EC	Erosion Control	
SE	Sediment Control	
TC	Tracking Control	
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	
WM	Waste Management and Materials Pollution Control	☑

Legend:

☑ **Primary Objective**

☒ **Secondary Objective**

Targeted Constituents

Sediment	☑
Nutrients	☑
Trash	☑
Metals	☑
Bacteria	
Oil and Grease	☑
Organics	☑

Potential Alternatives

None

Description and Purpose

Prevent or reduce the discharge of pollutants to drainage systems or watercourses from leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, properly disposing of spill materials, and training employees.

This best management practice covers only spill prevention and control. However, WM-1, Materials Delivery and Storage, and WM-2, Material Use, also contain useful information, particularly on spill prevention. For information on wastes, see the waste management BMPs in this section.

Suitable Applications

This BMP is suitable for all construction projects. Spill control procedures are implemented anytime chemicals or hazardous substances are stored on the construction site, including the following materials:

- Soil stabilizers/binders
- Dust palliatives
- Herbicides
- Growth inhibitors
- Fertilizers
- Deicing/anti-icing chemicals

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Fuels
- Lubricants
- Other petroleum distillates

Limitations

- In some cases it may be necessary to use a private spill cleanup company.
- This BMP applies to spills caused by the contractor and subcontractors.
- Procedures and practices presented in this BMP are general. Contractor should identify appropriate practices for the specific materials used or stored onsite

Implementation

The following steps will help reduce the stormwater impacts of leaks and spills:

Education

- Be aware that different materials pollute in different amounts. Make sure that each employee knows what a "significant spill" is for each material they use, and what is the appropriate response for "significant" and "insignificant" spills.
- Educate employees and subcontractors on potential dangers to humans and the environment from spills and leaks.
- Hold regular meetings to discuss and reinforce appropriate disposal procedures (incorporate into regular safety meetings).
- Establish a continuing education program to indoctrinate new employees.
- Have contractor's superintendent or representative oversee and enforce proper spill prevention and control measures.

General Measures

- To the extent that the work can be accomplished safely, spills of oil, petroleum products, substances listed under 40 CFR parts 110,117, and 302, and sanitary and septic wastes should be contained and cleaned up immediately.
- Store hazardous materials and wastes in covered containers and protect from vandalism.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Train employees in spill prevention and cleanup.
- Designate responsible individuals to oversee and enforce control measures.
- Spills should be covered and protected from stormwater runon during rainfall to the extent that it doesn't compromise clean up activities.
- Do not bury or wash spills with water.

- Store and dispose of used clean up materials, contaminated materials, and recovered spill material that is no longer suitable for the intended purpose in conformance with the provisions in applicable BMPs.

- Do not allow water used for cleaning and decontamination to enter storm drains or watercourses. Collect and dispose of contaminated water in accordance with WM-10, Liquid Waste Management.

- Contain water overflow or minor water spillage and do not allow it to discharge into drainage facilities or watercourses.

- Place proper storage, cleanup, and spill reporting instructions for hazardous materials stored or used on the project site in an open, conspicuous, and accessible location.

- Keep waste storage areas clean, well organized, and equipped with ample cleanup supplies as appropriate for the materials being stored. Perimeter controls, containment structures, covers, and liners should be repaired or replaced as needed to maintain proper function.

Cleanup

- Clean up leaks and spills immediately.

- Use a rag for small spills on paved surfaces, a damp mop for general cleanup, and absorbent material for larger spills. If the spilled material is hazardous, then the used cleanup materials are also hazardous and must be sent to either a certified laundry (rags) or disposed of as hazardous waste.

- Never hose down or bury dry material spills. Clean up as much of the material as possible and dispose of properly. See the waste management BMPs in this section for specific information.

Minor Spills

- Minor spills typically involve small quantities of oil, gasoline, paint, etc. which can be controlled by the first responder at the discovery of the spill.

- Use absorbent materials on small spills rather than hosing down or burying the spill.

- Absorbent materials should be promptly removed and disposed of properly.

- Follow the practice below for a minor spill:

  - Contain the spread of the spill.

  - Recover spilled materials.

  - Clean the contaminated area and properly dispose of contaminated materials.

Semi-Significant Spills

- Semi-significant spills still can be controlled by the first responder along with the aid of other personnel such as laborers and the foreman, etc. This response may require the cessation of all other activities.

- Spills should be cleaned up immediately:
  - Contain spread of the spill.
  - Notify the project foreman immediately.
  - If the spill occurs on paved or impermeable surfaces, clean up using "dry" methods (absorbent materials, cat litter and/or rags). Contain the spill by encircling with absorbent materials and do not let the spill spread widely.
  - If the spill occurs in dirt areas, immediately contain the spill by constructing an earthen dike. Dig up and properly dispose of contaminated soil.
  - If the spill occurs during rain, cover spill with tarps or other material to prevent contaminating runoff.

Significant/Hazardous Spills

- For significant or hazardous spills that cannot be controlled by personnel in the immediate vicinity, the following steps should be taken:
  - Notify the local emergency response by dialing 911. In addition to 911, the contractor will notify the proper county officials. It is the contractor's responsibility to have all emergency phone numbers at the construction site.
  - Notify the Governor's Office of Emergency Services Warning Center, (916) 845-8911.
  - For spills of federal reportable quantities, in conformance with the requirements in 40 CFR parts 110,119, and 302, the contractor should notify the National Response Center at (800) 424-8802.
  - Notification should first be made by telephone and followed up with a written report.
  - The services of a spills contractor or a Haz-Mat team should be obtained immediately. Construction personnel should not attempt to clean up until the appropriate and qualified staffs have arrived at the job site.
  - Other agencies which may need to be consulted include, but are not limited to, the Fire Department, the Public Works Department, the Coast Guard, the Highway Patrol, the City/County Police Department, Department of Toxic Substances, California Division of Oil and Gas, Cal/OSHA, etc.

Reporting

- Report significant spills to local agencies, such as the Fire Department; they can assist in cleanup.
- Federal regulations require that any significant oil spill into a water body or onto an adjoining shoreline be reported to the National Response Center (NRC) at 800-424-8802 (24 hours).

Use the following measures related to specific activities:

Vehicle and Equipment Maintenance

- If maintenance must occur onsite, use a designated area and a secondary containment, located away from drainage courses, to prevent the runon of stormwater and the runoff of spills.
- Regularly inspect onsite vehicles and equipment for leaks and repair immediately
- Check incoming vehicles and equipment (including delivery trucks, and employee and subcontractor vehicles) for leaking oil and fluids. Do not allow leaking vehicles or equipment onsite.
- Always use secondary containment, such as a drain pan or drop cloth, to catch spills or leaks when removing or changing fluids.
- Place drip pans or absorbent materials under paving equipment when not in use.
- Use absorbent materials on small spills rather than hosing down or burying the spill. Remove the absorbent materials promptly and dispose of properly.
- Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around
- Oil filters disposed of in trashcans or dumpsters can leak oil and pollute stormwater. Place the oil filter in a funnel over a waste oil-recycling drum to drain excess oil before disposal. Oil filters can also be recycled. Ask the oil supplier or recycler about recycling oil filters.
- Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries even if you think all the acid has drained out. If you drop a battery, treat it as if it is cracked. Put it into the containment area until you are sure it is not leaking.

Vehicle and Equipment Fueling

- If fueling must occur onsite, use designate areas, located away from drainage courses, to prevent the runon of stormwater and the runoff of spills.
- Discourage "topping off" of fuel tanks.
- Always use secondary containment, such as a drain pan, when fueling to catch spills/ leaks.

Costs

Prevention of leaks and spills is inexpensive. Treatment and/ or disposal of contaminated soil or water can be quite expensive.

Inspection and Maintenance

- Inspect and verify that activity–based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.

- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur.
- Keep ample supplies of spill control and cleanup materials onsite, near storage, unloading, and maintenance areas.
- Update your spill prevention and control plan and stock cleanup materials as changes occur in the types of chemicals onsite.

None

Description and Purpose

Solid waste management procedures and practices are designed to prevent or reduce the discharge of pollutants to stormwater from solid or construction waste by providing designated waste collection areas and containers, arranging for regular disposal, and training employees and subcontractors.

Suitable Applications

This BMP is suitable for construction sites where the following wastes are generated or stored:

- Solid waste generated from trees and shrubs removed during land clearing, demolition of existing structures (rubble), and building construction
- Packaging materials including wood, paper, and plastic
- Scrap or surplus building materials including scrap metals, rubber, plastic, glass pieces, and masonry products
- Domestic wastes including food containers such as beverage cans, coffee cups, paper bags, plastic wrappers, and cigarettes
- Construction wastes including brick, mortar, timber, steel and metal scraps, pipe and electrical cuttings, non-hazardous equipment parts, styrofoam and other materials used to transport and package construction materials
- Highway planting wastes, including vegetative material,

CALIFORNIA STORMWATER QUALITY ASSOCIATION

plant containers, and packaging materials

Limitations

Temporary stockpiling of certain construction wastes may not necessitate stringent drainage related controls during the non-rainy season or in desert areas with low rainfall.

Implementation

The following steps will help keep a clean site and reduce stormwater pollution:

- Select designated waste collection areas onsite.
- Inform trash-hauling contractors that you will accept only watertight dumpsters for onsite use. Inspect dumpsters for leaks and repair any dumpster that is not watertight.
- Locate containers in a covered area or in a secondary containment.
- Provide an adequate number of containers with lids or covers that can be placed over the container to keep rain out or to prevent loss of wastes when it is windy.
- Cover waste containers at the end of each work day and when it is raining.
- Plan for additional containers and more frequent pickup during the demolition phase of construction.
- Collect site trash daily, especially during rainy and windy conditions.
- Remove this solid waste promptly since erosion and sediment control devices tend to collect litter.
- Make sure that toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.
- Do not hose out dumpsters on the construction site. Leave dumpster cleaning to the trash hauling contractor.
- Arrange for regular waste collection before containers overflow.
- Clean up immediately if a container does spill.
- Make sure that construction waste is collected, removed, and disposed of only at authorized disposal areas.

Education

- Have the contractor's superintendent or representative oversee and enforce proper solid waste management procedures and practices.
- Instruct employees and subcontractors on identification of solid waste and hazardous waste.
- Educate employees and subcontractors on solid waste storage and disposal procedures.

- Hold regular meetings to discuss and reinforce disposal procedures (incorporate into regular safety meetings).
- Require that employees and subcontractors follow solid waste handling and storage procedures.
- Prohibit littering by employees, subcontractors, and visitors.
- Minimize production of solid waste materials wherever possible.

Collection, Storage, and Disposal

- Littering on the project site should be prohibited.
- To prevent clogging of the storm drainage system, litter and debris removal from drainage grates, trash racks, and ditch lines should be a priority.
- Trash receptacles should be provided in the contractor's yard, field trailer areas, and at locations where workers congregate for lunch and break periods.
- Litter from work areas within the construction limits of the project site should be collected and placed in watertight dumpsters at least weekly, regardless of whether the litter was generated by the contractor, the public, or others. Collected litter and debris should not be placed in or next to drain inlets, stormwater drainage systems, or watercourses.
- Dumpsters of sufficient size and number should be provided to contain the solid waste generated by the project.
- Full dumpsters should be removed from the project site and the contents should be disposed of by the trash hauling contractor.
- Construction debris and waste should be removed from the site biweekly or more frequently as needed.
- Construction material visible to the public should be stored or stacked in an orderly manner.
- Stormwater runon should be prevented from contacting stored solid waste through the use of berms, dikes, or other temporary diversion structures or through the use of measures to elevate waste from site surfaces.
- Solid waste storage areas should be located at least 50 ft from drainage facilities and watercourses and should not be located in areas prone to flooding or ponding.
- Except during fair weather, construction and highway planting waste not stored in watertight dumpsters should be securely covered from wind and rain by covering the waste with tarps or plastic.
- Segregate potentially hazardous waste from non-hazardous construction site waste.
- Make sure that toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.

- For disposal of hazardous waste, see WM-6, Hazardous Waste Management. Have hazardous waste hauled to an appropriate disposal and/or recycling facility.

- Salvage or recycle useful vegetation debris, packaging and surplus building materials when practical. For example, trees and shrubs from land clearing can be used as a brush barrier, or converted into wood chips, then used as mulch on graded areas. Wood pallets, cardboard boxes, and construction scraps can also be recycled.

Costs

All of the above are low cost measures.

Inspection and Maintenance

- Inspect and verify that activity–based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.

- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur

- Inspect construction waste area regularly.

- Arrange for regular waste collection.

Contaminated Soil Management WM-7

Categories

EC	Erosion Control	
SE	Sediment Control	
TC	Tracking Control	
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	
WM	Waste Management and Materials Pollution Control	☑

Legend:

☑ **Primary Objective**

☒ **Secondary Objective**

Targeted Constituents

Sediment	
Nutrients	☑
Trash	☑
Metals	☑
Bacteria	☑
Oil and Grease	☑
Organics	☑

Potential Alternatives

None

Description and Purpose

Prevent or reduce the discharge of pollutants to stormwater from contaminated soil and highly acidic or alkaline soils by conducting pre-construction surveys, inspecting excavations regularly, and remediating contaminated soil promptly.

Suitable Applications

Contaminated soil management is implemented on construction projects in highly urbanized or industrial areas where soil contamination may have occurred due to spills, illicit discharges, aerial deposition, past use and leaks from underground storage tanks.

Limitations

Contaminated soils that cannot be treated onsite must be disposed of offsite by a licensed hazardous waste hauler. The presence of contaminated soil may indicate contaminated water as well. See NS-2, Dewatering Operations, for more information.

The procedures and practices presented in this BMP are general. The contractor should identify appropriate practices and procedures for the specific contaminants known to exist or discovered onsite.

Implementation

Most owners and developers conduct pre-construction environmental assessments as a matter of routine. Contaminated soils are often identified during project planning and development with known locations identified in the plans, specifications and in the SWPPP. The contractor should review applicable reports and investigate appropriate call-outs in the

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

plans, specifications, and SWPPP. Recent court rulings holding contractors liable for cleanup costs when they unknowingly move contaminated soil highlight the need for contractors to confirm a site assessment is completed before earth moving begins.

The following steps will help reduce stormwater pollution from contaminated soil:

- Conduct thorough, pre-construction inspections of the site and review documents related to the site. If inspection or reviews indicated presence of contaminated soils, develop a plan before starting work.
- Look for contaminated soil as evidenced by discoloration, odors, differences in soil properties, abandoned underground tanks or pipes, or buried debris.
- Prevent leaks and spills. Contaminated soil can be expensive to treat and dispose of properly. However, addressing the problem before construction is much less expensive than after the structures are in place.
- The contractor may further identify contaminated soils by investigating:
  - Past site uses and activities
  - Detected or undetected spills and leaks
  - Acid or alkaline solutions from exposed soil or rock formations high in acid or alkaline forming elements
  - Contaminated soil as evidenced by discoloration, odors, differences in soil properties, abandoned underground tanks or pipes, or buried debris.
  - Suspected soils should be tested at a certified laboratory.

Education

- Have employees and subcontractors complete a safety training program which meets 29 CFR 1910.120 and 8 CCR 5192 covering the potential hazards as identified, prior to performing any excavation work at the locations containing material classified as hazardous.
- Educate employees and subcontractors in identification of contaminated soil and on contaminated soil handling and disposal procedures.
- Hold regular meetings to discuss and reinforce disposal procedures (incorporate into regular safety meetings).

Handling Procedures for Material with Aerially Deposited Lead (ADL)

- Materials from areas designated as containing (ADL) may, if allowed by the contract special provisions, be excavated, transported, and used in the construction of embankments and/or backfill.
- Excavation, transportation, and placement operations should result in no visible dust.
- Caution should be exercised to prevent spillage of lead containing material during transport.

- Quality should be monitored during excavation of soils contaminated with lead.

Handling Procedures for Contaminated Soils

- Minimize onsite storage. Contaminated soil should be disposed of properly in accordance with all applicable regulations. All hazardous waste storage will comply with the requirements in Title 22, CCR, Sections 66265.250 to 66265.260.
- Test suspected soils at an approved certified laboratory.
- Work with the local regulatory agencies to develop options for treatment or disposal if the soil is contaminated.
- Avoid temporary stockpiling of contaminated soils or hazardous material.
- Take the following precautions if temporary stockpiling is necessary:
  - Cover the stockpile with plastic sheeting or tarps.
  - Install a berm around the stockpile to prevent runoff from leaving the area.
  - Do not stockpile in or near storm drains or watercourses.
- Remove contaminated material and hazardous material on exteriors of transport vehicles and place either into the current transport vehicle or into the excavation prior to the vehicle leaving the exclusion zone.
- Monitor the air quality continuously during excavation operations at all locations containing hazardous material.
- Procure all permits and licenses, pay all charges and fees, and give all notices necessary and incident to the due and lawful prosecution of the work, including registration for transporting vehicles carrying the contaminated material and the hazardous material.
- Collect water from decontamination procedures and treat or dispose of it at an appropriate disposal site.
- Collect non-reusable protective equipment, once used by any personnel, and dispose of at an appropriate disposal site.
- Install temporary security fence to surround and secure the exclusion zone. Remove fencing when no longer needed.
- Excavate, transport, and dispose of contaminated material and hazardous material in accordance with the rules and regulations of the following agencies (the specifications of these agencies supersede the procedures outlined in this BMP):
  - United States Department of Transportation (USDOT)
  - United States Environmental Protection Agency (USEPA)
  - California Environmental Protection Agency (CAL-EPA)

- California Division of Occupation Safety and Health Administration (CAL-OSHA)
- Local regulatory agencies

Procedures for Underground Storage Tank Removals

- Prior to commencing tank removal operations, obtain the required underground storage tank removal permits and approval from the federal, state, and local agencies that have jurisdiction over such work.
- To determine if it contains hazardous substances, arrange to have tested, any liquid or sludge found in the underground tank prior to its removal.
- Following the tank removal, take soil samples beneath the excavated tank and perform analysis as required by the local agency representative(s).
- The underground storage tank, any liquid or sludge found within the tank, and all contaminated substances and hazardous substances removed during the tank removal and transported to disposal facilities permitted to accept such waste.

Water Control

- All necessary precautions and preventive measures should be taken to prevent the flow of water, including ground water, from mixing with hazardous substances or underground storage tank excavations. Such preventative measures may consist of, but are not limited to, berms, cofferdams, grout curtains, freeze walls, and seal course concrete or any combination thereof.
- If water does enter an excavation and becomes contaminated, such water, when necessary to proceed with the work, should be discharged to clean, closed top, watertight transportable holding tanks, treated, and disposed of in accordance with federal, state, and local laws.

Costs

Prevention of leaks and spills is inexpensive. Treatment or disposal of contaminated soil can be quite expensive.

Inspection and Maintenance

- Inspect and verify that activity–based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Arrange for contractor's Water Pollution Control Manager, foreman, and/or construction supervisor to monitor onsite contaminated soil storage and disposal procedures.
- Monitor air quality continuously during excavation operations at all locations containing hazardous material.
- Coordinate contaminated soils and hazardous substances/waste management with the appropriate federal, state, and local agencies.

- Implement WM-4, Spill Prevention and Control, to prevent leaks and spills as much as possible.

APPENDIX G

SEDIMENT RISK LEVEL CALCULATIONS
(on CD only)

This page intentionally left blank.

The following pages detail the soil erosion calculations to determine the risk level for IR Site 2 Landfill. A summary of the results are as follows.

Soil Loss: 1.99 tons/acre
Site Sediment Risk Factor of < 15 tons/acre = **Low**

Receiving Water Risk Factor = **High**

Combined Risk = **Level 2**

This risk analysis determines the requirements for ensuring compliance with the California Division of Water Quality National Pollutant Discharge Elimination System (NPDES) General Permit Order No. 2009-0009-DWQ, NPDES No. CAS000002. The total soil loss is based on the Soil Loss Equation from Order No. 2009-0009-DWQ Appendix 1 by the California Division of Water Quality. The equation takes into account the worst soil condition and no established vegetation to be conservative.

Soil Loss Equation (Calculation of Soil Loss from Runoff)

From: Order No. 2009-0009-DWQ Appendix 1 (Division of Water Quality)

A = R*K*(LS)

Where:
A = watershed erosion estimate (tons/acre)
R = rainfall erosivity factor
K = soil erodibility factor
LS = length-slope factor

R from Rainfall Erosivity Factor Calculator (USEPA 2009)

At IR Site 2 Landfill, Alameda, CA (see Sheet 4)

R= 16.56

LS from Order No. 2009-0009-DWQ Appendix 1 (Division of Water Quality)

We used a sheet flow length of 400 feet and a slope of 3.0% to be conservative. See Sheet 5 for determination of the length-slope factor.

Slope	Length	**LS Factor**
$S_1 = 3.0\%$	$L_1 = 400ft$	**0.80**

K from RUSLE K factor Map, Order No. 2009-0009-DWQ Appendix 1 (Division of Water Quality)

The RUSLE K factor map was used to obtain the K value (see Sheet 6).

K= 0.15

Determine Soil Loss

Watershed Erosion Estimate (=R x K x LS) in tons/acre	6.75
Site Sediment Risk Factor	**Low**
Low Sediment Risk: < 15 tons/acre	
Medium Sediment Risk: >=15 and <75 tons/acre	
High Sediment Risk: >= 75 tons/acre	

Determine Receiving Water Risk

The receiving water risk is high since IR Site 2 Landfill does discharge to a location listed with beneficial uses of fish spawning, fish migration, and cold freshwater habitat (see Sheet 7).

Receiving Water (RW) Risk Factor Worksheet		
A.1. Does the disturbed area discharge (either directly or indirectly) to a **303(d)-listed waterbody impaired by sediment**? (For help with impaired waterbodies please visit the link below) or has a **USEPA approved TMDL implementation plan for sediment?**: http://www.waterboards.ca.gov/water_issues/programs/tmdl/303d_lists2006_epa.shtml **OR** A.2. Does the disturbed area discharge to a waterbody with designated beneficial uses of SPAWN & COLD & MIGRATORY? http://www.ice.ucdavis.edu/geowbs/asp/wbquse.asp	**yes**	**High**

Risk Level

Combined Risk Level Matrix				
		Sediment Risk		
		Low	Medium	High
Receiving Water Risk	Low	Level 1	Level 2	Level 2
	High	Level 2	Level 2	Level 3

In 1992 the California State Water Quality Control Board (SWQCB) proposed that the Klamath River be listed for both temperature and nutrients, requiring the development of total maximum daily load (TMDL) limits and implementation plans. The United States Environmental Protection Agency (USEPA) and the NCRWQCB accepted this action in 1993. The basis for listing the Klamath River as impaired was aquatic habitat degradation due to excessively warm water temperatures and algae blooms associated with high nutrient loads, water impoundments, and agricultural water diversions.
1	Klamath River HU, Butte Valley HA	River & Stream	CAR1058103319990610123037	5	18010205	10580000	253	Miles	Temperature, water	Miscellaneous	List on 303(d) list (TMDL required list)	5A	01-Jan-19			The Klamath River, from source to mouth, is listed as water quality impaired (by both Oregon and California) under Section 303(d) of the Federal Clean Water Act. 1	Klamath River HU, Salmon River HA	River & Stream	CAR1052103419990610171042	4a	18010211	10520000	694	Miles	Temperature, water	Miscellaneous	Do Not Delist from 303(d) list (being addressed with USEPA approved TMDL)	5B			29-Mar-06	In 2008, the "Klamath River Hydrologic Unit, Wooley Creek Hydrologic Sub-Area" was removed from the "Klamath River Hydrologic Unit, Salmon River Hydrologic Area" in order to consider delisting the Wooley Creek Watershed for temperature as monitoring data indicated there may be different conditions in the Wooley Creek Watershed than the rest of the Salmon River Watershed. Upon review of the available data, there was insufficient information to determined if conditions in the Wooley Creek Watershed were different from the rest of the Salmon River Watershed. Additionally, temperature data in the Wooley Creek Watershed showed an exceedance of the evaluation guideline. Therefore, it was determined that the waterbody-pollutant combination should not be removed from the Section 303(d) List because applicable water quality standards for the pollutant are being exceeded.

The Big River provides habitat for coho salmon and steelhead trout, which are listed as a threatened species under the federal Endangered Species Act. Populations of coho salmon and steelhead trout in the Big River are extremely low compared to historical levels. Recent (1996-2000) temperature data gathered in the Big River watershed indicate that high temperature levels may be a source of impairment of cold water fisheries in the river. This listing is specific to the area of the watershed from the confluence with the North Fork Big River, including the watersheds of the mainstem Big River and the North Fork Big River.
1	Mendocino Coast HU, Garcia River HA, Garcia River	River & Stream	CAR1137002619980709103133	5	18010109	11370000	154	Miles	Sediment	Sediment	List on 303(d) list (being addressed by USEPA approved TMDL)	5B			07-Mar-02

The Russian River provides habitat for coho salmon and steelhead trout, which are listed as a threatened species under the federal Endangered Species Act. Temperature data collected from 1997 to 2000 in the Russian River watershed indicate that high temperature levels may be a source of impairment of cold water fisheries in the watershed.

1	Russian River HU, Middle Russian River HA, Laguna de Santa Rosa	River & Stream	CAR1142102019980709171122	5	18010111	11421000	96	Miles	Oxygen, Dissolved	Nutrients	Do Not Delist from 303(d) list (TMDL required list)	5A	01-Jan-12			The Laguna de Santa Rosa was added to the 303(d) List in 1990 for high levels of ammonia and low dissolved oxygen (DO) concentrations. A TMDL was completed for the Laguna for ammonia and dissolved oxygen in 1995. The TMDL concluded that high ammonia levels in the Laguna were the result of point and non-point source nitrogen inputs of various forms. Low dissolved oxygen concentrations were a result of inputs of organic matter and nutrients which stimulate algal growth and subsequently cause depressed dissolved oxygen levels when the algae dies and decays. The TMDL took the form of a Waste Reduction Strategy (WRS) which addressed the reduction of nitrogen loading from point and non-point sources. With the implementation of the WRS and operational improvements at the City of Santa Rosa Waste Water Treatment Plant as well as improvements in waste storage and disposal activities at local dairies, nitrogen inputs to the Laguna were significantly reduced. Following implementation of the WRS and the subsequent attainment of nitrogen-ammonia interim concentration goals, as stated in the WRS, the Laguna was removed from the 303(d) List for ammonia and dissolved oxygen in 1998, pursuant to a recommendation by US EPA. However, dissolved oxygen levels in the Laguna continue to fall below the Regional Water Board Basin Plan minimum DO objective of 7.0 mg/L and in many cases fluctuate significantly on a daily and seasonal basis. Based on available information, it appears that phosphorus may contribute to the dissolved oxygen fluctuations. However, the cause of the low dissolved oxygen levels is not certain. While elevated phosphorus levels may contribute to low DO, nitrogen to phosphorus ratios, based on recent Laguna measurements, indicate that nitrogen may be the macronutrient controlling plant growth in the Laguna. A TMDL addressing nutrients (both nitrogen and phosphorus) and dissolved oxygen is necessary for water quality objective attainment.

3	Las Tablas Creek	River & Stream	CAR3098129319980825123721	5	18060005	30981293	6	Miles	Metals	Metals/Metalloids	List on 303(d) list (TMDL required list)	5A	01-Jan-21			
3	Las Tablas Creek, North Fork	River & Stream	CAR3098129019980828104645	5	18060005	30981290	6	Miles	Metals	Metals/Metalloids	List on 303(d) list (TMDL required list)	5A	01-Jan-21			
3	Las Tablas Creek, South Fork	River & Stream	CAR3098129019980828110227	5	18060006	30981290	5	Miles	Metals	Metals/Metalloids	List on 303(d) list (TMDL required list)	5A	01-Jan-21			
3	Little Oso Flaco Creek	River & Stream	CAR3121003020080611165546	5	18060008	31210030	2	Miles	Fecal Coliform	Pathogens	List on 303(d) list (TMDL required list)	5A	01-Jan-13			
3	Little Oso Flaco Creek	River & Stream	CAR3121003020080611165546	5	18060008	31210030	2	Miles	Nitrate	Nutrients	List on 303(d) list (TMDL required list)	5A	01-Jan-13			
3	Little Oso Flaco Creek	River & Stream	CAR3121003020080611165546	5	18060008	31210030	2	Miles	Sediment Toxicity	Toxicity	List on 303(d) list (TMDL required list)	5A	01-Jan-13			
3	Little Oso Flaco Creek	River & Stream	CAR3121003020080611165546	5	18060008	31210030	2	Miles	Unknown Toxicity	Toxicity	List on 303(d) list (TMDL required list)	5A	01-Jan-13			
3	Llagas Creek (above Chesbro Reservoir)	River & Stream	CAR3052001419980826100148	5	18060002	30520014	9	Miles	Temperature, water	Miscellaneous	List on 303(d) list (TMDL required list)	5A	01-Jan-21			
3	Llagas Creek (above Chesbro Reservoir)	River & Stream	CAR3052001419980826100148	5	18060002	30520014	9	Miles	pH	Miscellaneous	List on 303(d) list (TMDL required list)	5A	01-Jan-21			
3	Llagas Creek (below Chesbro Reservoir)	River & Stream	CAR3053002020020319075726	5	18060002	30530020	16	Miles	Chloride	Salinity	Do Not Delist from 303(d) list (TMDL required list)	5A	01-Jan-21			Impaired section for Chlorides is located downstream of confluence with Miller Slough (approximately 1 mile of stream near Southside Drive).
3	Llagas Creek (below Chesbro Reservoir)	River & Stream	CAR3053002020020319075726	5	18060002	30530020	16	Miles	Chlorpyrifos	Pesticides	List on 303(d) list (TMDL required list)	5A	01-Jan-21			
3	Llagas Creek (below Chesbro Reservoir)	River & Stream	CAR3053002020020319075726	5	18060002	30530020	16	Miles	Electrical Conductivity	Salinity	List on 303(d) list (TMDL required list)	5A	01-Jan-21			
3	Llagas Creek (below Chesbro Reservoir)	River & Stream	CAR3053002020020319075726	5	18060002	30530020	16	Miles	Escherichia coli (E. coli)	Pathogens	List on 303(d) list (TMDL required list)	5A	01-Jan-11			
3	Llagas Creek (below Chesbro Reservoir)	River & Stream	CAR3053002020020319075726	5	18060002	30530020	16	Miles	Fecal Coliform	Pathogens	Do Not Delist from 303(d) list (TMDL required list)	5A	01-Jan-11			Impaired section for Fecal Coliform is located between the confluence with Church Creek and the confluence with Pajaro River (approximately 9.5 miles of stream length).
3	Llagas Creek (below Chesbro Reservoir)	River & Stream	CAR3053002020020319075726	5	18060002	30530020	16	Miles	Low Dissolved Oxygen	Nutrients	Do Not Delist from 303(d) list (TMDL required list)	5A	01-Jan-21			This listing was made by USEPA.
3	Llagas Creek (below Chesbro Reservoir)	River & Stream	CAR3053002020020319075726	5	18060002	30530020	16	Miles	Nutrients	Nutrients	List on 303(d) list (being addressed by USEPA approved TMDL)	5B			13-Oct-06	Nutrients Medium 16 Impaired section for Nutrients is located between the confluence with Church Creek and the confluence with Pajaro River (approximately 9.5 miles of stream length).
3	Llagas Creek (below Chesbro Reservoir)	River & Stream	CAR3053002020020319075726	5	18060002	30530020	16	Miles	Sedimentation/Siltation	Sediment	List on 303(d) list (being addressed by USEPA approved TMDL)	5B			03-May-07	Impaired section for Sediment/Siltation is located between the confluence with Church Creek and the confluence with Pajaro River (approximately 9.5 miles of stream length).
3	Llagas Creek (below Chesbro Reservoir)	River & Stream	CAR3053002020020319075726	5	18060002	30530020	16	Miles	Sodium	Salinity	List on 303(d) list (TMDL required list)	5A	01-Jan-21			Impaired section for Sodium is located downstream of confluence with Miller Slough (approximately 1 mile of stream near Southside Drive).
3	Llagas Creek (below Chesbro Reservoir)	River & Stream	CAR3053002020020319075726	5	18060002	30530020	16	Miles	Total Dissolved Solids	Salinity	List on 303(d) list (TMDL required list)	5A	01-Jan-21			Impaired section for Total Dissolved Solids is located between the confluence with Church Creek and the confluence with Pajaro River (approximately 9.5 miles of stream length).
3	Llagas Creek (below Chesbro Reservoir)	River & Stream	CAR3053002020020319075726	5	18060002	30530020	16	Miles	Turbidity	Sediment	List on 303(d) list (TMDL required list)	5A	01-Jan-21			
3	Lockhart Gulch	River & Stream	CAR3041204119990304141558	5	18060001	30412041	3	Miles	Low Dissolved Oxygen	Nutrients	List on 303(d) list (TMDL required list)	5A	01-Jan-21			
3	Lockhart Gulch	River & Stream	CAR3041204119990304141558	5	18060001	30412041	3	Miles	pH	Miscellaneous	List on 303(d) list (TMDL required list)	5A	01-Jan-21			
3	Lompico Creek	River & Stream	CAR3041204019980826100810	5	18060001	30412040	4	Miles	Nutrients	Nutrients	Do Not Delist from 303(d) list (being addressed with USEPA approved TMDL)	5B			14-Jan-03	
3	Lompico Creek	River & Stream	CAR3041204019980826100810	5	18060001	30412040	4	Miles	Pathogens	Pathogens	Do Not Delist from 303(d) list (TMDL required list)	5A	01-Jan-11			
3	Lompico Creek	River & Stream	CAR3041204019980826100810	5	18060001	30412040	4	Miles	Sedimentation/Siltation	Sediment	List on 303(d) list (being addressed by USEPA approved TMDL)	5B			19-Feb-04	
3	Los Berros Creek	River & Stream	CAR3103102319990304143314	5	18060008	31031023	13	Miles	Chloride	Salinity	List on 303(d) list (TMDL required list)	5A	01-Jan-21			
3	Los Berros Creek	River & Stream	CAR3103102319990304143314	5	18060008	31031023	13	Miles	Nitrate	Nutrients	List on 303(d) list (TMDL required list)	5A	01-Jan-21			
3	Los Berros Creek	River & Stream	CAR3103102319990304143314	5	18060008	31031023	13	Miles	Sodium	Salinity	List on 303(d) list (TMDL required list)	5A	01-Jan-21			
3	Los Carneros Creek	River & Stream	CAR3153102019990304143658	5	18060013	31531020	6	Miles	Electrical Conductivity	Salinity	List on 303(d) list (TMDL required list)	5A	01-Jan-21			
3	Los Carneros Creek	River & Stream	CAR3153102019990304143658	5	18060013	31531020	6	Miles	Enterococcus	Pathogens	List on 303(d) list (TMDL required list)	5A	01-Jan-13			
3	Los Carneros Creek	River & Stream	CAR3153102019990304143658	5	18060013	31531020	6	Miles	Escherichia coli (E. coli)	Pathogens	List on 303(d) list (TMDL required list)	5A	01-Jan-13			
3	Los Carneros Creek	River & Stream	CAR3153102019990304143658	5	18060013	31531020	6	Miles	Nitrate	Nutrients	List on 303(d) list (TMDL required list)	5A	01-Jan-21			
3	Los Carneros Creek	River & Stream	CAR3153102019990304143658	5	18060013	31531020	6	Miles	pH	Miscellaneous	List on 303(d) list (TMDL required list)	5A	01-Jan-21			
3	Los Osos Creek	River & Stream	CAR3102301219980826102833	5	1.806e+0	31023012	4	Miles	Fecal Coliform	Pathogens	Do Not Delist from 303(d) list (being addressed with USEPA approved TMDL)	5B			20-Jan-04	
3	Los Osos Creek	River & Stream	CAR3102301219980826102833	5	1.806e+0	31023012	4	Miles	Low Dissolved Oxygen	Nutrients	Do Not Delist from 303(d) list (TMDL required list)	5A	01-Jan-21			This listing was made by USEPA.
3	Los Osos Creek	River & Stream	CAR3102301219980826102833	5	1.806e+0	31023012	4	Miles	Nitrate	Nutrients	Do Not Delist from 303(d) list (being addressed with USEPA approved TMDL)	5B			04-Feb-05	Impaired Length is below Los Osos Valley Road to Creek Mouth. There is no evidence of impairment at Los Osos Valley Road.
3	Los Osos Creek	River & Stream	CAR3102301219980826102833	5	1.806e+0	31023012	4	Miles	Nutrients	Nutrients	Do Not Delist from 303(d) list (being addressed with USEPA approved TMDL)	5B			01-Mar-05	Impaired Length is below Los Osos Valley Road to Creek Mouth. There is no evidence of impairment at Los Osos Valley Road.
3	Los Osos Creek	River & Stream	CAR3102301219980826102833	5	1.806e+0	31023012	4	Miles	Sedimentation/Siltation	Sediment	Do Not Delist from 303(d) list (being addressed with USEPA approved TMDL)	5B			20-Jan-04

6	Indian Creek Reservoir	Lake & Reservoir	CAL6322001019980805154816	4a	1.60502e	63220010	164	Acres	Phosphorus	Nutrients	List on 303(d) list (being addressed by USEPA approved TMDL)	5B			01-Jul-03	Reservoir is eutrophic. Most significant source of nutrient loading is release of phosphorus from sediment. The USEPA approved the TMDL in 2003. Reductions in internal phosphorus loading from the sediment are expected to ameliorate other problems associated with eutrophication.
6	Leviathan Creek	River & Stream	CAR6321008019980803122747	4b	1.60502e	63210080	3	Miles	Metals	Metals/Metalloids	List on 303(d) list (being addressed by action other than TMDL)	5C		01-Jan-19		This listing is being addressed through a CERCLA remediation program and through ongoing work by Lahontan Water Board staff.

STATE WATER RESOURCES CONTROL BOARD
RESOLUTION NO. 2004-0063

ADOPTION OF THE WATER QUALITY CONTROL
POLICY (POLICY) FOR DEVELOPING CALIFORNIA'S
CLEAN WATER ACT SECTION 303(d) LIST

WHEREAS:

1. Section 303(d)(1) of the federal Clean Water Act (CWA) requires states to identify waters that do not meet applicable water quality standards with technology-based controls alone and prioritize such waters for the purposes of developing Total Maximum Daily Loads (TMDLs) [40 Code of Federal Regulations (CFR) 130.7(b)].

2. Section 13191.3(a) of the California Water Code (CWC) requires the State Water Resources Control Board (SWRCB) to prepare guidelines to be used by SWRCB and the Regional Water Quality Control Boards (RWQCBs) in listing, delisting, developing, and implementing TMDLs pursuant to section 303(d) of the federal CWA [33 United States Code (USC) section 1313(d)].

3. California Assembly Bill (AB) 982 Public Advisory Group (PAG) was established in 2000 to assist in the evaluation of SWRCB's water quality programs' structure and effectiveness as it relates to the implementation of section 303(d) of CWA [33 USC section 1313(d)] and applicable federal regulation.

4. CWC section 13191.3(b) also requires the SWRCB to consider the consensus recommendations on the guidelines adopted by PAG.

5. The 2001 Budget Act Supplemental Report required the use of a "weight of evidence" approach in developing the Policy for listing and delisting waters and to include criterion to ensure that data and information used are accurate and verifiable.

6. SWRCB, in compliance with CWC section 13147, held public hearings in Sacramento, California, on January 28, 2004 and in Torrance, California, on February 5, 2004 on the Water Quality Control Policy and carefully considered all testimony and comments received.

7. SWRCB has completed a scientific peer review by University of California scientists of the draft Functional Equivalent Document as required by section 57004 of the Health and Safety Code.

8. SWRCB has determined that the adoption of this Policy will not have a significant adverse effect on the environment.

9. The regulatory provisions of the Policy do not become effective until the regulatory provisions are approved by the Office of Administrative Law (OAL).

THEREFORE BE IT RESOLVED THAT:

The SWRCB:

1. Approves the final FED: Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List.

2. Adopts the Policy for Developing California's Clean Water Act Section 303(d) List (Attachment).

3. Authorizes the Executive Director or designee to submit the Policy to the Office of Administrative Law for approval.

4. Shall hold a public workshop after the approval of the 2004 section 303(d) list to assess implementation of the Policy.

CERTIFICATION

The undersigned, Clerk to the Board, does hereby certify that the foregoing is a full, true, and correct copy of a resolution duly and regularly adopted at a meeting of the State Water Resources Control Board held on September 30, 2004.

Debbie Irvin

WATER QUALITY CONTROL POLICY FOR DEVELOPING CALIFORNIA'S CLEAN WATER ACT SECTION 303(d) LIST

1 Introduction

Pursuant to California Water Code section 13191.3(a), this State policy for water quality control (Policy) describes the process by which the State Water Resources Control Board (SWRCB) and Regional Water Quality Control Boards (RWQCBs) will comply with the listing requirements of section 303(d) of the federal Clean Water Act (CWA). The objective of this Policy is to establish a standardized approach for developing California's section 303(d) list in order to achieve the overall goal of achieving water quality standards and maintaining beneficial uses in all of California's surface waters.

CWA section 303(d) requires states to identify waters that do not meet, or are not expected to meet by the next listing cycle, applicable water quality standards after the application of certain technology-based controls and schedule such waters for development of Total Maximum Daily Loads (TMDLs) [40 Code of Federal Regulations (CFR) 130.7(c) and (d)]. The states are required to assemble and evaluate all existing and readily available water quality-related data and information to develop the list [40 CFR 130.7(b)(5)] and to provide documentation for listing or not listing a state's waters [40 CFR 130.7(b)(6)]. The methodology to be used to develop the section 303(d) list [40 CFR 130.7(b)(6)(i)] is established by this Policy and includes:

- California Listing Factors and Delisting Factors;
- The process for gathering and evaluating of readily available data and information; and
- Total Maximum Daily Load (TMDL) scheduling.

This Policy applies only to the listing process methodology used to comply with CWA section 303(d). In order to make decisions regarding standards attainment, this Policy provides guidance for interpreting data and information as they are compared to beneficial uses, existing numeric and narrative water quality objectives, and antidegradation considerations. The Policy shall not be used to:

- determine compliance with any permit or waste discharge requirement provision;
- establish, revise, or refine any water quality objective or beneficial use; or
- translate narrative water quality objectives for the purposes of regulating point sources.

Data and information from water bodies shall be analyzed under the provisions of this Policy using a weight-of-evidence approach. The weight-of-evidence approach shall be used to evaluate whether the evidence is in favor of or against placing waters on or removing waters from the section 303(d) list (section 2). The following steps describe the weight-of-evidence approach:

1. Data and Information Preprocessing: All data and information for existing listings shall be solicited and assembled, as appropriate (sections 6.1.1 and 6.1.2.1). Water body fact sheets (section 6.1.2.2) describing the assessments shall be prepared. Evaluation guidelines (section 6.1.3), if needed, shall be selected and the quality of the data (section 6.1.4) and quantity of data (section 6.1.5) shall be assessed.

2. Data and Information Processing: All data and information shall be evaluated using the decision rules listed in sections 3 or 4, as appropriate, and using applicable implementation factors (including, but not limited to, sections 6.1.2.2 and 6.1.5.1 through 6.1.5.9). RWQCBs shall also develop a schedule for completion of TMDLs (section 5). All other information not addressed under sections 3, 4, 5, or 6, shall be evaluated and presented in fact sheets.

3. Data Assessment: An assessment in favor of or against a list action for a water body-pollutant combination shall be presented in fact sheets. The assessment shall identify and discuss relationships between all available lines of evidence for water bodies and pollutants. This assessment shall be made on a pollutant-by-pollutant (including toxicity) basis. RWQCBs shall approve all decisions to list or delist a water segment (section 6.2).

2 Structure of the CWA Section 303(d) List

This section describes the categories of waters that shall be included in the section 303(d) list. Sections 3 and 4 contain the factors that shall be used to add and remove waters from the list. At a minimum, the California section 303(d) list shall identify waters where standards are not met, pollutants or toxicity contributing to standards exceedance, and the TMDL completion schedule. The section 303(d) list shall contain the following categories:

2.1 Water Quality Limited Segments

Waters shall be placed in this category of the section 303(d) list if it is determined, in accordance with the California Listing Factors, that the water quality standard is not attained; the standards nonattainment is due to toxicity, a pollutant, or pollutants; and remediation of the standards attainment problem requires one or more TMDLs.

The water segment shall remain in this category of the section 303(d) list until TMDLs for all pollutants have been completed, U.S. Environmental Protection Agency (USEPA) has approved the TMDLs, and implementation plans have been adopted.

2.2 Water Quality Limited Segments Being Addressed

Water segments shall be placed in this category if the conditions for placement in the water quality limited segments category (section 3) are met and either of the following conditions is met:

1. A TMDL has been developed and approved by USEPA and the approved implementation plan is expected to result in full attainment of the standard within a specified time frame; or

2. The RWQCB has determined in fact sheets that an existing regulatory program is reasonably expected to result in the attainment of the water quality standard within a reasonable, specified time frame.

Waters shall only be removed from this category if it is demonstrated in accordance with section 4 that water quality standards are attained.

3 California Listing Factors

RWQCBs and SWRCB shall use the following factors to develop the California section 303(d) list. Waters meeting the conditions in section 3 exceed water quality standards.

In developing the list, the state shall evaluate all existing readily available water quality-related data and information. Data and information, collected during a known spill or violation of an effluent limit in a permit or waste discharge requirement (WDR), may be used in conjunction with other data to demonstrate that there is an exceedance of a water quality standard in the water body. Visual assessments or other semi-quantitative assessments shall also be considered as ancillary lines of evidence to support a section 303(d) listing.

Water segments shall be placed on the section 303(d) list if any of the following conditions are met.

3.1 Numeric Water Quality Objectives and Criteria for Toxicants in Water

Numeric water quality objectives for toxic pollutants, including maximum contaminant levels where applicable, or California/National Toxics Rule water quality criteria are exceeded as follows:

- Using the binomial distribution, waters shall be placed on the section 303(d) list if the number of measured exceedances supports rejection of the null hypothesis as presented in Table 3.1.

3.2 Numeric Water Quality Objectives for Conventional or Other Pollutants in Water

Numeric water quality objectives for conventional pollutants are exceeded as follows:

- Using the binomial distribution, waters shall be placed on the section 303(d) list if the number of measured exceedances supports rejection of the null hypothesis as presented in Table 3.2.

For depressed dissolved oxygen, if measurements of dissolved oxygen taken over the day (diel) show low concentrations in the morning and sufficient concentrations in the afternoon, then it shall be assumed that nutrients are responsible for the observed dissolved oxygen concentrations if riparian cover, substrate composition or other pertinent factors can be ruled out as controlling dissolved oxygen fluctuations. When continuous monitoring data are available, the seven-day average of daily minimum measurements shall be assessed. In the absence of diel measurements, concurrently collected measurements of nutrient concentration shall be assessed using applicable water quality objectives or acceptable evaluation guidelines (section 6.1.3) and using the binomial distribution as described in section 3.1.

3.3 Numerical Water Quality Objectives or Standards for Bacteria Where Recreational Uses Apply

In the absence of a site-specific exceedance frequency, a water segment shall be placed on the section 303(d) list if bacteria water quality standards in California Code of Regulations, Basin Plans, or statewide plans are exceeded using the binomial distribution as described in section 3.2.

If a site-specific exceedance frequency is available, it may be used instead of the ten percent exceedance frequency as described in Table 3.2 or four percent as described in the following paragraph. The site-specific exceedance frequency shall be the number of water quality standard exceedances in a relatively unimpacted watershed (i.e., a reference water segment). To the extent possible and allowed by water quality objectives, RWQCBs shall identify one or more reference beaches or water segments to compare the measurements.

For bacterial measurements from coastal beaches, if water quality monitoring was conducted April 1 through October 31 only, a four percent exceedance percentage shall be used. For bacterial measurements from inland waters, if water quality monitoring data were collected April 1 through October 31 only, a four percent exceedance percentage shall be used if (1) bacterial measurements are indicative of human fecal matter, and (2) there is substantial human contact in the water body. If the exceedance is due to a closure related to a sewage spill, the water segment shall not be placed on the section 303(d) list. Postings that are not backed by water quality data shall not be used to support placement of a water segment on the section 303(d) list.

3.4 Health Advisories

A water segment shall be placed on the section 303(d) list if a health advisory against the consumption of edible resident organisms, or a shellfish harvesting ban has been issued by the Office of Environmental Health Hazard Assessment (OEHHA), or Department of Health Services and there is a designated or existing fish consumption beneficial use for the segment. In addition, water segment-specific data must be available indicating the evaluation guideline for tissue is exceeded.

3.5 Bioaccumulation of Pollutants in Aquatic Life Tissue

A water segment shall be placed on the section 303(d) list if the tissue pollutant levels in organisms exceed a pollutant-specific evaluation guideline (satisfying the requirements of section 6.1.3) using the binomial distribution as described in section 3.1.

Acceptable tissue concentrations may be based on composite samples measured either as muscle tissue or whole body residues. Residues in liver tissue alone are not considered a suitable measure. Samples can be collected either from transplanted animals or from resident populations.

3.6 Water/Sediment Toxicity

A water segment shall be placed on the section 303(d) list if the water segment exhibits statistically significant water or sediment toxicity using the binomial distribution as described in section 3.1. The segment shall be listed if the observed toxicity is associated with a pollutant or pollutants. Waters may also be placed on the section 303(d) list for toxicity alone. If the pollutant causing or contributing to the toxicity is identified, the pollutant shall be included on the section 303(d) list as soon as possible (i.e., during the next listing cycle).

Reference conditions may include laboratory controls (using a t-test or other applicable statistical test), the lower confidence interval of the reference envelope, or, for sediments, response less than 90 percent of the minimum significant difference for each specific test organism.

Appropriate reference and control measures must be included in the toxicity testing. Acceptable methods include, but are not limited to, those listed in water quality control plans, the methods used by Surface Water Ambient Monitoring Program (SWAMP), the Southern California Bight Projects of the Southern California Coastal Water Research Project, American Society for Testing and Materials (ASTM), USEPA, the Regional Monitoring Program of the San Francisco Estuary Institute, and the Bay Protection and Toxic Cleanup Program (BPTCP).

Association of pollutant concentrations with toxic or other biological effects should be determined by any one of the following:

A. Sediment quality guidelines (satisfying the requirements of section 6.1.3) are exceeded using the binomial distribution as described in section 3.1. In addition, using rank correlation, the observed effects are correlated with measurements of chemical concentration in sediments. If these conditions are met, the pollutant shall be identified as "sediment pollutant(s)."

B. For sediments, an evaluation of equilibrium partitioning or other type of toxicological response that identifies the pollutant that may cause the observed impact. Comparison to reference conditions within a watershed or ecoregion may be used to establish sediment impacts.

C. Development of an evaluation (such as a toxicity identification evaluation) that identifies the pollutant that contributes to or caused the observed impact.

3.7 Nuisance

A water segment shall be placed on the section 303(d) list if qualitative assessments of the water segment for nuisance water odor, taste, excessive algae growth, foam, turbidity, oil, trash, and color are associated with numerical water quality data that meets any one of the following:

3.7.1 Nutrient-related

An acceptable nutrient-related evaluation guideline is exceeded using the binomial distribution as described in section 3.1 for excessive algae growth, unnatural foam, odor, and taste. Waters may also be placed on the section 303(d) list when a significant nuisance condition exists as compared to reference conditions, or when nutrient concentrations cause or contribute to excessive algae growth. If listing for nitrogen or phosphorus specifically, RWQCBs should consider whether the ratio of these two nutrients indicates which is the limiting agent.

3.7.2 Other Types

An acceptable evaluation guideline is exceeded using the binomial distribution as described in section 3.1 for taste, color, oil sheen, turbidity, litter, trash, and odor not related to nutrients. Water segments may also be placed on the section 303(d) list when there is significant nuisance condition compared to reference conditions.

3.8 Adverse Biological Response

A water segment shall be placed on the section 303(d) list if the water segment exhibits adverse biological response measured in resident individuals as compared to reference conditions and these impacts are associated with water or sediment concentrations of pollutants as described in section 3.6. Endpoints for this factor include reduction in growth, reduction in reproductive capacity, abnormal development, histopathological abnormalities, and other adverse conditions.

Qualitative visual assessments or other semi-qualitative assessments may be used as secondary lines of evidence to support placement on the section 303(d) list. These types of assessments include fish kills or bird kills related to water quality conditions.

For adverse biological response related to sedimentation, the water segment shall be placed on the section 303(d) list if adverse biological response is identified and effects are associated with clean sediment loads in water or with loads stored in the channel. Waters shall be placed on the section 303(d) list if evaluation guidelines (satisfying the conditions of section 6.1.3) are exceeded using the binomial distribution as described in section 3.1.

3.9 Degradation of Biological Populations and Communities

A water segment shall be placed on the section 303(d) list if the water segment exhibits significant degradation in biological populations and/or communities as compared to reference site(s) and is associated with water or sediment concentrations of pollutants including but not limited to chemical concentrations, temperature, dissolved oxygen, and trash. This condition requires diminished numbers of species or individuals of a single species or other metrics when compared to reference site(s). The analysis should rely on measurements from at least two stations. Comparisons to reference site conditions shall be made during similar season and/or hydrologic conditions.

Association of chemical concentrations, temperature, dissolved oxygen, trash, and other pollutants shall be determined using sections 3.1, 3.2, 3.6, 3.7, 6.1.5.9, or other applicable sections.

For population or community degradation related to sedimentation, the water segment shall be placed on the section 303(d) list if degraded populations or communities are identified and effects are associated with clean sediment loads in water or with loads stored in the channel when compared to evaluation guidelines (satisfying the conditions of section 6.1.3) using the binomial distribution as described in section 3.1 or as compared to reference sites.

Bioassessment data used for listing decisions shall be consistent with section 6.1.5.8. For bioassessment, measurements at one stream reach may be sufficient to warrant listing provided that the impairment is associated with a pollutant(s) as described in this section.

3.10 Trends in Water Quality

A water segment shall be placed on the section 303(d) list if the water segment exhibits concentrations of pollutants or water body conditions for any listing factor that shows a trend of declining water quality standards attainment. This section is focused on addressing the antidegradation component of water quality standards and threatened waters as defined in 40 CFR 130.2(j) by identifying trends of declining water quality. Numeric, pollutant-specific water quality objectives need not be exceeded to satisfy this listing factor. In assessing trends in water quality RWQCBs shall:

1. Use data collected for at least three years;

2. Establish specific baseline conditions;
3. Specify statistical approaches used to evaluate the declining trend in water quality measurements;
4. Specify the influence of seasonal effects, interannual effects, changes in monitoring methods, changes in analysis of samples, and other factors deemed appropriate;
5. Determine the occurrence of adverse biological response (section 3.8), degradation of biological populations and communities (section 3.9), or toxicity (section 3.6); and
6. Assess whether the declining trend in water quality is expected to not meet water quality standards by the next listing cycle.

Waters shall be placed on the section 303(d) list if the declining trend in water quality is substantiated (steps 1 through 4 above) and impacts are observed (step 5).

3.11 Situation-Specific Weight of Evidence Listing Factor

When all other Listing Factors do not result in the listing of a water segment but information indicates non-attainment of standards, a water segment shall be evaluated to determine whether the weight of evidence demonstrates that a water quality standard is not attained. If the weight of evidence indicates non-attainment, the water segment shall be placed on the section 303(d) list.

When making a listing decision based on the situation-specific weight of evidence, the RWQCB must justify its recommendation by:

- Providing any data or information including current conditions supporting the decision;
- Describing in fact sheets how the data or information affords a substantial basis in fact from which the decision can be reasonably inferred;
- Demonstrating that the weight of evidence of the data and information indicate that the water quality standard is not attained; and
- Demonstrating that the approach used is scientifically defensible and reproducible.

TABLE 3.1: MINIMUM NUMBER OF MEASURED EXCEEDANCES NEEDED TO PLACE A WATER SEGMENT ON THE SECTION 303(D) LIST FOR TOXICANTS. *Null Hypothesis: Actual exceedance proportion $\leq$ 3 percent.* *Alternate Hypothesis: Actual exceedance proportion > 18 percent.* *The minimum effect size is 15 percent.*	
Sample Size	List if the number of exceedances equal or is greater than
2 – 24	2*
25 – 36	3
37 – 47	4
48 – 59	5
60 – 71	6
72 – 82	7
83 – 94	8
95 – 106	9
107 – 117	10
118 – 129	11

*Application of the binomial test requires a minimum sample size of 16. The number of exceedances required using the binomial test at a sample size of 16 is extended to smaller sample sizes.

For sample sizes greater than 129, the minimum number of measured exceedances is established where α and $\beta \leq 0.2$ and where $|\alpha - \beta|$ is minimized.

α = Excel® Function BINOMDIST(n-k, n, 1 – 0.03, TRUE)
β = Excel® Function BINOMDIST(k-1, n, 0.18, TRUE)
where n = the number of samples,
k = minimum number of measured exceedances to place a water on the section 303(d) list,
0.03 = acceptable exceedance proportion, and
0.18 = unacceptable exceedance proportion.

TABLE 3.2: MINIMUM NUMBER OF MEASURED EXCEEDANCES NEEDED TO PLACE A WATER SEGMENT ON THE SECTION 303(D) LIST FOR CONVENTIONAL OR OTHER POLLUTANTS.

Null Hypothesis: Actual exceedance proportion ≤ 10 percent.
Alternate Hypothesis: Actual proportion > 25 percent.
The minimum effect size is 15 percent.

Sample Size	List if the number of exceedances equal or is greater than
5 – 30	5*
31 – 36	6
37 – 42	7
43 – 48	8
49 – 54	9
55 – 60	10
61 – 66	11
67 – 72	12
73 – 78	13
79 – 84	14
85 – 91	15
92 – 97	16
98 – 103	17
104 – 109	18
110 – 115	19
116 – 121	20

*Application of the binomial test requires a minimum sample size of 26. The number of exceedances required using the binomial test at a sample size of 26 is extended to smaller sample sizes.

For sample sizes greater than 121, the minimum number of measured exceedances is established where α and $\beta \leq 0.2$ and where $|\alpha - \beta|$ is minimized.

α = Excel® Function BINOMDIST(n-k, n, 1 – 0.10, TRUE)
β = Excel® Function BINOMDIST(k-1, n, 0.25, TRUE)
where n = the number of samples,
k = minimum number of measured exceedances to place a water segment on section 303(d) list,
0.10 = acceptable exceedance proportion, and
0.25 = unacceptable exceedance proportion.

4 California Delisting Factors

This section provides the methodology for removing waters from the section 303(d) list (including the Water Quality Limited Segments category and Water Quality Limited Segments Being Addressed category).

All listings of water segments shall be removed from the section 303(d) list if the listing was based on faulty data, and it is demonstrated that the listing would not have occurred in the absence of such faulty data. Faulty data include, but are not limited to, typographical errors, improper quality assurance/quality control procedures, or limitations related to the analytical methods that would lead to improper conclusions regarding the water quality status of the segment.

If objectives or standards have been revised and the site or water meets water quality standards, the water segment shall be removed from the section 303(d) list. The listing of a segment shall be reevaluated if the water quality standard has been changed.

Any interested party may request an existing listing be reassessed under the delisting factors of this Policy. In requesting the reevaluation, the interested party must, using the delisting factors: state the reason(s) the listing is inappropriate and the Policy would lead to a different outcome; and provide the data and information necessary to enable the RWQCB and SWRCB to conduct the review.

Water segments or pollutants shall be removed from the section 303(d) list if any of the following conditions are met.

4.1 Numeric Water Quality Objectives, Criteria, or Standards for Toxicants in Water

Numeric water quality objectives for toxic pollutants, including maximum contaminant levels where applicable, or California/National Toxics Rule water quality criteria are not exceeded as follows:

- Using the binomial distribution, waters shall be removed from the section 303(d) list if the number of measured exceedances supports rejection of the null hypothesis as presented in Table 4.1.
- The binomial distribution cannot be used to support a delisting with sample sizes less than 28.

4.2 Numeric Water Quality Objectives for Conventional or Other Pollutants in Water

Numeric water quality objectives for conventional pollutants are not exceeded as follows:

- Using the binomial distribution, waters shall be removed from the section 303(d) list if the number of measured exceedances supports rejection of the null hypothesis as presented in Table 4.2.
- The binomial distribution cannot be used to support a delisting with sample sizes less than 26.

4.3 Numeric Water Quality Objectives for Bacteria in Water

Numeric water quality objectives or standards for bacteria are not exceeded using the binomial distribution as described in section 4.2. If a site-specific exceedance frequency was used to place the water on the section 303(d) list, then the same exceedance frequency shall be used in the assessment to remove waters from the section 303(d) list. To the extent possible and allowed by water quality objectives, RWQCBs shall identify one or more reference beaches or water segments in a relatively unimpacted watershed to compare the measurements.

4.4 Health Advisories

The health advisory used to list the water segment has been removed or the chemical or biological contaminant-specific evaluation guideline for tissue is no longer exceeded.

4.5 Bioaccumulation of Pollutants in Aquatic Life Tissue

Numeric pollutant-specific evaluation guidelines are not exceeded using the binomial distribution as described in section 4.1.

4.6 Water/Sediment Toxicity

Water/Sediment Toxicity or associated water or sediment quality guidelines are not exceeded using the binomial distribution as described in section 4.1.

4.7 Nuisance

The water segment no longer satisfies the conditions for a nuisance listing or associated numerical water or sediment data meets any one of the following:

4.7.1 Nutrient-related

For excessive algae growth, unnatural foam, odor, taste, applicable numerical nutrient-related evaluation guidelines are not exceeded using the binomial distribution as described in section 4.1.

4.7.2 Other Types

Acceptable numerical evaluation guidelines are not exceeded using the binomial distribution as described in sections 4.1 and 4.2 for color, oil sheen, turbidity, trash, taste, or odor not related to nutrients. These types of nuisance shall also be removed from the list when there is no significant nuisance condition when compared to reference conditions.

4.8 Adverse Biological Response

Adverse biological response is no longer evident or associated water or sediment numeric pollutant-specific evaluation guidelines are not exceeded using the binomial distribution as described in section 4.1.

4.9 Degradation of Biological Populations and Communities

Biological populations and communities degradation in the water segment is no longer evident as compared to reference site(s) or associated water or sediment numeric pollutant-specific evaluation guidelines are not exceeded using the binomial distribution as described in section 4.1.

4.10 Trends in Water Quality

The factors for assessing trends in water quality (section 3.10) are not substantiated (steps 1 through 4) or impacts are no longer observed (step 5).

4.11 Situation-Specific Weight of Evidence Delisting Factor

When all other Delisting Factors do not result in the delisting of a water segment but information indicates attainment of standards, a water segment shall be evaluated to determine whether the weight of evidence demonstrates that a water quality standard is attained. If the weight of evidence indicates attainment, the water segment shall be removed from the section 303(d) list. If warranted, a listing may be maintained if the weight of evidence indicates a water quality standard is not attained.

When making a delisting decision based on the situation-specific weight of evidence, the RWQCB must justify its recommendation by:

- Providing any data or information including current conditions supporting the decision;
- Describing in fact sheets how the data or information affords a substantial basis in fact from which the decision can be reasonably inferred;
- Demonstrating that the weight of evidence of the data and information indicates that the water quality standard is attained; and
- Demonstrating that the approach used is scientifically defensible and reproducible.

TABLE 4.1: MAXIMUM NUMBER OF MEASURED EXCEEDANCES ALLOWED TO REMOVE A WATER SEGMENT FROM THE SECTION 303(D) LIST FOR TOXICANTS. *Null Hypothesis: Actual exceedance proportion $\geq$ 18 percent.* *Alternate Hypothesis: Actual proportion < 3 percent of the samples* *The minimum effect size is 15 percent.*	
Sample Size	Delist if the number of exceedances equal or is less than
28 – 36	2
37 – 47	3
48 – 59	4
60 – 71	5
72 – 82	6
83 – 94	7
95 – 106	8
107 – 117	9
118 – 129	10

For sample sizes greater than 129, the maximum number of measured exceedances allowed is established where α and $\beta \leq 0.10$ and where $|\alpha - \beta|$ is minimized.

α = Excel® Function BINOMDIST(k, n, 0.18, TRUE)
β = Excel® Function BINOMDIST(n-k-1, n, 1 – 0.03, TRUE)
where n = the number of samples,
k = maximum number of measured exceedances allowed,
0.03 = acceptable exceedance proportion, and
0.18 = unacceptable exceedance proportion.

TABLE 4.2: MAXIMUM NUMBER OF MEASURED EXCEEDANCES ALLOWED TO REMOVE A WATER SEGMENT FROM THE SECTION 303(D) LIST FOR CONVENTIONAL OR OTHER POLLUTANTS. *Null Hypothesis: Actual exceedance proportion $\geq$ 25 percent.* *Alternate Hypothesis: Actual exceedance proportion < 10 percent.* *The minimum effect size is 15 percent.*	
Sample Size	Delist if the number of exceedances equal or is less than
26 – 30	4
31 – 36	5
37 – 42	6
43 – 48	7
49 – 54	8
55 – 60	9
61 – 66	10
67 – 72	11
73 – 78	12
79 – 84	13
85 – 91	14
92 – 97	15
98 – 103	16
104 – 109	17
110 – 115	18
116 – 121	19

For sample sizes greater than 121, the maximum number of exceedances allowed is established at α and $\beta \leq 0.2$ and where $|\alpha - \beta|$ is minimized.

α = Excel® Function BINOMDIST(k, n, 0.25, TRUE)
β = Excel® Function BINOMDIST(n-k-1, n, 1 – 0.1, TRUE)
where n = the number of samples,
k = maximum number of measured exceedances allowed,
0.10 = acceptable exceedance proportion, and
0.25 = unacceptable exceedance proportion.

5 TMDL Scheduling

A schedule shall be established by the RWQCBs and SWRCB for waters on the section 303(d) list that identifies the TMDLs that will be established within the current listing cycle and the number of TMDLs scheduled to be developed thereafter.

For water quality limited segments needing a TMDL, RWQCBs shall develop a completion schedule in compliance with federal law and regulation based on, but not limited to, the following criteria:

- Water body significance (such as importance and extent of beneficial uses, threatened and endangered species concerns, and size of water body);
- Degree that water quality objectives are not met or beneficial uses are not attained or threatened (such as the severity of the pollution or number of pollutants/stressors of concern) [40 CFR 130.7(b)(4)];
- Degree of impairment;
- Potential threat to human health and the environment;
- Water quality benefits of activities ongoing in the watershed;
- Potential for beneficial use protection and recovery;
- Degree of public concern;
- Availability of funding; and
- Availability of data and information to address the water quality problem.

All water body-pollutant combinations on the section 303(d) list shall be assigned a TMDL schedule date.

6 Policy Implementation

This section provides SWRCB guidance on implementation of this Policy. The most recently completed section 303(d) list shall form the basis for any subsequent lists.

6.1 Process for Evaluation of Readily Available Data and Information

All readily available data and information shall be evaluated. To develop the section 303(d) list the RWQCBs and SWRCB shall use the following process.

6.1.1 Definition of Readily Available Data and Information

RWQCBs and SWRCB shall actively solicit, assemble, and consider <u>all</u> readily available data and information. Data and information that shall be reviewed include, but are not limited to: submittals resulting from the solicitation, selected data possessed by the RWQCBs, and other sources. At a minimum, readily available data and information includes paper and electronic copies of:

- The most recent section 303(d) list, and the most recent section 305(b) report;
- Drinking water source assessments;
- Municipal Separate Storm Sewer System (MS4) reports;
- Information on water quality problems in documents prepared to satisfy Superfund and Resource Conservation and Recovery Act requirements;
- Fish and shellfish advisories, beach postings and closures, or other water quality-based restrictions;
- Reports of fish kills, cancers, lesions or tumors;
- Dilution calculations, trend analyses, or predictive models for assessing the physical, chemical, or biological condition of streams, rivers, lakes, reservoirs, estuaries, coastal lagoons, or the ocean;
- Applicable water quality data and information from SWAMP, USEPA's Storage and Retrieval Database Access (STORET) or other USEPA databases and information sources, the Bay-Delta Tributaries Database, Southern California Coastal Water Research Project, and the San Francisco Estuary Regional Monitoring Program; and
- Water quality problems and existing and readily available water quality data and information reported by local, state and federal agencies (including receiving water monitoring data from discharger monitoring reports), citizen monitoring groups, academic institutions, and the public. The Federal agencies that shall be actively solicited for data and information include but are not limited to: U.S. Department of Agriculture, National Oceanic and Atmospheric Administration, U.S. Geological Survey, and U.S. Fish and Wildlife Service.

6.1.2 Administration of the Listing Process

6.1.2.1 Solicitation of All Readily Available Data and Information

SWRCB and RWQCBs shall seek all readily available data and information on the quality of surface waters of the State. Readily available data and information shall be solicited from any interested party, including but not limited to, private citizens, public agencies, state and federal governmental agencies, non-profit organizations, and businesses possessing data and information regarding the quality of the Region's waters.

Though the SWRCB and RWQCBs must specifically solicit all readily available data and assessment information, SWRCB and RWQCB may place emphasis in the solicitation on the data and information generated since the last listing cycle. For the purposes of this solicitation, information means any documentation describing the water quality condition of a surface water body. Data are considered a subset of information that consists of reports detailing measurements of specific environmental characteristics. The data and information may pertain to physical, chemical, and/or biological conditions of the State's waters or watersheds.

Information solicited should contain the following:

- The name of the person or organization providing the information;
- The name of the person certifying the completeness and accuracy of the data and information and a statement describing the standards exceedance;
- Mailing address, telephone numbers, and email address of a contact person for the information provided;
- A copy of all information provided. The submittal must specify the software used to format the information and provide definitions for any codes or abbreviations used;
- Bibliographic citations for all information provided; and
- If computer model outputs are included in the information, provide bibliographic citations and specify any calibration and quality assurance information available for the model(s) used.

Data solicited should contain the following:

- Data in electronic form, spreadsheet, database, or ASCII formats. The submittal should use the SWAMP data format and should define any codes or abbreviations used in the database.
- Metadata for the field data, i.e., when measurements were taken, locations, number of samples, detection limits, and other relevant factors.
- Metadata for any Geographical Information System data must be included. The metadata must detail all the parameters of the projection, including datum.
- A copy of the quality assurance procedures.
- A copy of the data.
- Data from citizen volunteer water quality monitoring efforts require the name of the group and indication of any training in water quality assessment completed by members of the group. Data submitted by citizen monitoring groups should meet the data quality assurance procedures as detailed in section 6.1.4.
- For photographic documentation, adhere to the guidelines detailed in section 6.1.4.

Data and information previously submitted to RWQCBs, such as Discharge Monitoring Reports, need not be solicited if the data and information are remain available to RWQCBs.

6.1.2.2 RWQCB Fact Sheet Preparation

When data and information are available, each RWQCB shall prepare a standardized fact sheet for each water and pollutant combination that is proposed for inclusion in or deletion from the section 303(d) list. Fact sheets shall present a description of the line(s) of evidence used to support each component of the weight of evidence approach. Fact sheets shall be prepared for all data and information solicited. If the data and information reviewed indicate standards are attained, a single fact sheet may address multiple water and pollutant combinations.

The fact sheets shall contain the following:

A. Region
B. Type of water body (Bay and Harbors, Coastal Shoreline, Estuary, Lake/Reservoir, Ocean, Rivers/Stream, Saline Lake, Tidal Wetlands, Freshwater Wetland)
C. Name of water body segment (including Calwater watershed)
D. Pollutant or type of pollution that appears to be responsible for standards exceedance
E. Medium (water, sediment, tissue, habitat, etc.)
F. Water quality standards (copy applicable water quality standard, objective, or criterion from appropriate plan or regulation) including:
    1. Beneficial use affected
    2. Numeric water quality objective/water quality criteria plus metric (single value threshold, mean, median, etc.) <u>or</u> narrative water quality objective plus guideline(s) used to interpret attainment or non-attainment
    3. Antidegradation considerations (if applicable to situation)
    4. Any other provision of the standard used
G. Brief Watershed Description (e.g., land use, precipitation patterns, or other factors considered in the assessment)
H. Summary of data and/or information
    1. Spatial representation, area that beneficial use is affected or determined to be supported, including a map, any site specific information, and reference condition
    2. Temporal representation
    3. Age of data and/or information
    4. Effect of seasonality and events/conditions that might influence data and/or information evaluation (e.g., storms, flow conditions, laboratory data qualifiers, etc.)
    5. Number of samples or observations
    6. Number of samples or observations exceeding guideline or standard
    7. Source of or reference for data and/or information
I. For numeric data include:
    1. Quality assurance assessment
J. For non-numeric data include:
    1. Types of observations
    2. Perspective on magnitude of problem
    3. Numeric indices derived from qualitative data
K. Potential source of pollutant (the source category should be identified as specifically as possible)
L. Program(s) addressing the problem, if known

M. Data evaluation as required by sections 3 or 4 of this Policy
N. Recommendation
O. TMDL schedule (developed only for the section 303(d) list as required by section 5 of this Policy).

6.1.3 Evaluation Guideline Selection Process

Narrative water quality objectives shall be evaluated using evaluation guidelines. When evaluating narrative water quality objectives or beneficial use protection, RWQCBs and SWRCB shall identify evaluation guidelines that represent standards attainment or beneficial use protection. The guidelines are not water quality objectives and shall only be used for the purpose of developing the section 303(d) list.

To select an evaluation guideline, the RWQCB or SWRCB shall:

- Identify the water body, pollutants, and beneficial uses;
- Identify the narrative water quality objectives or applicable water quality criteria;
- Identify the appropriate interpretive evaluation guideline that potentially represents water quality objective attainment or protection of beneficial uses. If this Policy requires evaluation values to be used as one line of evidence, the evaluation value selected shall be used in concert with the other required line(s) of evidence to support the listing or delisting decision. Depending on the beneficial use and narrative standard, the following considerations shall be used in the selection of evaluation guidelines:

  1. Sediment Quality Guidelines for Marine, Estuarine, and Freshwater Sediments: RWQCBs may select sediment quality guidelines that have been published in the peer-reviewed literature or by state or federal agencies. Acceptable guidelines include selected values (e.g., effects range-median, probable effects level, probable effects concentration), and other sediment quality guidelines. Only those sediment guidelines that are predictive of sediment toxicity shall be used (i.e., those guidelines that have been shown in published studies to be predictive of sediment toxicity in 50 percent or more of the samples analyzed).

  2. Evaluation Guidelines for Protection from the Consumption of Fish and Shellfish: RWQCBs may select evaluation guidelines published by USEPA or OEHHA. Maximum Tissue Residue Levels (MTRLs) and Elevated Data Levels (EDLs) shall not be used to evaluate fish or shellfish tissue data.

  3. Evaluation Guidelines for Protection of Aquatic Life from Bioaccumulation of Toxic Substances: RWQCBs may select the evaluation values for the protection of aquatic life published by the National Academy of Science.

  For other parameters, evaluation guidelines may be used if it can be demonstrated that the evaluation guideline is:

  - Applicable to the beneficial use
  - Protective of the beneficial use

- Linked to the pollutant under consideration
- Scientifically-based and peer reviewed
- Well described
- Identifies a range above which impacts occur and below which no or few impacts are predicted. For non-threshold chemicals, risk levels shall be consistent with comparable water quality objectives or water quality criteria.

RWQCBs shall assess the appropriateness of the guideline in the hydrographic unit. Justification for the alternate evaluation guidelines shall be referenced in the water body fact sheet.

6.1.4 Data Quality Assessment Process

Even though all data and information must be used, the quality of the data used in the development of the section 303(d) list shall be of sufficient high quality to make determinations of water quality standards attainment. Data supported by a Quality Assurance Project Plan (QAPP) pursuant to the requirements of 40 CFR 31.45 are acceptable for use in developing the section 303(d) list.

The data from major monitoring programs in California and published U.S. Geological Survey (USGS) reports are considered of adequate quality. The major programs include SWAMP, the Southern California Bight Projects of the Southern California Coastal Water Research Project, USEPA's Environmental Monitoring and Assessment Program, the Regional Monitoring Program of the San Francisco Estuary Institute, and the BPTCP.

Numeric data are considered credible and relevant for listing purposes if the data set submitted meets the minimum quality assurance/quality control requirements outlined below. A QAPP or equivalent documentation must be available containing, at a minimum, the following elements:

- Objectives of the study, project, or monitoring program;
- Methods used for sample collection and handling;
- Field and laboratory measurement and analysis;
- Data management, validation, and recordkeeping (including proper chain of custody) procedures;
- Quality assurance and quality control requirements;
- A statement certifying the adequacy of the QAPP (plus name of person certifying the document); and
- A description of personnel training.

A site-specific or project-specific sampling and analysis plan for numeric data should also be available containing:

- Data quality objectives or requirements of the project;
- A statement that data quality objectives or requirements were achieved;
- Rationale for the selection of sampling sites, water quality parameters, sampling frequency and methods that assure the samples are spatially and temporally representative of the surface water and representative of conditions within the targeted sampling timeframe; and

- Documentation to support the conclusion that results are reproducible.

The RWQCBs shall make a finding in the fact sheets on the availability of the QAPP (or equivalent), adequacy of data collection, analysis practices, and adequacy of the data verification process (including the chain of custody, detection limits, holding times, statistical treatment of data, precision and bias, etc). If any data quality objectives or requirements in the QAPP are not met, the reason for not meeting them and the potential impact on the overall assessment shall be documented.

Data without rigorous quality control can be used in combination with high quality data and information. If the data collection and analysis is not supported by a QAPP (or equivalent) or if it is not possible to tell if the data collection and analysis were supported by a QAPP (or equivalent), then the data and information should not be used by itself to support listing or delisting of a water segment. All data of whatever quality can be used as part of a weight of evidence determination (sections 3.11 or 4.11).

For narrative and qualitative submittals, the submission must:

- describe events or conditions that indicate impacts on water quality;
- provide linkage between the measurement endpoint (e.g., a study that may have been performed for some other purpose) and the water quality standard of interest;
- be scientifically defensible;
- provide analyst's credentials and training; and
- be verifiable by SWRCB or RWQCB.

For photographic documentation, the submission must:

- identify the date;
- identify location on a general area map;
- either mark location on a USGS 7.5 minute quad map along with quad sheet name or provide location latitude/longitude;
- provide a thorough description of photograph(s);
- describe the spatial and temporal representation of the photographs;
- provide linkage between photograph-represented condition and condition that indicates impacts on water quality;
- provide photographer's rationale for area photographed and camera settings used; and
- be verifiable by SWRCB and RWQCB.

6.1.5 Data Quantity Assessment Process

Before determining if water quality standards are exceeded, RWQCBs have wide discretion establishing how data and information are to be evaluated, including the flexibility to establish water segmentation, as well as the scale of spatial and temporal data and information that are to be reviewed. The following considerations shall be documented in each water body fact sheet.

6.1.5.1 Water Body Specific Information
Data used to assess water quality standards attainment should be actual data that can be quantified and qualified. Information that is descriptive, estimated, modeled, or projected may be used as ancillary lines of evidence for listing or delisting decisions. In order to be used in developing the lists:

- Data must be measured at one or more sites in the water segment;
- If applicable and available, environmental conditions in a water body or at a site must be taken into consideration (e.g., effects of seasonality, events such as storms, the occurrence of wildfires, land use practices, etc.); and
- The fact sheet shall contain a description of readily available pertinent factors such as the depth of water quality measurements, flow, hardness, pH, the extent of tidal influence, and other relevant sample- and water body-specific factors.

6.1.5.2 Spatial Representation
Samples should be representative of the water body segment. To the extent possible, samples should represent statistically or in a consistent targeted manner the segment of the water body.

Samples collected within 200 meters of each other should be considered samples from the same station or location. However, samples less than 200 meters apart may be considered to be spatially independent samples if justified in the water body fact sheet.

6.1.5.3 Temporal Representation
Samples should be representative of the critical timing that the pollutant is expected to impact the water body. Samples used in the assessment must be temporally independent. If the majority of samples were collected on a single day or during a single short-term natural event (e.g., a storm, flood, or wildfire), the data shall not be used as the primary data set supporting the listing decision.

Documentation should include the time of day in which the sample was taken, and, to the extent possible, the critical season for the pollutant and applicable water quality standard. In general, samples should be available from two or more seasons or from two or more events when effects or water quality objective exceedances would be expected to be clearly manifested.

Sampling ephemeral waters, during a specific season, or during human-caused events (except spills) should be used to assess significant pollutant-related exceedances of water quality standards. Timing of the sampling should include the critical season for the pollutant and applicable water quality standard. If the implementation of a management practice(s) has resulted in a change in the water body segment, only recently collected data [since the implementation of the management measure(s)] should be considered. The water quality fact sheet should describe the significance of the sample timing.

6.1.5.4 Aggregation of Data by Reach/Area
At a minimum, data shall be aggregated by the water body segments as defined in the Basin Plans. In the absence of a Basin Plan segmentation system, the RWQCBs should define distinct reaches based on hydrology and relatively homogeneous land use.

If available data suggest that a pollutant may cause an excursion above a water quality objective, the RWQCB should, to the extent information is readily available, identify land uses, subwatersheds, tributaries, or dischargers that could be contributing the pollutant to the water body. The RWQCBs should identify stream reaches or lake/estuary areas that may have different pollutant levels based on significant differences in land use, tributary inflow, or discharge input. Based on these evaluations of the water body setting, RWQCBs should aggregate the data by appropriate reach or area.

Data must be measured at one or more sites in the water segment in order to place a water segment on the section 303(d) list.

6.1.5.5 Quantitation of Chemical Concentrations

When available data are less than or equal to the quantitation limit and the quantitation limit is less than or equal to the water quality standard, the value will be considered as meeting the water quality standard, objective, criterion, or evaluation guideline.

When the sample value is less than the quantitation limit and the quantitation limit is greater than the water quality standard, objective, criterion, or evaluation guideline, the result shall not be used in the analysis.

The quantitation limit includes the minimum level, practical quantitation level, or reporting limit.

6.1.5.6 Evaluation of Data Consistent with the Expression of Numeric Water Quality Objectives, Water Quality Criteria, or Evaluation Guidelines

If the water quality objectives, criteria, or guidelines state a specific averaging period and/or mathematical transformation, the data should be evaluated in a consistent manner prior to conducting any statistical analysis for placement of the water on the section 303(d) list. If sufficient data are not available for the stated averaging period, the available data shall be used to represent the averaging period.

To be considered temporally independent, samples collected during the averaging period shall be combined and considered one sampling event. For data that is not temporally independent (e.g., when multiple samples are collected at a single location on the same day), the measurements shall be combined and represented by a single resultant value. For dissolved oxygen measurements, the minimum value shall be used to determine compliance with the water quality objective. For pH measurements, the minimum or maximum values of the data set shall be used to determine compliance with the water quality objective.

If the averaging period is not stated for the standard, objective, criterion, or evaluation guideline, then the samples collected less than 7 days apart shall be averaged.

6.1.5.7 Binomial Model Statistical Evaluation

Once data have been summarized, RWQCBs shall determine if standards are exceeded. The RWQCBs shall determine for each averaging period which data points exceed water quality standards. The number of measurements that exceed standards shall be reported in the water body fact sheet.

When numerical data are evaluated, all of the following steps shall be completed:

A. For each data point representing the averaging period, the RWQCB shall answer the question: Are water quality standards met?

B. If the measurement is greater than the water quality standard, objective, criterion, or evaluation guideline, then the standard is exceeded.

C. Sum the number of samples exceeding the standard, objective, criterion, or evaluation guideline.

D. Sum the total number of measurements (sample population).

E. Compare the result to the appropriate table (i.e., Tables 3.1, 3.2, 4.1, or 4.2).

F. Report the result of this comparison in the water body fact sheet.

6.1.5.8 Evaluation of Bioassessment Data

When evaluating biological data and information, RWQCBs shall evaluate all readily available data and information and shall:

- Identify appropriate reference sites within water segments, watersheds, or ecoregions. Document methods for selection of reference sites.
- Evaluate bioassessment data at reference sites using water segment-appropriate method(s) and index period(s). Document sampling methods, index periods, and Quality Assurance/Quality Control procedures for the habitat being sampled and question(s) being asked.
- Evaluate bioassessment data from other sites, and compare to reference conditions. Evaluate physical habitat data and other water quality data, when available, to support conclusions about the status of the water segment.
- Calculate biological metrics for reference sites and develop Index of Biological Integrity if possible.

6.1.5.9 Evaluation of Temperature Data

Temperature water quality objectives shall be evaluated as described in sections 6.1.5.1 through 6.1.5.7. When "historic" or "natural" temperature data are not available, alternative approaches shall be employed to assess temperature impacts.

In the absence of necessary data to interpret numeric water quality objectives, recent temperature monitoring data shall be compared to the temperature requirements of aquatic life in the water segment. In many cases, fisheries, particularly salmonids, represent the beneficial uses most sensitive to temperature. Information on current and historic conditions and distribution of sensitive beneficial uses (e.g., fishery resources) in the water segment is necessary, as well as recent temperature data reflective of conditions experienced by the most sensitive life stage of the aquatic life species. If temperature data from past (historic) periods corresponding to times when the beneficial use was fully supported are not available, information about presence/absence or abundance of sensitive aquatic life species shall be used to infer past (historic) temperature conditions if loss of habitat, diversions, toxic spills, and other factors are also considered.

Determination of life stage temperature requirements of sensitive aquatic life species shall be based on peer-reviewed literature. Similarly, evaluation of temperature data shall be based on temperature metrics reflective of the temperature requirements for the sensitive aquatic life species, including but not limited to, the maximum weekly average temperature and upper lethal limit.

6.2 RWQCB Approval

At a public hearing, the RWQCB shall consider and approve each proposed list change as documented in water body fact sheet. Advance notice and opportunity for public comment shall be provided. RWQCB shall develop written responses to all comments. After consideration of all testimony, RWQCBs shall approve a resolution in support of their recommendations for the section 303(d) list. RWQCBs shall submit to SWRCB the water body fact sheets, responses to comments, documentation of the hearing process, and a copy of <u>all</u> data and information considered. For the 2004 section 303(d) list, RWQCB approval of list changes is not required.

6.3 SWRCB Approval

During the development of the 2004 section 303(d) list, SWRCB shall perform all tasks required by this Policy.

Subsequent to the 2004 listing cycle, SWRCB shall evaluate RWQCB-developed water body fact sheets for completeness, consistency with this Policy, and consistency with applicable law. The SWRCB shall assemble the fact sheets and consolidate all the RWQCB lists into the statewide section 303(d) list.

Before the adoption of the section 303(d) list, the SWRCB shall hold a public workshop. Advance notice and opportunity for public comment shall be provided. Requests for review of specific listing decisions must be submitted to the SWRCB within 30 days of the RWQCB's decision. The SWRCB shall consider changes only to waters that are requested for review unless the SWRCB, on its own motion, decides to consider recommendations on other waters. Subsequent to the workshop, the SWRCB shall approve the section 303(d) list at a Board Meeting. The approved section 303(d) list and the supporting fact sheets shall be submitted to USEPA for approval as required by the Clean Water Act.

7 Definitions

α (Alpha) is the statistical error of rejecting a null hypothesis that is true. This type of error is also called Type I error.

ALTERNATE HYPOTHESIS is a statement or claim that a statistical test is set up to establish.

β (Beta) is the statistical error of failing to reject a null hypothesis that is not true. This type of error is also called Type II error.

BINOMDIST is an Excel® function that is used to calculate the cumulative binomial distribution.

BINOMIAL DISTRIBUTION is a mathematical distribution that describes the probabilities associated with the possible number of times particular outcomes will occur in series of observations (i.e., samples). Each observation may have only one of two possible results (e.g., standard exceeded or standard not exceeded).

BIOACCUMULATION is the process by which a chemical is taken up by an organism from its surrounding medium through gill membranes, epithelial tissue, or from food and subsequently concentrated and retained in the body of the organism.

BIOASSESSMENT is an assessment of biological community information along with measures of the physical/habitat quality to determine, in the case of water quality, the integrity of a water body of interest.

CONVENTIONAL POLLUTANTS include dissolved oxygen, pH, and temperature.

DIEL measurements pertain to measurements taken over a 24-hour period of time.

EFFECT SIZE is maximum magnitude of exceedance frequency that is tolerated.

NULL HYPOTHESIS is a statement used in statistical testing that has been put forward either because it is believed to be true or because it is to be used as a basis for argument, but has not been proved.

RANK CORRELATION is the association between paired values of two variables that have been replaced by their ranks within their respective samples (e.g., chemical measurements and response in a toxicity test).

REFERENCE CONDITION refers to the characteristics of water body segments least impaired by human activities. As such, reference conditions can be used to describe attainable biological or habitat conditions for water body segments with common watershed/catchment characteristics within defined geographical regions.

STATISTICAL SIGNIFICANCE occurs when it can be demonstrated that the probability of obtaining a difference by chance only is relatively low.

TOXICANTS include priority pollutants, metals, chlorine, and nutrients.

TOXICITY IDENTIFICATION EVALUATION (TIE) is a technique to identify the unexplained cause(s) of toxic events. TIE involves selectively removing classes of chemicals through a series of sample manipulations, effectively reducing complex mixtures of chemicals in natural waters to simple components for analysis. Following each manipulation the toxicity of the sample is assessed to see whether the toxicant class removed was responsible for the toxicity.

WATER QUALITY LIMITED SEGMENT is any segment of a water body where it is known that water quality does not meet applicable water quality standards, and/or is not expected to meet applicable water quality standards, even after application of technology-based effluent limitations required by CWA sections 301(d) or 306.

10			**Step 3**	Determine Combined Risk Level		

	A	B	C
1	**Sediment Risk Factor Worksheet**		**Entry**
2	**A) R Factor**		
3	Analyses of data indicated that when factors other than rainfall are held constant, soil loss is directly proportional to a rainfall factor composed of total storm kinetic energy (E) times the maximum 30-min intensity (I30) (Wischmeier and Smith, 1958). The numerical value of R is the average annual sum of EI30 for storm events during a rainfall record of at least 22 years. "Isoerodent" maps were developed based on R values calculated for more than 1000 locations in the Western U.S. Refer to the link below to determine the R factor for the project site.		
4	http://cfpub.epa.gov/npdes/stormwater/LEW/lewCalculator.cfm		
5	**R Factor Value**		16.56
6	**B) K Factor (weighted average, by area, for all site soils)**		
7	The soil-erodibility factor K represents: (1) susceptibility of soil or surface material to erosion, (2) transportability of the sediment, and (3) the amount and rate of runoff given a particular rainfall input, as measured under a standard condition. Fine-textured soils that are high in clay have low K values (about 0.05 to 0.15) because the particles are resistant to detachment. Coarse-textured soils, such as sandy soils, also have low K values (about 0.05 to 0.2) because of high infiltration resulting in low runoff even though these particles are easily detached. Medium-textured soils, such as a silt loam, have moderate K values (about 0.25 to 0.45) because they are moderately susceptible to particle detachment and they produce runoff at moderate rates. Soils having a high silt content are especially susceptible to erosion and have high K values, which can exceed 0.45 and can be as large as 0.65. Silt-size particles are easily detached and tend to crust, producing high rates and large volumes of runoff. Use Site-specific data must be submitted.		
8	Site-specific K factor guidance		
9	**K Factor Value**		0.15
10	**C) LS Factor (weighted average, by area, for all slopes)**		
11	The effect of topography on erosion is accounted for by the LS factor, which combines the effects of a hillslope-length factor, L, and a hillslope-gradient factor, S. Generally speaking, as hillslope length and/or hillslope gradient increase, soil loss increases. As hillslope length increases, total soil loss and soil loss per unit area increase due to the progressive accumulation of runoff in the downslope direction. As the hillslope gradient increases, the velocity and erosivity of runoff increases. Use the LS table located in separate tab of this spreadsheet to determine LS factors. Estimate the weighted LS for the site prior to construction.		
12	LS Table

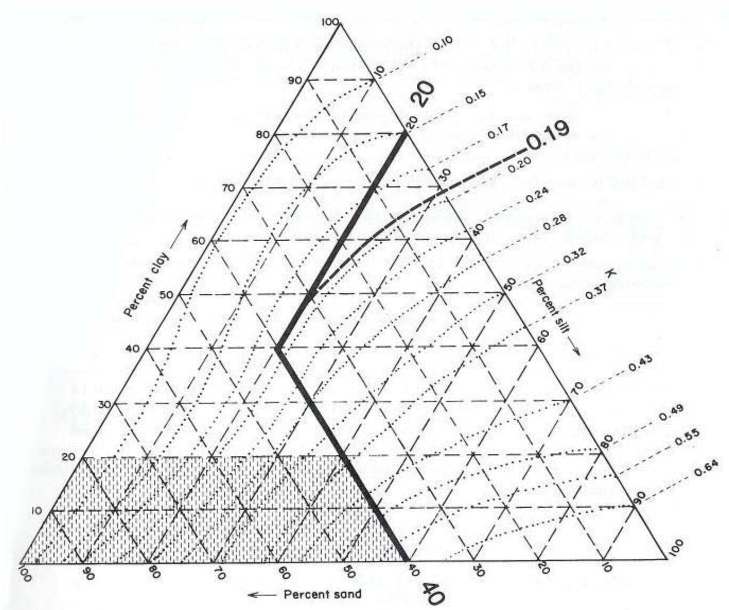
Soil Erodibility Factor (K)

The K factor can be determined by using the nomograph method, which requires that a particle size analysis (ASTM D-422) be done to determine the percentages of sand, very fine sand, silt and clay. Use the figure below to determine appropriate K value.



Erickson triangular nomograph used to estimate soil erodibility (K) factor.
The figure above is the USDA nomograph used to determine the K factor for a soil, based on its texture (% silt plus very fine sand, % sand, % organic matter, soil structure, and permeability). *Nomograph from Erickson 1977 as referenced in Goldman et. al., 1986.*

1.0 INTRODUCTION

This Dust Control and Air Monitoring Plan (DCAMP) has been prepared to support the Tetra Tech EC, Inc. (TtEC) remedial action (RA) at Installation Restoration (IR) Site 2 at Alameda Point, Alameda, California. TtEC has been contracted by the Department of the Navy (DON) to develop and implement this RA for the Base Realignment and Closure Program Management Office West under Naval Facilities Engineering Command Southwest Contract No. N62473-10-D-0809.

The DON is directing the RA in accordance with the requirements of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and the National Oil and Hazardous Substances Pollution Contingency Plan. According to Section 121(e) of CERCLA, permits are not required for on-site activities associated with a CERCLA action. Therefore, no permits that potentially relate to air quality protection or air monitoring will be prepared or submitted for the RA. However, the substantive provisions of permits that would otherwise be required for a non-CERCLA action will be adhered to during the project. Specifically, the site is located within the jurisdiction of the Bay Area Air Quality Management District (BAAQMD). While no BAAQMD permits are required or will be obtained, the RA project will meet the substantive aspects of BAAQMD air quality permitting requirements.

The final Record of Decision (ROD) for IR Site 2 was approved by the DON, U.S. Environmental Protection Agency, California Environmental Protection Agency, and the San Francisco Bay Regional Water Quality Control Board (DON 2010). The soil remedy selected for IR Site 2 in the approved final ROD consists of installation of a multilayer soil cover to isolate buried waste and soil contaminants and to prevent animal burrowing.

This DCAMP is to be used in conjunction with Remedial Action Work Plan (RAWP) and in the Radiological Work Plan (Attachment 2 to the RAWP). All radiological aspects will be implemented in close coordination with the Naval Sea Systems Detachment Radiological Affairs Support Office (RASO).

This page intentionally left blank.

2.0 PROJECT BACKGROUND

The location, general site features, and history of IR Site 2 are described in Section 2.0 of the RAWP. The activities to implement the RA are included in Section 5.0 of the RAWP. The site location is shown on Figure 1-1 and site features are shown on Figure 2-2 of the RAWP. Design drawings and specifications are included in the 100% Remedial Design (Attachment 1 to the RAWP). Radiological control and monitoring during implementation of the RA are discussed in the Radiological Work Plan (Attachment 2 to the RAWP) and the Radiation Protection Plan (Attachment 3 to the RAWP).

2.1 CLIMATE

Average daily temperature at Alameda Point ranges from approximately 51 degrees Fahrenheit (ºF) in December and January to approximately 66 ºF in August and September. Alameda Island's mean annual precipitation is approximately 23 inches, with the majority of the precipitation occurring between October and April. There is generally little precipitation during the summer months and intermittent rain during the winter months. In the Alameda Point area, winds are predominantly from the west to northwest. Generally, prevailing winds are most evident in the late spring, summer, and early fall, with more variable winds in winter. The winter wind pattern is influenced by storms that track generally from north to south, which can result in winds from the east or southeast (FWENC 2002). A windrose diagram for the Alameda Point area is included as Figure 2-1.

2.2 PROJECT DESCRIPTION

To achieve the project Remedial Action Objectives, the scope of the selected remedy in the approved final ROD for IR Site 2 (DON 2010) includes a multilayer soil cover, engineering and institutional controls, and monitoring. This alternative consists of installation of an engineered soil cover over the former landfill to isolate buried waste and soil contaminants and prevent animal burrowing; implementation of engineering and land use controls to protect human health and soil cover integrity; provision for any necessary wetlands mitigation if impacts to wetlands occur; monitoring the soil cleanup action and wetlands mitigation to ensure their proper construction and long-term effectiveness; and conduct of methane gas monitoring as necessary.

This page intentionally left blank.

3.0 DUST CONTROL

Two forms of dust control will be implemented at the site during the IR Site 2 RA project. Specifically, dust prevention will be proactively practiced in areas of the site where potential radiologically impacted sediment and soil are staged or handled. Dust prevention for these areas will be implemented through engineering practices accompanied by in situ moisture content monitoring, airborne dust and radioactivity monitoring, and mitigation contingencies.

In areas where nonimpacted sediment and soil will be staged or handled, and generally across other portions of the site, dust control will be implemented through engineering practices and routine airborne dust monitoring. Dust monitoring for these portions of the site will also be accompanied by mitigation contingencies. Monitoring in support of the dust control plan is described in Section 4.0, and mitigation contingencies are described in Section 5.0.

3.1 POTENTIAL SOURCES OF FUGITIVE DUST

Site activities have the potential to generate air emissions in the form of fugitive dust. Possible sources of emissions include the following activities:

- Construction Traffic – Movement of construction equipment around the construction areas is capable of creating construction emissions in excavated or cleared areas.
- Site Preparation – Vegetation removal will increase the potential for fugitive dust emissions through wind erosion.
- Excavation – Removal of soil from the ground and loading it either onto screening pads or into waiting vehicles could cause fugitive dust emissions.
- Material Stockpiles – Import soils or on-site soil that has been cleared of radioactivity may be stockpiled prior to being used as backfill. Soil will be loaded into trucks for stockpiling or direct site placement. Fugitive emissions during stockpiling and truck loading, as well as wind erosion, are possible.

3.2 DUST PREVENTION

Dust prevention in the areas of the site where potential radiologically impacted sediment and soil are staged or handled will be accomplished primarily by maintaining the material in a sufficiently moist condition to eliminate the potential for dust generation. The areas of the site where potential radiologically impacted sediment and soil will be staged or handled include debris staging/screening pads, radiological sediment holding pads, rejected waste screening pads, and associated decontamination pads.

The approach to dust prevention will be proactive as opposed to reactive. Dust generation is significantly reduced at moisture levels as low as 1 to 5 percent and is nearly negligible at levels of 10 percent or higher. Accordingly exposed areas where dust could be generated will be monitored for moisture.

3.3 DUST CONTROL MEASURES

General dust control measures identified below will also be implemented across the site:

- Water trucks will be dedicated to IR Site 2 remedial action operations.
- Active construction areas outside the dewatering and radiological screening pads will be watered at a minimum of twice daily and more often during windy conditions that generate visible dust.
- Soil will be wetted prior to excavation activities to reduce dust migration. Additional water will be added during active excavation, material handling, and loading on an as-needed basis. Active excavation areas will be wetted every 2 hours during periods of dry weather or in windy conditions that generate visible dust. A water truck or water buffalo shall be dedicated to excavation and removal operations.
- The area subject to excavation and other construction activity will be limited at any one time. A soil tackifier (SoilTac or equivalent) stabilizer will be applied to on-site storage piles of soil or sediments.
- The height from which excavated soil is dropped either to trucks, stockpiles, or pads will be minimized.
- Truck traffic shall be minimized to the shortest haul routes from the work areas, screening yard, and stockpile areas.
- Chemical soil stabilizer will be applied in sufficient quantities to disturbed areas so as to create a stabilized surface.
- Backfill materials will be wetted on an as-needed basis to maintain moisture. Loader buckets will be emptied slowly and drop height from loader bucket minimized.
- A chemical soil stabilizer will be applied to backfill material and storage piles when not actively handled (i.e., no activity in 7 days).
- All trucks hauling loose materials will have at least 1 foot of freeboard.
- All paved access roads, parking areas, and staging areas will be swept (with water sweepers; dry sweepers will not be used to avoid the potential of dust generation), and streets will be swept daily if visible soil material is deposited onto the adjacent roads.
- Traffic speeds on roads will be limited to 15 miles per hour (mph).
- Field work with heavy equipment will not proceed when wind conditions are in excess of 25 mph.

Sediment handling activities will be suspended if high winds produce visible dust clouds that extend beyond the construction site.

4.0 MONITORING

In support of the dust control and overall radiological control program during the IR Site 2 RA, monitoring will be conducted for ambient dust and airborne radioactive particulate concentrations. Air monitoring for airborne radioactive particulates will be conducted in accordance with TtEC's Standard Operating Procedure (SOP) 9 (See the Radiological Work Plan, Attachment 2 to the RAWP, for reference).

4.1 AIR MONITORING

Air monitoring is performed to ensure worker and associated Alameda Point personnel safety in accordance with approved air sampling methodologies. The current RA plans at IR Site 2 minimizes hazards associated with the chemicals and radionuclides of interest for the IR Site 2 sediment by minimizing excavations in known waste areas. No material hazard of chemical or radiological exposure is expected in ambient air itself based on the site history; however, personnel monitoring during any excavation work will be conducted by the Site Safety and Health Officer and rely on specific meters to detect any hazardous emission. These contingencies are detailed in the Site Safety and Health Plan.

A field instrument and visual observations will be used to verify that no fugitive dusts are present in air in the area of excavations, debris staging/screening pads, radiological screening and sediment holding pads, rejected waste screening pads, and associated decontamination pads. In addition, airborne radioactive particulate concentration monitoring will be conducted to ensure no work areas exceed 10 percent of a derived air concentration (DAC) for radionuclides of interest for the project, including radium-226 (^{226}Ra), cesium-137 (^{137}Cs), strontium-90 (^{90}Sr), cobalt-60 (^{60}Co), thorium-232 (^{232}Th) and uranium-238 (^{238}U). Note that a separate DAC value is used for radioactive particulate alpha and beta/gamma concentrations because ^{226}Ra, ^{232}Th and ^{238}U are primarily alpha emitters and ^{60}Co, ^{137}Cs and ^{90}Sr are primarily beta and/or gamma emitters. DAC values are provided in the Nuclear Regulatory Commission (NRC) regulation Title 10, *Code of Federal Regulations*, Part 20, Appendix B for the relevant radionuclides. For alpha emitters the most restrictive DAC value for ^{232}Th will be used. For beta/gamma emitters, the most restrictive DAC value for ^{90}Sr will be used. The DAC and 10 percent DAC values are listed in Table 4-1.

Air will be monitored downwind of site operations to evaluate the impact of RA activities. Upwind (background) conditions will also be assessed to evaluate the relative contribution of off-site activities to any measurement.

4.1.1 Air Monitoring Stations

Air monitoring locations will be established at a minimum of two sites in each work area to collect ambient measurements during the IR Site 2 RA. Specifically, for each portion of the site being monitored, one upwind and one downwind monitoring location will be established. The number of monitoring locations may be altered in the field in consultation with the RASO.

As described in Section 2.0 of this DCAMP, the predominant wind direction at Alameda Point is from the west. A representative windrose diagram showing the predominant wind direction is included as Figure 2-1. Specific air monitoring locations will be selected in the field on the basis of field conditions (e.g., wind speed and prevalent wind direction) and the judgment of site personnel. Daily assessments of the prevailing wind direction will be conducted in the morning, prior to the beginning of site work, and any significant changes in the predominant wind direction during the days operations will be observed and recorded. Adjustments to air monitoring locations may be made as needed, but monitoring locations will not be moved while sampling is occurring. A windsock will be set up to clearly indicate wind direction. The windsock will be established at the project office trailer location or in another suitable location that is easily accessed by/visible to project workers. Wind speed can be determined by the use of portable or stationary equipment.

4.1.2 Air Monitoring Equipment

Air monitoring for dust will be conducted using a factory calibrated, portable aerosol dust monitor (Thermo Electron pDR 1200). The dust monitor (shown below) will be configured to provide concentrations of PM_{10} particulates in units of micrograms per cubic meter ($\mu g/m^3$).

Air monitoring for airborne radioactive particulate will be conducted using a properly calibrated, portable, real-time sampling device (i.e., a pump with appropriate filter media) and a radiation detection instrument (e.g., a Ludlum Model 2929 meter with a Ludlum Model 43-10-1 detector or equivalent) in accordance with TtEC's SOP 9.

4.1.3 Air Monitoring Frequency

Air monitoring for ambient dust will be conducted at different frequencies during RA dependent on field activities and field observations, including high wind conditions and any visual observations that suggest the potentially imminent release of dust. During the initial subgrade preparation, fieldwork will include clear and grubbing, excavations of non-impacted berms and small areas within waste cells, and the placement of stockpiled fill materials. The initial subgrade work will require daily monitoring for dust to document compliance with dust control measures. At the completion of work to establish the subgrade elevations, site work will consist of placement and compaction of clean fill material to reach final elevations. During this period dust monitoring will occur on a weekly basis to confirm that fugitive dust is controlled and that contingencies actions are effective.

Air monitoring for airborne radioactivity will be conducted on a daily basis when all filling, excavations, or processing of impacted materials occurs, with each day's monitoring being a continuous assessment throughout the work day. As with dust monitoring, this frequency may be altered on the basis of field observations.

During prolonged precipitation events (greater than 8 hours of precipitation in a 24-hour period), the air monitoring units will not be operated. An air monitoring station or individual units being inoperable shall not preclude construction activities at the associated work site.

4.1.4 Air Monitoring for Dust

The potential for fugitive dust emissions will be monitored at each monitoring station using the pDR1200s. At each location and monitoring episode, the instruments will be deployed upwind and downwind of the monitored area per the manufacturer's operating manual for a minimum of 1 hour. The instruments will be deployed in the breathing zone at roughly 3 to 6 feet above ground surface. The maximum and 5-minute average observed measurements will be recorded for the measurement period.

PM_{10} levels shall not exceed 50 $\mu g/m^3$ when determined by simultaneous monitoring as the difference between upwind and downwind monitoring locations (Rule 403). If no upwind monitors are utilized, upwind concentrations will be assumed zero and the downwind level shall not be allowed to exceed 50 $\mu g/m^3$. If monitoring indicates the potential for an exceedance of the 50 $\mu g/m^3$ threshold, site activities should be modified and fugitive dust controls increased and/or adjusted to ensure that an exceedance does not occur.

4.1.5 Air Monitoring for Radioactive Particulate Concentrations

Airborne radioactive particulate concentrations will be monitored in accordance with TtEC's SOP 9 as discussed in the Radiological Work Plan (Attachment 2 to the RAWP).

Airborne radioactive particulate sampling results will be provided to the RASO. In consultation with the RASO, dust control contingencies specified in Section 5.0 will be implemented as necessary and in accordance with TtEC's NRC Radioactive Material License.

If analytical results indicate exceedances of 10 percent of DAC values for project radionuclides of interest, work will be suspended until the source of the emissions is identified. If the project activities are the cause of exceedances, additional control measures will be considered.

This page intentionally left blank.

5.0 MITIGATION CONTINGENCIES

5.1 DUST MITIGATION CONTINGENCIES

If the moisture content of the sediment material in the radiological screening pads or holding areas is measured below 10 percent and/or radioactivity is measured in air and consultation with the RASO requires, the sediment material will either be wetted or coated with a soil tackifier (SoilTac or equivalent) material to suppress dust. A Material Data Safety Sheet for the soil tackifier is included as Appendix A.

When sediment material is moved from the radiological screening pads to temporary holding areas pending dredge material radiological sampling data and a determination of whether the sediment is low-level radioactive waste (LLRW) or non-LLRW, it will be coated with soil tackifier (SoilTac or equivalent), following sampling, to proactively prevent dust generation. Visible dust will not be permitted during the execution of the IR Site 2 RA. If visible dust is observed, contingency measures will be implemented immediately.

5.2 ADDITIONAL CONTINGENCIES

Additional engineering controls may be developed in conjunction with the RASO and the regulatory agencies and will be implemented, if required, to maintain airborne radioactive particulate concentrations below 10 percent of a DAC for project radionuclides of interest.

This page intentionally left blank.

6.0 QUALITY ASSURANCE

This section discusses quality assurance elements of the dust control and air monitoring program.

6.1 AIR MONITORING PERSONNEL

Qualified field technicians with proper training will conduct routine field operations and air monitoring/sampling. Training in the use of specific air monitoring equipment will be provided and will include routine maintenance and calibration procedures. The field technician's activities will be documented in appropriate operating logs and maintenance forms.

Air monitoring and/or sampling for airborne radioactive particulate concentrations will be performed by a qualified Radiological Control Technician. All radiological air monitoring and/or sampling information will be provided to the RASO throughout the IR Site 2 RA.

6.2 ROUTINE OPERATION AND MAINTENANCE

Routine operations, calibration, and maintenance procedures will be used to minimize the potential for instrument downtime or collection of distorted data. Field technicians will perform routine equipment inspections in accordance with manufacturer recommendations. Routine communications on field activities will be conducted with and may be periodically supplemented by inspection by the TtEC Radiation Safety Officer Representative.

For airborne radioactive particulate concentration monitoring, routine operation and maintenance will be performed in accordance with TtEC's SOPs 2 and 9.

For non-airborne radioactive particulate concentration monitoring, technicians will follow a prescribed list of activities to check the status of each equipment item upon visiting each monitoring station. The results of all checks will be documented on check sheets and in on-site logbooks. Whenever monitoring locations are visited, technicians will note any phenomena or unusual activity that could have an effect on measurements. Equipment inspection will be conducted at the beginning and end of every sampling sequence as part of scheduled preventive maintenance.

6.3 NON-ROUTINE MAINTENANCE AND CORRECTIVE ACTION

Routine operations, preventive maintenance, and quality control (QC) procedures are intended to minimize the potential for monitoring system component failures. Non-routine maintenance provisions are intended to minimize the downtime or loss of data that may result from any unscheduled outages. It should be noted that the equipment specified for this program would be selected in part based on its reliability and minimum potential for failure.

Field technicians will initially attempt to diagnose and correct a problem with existing components and perform repairs on-site. Major repairs that require professional service will be given top priority so systems can be returned to service and spare parts restocked as quickly as possible.

7.0 QUALITY CONTROL

This section discusses the activities associated with the QC program for the dust control and air monitoring program. The purpose of the QC program is to ensure that the monitoring instrumentation and support equipment are operating within specifications at all times. Furthermore, the QC program will ensure that a complete, valid, and defensible database is developed. For airborne radioactive particulate concentration monitoring, QC will be performed in accordance with TtEC's NRC Radioactive Materials License and associated SOPs as discussed in the Radiological Work Plan (Attachment 2 to the RAWP).

7.1 QUALITY CONTROL PROCEDURES

The QC program will be implemented to ensure that collected data are accurate and precise in order to effectively characterize both the magnitude and variations in measured conditions at the monitoring stations. Complete documentation of the results of routine operations and QC aspects of the program, including all log notes, calibration forms, and certifications, will be maintained on file and will be delivered to the DON upon completion of the project. Key elements of the routine field QC program will include:

- Routine assessment at each sampling location over the sampling period to verify operation and sample conditions, and note any ambient conditions that could affect the accuracy or representativeness of the sample, as appropriate
- Calibration of field instruments, sampling pumps, and flow devices
- Routine preventive maintenance of all equipment components, as appropriate

Although laboratory analysis is not required, in the event that changes, any laboratory performing sample analyses will have a QC program that will ensure the accuracy of the data as the data are being analyzed. Key elements of the routine QC procedures implemented during the sample analyses will include analysis of laboratory blanks and spikes and calibration of the analytical instruments as specified in the appropriate methodology.

In addition to the field QC activities, data will be subjected to a series of data consistency and miscellaneous checks during the data processing phase. This will include a review of all component performances, daily data sheets, operating logs, calibration records, laboratory documentation, and the results of chemical and radiological analysis, as applicable.

An operations logbook for non-airborne radioactive particulate concentration monitoring will be initiated at the onset of the sampling program and will be maintained throughout the program. This log will allow for a narrative description of all activities and conditions as these events affect the collected data and will include the following information:

- Sample identification
- Monitoring/sample date
- Monitoring/sample site
- Construction activity occurring on the day of monitoring/sampling
- Sample start and stop times
- Record of differential pressure for sampling systems
- Total monitoring/sample time
- Submittal date of samples to the laboratory
- Signature of the technician responsible for monitoring/sampling and completing the sheet

Also, the following information will be documented during each monitoring/sampling sequence:

- Observation date
- Observation site
- Construction activity occurring on the day of monitoring/sampling
- Times of instrument inspections
- Observed readings during the inspection
- Observations of ambient conditions and the monitored/sampled environment
- Signature of the technician responsible for acquiring the data

An additional element of the overall QC program will be the documentation of certificates of calibration for all calibration and test equipment during field activities. This requirement will also extend to any vendor factory calibration checks.

Field logs will be used to properly record information after monitoring information and samples are collected. Appropriate field data, such as date, time, sample identification, calibration data, sample location, ambient temperature, and pressure, and any additional information or observations that could influence analyses of the results, will be entered on the field logs.

8.0 DATA EVALUATION

All field materials, including field notes and operating logs, calibration forms, filters, and laboratory results, will be periodically assembled and reviewed. The purpose of the review is to monitor performance, check for completeness, and assess data validity as well as compare the monitoring results to the compliance standards. Field records and logbook entries of calibration results will also be reviewed and verified, as appropriate, and final calculated data values will be entered into the data file.

Ultimately, all final data values for the site will be prepared in a tailored format listing monitoring and/or sampling values for all parameters, as available. The TtEC Project Managers will review results of all activities, and corrections and modifications to the file will be made as appropriate.

Soiltac® Soil Stabilizer & Dust Control Agent Material Safety Data Sheet

SECTION 1 - MATERIAL IDENTIFICATION	
PRODUCT NAME	SOILTAC*
	SOILTAC is a registered trademark of Soilworks, LLC.
MANUFACTURER	Soilworks, LLC.
	1750 E. Northrop Blvd., Suite 250, Chandler, AZ 85286-1747 USA www.soilworks.com
TELEPHONE NUMBER	800-545-5420
ONLINE INFORMATION	www.Soiltac.com
EMERGENCY TELEPHONE NUMBERS	800-545-5420 (National & International)
REVISION DATE	November 2009
EMERGENCY OVERVIEW	
PHYSICAL FORM	Mobile liquid
COLOR	Milky White (transparent once cured)
ODOR	Mild / Slight (no odor once cured)
HAZARDS	There are no known health hazards.
EXTINGUISHING MEDIA	The product will only burn after the water it contains is driven off.
C.A.S. CHEMICAL NAME	Mixture
SYNONYMS	Soil stabilizer, soil stabilization agent, soil solidifier, soil amendment, soil additive, soil crusting agent, dust control agent, dust inhibitor, dust palliative, dust suppressant, dust retardant
CHEMICAL FAMILY	Vinyl Copolymer Emulsion
EMPIRICAL FORMULA	Mixture

Product Information | Application Uses | Application Rates | Application Equipment | Application Methods | Shipping Containers | Photo Gallery | Material Safety Data Sheet | Frequently Asked Questions | Product Pricing | Test and Evaluation Data | Environmental Data | Downloads | About Soilworks | Contact Information |

INTENDED USE	Soil stabilization, soil solidification, fugitive dust control, dust suppression, dust abatement, tackifier, dust abatement, PM10 and PM2.5 air quality control and erosion control

SECTION 2 - INGREDIENTS

	%	**CAS Number**	**Chemical Name**
1.	50-60	Proprietary	Vinyl Copolymer
2.	40-60	7732-18-5	Water

SECTION 3 - HEALTH HAZARDS

ROUTES OF ENTRY
Eye Contact, Skin Contact, Ingestion and Inhalation

SIGNS AND SYMPTOMS OF ACUTE EXPOSURE
Eyes: Direct contact with this material may cause eye irritation including lachrymation (tearing).
Inhalation: Inhalation of vapor or aerosol may cause irritation to the respiratory tract (nose, throat, and lungs).
Skin: Contact may cause skin irritation. Ingestion: No hazard in normal industrial use. Skin: Contact may cause skin irritation. Ingestion: No hazard in normal industrial use.

SIGNS AND SYMPTOMS OF CHRONIC EXPOSURE
Prolonged or repeated contact with skin may cause irritation and dermatitis (inflammation).

CARCINOGENICITY
This material **does not** contain 0.1% or more of any chemical listed by the International Agency for Research on Cancer (IARC), the National Toxicology Program (NTP), or regulated by the Occupational Safety and Health Administration (OSHA) as a carcinogen.

SECTION 4 - FIRST AID

EYE CONTACT
Rinse immediately with plenty of water. Get immediate medical attention.

SKIN CONTACT
Remove contaminated clothing and shoes. Wash affected area with soap and water. Get medical attention if irritation develops or persists.

INHALATION
Move patient to fresh air. If breathing has stopped or is labored give assisted respiration (e.g. mouth-to-mouth). Supplemental oxygen may be indicated. Seek medical advice.

INGESTION
Give the victim one or two glasses of water or milk to drink. Get immediate medical attention . Never give anything by mouth to an unconscious person.

SECTION 5 - FIRE AND EXPLOSION DATA

FLASH POINT (closed cup)	Not applicable
UPPER EXPLOSION LIMIT (UEL)	Not applicable
LOWER EXPLOSION LIMIT (LEL)	Not applicable
AUTOIGNITION TEMPERATURE	Not applicable
FIRE HAZARD CLASSIFICATION (OSHA/NFPA)	Non-Combustible

EXTINGUISHING MEDIA
Product does not burn. The product will only burn after the water it contains is driven off. For dry polymer use carbon dioxide, foam, dry chemical or water fog to extinguish fire. Aqueous solution **is not flammable**.

FIRE FIGHTING EQUIPMENT
Wear self-contained breathing apparatus (SCBA) and full fire-fighting protective clothing. Thoroughly decontaminate all protective equipment after use.

FIRE AND EXPLOSION HAZARDS
This material **will not burn** unless it is evaporated to dryness. Closed containers may rupture when exposed to extreme heat.

HAZARDOUS COMBUSTION PRODUCTS
When dried polymer burns, water (H2O), carbon dioxide (CO2), carbon monoxide (CO) and smoke are produced.

SECTION 6 - ACCIDENTAL RELEASE MEASURES

CONTAINMENT TECHNIQUES (Removal of ignition sources, diking etc)
Stop the leak, if possible. Ventilate the space involved.

CLEAN-UP PROCEDURES
Wear suitable protective equipment. If recovery is not feasible, admix with dry soil, sand or non-reactive absorbent and place in an appropriate chemical waste container. Prevent spilled material from entering sanitary sewers, storm sewers, drainage systems and from entering bodies of water or ditches that lead to waterways. Transfer to containers by suction, preparatory for later disposal. Place in metal containers for recovery or disposal. Flush area with water spray. Wash contaminated property (e.g., automobiles) quickly before the material dries. For large spills, recover spilled material with a vacuum truck.

OTHER EMERGENCY ADVICE
Spilled polymer emulsion is very slippery. Use care to avoid falls. A film will form on drying. Remove saturated clothing and wash contacted skin area with soap and water. Product imparts a milky white color to contaminated waters. Foaming may result. Sewage treatment plants may not be able to remove the white color imparted to the water.

SECTION 7 - HANDLING AND STORAGE

STORAGE
Keep from freezing. Store in a dry area. Keep containers closed when not in use to minimize contact with atmospheric air and prevent inoculation with microorganisms.

HANDLING
Use only in well-ventilated areas. Avoid contact with eyes. Avoid breathing vapors. Avoid prolonged or repeated contact with skin. Wash hands thoroughly after handling and before eating or drinking.

SECTION 8 - PERSONAL PROTECTION / EXPOSURE CONTROLS

EXPOSURE GUIDELINES
There are no Occupational Safety and Health (OSHA) Permissible Exposure Limits (PEL) or American Conference of Governmental Industrial Hygienists (ACGIH) Threshold Limit Values (TLV) or Short Term Exposure Limits (STEL) established for the component(s) of this product.

EYE PROTECTION
Chemical safety glasses.

HAND PROTECTION
Rubber Gloves. The breakthrough time of the selected glove(s) must be greater than the intended use period.

RESPIRATORY PROTECTION
Not required under normal use.

PROTECTIVE CLOTHING
No specific recommendation.

ENGINEERING CONTROLS
Good general ventilation should be sufficient to control airborne levels of irritating vapors.

SECTION 9 - TYPICAL PHYSICAL AND CHEMICAL PROPERTIES

PHYSICAL FORM	liquid

COLOR	Milky White (transparent once cured)
ODOR	Mild / Slight (no odor once cured)
pH	4. 5-6.0
EVAPORATION RATE	< 1 (BuAc=1)
VAPOR DENSITY	> 1 (Air = 1)
BOILING POINT	> 100.00°C (>212.00°F)
FREEZING POINT	<0°C (<32°F)
SOLUBILITY IN WATER	Completely (100%) (until cured)
SPECIFIC GRAVITY (Water = 1)	1.0 5-1.10

SECTION 10 - STABILITY AND REACTIVITY

STABILITY
Stable at ambient temperatures. Coagulation may occur following freezing, thawing or boiling.

INCOMPATIBILITY (Materials to Avoid)
No incompatibilities have been identified.

HAZARDOUS DECOMPOSITION PRODUCTS
Thermal decomposition may form: Acetic acid and Acrolein. Thermal decomposition may produce various hydrocarbons and irritating, acrid vapors.

HAZARDOUS POLYMERIZATION
Will not occur

CONDITIONS TO AVOID
Freezing temperatures (until cured).

SECTION 11 - TOXICOLOGICAL PROPERTIES

ACUTE EYE TOXICITY
No Information is available.

ACUTE ORAL TOXICITY
No Information is available.

ACUTE SKIN TOXICITY
No Information is available.

ACUTE INHALATION TOXICITY
No Information is available.

CHRONIC/CARCINOGENICY
This material **does not** contain 0.1% or more of any chemical listed by the International Agency for Research on Cancer (IARC), the National Toxicology Program (NTP), or regulated by the Occupational Safety and Health Administration (OSHA) as a carcinogen.

SECTION 12 - ECOLOGICAL INFORMATION

ECOTOXICITY				
Common Name	**Species**	**Test**	**Result**	**Concentration**
Green Algae	Raphidocelus Subcapitata	96-hr chronic LC50	>1,000	Undiluted

Fathead Minnow	Pimephales Promelas	96-hr acute LC50	>1,208	Undiluted
Rainbow Trout	Oncorhynchus Mykiss	96-hr acute LC50	>1,000	Undiluted

ENVIRONMENTAL FATE
No data is available.

SECTION 13 - DISPOSAL CONSIDERATIONS

WASTE DISPOSAL METHOD
This material **is not** a RCRA hazardous waste. Disposal of this material is not regulated under RCRA. Consult federal, state and local regulations to ensure that this material and its containers, if discarded, is disposed of in compliance with all regulatory requirements . NOTE: As supplied or diluted, product material (foam included), when splashed on automobiles or other personal property, is difficult to remove if allowed to dry.

RCRA HAZARD CLASS
This material **is not** a RCRA hazardous waste. When discarded in its purchased form, this material would not be regulated as a RCRA Hazardous waste under 40 CFR 261.

SECTION 14 - TRANSPORT INFORMATION

DOT NON-BULK SHIPPING NAME	Refer to Bill of Lading - Not DOT Regulated // Keep From Freezing // Not dangerous goods
DOT BULK SHIPPING NAME	Refer to Bill of Lading.
IMO SHIPPING DATA	Refer to Bill of Lading.
ICAO/IATA SHIPPING DATA	Refer to Bill of Lading - Not IATA Regulated // Keep From Freezing // Not dangerous goods
CFR	Not Regulated // Keep From Freezing // Not dangerous goods
IMDG	Not Regulated // Keep From Freezing // Not dangerous goods
CTC	Not Regulated // Keep From Freezing // Not dangerous goods

SECTION 15 - REGULATORY INFORMATION

TSCA SECTION 8(b) INVENTORY STATUS
All components are included in the EPA Toxic Substances Control Act (TSCA) Chemical Substance Inventory.

TSCA SECTION 12(b) EXPORT NOTIFICATION
This material **does not** contain any components that are subject to the U.S. Toxic Substances Control Act (TSCA) Section 12 (b) Export Notification requirements.

OSHA Hazard Communication Standard (29CFR1910.1200) hazard class(es)
This material **is not** classified as hazardous under the criteria of the U.S. Occupational Safety and Health Administration (OSHA) Hazard Communication Standard, 29 CFR 1910.1200

EPA SARA Title III Section 304 CERCLA
Reportable quantities have not been established for any of this material's components.

EPA SARA Title III Section 311/312 HAZARD COMMUNICATION STANDARD (HCS)
This material **is not** a hazardous chemical.

EPA SARA Title III Section 313 TOXIC CHEMICAL LIST (TCL)
This product **does not** contain Section 313 Reportable Ingredients.

CANADIAN INVENTORY STATUS
All components of this material are listed on the Canadian Domestic Substances List (DSL)

CANADIAN WHMIS
This material **is not** classified as a controlled product under the Canadian Workplace Hazardous Material Information System.

ADDITIONAL CANADIAN REGULATORY INFORMATION
This product **does not** contain a substance present on the WHMIS Ingredient Disclosure List (IDL) which is at or above the specified concentration limit.

EUROPEAN INVENTORY STATUS (EINECS)
The polymer portion of this product is manufactured from reactants which are listed on EINECS and meets the EINECS definition of an exempt polymer.

AICS (Australia)
Included on inventory

ENCS (Japan)
Included on inventory

ECL (South Korea)
Included on inventory

SEPA (China)
Included on inventory

SECTION 16 – OTHER INFORMATION

1.0 WASTE MANAGEMENT PLAN

The purpose of the Waste Management Plan (WMP) is to present the waste management practices and procedures to be followed for the types and quantities of waste expected to be generated during the field activities at Installation Restoration Program (IR) Site 2. The WMP identifies waste management activities conducted during the storage and the preparation and/or disposal of waste (including waste characterization, packaging, storage, and management while in storage). The transportation and disposition of waste materials at appropriate disposal and recycling facilities are also included. It is the responsibility of the Project Manager (PjM) to verify that all project personnel are aware of the requirements stipulated in this WMP.

The WMP provides information on how wastes, including potentially hazardous wastes associated with project activities, will be managed and disposed. In addition, a secondary goal of this section is to ensure that waste minimization practices are followed, to the extent practical, to reduce the volume of waste that will be generated, stored, and removed from the site for disposal.

The WMP is also a primary component of the Tetra Tech EC, Inc. (TtEC), Compliance Program, which includes on-site environmental compliance inspections. The WMP will be revised if the scope of this project or the applicable regulations change.

1.1 PROJECT WASTE DESCRIPTIONS

Construction activities will involve the generation, management, and disposal of various waste streams, which may include:

- Green waste including grass, shrubs, and trees removed prior to grading activities
- Low-level radioactive waste (LLRW) including soil and point sources
- RCRA hazardous, non-RCRA hazardous, and nonhazardous soil
- Nonhazardous solid waste, such as trash, empty calibration gas canisters, and inert construction debris
- Oversized contaminated debris – rock, wood, piping, concrete, and scrap metal
- Wastewater, including impacted stormwater runoff, fluids from equipment and personnel decontamination, and groundwater monitoring well development purge water
- Used oil (including motor oil, hydraulic fluid, greases, antifreeze/coolant, and so forth), oil filters, fuel and air filters from equipment maintenance operations
- Decontamination pad solids/sludges
- Used polyethylene liners from soil stockpiles and/or waste storage areas

- Used personal protective equipment (PPE)

During these activities, the site will be managed under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Area-of-Contamination policy, which allows impacted soil and/or waste to be uncovered, moved, and reconsolidated without triggering the Resource Conservation and Recovery Act (RCRA) land disposal restrictions (LDRs) and minimum technical requirements for a landfill under RCRA.

Table 1-1 presents a summary of applicable waste characterization, containment, storage, transportation, and disposal requirements for each of the aforementioned waste streams.

1.2 WASTE MANAGEMENT

In accordance with the applicable or relevant and appropriate requirements (ARARs) for remedial activities, the substantive requirements of the state and federal hazardous waste generation, characterization, storage, treatment, and management regulations of Title 22 *California Code of Regulations* (CCR), Sections 66261, 66262, and 66264, and 40 *Code of Federal Regulations* (CFR), Parts 261, 262 and 264, are applicable to the management of hazardous wastes generated during the remedial action and associated project activities. A summary of the key aspects of the waste management program is provided below.

1.2.1 Waste Classification

Federal RCRA hazardous waste determination is necessary to determine whether a waste is subject to RCRA requirements at Title 22 CCR, Division 4.5 and other state requirements at Title 23 CCR, Division 3, Chapter 15. The first step in the RCRA hazardous waste characterization process is to evaluate contaminated media at the site(s) and determine whether it constitutes a "listed" RCRA waste. The preamble to the National Oil and Hazardous Substances Pollution Contingency Plan states that "…it is often necessary to know the origin of the waste to determine whether it is a listed waste and that, if such documentation is lacking, the lead agency may assume it is not a listed waste" (55 Federal Regulation 8666, 8758 [1990]).

This approach is confirmed in the U.S. Environmental Protection Agency (EPA) guidance for CERCLA compliance with other laws (EPA 1988), as follows: "To determine whether a waste is a listed waste under RCRA, it is often necessary to know the source. However, at many Superfund sites, no information exists on the source of wastes. The lead agency should use available site information, manifests, storage records, and vouchers in an effort to ascertain the nature of these contaminants. When this documentation is not available, the lead agency may assume that the wastes are not listed RCRA hazardous wastes, unless further analysis or information becomes available that allows the lead agency to determine that the wastes are listed RCRA hazardous wastes."

RCRA hazardous wastes that have been assigned EPA hazardous waste numbers (or codes) are listed in Title 22 CCR, Sections 66261.30 through 66261.33. The lists include hazardous waste codes beginning with the letters "F," "K," "P," and "U." Knowledge of the exact source of a waste is required for source-specific listed wastes ("K" waste codes). Some knowledge of the nature or source of the waste is required even for listed wastes from non-specific sources, such as spent solvents ("F" waste codes) or commercial chemical products ("P" and "U" waste codes). These listed RCRA hazardous wastes are restricted to commercially pure chemicals used in particular processes such as degreasing. P and U wastes cover only unused and unmixed commercial chemical products, particularly spilled or off-specification products (EPA 1992). Not every waste containing a P or U chemical is a hazardous waste. To determine whether a CERCLA investigation-derived waste contains a P or U waste, there must be direct evidence of product use. In particular, all the following criteria must be met. The chemicals must be:

- Discarded (as described in 40 CFR, Section 261.2[a][2])
- Either off-specification commercial products or a commercially sold grade
- Not used (soil contaminated with spilled unused wastes is a P or U waste)
- The sole active ingredient in a formulation

Hazardous waste characteristics, as defined in 40 CFR, Sections 261.21 through 261.24, are commonly referred to as ignitable, corrosive, reactive, and toxic. California environmental health standards for the management of hazardous waste set forth in 22 CCR, Division 4.5, were approved by EPA as a component of the federally authorized California RCRA program. Therefore, the characterization of RCRA waste is based on the state requirements.

The characteristics of ignitability, corrosivity, reactivity, and toxicity are defined in 22 CCR, Sections 66261.21 through 66261.24. According to 22 CCR, Section 66261.24(a)(1)(A), waste that exhibits the characteristic of toxicity is assigned a hazardous waste code beginning with the letter "D" to wastes that exhibit the characteristic of toxicity; D waste codes are limited to "characteristic" hazardous wastes.

According to 22 CCR, Section 66261.10, waste characteristics can be measured by an available standardized test method or be reasonably classified by generators of waste based on their knowledge of the waste, provided that the waste has already been reliably tested or if there is documentation of chemicals used.

A waste determined not to be a RCRA hazardous waste may still be considered a state-regulated non-RCRA hazardous waste. The state is broader in scope in its RCRA program in determining hazardous waste. Title 22 CCR, Section 66261.24(a)(2), lists the Total Threshold Limit Concentrations (TTLCs) and the Soluble Threshold Limit Concentrations (STLCs) for non-RCRA hazardous waste. The state applies its own leaching procedure, Waste Extraction Test

(WET), which uses a different acid reagent and has a different dilution factor (tenfold). There are other state requirements that may be broader in scope than federal ARARs for identifying non-RCRA wastes regulated by the state. See additional subsections of 22 CCR, Section 66261.24. A waste is considered hazardous if its total concentrations exceed the TTLCs or if the extract concentrations from the WET exceed the STLCs. A WET is required when the total concentrations exceed the STLC by a factor of ten, but are less than the TTLCs. California also has additional hazardous waste classification criteria (including 96-hour fish bioassays) that may need to be considered on a case-by-case basis. Wastes determined to be hazardous wastes under California regulations and not under federal regulations are referred to as non-RCRA wastes.

The waste classification requirements also apply to contents from decontamination water generated from daily decontamination activities, collected stormwater, groundwater monitoring well purge water, construction debris, and waste oils and fluids generated from the on-site project equipment. Wastewater resulting from stormwater runoff and decontamination water will be collected and contained within a portable aboveground tank. When the tank or container is approximately half-full or at least every 60 days, whichever occurs first, the tank will be sampled to determine proper disposition of the wastewater. PPE and soil stockpile liners will be characterized based on generator knowledge and will be disposed of at an off-site landfill. Debris will also be characterized based on generator knowledge to determine if it is a potential hazardous waste. Waste oil and other fluids generated during equipment maintenance activities will be collected, contained, and sent off-site for recycling.

1.2.2 Waste Accumulation and Storage

Title 40 CFR, Part 262, 40, and 22 CCR, Section 66262, consist of regulations applicable to the generation, storage, management, and accumulation of RCRA and non-RCRA hazardous wastes, respectively. Specific requirements apply to the accumulation time for hazardous wastes on site and to the accumulation and labeling of hazardous wastes. This project may result in the temporary accumulation of hazardous wastes in staging piles, containers, and tanks. These wastes will be managed, accumulated, and inspected in accordance with the regulations.

Nonhazardous waste is not subject to specific regulatory requirements for accumulation or storage; however, appropriate best management practices (BMPs) will be implemented.

1.2.3 Soil and Waste Stockpiles and Staging Piles

Soil excavated during this project will be stockpiled in inactive areas of the site until such time it is needed for reconsolidation or for use as cover material. During these activities, the soil and refuse will be managed under the CERCLA Area-of-Contamination policy, which allows impacted soil and/or refuse waste to be uncovered, moved, and reconsolidated without triggering the RCRA LDRs and minimum technical requirements for a landfill under RCRA. During construction, excavated materials and drill cuttings requiring temporary stockpiling prior to reconsolidation will be staged on-site and will not require characterization or off-site disposal. While not anticipated, if refuse is excavated and is not reconsolidated and the material is determined to be RCRA hazardous waste based on representative sampling and analysis data, then the new (effective April 22, 2002) RCRA temporary Corrective Action Management Unit (CAMU) regulations are applicable. These regulations consist of the performance and technical standards for staging piles (Sections 264.554[d][1][i–ii] and [d][2]) and closure requirements for staging piles (Section 264.554[j–k]). Under the new regulations, a temporary CAMU may be designated for temporary (up to 2 years) treatment or storage of solid, non-flowing remediation waste. The RCRA LDRs, the landfill minimum technology requirements, and the waste pile permitting requirements are not applicable to temporary CAMUs for RCRA hazardous wastes. The temporary CAMU regulations also require that the unit:

- The unit will be designed using appropriate measures (for example, liners, soil crusting agents, run-on/runoff controls, groundwater monitoring system) to prevent or minimize releases and cross media transfers of hazardous wastes and constituents (Section 264.554[d][1][ii]).
- For units located in a previously contaminated area of the facility—All remediation wastes, contaminated containment system components, structures, and equipment that are contaminated with waste or leachate must be removed and decontaminated within 180 days (264.554[j]). In addition, contaminated subsoils must be remediated in accordance with an approved plan and schedule, but the 180-day time limit does not apply.
- For units located on uncontaminated areas of the facility—Within 180 days following expiration of the operating term, any remaining contamination (such as, containment system components and subsoils) must be removed in accordance with the clean closure standards for waste piles in 22 CCR, Sections 66264.558(a) or 66265.558(a), and the closure performance standards in 22 CCR, Sections 66264.111 or 66265.111, for permitted and interim status facilities, respectively (264.554[k]).

For non-RCRA hazardous waste, in accordance with Division 20, Chapter 6.5, Section 25123.3 of the *California Health and Safety Code*, the material can be stockpiled at the site for up to 90 days without satisfying all substantive requirements of a hazardous waste facility permit, provided the following conditions are met:

- The materials do not contain free liquids.
- The waste is accumulated on an impermeable surface (minimum 20-mil liner).
- The generator controls against wind dispersion and rain runoff.
- The generator inspects the site weekly and after storms to ensure the erosion controls are working properly.

- After final off-site transportation, the accumulation site is inspected and remediated as necessary.
- The site is certified for compliance with these standards by a registered engineer.

A log of all hazardous soil and debris stockpiles (or staging piles) will be maintained and updated on a daily basis. The log will include date of accumulation, date of sampling, analytical results obtained or pending, RCRA hazardous or non-RCRA hazardous designation, and so forth.

In addition to the aforementioned requirements, the State Water Resources Control Board Policy Number 92-08, which pertains to the control of stormwater discharges from construction activities, may also be relevant and appropriate to the temporary storage of stockpiled materials. Appropriate best management practices (BMPs) will be implemented to protect stockpiles from erosion and from stormwater run-on and runoff. These BMPs include erosion control, stormwater drainage control, secondary containment, fugitive emissions and wind dispersion control, and spill prevention. A site-specific Stormwater Pollution Prevention Plan (SWPPP) has been prepared for the project in accordance with ARARs (See Attachment 8 to the RAWP).

1.2.4 Wastewater and Waste Fluids

Title 22 CCR, Section 66264, and 40 CFR, Part 264, contain applicable requirements for facilities that store hazardous wastes in tanks or containers for over 90 days. Decontamination water and stormwater that comes in contact with the hazardous waste stockpiles will be collected and stored on-site in an approved tank of an appropriate capacity. The tank will be installed, managed, and inspected in accordance with the substantive requirements of 22 CCR, Sections 66264.191, 66264.192, 66264.193, and 66264.194. These regulations require specific engineering and design specifications, daily inspections of the tanks, adequate secondary containment (110 percent of the tank volume, plus the maximum rainfall from a 25-year, 24-hour storm event), and closure standards. The contents of the tank will be characterized based on generator knowledge from the project waste streams and/or per the requirements of 22 CCR, Section 66261, to determine appropriate disposal options. In addition, daily inspections of wastewater tanks will be conducted and logged to ensure the integrity of the tanks and secondary containment to check for leaks or spills, and to ensure that labels and markings are in good condition.

Wastewater generated, which may include decontamination water generated from equipment and personnel decontamination and purge water from well development activities, will be collected in 55-gallon drums, or combined in a large temporary storage tank (such as a Baker tank), and labeled as “Potentially Hazardous Decontamination (or Purge) Water.” The drums will be temporarily staged within a pre-designated and secondarily contained on-site waste accumulation area pending characterization and appropriate disposal. When possible, waste fluids generated from heavy equipment maintenance activities will be collected and removed from the site by the maintenance contractor for recycling. If waste fluids are required to be stored on-site, they will be labeled accordingly, contained within Department of Transportation (DOT)-approved 55-gallon drums, and situated within a pre-designated and properly designed hazardous waste container storage area. Containers of hazardous wastes containing free liquids have stringent secondary containment requirements. These requirements include:

- A base free of cracks or gaps and sufficiently impervious to contain leaks, spills, and accumulated precipitation until the collected material is detected and removed.
- The base will be sloped or the containment system will be otherwise designed and operated to drain and remove liquids resulting from leaks, spills, or precipitation. Alternatively, the containers may be elevated on pallets to prevent contact with accumulated liquids.
- The containment system will have sufficient capacity to contain 10 percent of the volume of containers or the volume of the largest container, whichever is greater, plus the maximum rainfall from a 25-year 24-hour storm event.
- Spilled or leaked waste and accumulated precipitation will be removed from the sump or collection area in a timely manner to prevent overflow of the collection system.

1.2.5 Used Personal Protective Equipment

Used PPE will be stored in DOT-approved 55-gallons drums or LLRW bins within the designated hazardous waste container storage area or the Radiological Material Area (RMA), respectively. The storage area will be designed and managed in accordance with the substantive requirements of the container management regulations codified in 22 CCR, Sections 66264.170 through 66264.178.

1.2.6 Container Labeling

Containers of potentially hazardous waste will be labeled with indelible ink with the following information: source and location; contents and quantity; potential health, safety, and environmental hazards; accumulation start date; date container sampled; parameters analyzed for; and the words “Analysis Pending – Potentially Hazardous.” If containers are determined to contain nonhazardous waste, they will be labeled accordingly. If containers are determined to contain hazardous waste, they will immediately be labeled with a completed “Hazardous Waste” label, which will include:

- EPA Identification Number of the generator
- Name and address of the generator
- EPA waste code
- DOT shipping name (prior to off-site shipment)
- Description of contents
- Date of generation (date first drop of waste placed in container)

An inventory of waste containers will be maintained for later submittal to the Department of the Navy (DON). In addition, weekly inspections of container storage areas will be conducted and logged while wastes remain in these areas to ensure the integrity of the containers and secondary containment, to check for leaks or spills, and to ensure labels and markings are in good condition.

1.2.7 Waste Accumulation Areas

Hazardous waste storage areas require:

- A sign with the legend, "Danger Hazardous Waste Area-Unauthorized Personnel Keep Out" (written in English and Spanish), will be posted at each 90-day accumulation area and stockpile in sufficient numbers to be seen from any approach. The signs will be legible from a distance of at least 25 feet.
- Aisle space will be maintained to allow the unobstructed movement of personnel, fire protection equipment, spill control equipment, and decontamination equipment to any area of facility operation in an emergency, unless aisle space is not needed for any of these purposes.
- The following emergency equipment will be located or available to personnel during active waste management activities at each accumulation area:
  - A device, such as a telephone or a hand-held two-way radio, capable of summoning emergency assistance will be available.
  - Portable fire extinguishers, fire control equipment, spill control equipment, and decontamination equipment will be available.
  - Water at adequate volume and pressure to supply water hose streams, or foam producing equipment, or automatic sprinklers, or water spray systems.
  - A spill response kit for minor spills. The kit will include a shovel, adsorbent pads and/or "kitty litter," and a collection container.

Bulk quantities of fuel, oil, or other hazardous materials will not be stored on-site. Equipment fueling and maintenance activities will be performed by an off-site contractor on an as-needed basis.

1.2.8 Waste Disposal

Although not anticipated, soil or refuse that is excavated during this project and that is not reconsolidated will be disposed of off-site at an appropriately permitted waste disposal facility. Non-soil related wastes, which may include wastewater, debris, used PPE, used oil, and impacted stormwater, will be managed in accordance with the regulations and transported off-site for appropriate recycling or disposal. Used PPE will generally be managed as LLRW and disposed of by the LLRW contractor. Each waste stream requiring off-site disposal will be characterized by generator knowledge or sampled and analyzed, as necessary, to ensure that it is properly characterized and profiled and meets the waste acceptance criteria and packaging requirements for the proposed treatment, storage, and disposal facility (TSDF) prior to transport. Hazardous waste debris generated on site, which has been treated using an alternate treatment technology as indicated in 40 CFR, Part 268.45, and 22 CCR, Section 66268, (decontaminated with a water wash and spray), will be disposed of as nonhazardous solid waste. Used PPE and debris (oversized material, polyethylene liners, polyvinyl chloride piping, and so forth) that is determined to be radiological waste or a hazardous waste and is unsuitable for decontamination, will be transferred to the LLRW contractor or sent off-site to a hazardous waste landfill facility respectively. Waste oil and other fluids generated during equipment maintenance activities will be collected, contained, and sent off-site for recycling.

Non-radiologically impacted hazardous waste will be disposed only at a hazardous waste disposal facility approved by the DON and permitted for the disposal of the particular type of hazardous waste generated. Wastes disposed off-site will be sent to RCRA Subtitle C or RCRA Subtitle D facilities that meet the requirements of 40 CFR, Part 300.440 (CERCLA Off-site Policy).

1.2.9 Waste Transportation

Hazardous wastes sent off-site for disposal or recycling will be done so in accordance with the DOT Hazardous Material Transportation regulations of 49 CFR, Parts 171 through 177, and 40 CFR, Part 262, Subpart B, and 22 CCR, Section 66262, which involve packaging, placarding, labeling, and manifesting requirements, and with appropriate LDR certification notices per 40 CFR, Part 268, and 22 CCR, Section 66268. Personnel having the required DOT-training will perform all DOT functions. In addition, all transporter and disposal contractors will be subject to the contractor qualification process. Under no circumstances will TtEC personnel sign hazardous waste manifests.

Material that does not exhibit one of the nine DOT hazard class characteristics (explosives, gases, flammable/combustible liquids, flammable solids/spontaneously combustible materials, dangerous when wet materials, oxidizers and organic peroxides, toxic materials and infectious substances, radioactive materials, corrosive materials) is not regulated under DOT rules for hazardous material transportation. If material is suspected to be hazardous, it will be shipped under the appropriate hazard class. All hazardous waste will be transported under DOT hazardous material regulations. Each shipment of a suspected hazardous material will be properly classed using the Hazardous Materials Table in 49 CFR, Part 172.101. DOT-trained personnel will make all determinations.

1.2.10 Waste Minimization

To minimize the volume of waste, the following general guidelines will be followed:

- Waste materials will not be contaminated unnecessarily.

- Work will be planned ahead.
- Materials may be stored in large containers, but the smallest reasonable container will be used to transport the material to the location where it is needed.
- Cleaning and extra sampling supplies will be maintained outside any potentially contaminated area to keep them clean and to minimize additional waste generation.
- Mixing of detergents or decontamination solutions will be performed outside potentially contaminated areas.
- Drop cloths or other absorbent material will be used to contain small spills or leaks.
- Contaminated materials will not be placed with clean materials.
- Wooden pallets inside the exclusion zone will be covered with plastic.
- Material and equipment will be decontaminated and reused when practical.
- Volume reduction techniques will be used when practicable.
- Waste containers will be verified to ensure they are solidly packed to minimize the number of containers.
- Only the size waste containers adequate to contain the volume of waste generated will be used.
- Less hazardous substances will be used whenever possible (only the volume of standard solutions needed for testing will be brought; minimal amounts of decontamination water and solvent rinses will be used).

1.2.11 Waste Management Inspection and Documentation Program

This section presents the waste inspection procedures and documentation program to be employed during the project field activities.

1.2.12 Inspections

While all waste accumulation areas will be informally inspected on a daily basis, formal inspections of all hazardous container accumulation areas will be conducted and recorded at least weekly in accordance with 40 CFR, Part 264, Subpart I, and 22 CCR, Section 66264. However, daily inspections will be conducted for tanks containing hazardous wastewater. In addition, hazardous soil stockpiles will be inspected daily to ensure that liners are in place and the stockpiles are adequately protected. The Project Quality Control Manager or his designee will conduct inspections. Inspections will be logged in a field notebook, and a weekly (daily for tanks) inspection checklist will be completed. The container storage area(s) will be inspected to ensure the following:

- Containers are in good condition. If a container is not in good condition or appears to be leaking, the waste will be transferred to another container.

- Containers are made of materials that will not react with, and are otherwise compatible with, the hazardous waste to be stored.
- Containers are closed at all times, except when adding or removing waste.

Tanks used for storage of collected hazardous runoff and decontamination water will be inspected on a daily basis and the inspections will be logged. The inspections will ensure that tanks have adequate secondary containment, are properly labeled, are in good condition (no apparent structural defects or deterioration), and have no visible leaks.

1.2.13 Documentation

Documentation requirements apply to all waste managed during project activities. Field records will be kept of all waste generation activities. All pages of the field data record log will be signed and dated by the supervising field leader who is entering the data. In addition, the following information will be recorded in the log:

- Description of waste generating activities
- Location of waste generation (including depth, if applicable)
- Type and volume of waste
- Date and time of generation
- Description of any waste sampling
- Name of person recording information
- Name of field manager at time of generation

1.2.14 Hazardous Waste Manifests and LDR Certification

All hazardous waste transported from the site will be accompanied by a Hazardous Waste Manifest. DON personnel will be responsible for reviewing and signing all waste documentation, including waste profiles, manifests, and LDR notifications (manifest packages). Prior to signing the manifest, the designated DON official will ensure that pre-transport requirements of packaging, labeling, marking, and placarding are met according to 40 CFR, Parts 262.30 through 262.33, and 49 CFR, Parts 100 through 178.

The DON will receive one copy of the manifest; the remaining copies will be given to the transporter. The manifest will be returned to the DON's signatory official for the base's recordkeeping requirements. Copies of all manifests for waste generated at the site will be kept in a compliance file within the project files. (The PjM will provide the DON with the generator's copies of the manifest.)

An LDR form will accompany the shipment of hazardous waste to the TSDF. The TSDF will be notified prior to the waste being sent. The following items must accompany the notification and are included in one of the following facility-specific forms:

- EPA Hazardous Waste Generator identification number for material flow analysis
- Manifest number, including state disposal application number
- Waste analysis data
- Corresponding concentration-based or technology-based treatment standards will be identified if the waste is also land disposal restricted

RCRA recordkeeping requirements per 40 CFR, Parts 262.20 through 262.44, including retention of signed copies of manifests from the designated facility that received the waste, will be adhered. Additionally, biennial and exception reporting information will be submitted, as necessary, according to 22 CCR, Sections 66262.41 and 66261.42, and 40 CFR, Parts 262.41 and 262.42. Additional reporting may be required in accordance with 22 CCR, Section 66262.43, and 40 CFR, Part 262.43.

1.3 WASTE MANAGEMENT FOR RADIOACTIVE WASTES

The following subsections address specific control and management practices for LLRW and low-level mixed waste (LLMW), hereafter including low-level contaminated waste (LLCW), that should be followed by the certified waste broker contracted by the Department of Defense (DoD) Executive Agency for LLRW. Disposal of all LLRW and LLMW will be handled through the DON's LLRW Disposal Program. TtEC has no responsibilities in verifying that the DoD broker adheres to these requirements.

The certified DoD waste broker should be used for all packaging, storage, shipping, manifesting, and disposal of LLRW and LLMW. The waste broker should coordinate closely with the Radiological Affairs Support Office (RASO).

1.3.1 Waste Classification

Radioactive wastes should be classified as specified in 49 CFR and/or disposal facility requirements. These wastes should be categorized as either LLRW or LLMW. Waste characteristics, including the radionuclides present and their associated specific activity, should be measured by an available standardized test method such as gamma spectroscopy, strontium analyses, and/or alpha spectroscopy. Additionally, for LLMW, chemical waste characteristics can be measured by a standardized test method or be reasonably classified by generators of waste based on their knowledge of the waste, provided that the waste has already been reliably tested for acceptance at the waste disposal facility.

A waste determined not to be a RCRA LLMW may still be considered a state-regulated non-RCRA LLCW (low level radioactive and non-RCRA hazardous). The state is broader in scope in its RCRA program in determining hazardous waste.

1.3.2 Waste Accumulation and Storage

As for hazardous waste, specific requirements apply to the accumulation time for LLMW or LLCW on-site and to the accumulation and labeling of LLMW. This project may result in the temporary accumulation of LLMW or LLCW in containers. These wastes should be managed, accumulated, and inspected in accordance with the hazardous waste regulations and may only be stored on-site for less than 90 days. Accumulation time requirements do not apply to LLRW-only waste.

All LLRW, LLMW, and LLCW should be packaged per the direction of a waste broker certified by the DoD Executive Agency for LLRW (Army Field Support Command) in accordance with federal directives and disposal facility requirements. Typical containers that may be used for these wastes include bins, 55-gallon drums, B-25 boxes, and/or covered roll-off containers. Containers should be properly lined, and absorbent should be used if it is considered necessary. All containers should be radiologically surveyed and/or swiped by the DoD broker when received. Each container should be properly inventoried and labeled. Inventories should include material description and isotopic identification, and hazardous components if appropriate. The contents of each container should be recorded in the field logbook, and each container should be assigned a unique identification number. Records should be maintained by the DoD broker.

Containers should be stored in a designated and posted radiological materials storage area under the authority of the DoD broker's Nuclear Regulatory Commission (NRC) or California Agreement State radioactive materials license. Storage areas may be at the site where the waste originated. Containers should be secured to prevent unauthorized access to the contents of the container. Once filled, all containers should be surveyed and surface radiation measurements collected by the DoD broker using an ion chamber survey meter or equivalent.

1.3.3 Radiological Point Sources

Radiological point sources (such as radium-containing dials) should be packaged in metal drums in accordance with DOT regulations specified in 49 CFR, Subpart I, and should be stored in a posted radiological materials area. The DON is responsible for the transportation and disposal of radiological point sources.

1.3.4 Soil, Debris, and Materials

Soil, debris, and materials classified as LLRW or LLMW may be generated during excavation. When classified as LLRW or LLMW, these wastes should be placed in bins, 55-gallon drums, B-25 boxes, and/or roll-off containers.

1.3.5 Wastewater and Waste Fluids

Wastewater from the radioactive material decontamination area should be maintained separately from hazardous decontamination and dewatering wastewater. If the wastewater chemical characteristics are unknown, wastewater should be managed as LLRW wastewater, until characterized. Known or suspected LLMW or LLCW wastewater should be segregated during accumulation and storage. When decontaminating and dewatering radioactively contaminated material, every effort should be made to minimize the generation of mixed waste.

1.3.6 Labeling and Posting of Containers Containing Radioactive Waste

Each waste container containing LLRW or LLMW should be labeled by the DoD broker. The specific activity contained in each waste container and maximum contact radiation levels should be measured in milliroentgens per hour (mR/hr). Following the surveying and labeling, the waste container should be placed in a designated and posted radioactive material storage area. The waste container should be posted with a "Caution – Radioactive Material" sign. The sign should also note the maximum surface radiation level (measured in mR/hr). An inventory of contents with radionuclide and specific activity (if available) should be posted on the outside of the container or a notice should be posted stating where this information is found. The waste inventories should be managed under DoD NRC or California Agreement State radioactive materials license, including the mixed waste inventory due to the radioactive constituents.

1.3.7 Waste Accumulation Areas

The DoD broker working on this project in conjunction with TtEC should implement, at a minimum, the following requirements for radioactive waste stored on-site within a designated radioactive waste storage area:

- An industry standard placard and barrier materials should be displayed with wording that includes the following, "Caution, Radioactive Materials Area-Unauthorized Personnel Keep Out" (written in English and Spanish), at each radioactive waste storage area sufficient to be seen from any approach. The signs should be legible and clearly conspicuous for outdoor and indoor locations.
- Aisle space should be maintained to allow for the unobstructed movement of personnel, fire protection equipment, spill control equipment, and decontamination equipment to any area of facility operation in an emergency, unless aisle space is not needed for any of these purposes.
- The areas should be secured to prevent unauthorized access to the material.
- The following emergency equipment should be located or available to personnel during radioactive waste management activities at each accumulation area:
  - A device, such as a telephone or a hand-held two-way radio, capable of summoning emergency assistance

- Portable fire extinguishers, fire control equipment, spill control equipment, and decontamination equipment

Filled containers generated during performance of this remedial action should be stored at the site where they were generated, until the contained material can be characterized for packaging and disposal by the DoD waste broker.

1.3.8 Waste Disposal

A certified waste broker contracted by the DoD Executive Agency for LLRW should be used for all packaging, shipping, manifesting, transportation, and disposal of LLRW, LLMW, and LLCW. The certified waste broker should coordinate closely with RASO. LLRW, LLMW, and LLCW inventories once identified by TtEC will be immediately turned over for management to the waste broker. These materials should be managed under the DoD broker's NRC license because of the radioactive constituents.

The certified waste broker should be responsible for preparing the hazardous waste manifests for the LLMW and the radioactive waste manifests for the LLRW. These manifests should be signed by the certified waste broker. The certified waste broker should also be responsible for coordinating the shipment of LLMW and LLRW and coordinating with the waste disposal facilities.

1.3.9 Waste Transportation

Wastes sent off-site for disposal should be done so in accordance with the DOT Radioactive Material Transportation regulations of 49 CFR, by a certified waste broker contracted by the DoD Executive Agency for LLRW. Personnel having the required DOT training should perform assistance as needed.

The certified waste broker should be responsible for surveying and taking radiation measurements on the outside of the container prior to shipment. The certified waste broker should work with the Caretaker Site Office (CSO) representative to ensure that containers leaving the site meet the release limits for equipment and materials as identified in the Radiological Work Plan (Attachment 2 to the RAWP).

1.3.10 Waste Minimization

To minimize the volume of radioactive waste generated during the project, the following general guidelines will be followed:

- Waste material will not be contaminated unnecessarily.
- Work will be planned ahead.
- Cleaning and extra sampling supplies will be maintained outside any potentially contaminated area to keep them clean and to minimize additional waste generation.

- Mixing of detergents or decontamination solutions will be performed outside potentially contaminated areas.
- When decontaminating radioactively contaminated material, every effort should be made to minimize the generation of mixed waste.
- Contaminated material will not be placed with clean material.
- Wooden pallets inside the exclusion zone will be covered with plastic.
- Material and equipment will be decontaminated and reused when practicable.
- Volume reduction techniques will be used when practicable.

1.3.11 Inspections

The DoD broker is responsible for LLRW accumulation areas. While all waste accumulation areas should be informally inspected on a daily basis, formal inspections of all container accumulation areas should be conducted and recorded at least weekly in accordance with the DoD broker's NRC license requirements. The RTM or designee will conduct inspections. Inspections will be recorded in a dedicated field logbook, and a weekly inspection checklist should be completed. The container storage area(s) should be inspected to ensure the following:

- The containers should be checked for good condition. If a container is not in good condition the certified waste broker will be informed.
- The containers should l be checked to ensure that they remain closed and secured at all times, except when adding or removing waste.
- The container label should be checked to ensure that it is visible and filled out properly.

1.3.12 Documentation

Documentation requirements apply to all waste managed during project activities. Field records should be kept of all waste-generation activities. All pages of the field data record log will be signed and dated by the person who is entering the data. In addition, the following information will be recorded in the log:

- Description of waste-generating activities
- Location of waste generation (including depth, if applicable)
- Type and volume of waste
- Date and time of generation
- Description of any waste sampling
- Name of person recording information
- Name of RTM at time of generation

1.3.13 Radioactive Waste Manifests

All radioactive waste transported from the site should be accompanied by a radioactive waste manifest and/or hazardous waste manifest if necessary. The LLRW/LLMW/LLCW manifests are the responsibility of the certified waste broker. LLRW manifests are signed by the broker.

The CSO and RASO should each receive one copy of the manifest; the remaining copies should be given to the transporter. The manifest should be returned to the DON's signatory official for the base's recordkeeping requirements. Copies of all manifests for waste generated at the site should be kept in a compliance file within the DoD broker's project files.

1.4 HAZARDOUS MATERIAL SECURITY PLAN

If it is determined that placardable DOT hazardous materials will be generated on-site, a DOT Hazardous Material Security Plan will be prepared as a stand-alone document. The Hazardous Material Security Plan will be prepared in accordance with 49 CFR 172, Subpart H, and will guide the management for security purposes of hazardous materials prior to shipment. All site personnel responsible for hazardous materials security will receive both general awareness and plan-specific training. This training will be documented in the project file.

1.5 UPDATING THE WASTE MANAGEMENT PLAN

The WMP will be updated as changes in site activities or conditions or changes in applicable regulations occur. Revisions to the WMP will be reviewed and approved by the DON. All changes to the WMP associated with radioactive or mixed waste will require approval from the RASO.

TABLE 1-1

SUMMARY OF WASTE MANAGEMENT, TRANSPORTATION, AND DISPOSAL REQUIREMENTS

Waste Types	Characterization Requirements	Containment Requirements	Storage Requirements	Transportation Requirements	Disposal Requirements
Excavated soil and/or refuse intended for off-site disposal	Unless a waste determination (e.g., RCRA hazardous, non-RCRA hazardous or nonhazardous) can be made based on generator knowledge, stockpiled soil and/or refuse will be sampled in accordance with the SAP. Samples will be run for potential contaminants including: VOCs, SVOCs, TPH, PCBs/Pesticides, total metals analysis and STLC or TCLP, as appropriate.	Contain in within the RMA until characterized. RCRA hazardous and non-RCRA hazardous soil contain in bermed pad with underlying 20-mil polyethylene liners.	All hazardous excavated soil and/or refuse intended for off-site disposal will be stockpiled on liners or placed bins. Nonhazardous soils may be taken to an unlined area the Navy has designated. All stockpiles will have appropriate erosion, wind, and stormwater run-on and runoff controls and other appropriate BMPs will be employed as required. Hazardous stockpiles will be identified as RCRA hazardous or non-RCRA hazardous waste. Hazardous stockpiles will be managed in accordance with the staging pile requirements of 40 CFR, Section 264.554.	If material is a hazardous waste, a hazardous waste manifest and DOT vehicle placarding are required. Must use a Cal/EPA-permitted transporter. Must also have LDR certifications as necessary. Hazardous waste manifest to be signed by the DON. Individuals involved in overseeing or shipping hazardous materials must meet DOT training requirements.	Due to the CERCLA Off-site Rule, all excavated soil will be sent to an appropriate TSDF approved under the CERCLA Off-site Rule. Prior to transport, the soil will be segregated as RCRA hazardous, non-RCRA hazardous, and/or nonhazardous. All disposal facilities will be submitted for preapproval to the CSO prior to off-site transport and disposal. All LLRW wastes will be turned over to the DoD Waste Broker for transportation and disposal.
Trees and other above ground vegetation	Above ground tree and other vegetation will be considered to be non-hazardous unless it has contacted hazardous materials	Laydown in uncontaminated area or on a clean surface within the contaminated area.	For clean vegetation and trees, no storage requirements. For vegetation or debris contacting radiological or other contamination materials, the materials will be stored in accordance with the above (Excavated soil or refuse intended for disposal off-site).	Trees and vegetation may be transported in open rolloff bins as green wastes.	Green materials will be sent to an off-site composting facility. Trees and woody materials may be chipped and dispersed in the random fill area of the landfill.

TABLE 1-1

SUMMARY OF WASTE MANAGEMENT, TRANSPORTATION, AND DISPOSAL REQUIREMENTS

Waste Types	Characterization Requirements	Containment Requirements	Storage Requirements	Transportation Requirements	Disposal Requirements
Used oil (including motor oil, hydraulic fluid, greases	Used oil may be characterized based on process knowledge when solely from heavy equipment. Other oils, or oils without process knowledge will be sampled and tested in accordance with the SAP	Used oil to be stored in 55-gallon containers.	Used oil to be stored in 55-gallon drums labeled "**USED OIL**" and located within a secondary containment unit. A contracted waste oil recycler shall pick up used oil for recycling.	Used oil will require a bill of laden for recycled materials.	Used Oil will be Recycled, no disposal.
Used fuel and oil filters	Used oil filters and oil will be handled as a Specified California Hazardous Waste. "Drained" oil filters may be managed as a nonhazardous solid waste. Recycling of the "empty" filters is an alternate method for removal of this material from site. Run total analysis and STLC or TCLP, or use process knowledge to make a waste determination. Spent fuel filters (drained) will be handled as nonhazardous solid waste.	"Drained" oil filters to be placed into plastic bags within 55 gallon open top drums. Filters to be drained and stored within the secondary containment area.	Spent oil and fuel filters will be completely drained and placed into plastic bags before being placed into nonhazardous solid waste dumpsters or retained for recycling.	Hazardous waste manifest required for disposal. Hazardous waste manifest to be signed by the DON. Recycled filters will require a bill of laden for recycled materials.	Contracted recycler to pick up and recycle used oil Secondary choice would be disposal of the bagged (drained) oil filters at an approved Class III solid waste landfill.

TABLE 1-1

SUMMARY OF WASTE MANAGEMENT, TRANSPORTATION, AND DISPOSAL REQUIREMENTS

Waste Types	Characterization Requirements	Containment Requirements	Storage Requirements	Transportation Requirements	Disposal Requirements
Wastewater (decontamination water, and collected radiologically impacted stormwater)	Unless a waste determination (e.g., RCRA hazardous, non-RCRA hazardous or nonhazardous) can be made based on generator knowledge, the material will be sampled to determine appropriate management and disposal procedures. Samples will be run for potential contaminants including: pH, VOCs, SVOCs, TPH, PCBs/Pesticides, total metals analysis and STLC or TCLP, as appropriate.	DOT-approved 55-gallon (bunghole-type) metal drums (1A1) or aboveground tank(s).	Ninety-day storage limit applies to tanks and containers containing hazardous waste. Containers and tanks will be marked as **“HAZARDOUS WASTE”** and include the accumulation date, composition and physical state of the waste, hazardous properties, and name and address of generator. Containers and tanks will be sealed when not being filled/unloaded. Containers will be elevated to prevent contact with any ponded precipitation and/or liquids. Store in predesignated hazardous waste storage areas with secondary containment.	If material is a hazardous waste, a hazardous waste manifest and DOT vehicle placarding are required. Must use a Cal/EPA-permitted transporter. Must also have LDR certifications as necessary. Hazardous waste manifest to be signed by the DON. Individuals involved in overseeing or shipping hazardous materials must meet DOT training requirements.	The waste will be containerized and sent off-site for disposal at an appropriate TSDF approved under the CERCLA Off-site Rule. All disposal facilities will be submitted for preapproval to the CSO prior to off-site transport and disposal. Alternately, radiologically impacted waters may be treated on site, sampled and used for dust control purposes.

TABLE 1-1

SUMMARY OF WASTE MANAGEMENT, TRANSPORTATION, AND DISPOSAL REQUIREMENTS

Waste Types	Characterization Requirements	Containment Requirements	Storage Requirements	Transportation Requirements	Disposal Requirements
Hazardous contents from buried containers, if encountered.	Unless a definitive nonhazardous waste determination can be made based on generator knowledge, container contents will be presumed hazardous pending analytical results and waste determination (e.g., RCRA hazardous, non-RCRA hazardous or nonhazardous) to determine appropriate management and disposal procedures. Samples will be run for reactivity, corrosivity, ignitability, and all potential contaminants of concern including: VOCs, SVOCs, PCBs, Pesticides, TPH, and metals.	DOT-approved 55-gallon (bunghole-type) metal drums for liquids (1A1) or over-pack containers. For limited amounts of material, open top 55 gallon drums maybe be used. For bulk wastes, closed top rolloffs can be used, or the materials placed on a lined containment area and covered	Ninety-day storage limit applies to containers containing hazardous waste. Containers will be marked as **"HAZARDOUS WASTE"** and include the accumulation date, composition and physical state of the waste, hazardous properties, and name and address of generator. Containers and tanks will be sealed when not being filled/unloaded. Containers will be elevated to prevent contact with any ponded precipitation and/or liquids. Store in predesignated hazardous waste storage areas with secondary containment. Incompatible materials will be segregated.	If material is a hazardous waste, a hazardous waste manifest and DOT vehicle placarding are required. Must use a Cal/EPA-permitted transporter. Must also have LDR certifications as necessary. Hazardous waste manifest to be signed by the DON. Individuals involved in overseeing or shipping hazardous materials must meet DOT training requirements.	The waste will be containerized and sent off-site for disposal at an appropriate TSDF approved under the CERCLA Off-site Rule. All disposal facilities will be submitted for preapproval to the CSO prior to off-site transport and disposal.
Used air filters	Air filters will be surveyed for radiological contamination.	Spent air	All filters are to be placed into plastic bags and placed into nonhazardous solid waste dumpsters.	Contracted solid waste management company to collect trash.	Dispose of air filters in site dumpsters or roll-off bins for nonhazardous solid waste and subsequent disposal at an approved Class III Landfill.

TABLE 1-1

SUMMARY OF WASTE MANAGEMENT, TRANSPORTATION, AND DISPOSAL REQUIREMENTS

Waste Types	Characterization Requirements	Containment Requirements	Storage Requirements	Transportation Requirements	Disposal Requirements
Construction debris (rock, wood, piping, concrete, asphalt, and oversized material)	Unless a waste determination (e.g., RCRA hazardous, non-RCRA hazardous or nonhazardous) can be made based on generator knowledge, the material will be sampled to determine appropriate management and disposal procedures. Samples will be run for potential contaminants including: VOCs, SVOCs, TPH, total metals analysis, and STLC or TCLP. Debris not having contact with waste or contaminated soil may be characterized as a nonhazardous solid waste.	Hazardous debris moved from point of generation to the decontamination area. Hazardous debris stored in bins or managed stockpiles.	Decontaminated debris (debris that meets the debris treatment standard and is not contaminated with a listed waste) and nonhazardous debris may be stored in nonhazardous solid waste roll-offs bins. Hazardous debris that cannot be decontaminated and does not meet the debris treatment standards will be stored in containers and/or bins and will be marked as follows: **"HAZARDOUS WASTE"** and include the accumulation date, composition and physical state of the waste, hazardous properties, and name and address of generator. Containers and/or bins will be sealed/ covered when not being loaded/unloaded. Containers will be elevated to prevent contact with any ponded precipitation and/or liquids.	No special transporter requirements for debris determined to be nonhazardous. Contracted solid waste management company to collect material. If material is a hazardous waste, a hazardous waste manifest and DOT vehicle placarding are required. Must use a Cal/EPA-permitted transporter. Must also have LDR certifications as necessary. Hazardous waste manifest to be signed by the DON. Individuals involved in overseeing or shipping hazardous materials must meet DOT training requirements.	Nonhazardous debris or debris treated to meet "Alternate Treatment" standards may be disposed off-site at an approved Class III solid waste landfill. Hazardous waste will be containerized and sent off-site for disposal at an appropriate TSDF approved under the CERCLA Off-site Rule. All disposal facilities will be submitted for preapproval to the CSO prior to off-site transport and disposal.
Nonhazardous waste (trash, inert construction debris, calibration canisters, clean polyethylene liners, and so forth)	Materials generated during the remedial action project and not contaminated with any waste or waste residue may be characterized as a nonhazardous solid waste.	Waste to be stored in nonhazardous roll-off bins or stockpiles.	Nonhazardous waste to be stored separate from hazardous waste and labeled accordingly to prevent commingling of hazardous and nonhazardous wastes.	No special transporter requirements for wastes determined to be nonhazardous. Contracted solid waste management company to collect material.	Nonhazardous waste to be disposed off-site at an approved Class III solid waste landfill.

TABLE 1-1

SUMMARY OF WASTE MANAGEMENT, TRANSPORTATION, AND DISPOSAL REQUIREMENTS

Waste Types	Characterization Requirements	Containment Requirements	Storage Requirements	Transportation Requirements	Disposal Requirements
Polyethylene sheeting or other liner materials (Contaminated)	Liners used for containing hazardous soil will be presumed to be hazardous.	Liners will be stored in roll-off bins or DOT 55-gallon drums.	Labeling should consist of a completed commercial hazardous waste label. Roll-off bins will be marked as **"HAZARDOUS WASTE"** and include the accumulation date, composition and physical state of the waste, hazardous properties, and name and address of generator. Roll-off bins will be sealed/covered when not being loaded/unloaded. Roll-off bins will be elevated to prevent contact with any ponded precipitation and/or liquids.	If material is a hazardous waste, a hazardous waste manifest and DOT vehicle placarding are required. Must use a Cal/EPA-permitted transporter. Must also have LDR certifications as necessary. Hazardous waste manifest to be signed by the DON. Individuals involved in overseeing or shipping hazardous materials must meet DOT training requirements.	The waste will be containerized and sent off-site for disposal at an appropriate TSDF approved under the CERCLA Off-site Rule. All disposal facilities will be submitted for preapproval to the CSO prior to off-site transport and disposal. For LLRW, wastes will be turned over to the US Army Waste Broker for transportation and disposal.
Scrap metal	Unless generator knowledge is sufficient to make a nonhazardous determination, metal debris will be decontaminated in accordance with the hazardous debris treatment standards before it can be managed as scrap metal for recycling.	Segregate scrap metal from other construction debris following decontamination.	Store in unique rolloffs outside the contamination area to prevent commingling with hazardous wastes and construction debris.	No special transporter requirements for scrap metal determined to be nonhazardous. Contracted scrap metal recycling company to collect material.	Scrap metal routed thru a portal monitor prior to being sent to an approved scrap metal recycling facility.

TABLE 1-1

SUMMARY OF WASTE MANAGEMENT, TRANSPORTATION, AND DISPOSAL REQUIREMENTS

Waste Types	Characterization Requirements	Containment Requirements	Storage Requirements	Transportation Requirements	Disposal Requirements
PPE	Use process knowledge to make a waste determination. Decontaminated PPE can be managed as a nonhazardous solid waste. LLRW PPE will be treated as being LLRW.	Use plastic bags at point of generation to transport to the 90-day accumulation area. (for non-rad PPE). LLRW PPE will be placed in DOT-approved 55-gallon metal drums (1A2).or placed into LLRW rolloff bins.	Labeling should consist of a completed commercial hazardous waste label. Containers will be sealed/covered when not being loaded/unloaded. Containers and roll-off bins will be elevated to prevent contact with any ponded precipitation and/or liquids. Store in predesignated hazardous waste storage areas with secondary containment.	If material is a hazardous waste, a hazardous waste manifest and DOT vehicle placarding are required. Must use a Cal/EPA-permitted transporter. Must also have LDR certifications as necessary. Hazardous waste manifest to be signed by the DON. Individuals involved in overseeing or shipping hazardous materials must meet DOT training requirements. Decontaminated PPE may be placed into nonhazardous solid waste roll-off bin to be picked up by contracted solid waste disposal contractor.	Decontaminated PPE may be disposed at an approved Class III solid waste landfill. If hazardous the waste will be containerized and sent off-site for disposal at an appropriate TSDF approved under the CERCLA Off-site Rule. All disposal facilities will be submitted for preapproval to the CSO prior to off-site transport and disposal. For LLRW, wastes will be turned over to the DoD Waste Broker for transportation and disposal.

TABLE 1-1

SUMMARY OF WASTE MANAGEMENT, TRANSPORTATION, AND DISPOSAL REQUIREMENTS

Waste Types	Characterization Requirements	Containment Requirements	Storage Requirements	Transportation Requirements	Disposal Requirements
Unidentified waste streams (i.e., waste streams that may be generated during site activities, but have yet to be identified)	Unless a waste determination (e.g., RCRA hazardous, non-RCRA hazardous or nonhazardous) can be made based on generator knowledge, the material will be sampled to determine appropriate management and disposal procedures. Samples will be run for potential contaminants including VOCs, SVOCs, TPH, PCBs/pesticides, total metals analysis, and STLC or TCLP, as appropriate.	DOT-approved 55-gallon metal drums (1A1 or 1A2) depending on whether a liquid or solid.	If hazardous waste, labeling should consist of a completed commercial hazardous waste label. Containers will be sealed/covered when not being managed. Containers will be elevated to prevent contact with any ponded precipitation and/or liquids. If a hazardous waste, the storage accumulation clock starts from the date that waste is first put into the container destined for off-site disposal (90-day max. allowed). Store in predesignated hazardous waste storage areas with secondary containment.	If material is a hazardous waste, a hazardous waste manifest and DOT vehicle placarding are required. Must use a Cal/EPA-permitted transporter. Must also have LDR certifications as necessary. Hazardous waste manifest to be signed by the DON. Individuals involved in overseeing or shipping hazardous materials must meet DOT training requirements.	The waste will be containerized and sent off-site for disposal at an appropriate TSDF approved under the CERCLA Off-site Rule. All disposal facilities will be submitted for preapproval to the CSO prior to off-site transport and disposal.
UXO/MEC	UXO/MEC will be evaluated by a UXO Technician to determine if the item(s) are hazardous or inert.	MEC that is determined to be MEC or MMPEH	Will be inventoried and stored in drums or magazines as determined by the UXO Supervisor.	Will be made inert, demilitarized by the UXO supervisor, or destroyed by EOD.	Disposal at an approved disposal facility as determined by the UXO Supervisor.

Abbreviations and Acronyms:

Cal/EPA – California Environmental Protection Agency
CFR – *Code of Federal Regulations*
CERCLA – Comprehensive Environmental Response, Compensation, and Liability Act
CSO – Caretaker Site Office
DoD – Department of Defense
DON – Department of the Navy
DOT – Department of Transportation
LLRW – low-level radioactive waste
LDR – land disposal restriction
MEC – munitions and explosives of concern
MPPEH – material potentially presenting an explosive hazard
PCB – polychlorinated biphenyl
PPE – personal protective equipment
RCRA – Resource Conservation and Recovery Act
RMA – Radiological Material Area
SAP – Sampling and Analysis Plan
STLC – Soluble Threshold Limit Concentration
SVOC – semivolatile organic compound
TCLP – Toxicity Characteristic Leaching Procedure
TPH – total petroleum hydrocarbons
TSDF – treatment, storage, and disposal facility
UXO – unexploded ordnance
VOC – volatile organic compound

1.0 INTRODUCTION

Tetra Tech EC, Inc., has prepared this Post-Closure Operations, Maintenance, and Monitoring Plan (Plan) for Installation Restoration (IR) Site 2, former Naval Air Station (NAS) Alameda, Alameda Point, Alameda, California. This Plan was prepared for the Department of the Navy (DON), Base Realignment and Closure Program Management Office West under Contract No. N62473-10-D-0809, Contract Task Order 0009. The purpose of this Plan is to describe the operations, maintenance, and monitoring to be implemented after construction of the multilayer soil cover (cover) on the IR Site 2 landfill. The approach set forth in this Plan was developed based on the description of the selected soil remedy in Record of Decision (ROD) (DON 2010), site conditions described in the Remedial Investigation (RI) Report (Battelle and BBL 2006), and the Feasibility Study (FS) Report (Battelle and BBL 2008)

1.1 SITE DESCRIPTION

The site covers approximately 110 acres in the southwest corner of the former Alameda NAS, now referred to as Alameda Point (Figure 1-1). The site consists of the former landfill area (West Beach Landfill), which occupies approximately 60 acres, and a wetland, which covers approximately 33 acres immediately south and west of the landfill. The wetland area includes two surface water features, the north pond and the south pond. The north pond is connected by a culvert to San Francisco Bay. The remaining 17 acres within the site boundary is known as the interior margin and the coastal margin. The site is bound on the south and west by San Francisco Bay and on the east and north by runways and tarmacs.

Additional site background information is presented in Section 2.0 of the Remedial Action Work Plan (RAWP).

1.2 SITE HISTORY

The site was formerly part of the San Francisco Bay and was created by construction of a seawall around the perimeter, filling with dredge materials, and subsequent disposal of wastes generated by former NAS Alameda activities from 1956 through early 1978. Historical disposal methods at the site generally consisted of trench-and-fill operations and placement of cover soil on an intermittent basis. These operations resulted in waste that is in contact with shallow groundwater. Alameda Point was included on the National Priorities List of Superfund sites in August 1999, U.S. Environmental Protection Agency (EPA) (Identification: CA2170023236).

After landfill operations ceased in 1978, an earthen berm was constructed around the perimeter of the landfill. The extent of the landfill, as defined in the ROD (DON 2010) and as modified based on the Intermediate Draft Remedial Design Report (KCH 2011), is shown on Figure 1-1.

1.3 FUTURE USE

IR Site 2 has been designated for federal agency (DON) to federal agency (Office of Veterans Affairs) transfer. The proposed future use at IR Site 2 is "undeveloped" with potential for recreational uses such as a perimeter hiking trail.

1.4 PREVIOUS ACTIVITIES

IR Site 2 was used as a landfill. There was no land use at the site prior to 1956, when the perimeter sea wall was constructed and the site was first formed by using dredged fill. Due to its historical use solely as a landfill, no persons have resided or currently reside at the site.

1.4.1 Remedial Investigation/Feasibility Study

The Final RI Report (Battelle and BBL 2006), the FS, and Basewide Groundwater Monitoring Program (BGMP) reports describe in detail the nature and extent of groundwater contamination. The most commonly detected organic contaminants in site groundwater are volatile organic compounds, total petroleum hydrocarbons, and other fuel-related compounds (ITSI 2008). Groundwater contamination is characterized by a relatively widespread pattern of low-level contamination. The source of contamination is attributed to the operation of the site as the principal waste disposal facility for Alameda Point between 1956 and 1978.

1.4.2 Record of Decision

The DON conducted an FS (Battelle and BBL 2008) to evaluate potential remedial alternatives for IR Site 2 and prepared a ROD (DON 2010) to document the selected remedy for the site. The DON and the Federal Facility Agreement signatories (the EPA, California Environmental Protection Agency, Department of Toxic Substances Control [DTSC], and the San Francisco Bay Regional Water Quality Control Board) concurred on the selected remedy for the site. The decision agreed to in the ROD is based on information contained in the administrative record file as well as on extensive field investigations, laboratory analyses, interpretation of the data, review of current and future conditions, assessment of the potential human health and ecological risks, and an evaluation of potential remedial alternatives.

1.4.3 Remedy for Soil

The selected remedy for soil, as outlined in the ROD, is Alternative 2, a multilayer soil cover, engineering controls (ECs) and institutional controls (ICs), and monitoring. This alternative consists of installation of an engineered soil cover over the former landfill to isolate buried waste and soil contaminants and prevent animal burrowing; implementation of engineering and land use controls to protect human health and soil cover integrity; provision for any necessary wetlands mitigation if impacts to wetlands occurs; monitoring of the soil cleanup action and wetlands mitigation to ensure their proper construction and long-term effectiveness; and conduct of methane gas monitoring as necessary. The RAWP addresses the design of the soil remedy and includes more details on the ECs and ICs.

1.4.4 Remedy for Groundwater

The selected remedy for groundwater, as outlined in the ROD, is Alternative 2 – Monitored Natural Attenuation (MNA). This alternative consists of regularly monitoring groundwater quality using shoreline groundwater monitoring wells to ensure that there are continued stable to decreasing trends in contaminant concentrations, and protection of the beneficial uses of surface water in San Francisco Bay; and implementation of engineering controls and ICs to protect human health and the groundwater remedy.

The objective of MNA is to verify the occurrence of natural attenuation of groundwater contaminants through monitoring. In accordance with the ROD, contaminants will not be actively remediated, but will be allowed to degrade, adsorb, dilute, or transform according to natural, unaided environmental processes (DON 2010). The groundwater remedy meets the Remedial Action Objective (RAO) described in the ROD to protect beneficial uses of surface water in San Francisco Bay from the potential for discharge of site groundwater (DON 2010).

Because groundwater at the site is not used for drinking water and is not considered a potential drinking water source, numerical standards associated with groundwater (such as maximum contaminant levels for drinking water) do not apply. Instead, chemicals identified during the remedial investigation in excess of California Toxics Rule (CTR) surface water quality criteria were summarized in ROD Table 2.7.

While the CTR criteria are not directly applicable to groundwater, the criteria are appropriate to provide suitable context for evaluating IR Site 2 groundwater relative to groundwater RAOs. Currently, risk to San Francisco Bay surface water from site groundwater is considered negligible. A groundwater monitoring evaluation and groundwater monitoring activities will be detailed in an Addendum to the RAWP.

1.5 SELECTED REMEDY COMPONENTS

1.5.1 Gas Venting

The landfill area was designed with a passive gas venting system to prevent landfill gas buildup which could disrupt the cover. The gas venting trenches are filled with high permeability aggregate and geotextile surrounding a 4-inch perforated pipe. The pipes connect to gas vents open to the atmosphere.

Ten existing landfill gas probes will be destroyed during soil cover construction. Nine new perimeter gas probes will be installed at IR Site 2, as shown in the design drawings presented in RAWP Attachment 1. These probes will be designed and located as described in the RAWP and attached 100% Remedial Design (RD).

1.5.2 Subgrade and Foundation Fill

The subgrade and foundation fill will consist of common fill materials or natural ground. The primary requirement for this fill material is that it be compatible and provide stable support for the cover. The primary purpose of the subgrade and foundation fill is to build up the original landfill surface to moderate, uniform slopes. Grades established for the cover system will be approximately 1.5 percent to account for potential settlement and maintain positive drainage over the cover system.

1.5.3 Multilayer Soil Cover

The proposed cover will be 2 feet thick to provide required isolation from the waste, and will consist of three distinct layers:

- Animal intrusion barrier consisting of minimum 220-mil high-density polyethylene geonet
- Cover layer of 18 inches of common fill
- Vegetative layer of 6-inch-thick topsoil amended to help establish vegetation

1.5.3.1 Animal Intrusion Barrier

The animal intrusion barrier will be installed utilizing minimum 220-mil layer of high-density polyethylene geonet. The material will require no specialized seaming and will transverse the fill.

1.5.3.2 Cover Layer

After the animal intrusion barrier is placed over a portion of the site, a cover layer will be installed consisting of an 18-inch layer of import material meeting geotechnical specifications and conditioned for moisture.

1.5.3.3 Vegetative Layer

The vegetative layer is a 6-inch layer that requires only 85 percent compaction and is amended to help establish vegetation. This fill material is similar to the cover material.

1.5.3.4 Vegetation

The landfill cover will be hydroseeded with a mixture identified in the Specifications in the 100% RD (Attachment 1 to the RAWP).

1.5.3.5 Surface Water Management System (Drainage and Swale Layer)

Two new earthen swales with turf reinforcement mats are integrated into the cover design. The channels slope from 0.5 to 1 percent and have been placed to maximize the efficiency of collection and transfer of sheet flow from the completed cover. An existing concrete channel located on the eastern boundary of the site will be maintained throughout construction and incorporated into the final drainage system.

1.5.4 Settlement Monuments

Four settlement monuments will be installed on the final cover system as specified in the 100% RD (Attachment 1 of the RAWP). Markers will be located where the depth of fill is the greatest and therefore settlement potential the highest. The monuments will be located so that settlement rate and trends can be monitored and assessed.

1.6 DOCUMENT ORGANIZATION

This Plan is organized as follows:

- **Section 1.0** provides the site description, history, previous activities, site remedy components, and document organization.
- **Section 2.0** describes the requirements for post-closure groundwater and methane monitoring.
- **Section 3.0** describes the operation and maintenance requirements for site structures.
- **Section 4.0** describes the operation and maintenance requirements for the landfill cover settlement.
- **Section 5.0** describes the monitoring and maintenance requirements for the wetlands mitigation areas.
- **Section 6.0** provides the proposed schedule.
- **Section 7.0** describes reporting requirements.
- **Section 8.0** provides post-closure financial assurance.
- **Section 9.0** provides post-closure certification.
- **Section 10.0** lists the references cited in the text.
- Tables and figures follow the text.
- **Appendix A** includes the Standard Operating Procedures (SOPs).
- **Appendix B** presents the estimated annual cost for operations, maintenance, and monitoring.
- **Appendix C** presents the required Emergency Response Plan.

This page intentionally left blank.

2.0 OPERATIONS AND MAINTENANCE FOR GROUNDWATER AND METHANE MONITORING

2.1 GROUNDWATER MONITORING WELL NETWORK EVALUATION

The DTSC, in a written communication dated March 1, 2013, requested that the DON submit a separate Groundwater Monitoring Evaluation (GME) as a Remedial Design Addendum document. Groundwater monitoring requirements will be detailed in the GME and will be incorporated in the post-closure United Federal Programs Quality Assurance Project Plan. The construction of the soil remedy is not dependent on concurrence with a GME.

2.2 METHANE MONITORING

Methane monitoring will be conducted in accordance with Title 27 CCR, Section 20921 (a), to provide for the protection of public health and safety and the environment by demonstrating that methane migration is not occurring in the vadose zone and that methane levels in ambient air at the landfill perimeter is in compliance. Nine new monitoring probes will be installed around the landfill perimeter. Methane monitoring probe construction details are included in the 100% RD (Attachment 1 to the RAWP, sheet D-2). Probe locations are shown on sheets C-9 through C-11.

Methane monitoring will be conducted quarterly. Methane will be measured at each probe to evaluate subsurface concentrations. An exceedance of the criterion will be considered verified if concentrations are above 5 percent by volume for any two of three consecutive quarters. If methane concentrations are confirmed, the EPA and the San Francisco Bay Regional Water Quality Control Board will be promptly notified and the gas control system design re-evaluated.

In addition, barometric pressure, atmospheric temperatures, and general weather conditions will be reported at the time of gas collection. It is recommended by the Integrated Waste Management Board to collect landfill gas during barometric low pressures. Depending on the weather, this may be late in the morning or early in the afternoon.

In addition to monitoring the probes, perimeter monitoring locations spaced approximately 250 feet apart along the boundary of the landfill cover will be used to monitor ambient air at the point of compliance. Establishing the perimeter monitoring locations will be the responsibility of the post-closure operations and maintenance contractor. Relevant standard operating procedures for landfill probe and surface perimeter monitoring are listed in Table 2-1 and included in Appendix A.

This page intentionally left blank.

3.0 OPERATIONS AND MAINTENANCE FOR SITE STRUCTURES

The maintenance and monitoring will begin once the landfill soil cover construction is complete, anticipated in January 2014.

3.1 LANDFILL COVER SURFACE WATER MANAGEMENT SYSTEM

Existing drainage features include concrete channel, drainage piping and inlets, concrete outfall culverts, and earthen swales. Supplemental drainage in accordance with the final cover design will supplement existing drainage with a total of three turf reinforced mat channels. An existing concrete channel located on the eastern boundary of the site will be maintained throughout construction, and incorporated into the final drainage system.

Concrete channels and earthen swales with turf reinforcement mat collect and divert stormwater runoff. Concrete channels prevent erosion in areas where stormwater flow might accumulate. Proper and adequate inspections of the channels are required to prevent sediment build-up and failure of integrity. Inspections will be conducted annually before the rainy season and in the event of heavy precipitation resulting in either 0.50 inch or more of rainfall within 24 hours or 0.25 inch or more within 1 hour. The inspection will be in accordance with SOP 004 (Appendix A).

Concrete channels associated with the landfill cover drainage system will be visually inspected by walking the length of each channel. Special attention is required to verify sediment and debris accumulation along the channels, cracking or fractures of the concrete structure, erosion at joints or along edges, and separation or deterioration of joints between concrete sections.

Drainage pipe cleanout ports and discharge piping will be visually inspected for damage or blockage. Drainage pipe outlets, discharge piping, and riser pipes will be cleared to allow free flow of water. The pipe outlets will also be inspected for blockage.

Nonconcrete drainage channels and swales will be inspected for erosion and proper functioning. Special attention should be directed to areas of no grass or patchy grass; ripples or swells in the soil caused by erosion; and settlement that inhibits or prohibits storm water flow.

Stormwater should flow around, off, and away from the landfill covers, with visual flow directly into the concrete channels or other established drainage routes. The perimeter of both covers should be inspected to check that drainage flows around and away from the covers. The lip and entrance to concrete drainage channels will also be inspected to check for areas where storm water may not readily enter a channel. Inspection should be made by walking the cover perimeters and drainage channels.

3.2 WETLANDS CULVERT

The wetlands culvert hydraulically connects the North Pond to San Francisco Bay. The culvert will be inspected quarterly and in the potential event that tidal circulation is inhibited or blocked due to culvert failure, the Navy will restore tidal circulation within 7 days.

3.3 GAS COLLECTION

The landfill passive gas collection system consists of a perimeter boundary conveyance trench filled with high permeability sandy soil surrounding a 4-inch perforated pipe. The pipes are connected to gas vents open to the atmosphere at the high end of the trenches.

The gas vent pipes will be visually inspected in accordance with SOP 009 (Appendix A) with extra attention centered on cracks or holes in the riser pipe; missing or damaged screens and end caps; and completely destroyed riser pipes. The gas collection system will be decommissioned if results of methane monitoring indicate that the system is not required.

3.4 GAS PROBES

Existing soil gas probes located within the landfill boundary will be destroyed prior to multilayer soil cover installation (see Figure 2-1). A network of nine probes will be installed around the perimeter of the landfill in order to establish a compliance plane. The probes will be monitored in accordance with SOP 008 (Appendix A).

3.5 MONITORING WELLS

Existing groundwater monitoring wells located within the landfill boundary will be protected during cover construction, where feasible. If an existing well is damaged or removed for cover construction purposes, replacement wells screened at the same intervals will be installed within a 5-ft radius of the original well (see Figures 2-1 and 2-2). Monitoring well inspection and maintenance will be during sampling activities. The condition of the well vault lid, lid bolds, well cap, and well ID will be inspected and noted during each sampling event. Observations will be recorded on field monitoring well sampling forms.

3.6 SETTLEMENT MONUMENTS

Four settlement monuments will be installed on the final cover system as shown in the100% RD (Attachment 1). Markers will be located where the depth of fill is the greatest and, therefore, settlement potential is the highest. The monuments will be located so that settlement rate and trends can be monitored and assessed.

Monuments will be surveyed annually. Additionally, topographic surveys of the entire cover will be conducted every 5 years to evaluate settlement. Annual surveying will include the following:

- Inspect each monument with respect to the surrounding surface of the cover, noting whether the station appears to be even with the surrounding surface, if it is in a depressed area, or if the area is higher than the surrounding surface.
- Record all observations.
- Survey and record the elevations of all four settlement monitoring stations to an accuracy of 0.01 foot vertically against the benchmark.

Survey data will be collected by a California licensed surveyor and the data will be included in the annual reports and 5-Year Review. If significant settlement is found (typically more than 0.75 foot), a professional engineer will evaluate the situation and the site operator/manager will be notified.

3.7 ACCESS ROADS

Access roads within IR Site 2 will be constructed to provide easy access to the site for monitoring and maintenance activities. Each road is approximately 24 feet wide, constructed with 12 inches of compacted aggregate over geotextile fabric (100% RD, Attachment 1 to the RAWP, sheet D-4). Inspection of the roads will be conducted in association with other monitoring and maintenance activities. Access road inspection will be in accordance with SOP 003 (Appendix A). Access road maintenance and repair will be conducted in accordance with SOP 006 (Appendix A).

3.8 SIGNAGE

Maintenance activities will include inspection of general information placards for the perimeter monitoring locations and signs for the public indicating trail use or restoration areas on a semiannual basis to ensure that they have not been damaged. Signs that have been altered, or affected by natural conditions, will be replaced.

This page intentionally left blank.

4.0 OPERATIONS AND MAINTENANCE FOR LANDFILL COVER SETTLEMENT, EROSION, AND VEGETATION

4.1 DIFFERENTIAL SETTLEMENT AND EROSION

Differential settlement is caused by decomposition and/or consolidation of subsurface material, which may result in adverse grade or depression on the surface of the landfill cover. Since the groundwater remedy is MNA and the cover design does not address groundwater, differential settlement that results in ponding of surface water or affects drainage controls may not require corrective action. Erosion is anticipated to be the most common problem that will affect the landfill cover. Erosion is typically noted at the base of long slopes where water tends to accumulate due to grading and drainage patterns. Settlement or effects to drainage controls that cause erosion and reduce the thickness of the cover will need to be corrected.

4.1.1 Detection

The IR Site 2 landfill cover will be visually inspected quarterly by the Operations Manager or his/her designee and annually by a registered civil engineer or engineering geologist as described in SOP 001 (Appendix A) to ensure the integrity. Landfill cover maintenance activities will include assessment of the landfill cover conditions, vegetation control and restoration, and animal control. The perimeter of the landfill will be evaluated for areas where surface water is impounded, excessive erosion is evident, or sloughing is apparent on a slope. Surface cracks more than 1 inch wide and 12 inches deep, or longer than 20 feet may indicate slope instability, settlement, or internal thermal activity of the landfill. The quarterly inspection will include looking for pieces of geonet material and waste items on the cover surface that indicate the geonet animal intrusion barrier has been breached by burrowing animals. Landfill cover maintenance and repairs will be conducted in accordance with SOP 007 (Appendix A).

4.1.2 Repairs

For areas where the thickness of the cover has been compromised and repair is warranted, the cover will be repaired by excavating and stockpiling the top cover soils in the impacted area down to the animal intrusion barrier, and regrading that portion of the cover with material comparable to that used in the original cover design. Animal burrows that breach the geonet layer will be filled with low-strength concrete slurry. Repairs will need to be inspected by a registered civil engineer.

New fill soils would be placed at the locations designated by the registered civil engineer and compacted to 6 inches below the unaffected surrounding cover and compacted to approximately 90 percent of the Modified Proctor maximum dry density with water content within 0 to 4 percent of the modified optimum. The area will be re-covered with the removed topsoil cover material, compacted to approximately 85 percent, and scheduled for vegetation restoration.

The final grade will be graded with no more than a 1.5 percent slope and reseeded to match the undisturbed surrounding area. Major repair work will be inspected after completion by a registered engineer. The area will be surveyed after repair to obtain a record of the surface elevations of the repaired area.

4.2 VEGETATION

The landfill cover will be hydroseeded a mixture identified in the Specifications (100% RD Attachment 1 to the RAWP, sheet C-12). Once established, the vegetative cover will appear similar to local natural open space areas. The vegetative cover will turn green during the rainy season and is expected to fade to brown during the dry season. Since the landfill cover will be hydroseeded, during the rainy season, supplemental irrigation is not anticipated. The cover vegetation will be inspected as described in SOP 005 (Appendix A).

Reseeding may be required to cover repairs, eroded areas, dead areas, and bald spots. Supplemental irrigation may be required to help establish reseeded areas. Water will be apply re-seeded areas at a sufficient rate to ensure moist soil conditions to a minimum 1 inch depth, while preventing run-off.

4.3 DOCUMENTATION

Inspection of cover settlement should be recorded on the standardized form developed for this purpose provided in SOP 001, Multilayer Soil Cover Inspection.

Information on the form includes:

- Settlement location with regard to permanent markers
- Measurements of settlement or erosion

4.4 EXTRAORDINARY REPAIRS FOR THE COVER, BERM, AND SEAWALL

If a major seismic event occurs, the operation and maintenance contractor or designated alternate will initiate procedures to inspect all landfill systems, including settlement monuments. Initial repairs will be performed within 72 hours. For the purpose of this plan, a major seismic event is defined as one that equals or exceeds Intensity V (as defined by the Modified Mercalli Scale) at the site.

A major earthquake will require implementation of the following SOPs for inspection of all systems:

- SOP 001 Multilayer Soil Cover Inspection
- SOP 002 Landfill Gas Surface Monitoring
- SOP 003 Access Road Inspection
- SOP 004 Surface Water Management System Inspection and Maintenance

- SOP 005 Vegetative Cover Inspection and Maintenance
- SOP 006 Access Road Maintenance and Repair
- SOP 007 Multilayer Soil Cover Maintenance and Repair
- SOP 008 Landfill Gas Probe Monitoring
- SOP 009 Landfill Perimeter Gas Vent Inspection and Maintenance

If the seawall or the berm is damaged, it will be repaired. SOP 007 has procedures for repairing shallow and deep cracks, vertical cracks, cracks with vertical displacement, depressions, and sloughing/slope failure, which will be used for berm repair. For seawall repairs, inspection of the damage by a qualified engineer will be required to design the repairs including procedures for completing these repairs. These repairs could include relocating displaced riprap, and the use of gunite, concrete, or other similar materials to repair cracks and voids. Placement of additional riprap may also be necessary to repair and/or raise the seawall. Surface water that contacts the landfill waste as a result of a major seismic event will be confined and addressed. The PCGMP well network will also be inspected. Resampling of the monitoring wells will be evaluated. If inspection of the systems detects a noncompliance, the operations and maintenance contractor will notify the site management representative, who will notify the EPA, DTSC and the Regional Water Quality Control Board.

This page intentionally left blank.

5.0 MONITORING AND MAINTENANCE OF WETLANDS MITIGATION AREAS

A baseline vegetation and wildlife survey that will occur immediately prior to construction will establish overall percent cover, document the composition of the vegetative community, and establish average daily use of the reference areas by shorebirds and waterfowl. Hydrologic success will also be considered.

5.1 SUCCESS CRITERIA FOR VEGETATION

During the vegetation survey, permanent 1-meter-square reference plots will be established on transects running through the entire mitigation sites. These transects and monitoring plots will be assessed on a yearly basis using the same criteria as those used to establish baseline conditions. The survey will document mortality, weed invasion, and rate of colonization. Success criteria for vegetation are as follows:

- In the tidal marsh area, existing conditions show a pickleweed community cover density of approximately 75 to 100 percent in the wetland areas that will be affected. The 5-year monitoring goal is to attain this same density and the same plant community composition as under existing conditions. The Year 1 goal is to show 10 percent pickleweed cover, increasing to 25 percent at Year 2, 50 percent in Year 3, and 75 percent in Year 4. If these goals are not met, the restored area will be assessed to determine if site conditions are not conducive to plant growth. If needed, corrective actions including planting pickleweed plugs taken from a nearby location will be implemented. Corrective actions would be implemented in Year 2 and beyond if needed.
- There is no invasive cordgrass or pepperweed in the tidal marsh at this time. Success criteria require that this state be attained and maintained in the mitigation area for the duration of the 5-year monitoring period.
- In the open water/mudflat habitat, there will be little to no vegetation in the low-marsh (mudflat) areas, and the mid- and high-marsh areas are projected to be vegetated almost exclusively with pickleweed to reflect current conditions. Success criteria are such that the mudflat area will have less than 10 percent vegetation below -0.2 feet NGVD29, and this vegetation will be a minimum of 80 percent pickleweed. Above -0.2 feet, pickleweed will increase in density to 75 to 100 percent over 5 years. The pickleweed fringe will be maintained by work crews who will remove cordgrass and pepperweed by hand or other approved method to ensure no encroachment of these weed species.
- If success criteria are not met, corrective action will be taken. For vegetation establishment, this means that pickleweed plugs will be planted in quantities needed to attain goals if goals are not met at Years 2 and beyond. For invasive species, this means that all invasive cordgrass or pepperweed will be removed on a yearly basis, on a date preceding normal seedset.

5.2 SUCCESS CRITERIA FOR WILDLIFE

For wildlife, bird counts will occur at the appropriate time of year and will occur over successive tidal cycles. Bird usage of the tidal pond, the mudflats, and freshwater pond will be documented and used to create the baseline conditions against which to measure success. Success criteria for bird use of the mitigation sites is such that bird use would increase incrementally over a 5-year period as the invertebrate community in the substrate increased, and would match the rate of bird use in the reference (adjacent) areas at the end of the 5-year monitoring period.

5.3 SUCCESS CRITERIA FOR HYDROLOGY

Although a detailed hydrologic study of the site has not been completed, success criteria are such that hydrological features found at the reference areas (meaning wetlands directly adjacent to the mitigation areas) will be found in the mitigation areas as well. In the tidal areas, this means that the constructed wetlands will be tidally inundated and drained on a diurnal basis on the same intervals as the reference area.

In the open water/mudflat/pickleweed freshwater areas near the South Pond, the mitigation wetlands will have been graded to the same elevation as the reference habitat; therefore, success criteria are such that surface water levels and mudflats will mimic conditions found in the surrounding areas that have the same surface elevation. In general, this means that surface water levels will be highest in the period from December through April, and will diminish thereafter. In dry years, the freshwater open water area and mudflat may dry completely in late summer.

Hydrologic features of the site will not be manipulated during construction; however, if after project implementation hydrological features do not appear to be operating as planned, a hydrologic assessment of the area will be performed by a hydrologist and recommendations for further grading will be made.

6.0 SCHEDULE FOR ROUTINE OPERATIONS AND MAINTENANCE ACTIVITIES

The proposed schedule is presented on Figure 6-1. The schedule assumes that construction of the cover will be complete in January 2014. Adjustments to the schedule may be necessary if there are changes to the construction schedule. Time frames for activities are approximate and correspond with the frequency of tasks discussed in subsequent sections. Severe damage, catastrophic events, and some minor items, such as watering of the cover vegetation, have not been included since these events do not occur on a regular schedule.

6.1 SCHEDULED INSPECTION

IR Site 2 will be inspected quarterly and after major weather (any rain event with 0.5 inch of rain occurring in a 24-hour period) or seismic events (Modified Mercalli Intensity VII) for damage, and maintenance will be performed as necessary. Inundation due to gradual sea level rise will be monitored and reported as part of the quarterly inspections. Inspection items and corrective actions are described in the following sections. If damage to the cover system is observed during any post-closure inspection, the cause of the damage will be investigated and documented in the inspection log.

6.1.1 Cover Settlement

Inspection of the landfill cover condition and the slopes of the landfill will occur on a quarterly basis and after significant events.

6.1.2 Geonet Animal Intrusion Barrier

The quarterly inspection will include looking for pieces of geonet material and waste items on the cover surface that indicate the geonet animal intrusion barrier has been breached by burrowing animals.

6.1.3 Methane Monitoring

Methane monitoring will be conducted quarterly for the first 5 years following the completion of the cover construction, and will be re-evaluated during the 5-year review. Methane monitoring will consist of both soil gas probe monitoring and ambient air monitoring at the perimeter of the landfill.

6.1.4 Wetlands Culvert

The culvert connecting San Francisco Bay with the IR Site 2 wetlands area will be inspected on a quarterly basis and after significant events. The Navy will make necessary repairs, modifications or replacement to maintain tidal circulation as recommended by the structural assessment of the culvert if warranted. In the potential event that tidal circulation is inhibited or blocked due to culvert failure, the Navy will restore tidal circulation within 7 days.

6.1.5 Site Structures

The following structures shall be inspected semiannually:

- Signage
- Landfill perimeter gas vents
- Settlement monuments

Settlement monuments will be surveyed annually. Access roads and surface water management structures will be inspected annually before the rainy season and in the event of heavy precipitation resulting in either 0.50 inch or more of rainfall within 24 hours or 0.25 inch or more within 1 hour.

6.2 FIELD DOCUMENTATION

SOPs have been included in Appendix A with documentation forms for field recording of scheduled routine maintenance and monitoring data collection.

6.2.1 Document Corrections

Changes or corrections on any project documentation will be made by crossing out the erroneous item with a single line and initialing (by the person performing the correction) and dating the correction. The original item, although erroneous, must remain legible beneath the crossed-out line. The new information should be written clearly above the crossed-out item.

7.0 REPORT REQUIREMENTS AND DATA MANAGEMENT

Reporting will occur as a part of this Plan. Reporting will consist of submitting annual reports to the EPA, DTSC, and Regional Water Quality Control Board. The inspection and monitoring program established will be evaluated annually by an independent, qualified engineer registered in California, The inspection will include review of the condition of all surface improvements, drainage facilities, erosion control facilities, vegetative cover, gas control facilities, and monitoring facilities. Specifically, the annual report will present:

- Survey data
- Site inspection data:
  - Condition of vegetation
  - Erosion
  - Cracking
  - Seepage
  - Slope stability
  - Subsidence
  - Settlement
  - Condition of run-on and run-off control systems
  - Condition of surveyed benchmarks
- Groundwater monitoring system and analytical results for samples collected in the previous semiannual and current annual sampling events
- Perimeter landfill gas probe and ambient air monitoring results
- Trends analyses results

Initially (for the first year at a minimum), stand-alone reports will be submitted. A 5-year review will be completed for the site at the time of the basewide 5-year review cycle in 2016.

This page intentionally left blank.

8.0 POST-CLOSURE FINANCIAL ASSURANCE

A detailed cost estimate for annual operating, maintenance, monitoring, and reporting is included in Appendix B. The estimated annual cost for anticipated activities is $101,715 in 2012 dollars. The DON is fiscally responsible for post-closure related costs until such time as the site is transferred to the Office of Veteran Affairs.

MULTILAYER SOIL COVER INSPECTION

1.0 GENERAL

The multilayer soil cover should remain intact, free of major cracking (defined as cracks 1-inches or wider, deeper than 12-inches, and longer than 20-feet), erosion (deeper than 12-inches) and surface depressions that could cause ponding. The vegetation inspection is described in Standard Operating Procedure (SOP) 005 (Vegetation Cover Inspection and Maintenance).

2.0 TASK DESCRIPTION

The task covered by this SOP is the visual inspection of the cover which guides maintenance and repair planning and implementation. Regular visual inspections of the cover shall be performed quarterly by the Operations Manager or his designee, and annually by a registered civil engineer.

3.0 REQUIRED MATERIALS

The following items are needed to perform a visual inspection:

- A copy of the landfill map (attached)
- Form SOP 001 (Cover Inspection Form)
- Survey stakes
- Measuring tape
- Clipboard
- Pen with indelible ink
- Camera

4.0 TASK PERFORMANCE

Record inspection observations on Form SOP 001. All areas exhibiting the conditions listed below shall be recorded on the form and flagged or staked in the field. The completed form shall be given to the Operations Manager, who will then refer to SOP 007 (Multilayer Soil Cover Maintenance and Repair). The following are guidelines for conditions to be observed and recorded:

- Eroded areas (erosion deeper than 6-inches)
- Landfill cover soil conditions such as sloughing and sliding

- Cracks, fissures, or other features that may potentially allow gas migration or surface water infiltration. Cracks in the cover longer than 20 feet and deeper than 12 inches and wider than 1 inches shall be examined and evaluated by a registered civil engineer.
- Areas of subsidence, depressions, or topography where ponding may occur
- The state of surface water management facilities, failure or malfunction of which could impact cover performance
- Culvert integrity and blockage which would impede flow to wetlands

In addition to regular visual inspections, the landfill cover shall be inspected as soon as it is accessible following the events listed below:

- Significant rainfall (as defined in SOP 004 – Surface Water Management System Inspection). Note in particular erosion, or areas of slope deformation
- Major earthquakes. Note in particular cracks, deformation, or zones of slope instability.
- Failure of the surface water management control system. Note in particular erosion, wet or saturated cover soils, ponding, or areas where there is a potential for increased infiltration.
- An emergency as defined in the Emergency Response Plan

If at any time a condition of cover distress is observed, it shall immediately be reported to the Operations Manager.

SOP 002

LANDFILL SURFACE GAS MONITORING

1.0 GENERAL

Landfill surface gas monitoring is performed to evaluate the effectiveness of the landfill cover and the passive gas control system in controlling the movement of methane through the cover. The objective of this Standard Operating Procedure (SOP) is to monitor ambient air at 250 foot intervals around the perimeter of the landfill in order to identify specific locations or areas of the landfill surface with elevated emission rates greater than 50 ppmv. Selection and permanently identifying the monitoring stations will be the responsibility of the Operations and Maintenance contractor.

2.0 TASK DESCRIPTION

Surface gas monitoring will be conducted quarterly during landfill gas probe monitoring activities (SOP 008). Surface gas monitoring will be conducted buy a field technician using hand held instruments.

3.0 REQUIRED MATERIALS

The following equipment and supplies are needed:

- Methane monitoring instrument capable of measuring methane in the PPM range (such as the GasTech Innova or equivalent)
- Landfill map with monitoring stations
- Clipboard
- Portable wind speed (anemometer) meter
- Thermometer
- Pen with indelible ink
- Safety vest (orange)
- Surface Emission Data Sheet (Form SOP 002-1)

Note: Other safety-related equipment may be required when performing emissions monitoring.

4.0 TASK PERFORMANCE

4.1 EQUIPMENT STARTUP PROCEDURES

Calibrate instruments in accordance with manufacturer specifications.

4.2 MONITORING CONDITIONS

The average wind speed suitable for surface gas monitoring is less than 10 miles per hour (mph). Monitoring is terminated when the average wind speed exceeds 10 mph or the instantaneous wind speed exceeds 15 mph. Average wind speed is determined on 15 minute intervals. Suface gas monitoring is conducted when the landfill is dry and no rain is falling. The landfill is considered dry when there has been no rain (>.10 inches) for the preceding 72 hours prior to monitoring. Any delays due to excessive wind speeds, rainfall, construction activities, etc., should be noted.

4.3 SAMPLING PROCEDURES

At each monitoring locations, the field technician record the temperature, and the average and maximum wind speed. The methane monitoring instrument will be held approximately 3 inches from the landfill surface for 2 to 5 minutes or until methane concentrations (if any) is stabilize. Measurements will be recorded on the Surface Emissions Data Sheet (Form SOP 002-1).

For readings of 50 ppmv or greater description of the suspected cause of the exceedance (i.e., cracking, thin cover, exposed waste) will be recorded on the form.

4.4 EXCEEDANCE ACTION

If a location exceeds 50 ppmv, the location will reported to the Operations Manager for appropriate actions including possible cover repair or modifications to the passive gas collection system. Within 1 day after the repair, the area will be re-monitored to determine if additional remediation is required.

4.5 REPORTING REQUIREMENTS

In the event of an exceedance, report of findings will be submitted to the DON six weeks after completion of the survey.

Notes:

SOP 003
ACCESS ROAD INSPECTION

1.0 GENERAL

The access roads provide all-weather access to the landfill. Each road is approximately 24 feet wide, constructed with 12 inches of compacted aggregate over geotextile fabric.

2.0 TASK DESCRIPTION

This SOP addresses the visual inspection of the access roads to note conditions that may require road maintenance and repair. Access Roads will be inspected annually by a registered civil engineer before the rainy season and in the event of heavy precipitation resulting in either .50 inch or more of rainfall within 24 hours or 0.25 inch or more within 1 hour.

3.0 REQUIRED MATERIALS

The following items are needed for a visual inspection:

- Copy of the access road system map
- Copy of the Access Road Inspection Form (Form SOP 003-1)
- Pen with indelible ink
- Clipboard
- Survey stakes
- Ribbons and markers
- Measuring tape
- Camera

4.0 TASK PERFORMANCE

Inspection observations are recorded on Form SOP 003-1. Inspection results will be evaluated against SOP 006 (Access Road Maintenance and Repair). The following are guidelines for conditions to be observed and recorded:

- Adverse grades (that may impede drainage)
- Cracks wider than ½ inch, and longer than 50 feet (cracks wider than 2 inches and deeper than 12 inches and longer than 50 feet shall be examined by a registered civil engineer)
- Localized depressions (that may cause ponding)

- Sloughing
- Excessive erosion (greater and 3 inches) of road surface
- Loss or deterioration of surfacing
- Debris (soil or vegetation) from upgradient slope
- Damaged or missing road signs
- Damaged drainage structures (see SOP 004 - Surface Water Management System Inspection and Maintenance).
- Deformation of the upgradient or downgradient slope that affects road use (see SOP 001 – Cover Inspection).
- Extensive cracking (deeper than 6 inches)
- Depressions (causing ponding)
- Deep erosion (deeper than 6 inches)
- Adjacent slope instability
- Exposure of a geotextile material or absence of granular road base material.

A registered civil engineer shall establish the need for additional observations, including but not limited to:

- Test pits
- Test trenches
- Settlement or deformation measurements

In addition to annual inspections, access roads shall be inspected after the following:

- Significant rainfall (as defined in 004 – Surface Water Management System Inspection). Note in particular erosion.
- Major earthquakes. Note in particular cracks, deformation, or zones of actual or incipient slope instability.
- Failure of the surface water management control system. Note in particular erosion, wet or saturated soils, ponding, or areas where there is a potential for increased infiltration.
- An emergency as defined in the Emergency Response Plan.

SOP 004
SURFACE WATER MANAGEMENT SYSTEM
INSPECTION AND MAINTENANCE

1.0 GENERAL

The inspection and maintenance of the Surface Water Management (SWM) system are described in this Standard Operating Procedure (SOP). The SWM system provides for surface water drainage, and controls infiltration into and erosion of the landfill cover. SWM components include the concrete channel and three turf reinforced mat channels.

2.0 TASK DESCRIPTION

An annual survey of the SWM system will be conducted prior to the rainy season. The survey will be performed by a registered professional civil engineer or other qualified professional in addition to site personnel. In the event of heavy precipitation resulting in either .50 inch or more of rainfall within 24 hours or 0.25 inch or more within 1 hour, a site inspection will be conducted immediately following the storm event.

3.0 TASK PERFORMANCE

As part of the annual survey, complete Form SOP 004-1. Form SOP 004-2 should be completed during the routine inspections and inspections performed after rain events.

Any breakdown and subsequent repair of the SWM system shall be documented on Form SOP 004-3 and reported to the Operations Manager immediately. Below is a list of procedures associated with SWM system maintenance:

1. Concrete Channel
   - Clear debris or vegetation having a stem greater than 1 inch in diameter
   - Repair cracks and grout as required to maintain integrity of concrete
2. Turf Reinforced Mats
   - Clear debris or other drainage obstructions
   - Repair or remove and replace matting as needed due to base soil loss or washouts
   - Replace infill as needed to maintain proper grades and/or soil loss
   - Re seed to maintain vegetation cover
3. Drop Inlets
   - Adjust inlet riser to remain flush with top of geocell
   - Repair gaps between pipe and surface completion

4. Sediment Traps/Erosion Control
   - Remove silt buildup greater than 6 inches
   - Repair as necessary
   - Follow maintenance procedures outlined in the SWPPP for the BMPs for Erosion and Sediment Control
5. Discharge Outlets
   - Clear debris, vegetation, and other obstructions
   - Repair or replace discharge piping or structure as necessary
6. Drainage Pipe
   - Clear vegetation and debris
   - Remove silt when buildup exceeds 6 inches
   - Remove and replace pipe if the integrity of the pipe is impacted
7. Drainage Inlet
   - Clean and regrout areas of cracking or spalling
   - Remove debris and silt buildup inside box and weep holes
   - Clear debris or vegetation from debris rack or grate
   - Remove silt buildup greater than 6 inches

SOP 005
VEGETATIVE COVER
INSPECTION AND MAINTENANCE

1.0 GENERAL

The vegetative cover provides moisture penetration control, erosion control, and visual enhancement across the landfill slopes and top deck. The vegetative cover selected to provide these results is comprised of California native plants.

Once established the vegetative cover will appear similar to local natural open space areas. The vegetative cover will turn green during the rainy season and is expected to fade to brown during the dry season.

2.0 TASK DESCRIPTION

The vegetative cover shall be visually inspected at the intervals listed in the Post Closure Operations, Maintenance and Monitoring Plan. The frequency of inspection and maintenance may be varied by the Operations Manager to respond to seasonal variations in precipitation and vegetation establishment and growth.

In addition to the landscaping covering the refuse, some areas along the periphery contain native growth areas and wetland that will require inspection which must be inspected and cut back as necessary.

3.0 REQUIRED MATERIALS

The following items are necessary:

- Copy of the Wetlands Mitigation Plan (attachment 7- of the Remedial Action Work Plan)
- Copy of Vegetative Cover Inspection Form (Form SOP 005-1)
- Copy of Landfill Map

4.0 TASK PERFORMANCE

Using the following as guidance record observations, on Form SOP 005-1(Vegetative Cover Inspection Form):

- Weed and fire control - Observe growth of nuisance weeds and plant materials after the end of the rainy season. Nuisance weeds include Mustard, Tumbleweed, Tree Tobacco, Castor Bean, Pompas Grass, Eucalyptus, Elm, and Bermuda Grass. Other plants that may naturalize should be verified for removal when they occur.

- Reseeding and Soil fertilization program - Determine locations of poor growth for soil analysis in late summer. Evaluate the establishment rate and appearance of the vegetation. Determine areas that require reseeding.
- Rodent control - Evaluate visible signs of burrowing rodents during routine inspections around the site.
- Erosion Control – check for soil erosion

5.0 MAINTENANCE

In cases where an inspection establishes a deficiency in the vegetation that could be repaired by immediate action, such action shall be taken in discussion with the Operations Manager.

Inspections recorded on Form SOP 005-1 shall be considered by the Operations Manager. He shall issue plans and instructions for ongoing vegetation maintenance or replacement. Examples are:

- Weed removal – Remove by hand at first signs of growth. If Mustard and Thistle has spread, removal options include mowing. Foliage removal is another option for Mustard.
- Reseeding and soil fertilization program – Reseed areas of poor growth in late fall or early winter using seed mix specification in Attachment 1 sheet C-12.
- Soil Erosion – Repair per SOP 004 (Surface Water Management System Inspection, Surveillance, and Maintenance Activities.
- After the end of the rainy season, and after grasses have produced seed, the crown of the landfill will be mowed to control weeds. Other areas of the landscaped portion of the site will be weeded or mowed if practical.
- Until coverage of seed mixes approaches design values, probably in the second or third growing season post mechanical completion, a landscape consultant will be used seasonally to recommend mixes, amendments, and reseeding techniques.

SOP 006
ACCESS ROAD
MAINTENANCE AND REPAIR

1.0 GENERAL

Standard Operating Procedure (SOP) 003 (Access Road Inspection) describes the access and road inspection procedures. The inspection findings are documented on Form SOP 003-1. Based on that information, the Operations Manager will implement maintenance and repair activities as described in this SOP.

2.0 TASK DESCRIPTION

Maintenance includes ongoing, routine, or regular activities necessary to keep the roads in a safe and functional state and protect the cover design.

Repair includes area specific work that may be required from time to time to restore or improve the state or functioning of the roads and the cover.

3.0 TASK PERFORMANCE

The Operations Manager shall review relevant inspection observations and monitoring data, and shall establish the need for and extent of maintenance and repair. Repairs will be done in accordance with RD Attachment 1specifications. The Operations Manager may consult with licensed/registered specialists to compile alternate repair plans or specifications.

4.0 GUIDELINES FOR MAINTENANCE AND REPAIR

Maintenance and repair procedures vary depending on existing conditions such as cracks, adverse grades, depressions, erosion gullies, sloughing or slope failures. Maintenance and repair of the access roads shall be documented on Form SOP 006-1.

1. Cracks
    - Cracks wider than ½-inch and longer than 20-feet shall be repaired. Surface cracks shall be evaluated for evidence of vertical displacement across the crack and depth of crack. If crack extends to full depth of road base, the geotextile layer separating the road base and underlying layer may have to be penetrated or removed to evaluate depth of crack. The location of cracks shall be mapped and documented. An up-to-date crack location map shall be maintained to identify areas of chronic cracking.

- Minor cracks less than 6 inches in depth shall be scarified to the depth of crack and recompacted.
- Cracks deeper than 6-inches and with no vertical displacement across the cracks shall be repaired by excavating a 2 to 3 foot wide zone to the depth of crack and replacing the excavated layer with aggregate base to RD Attachment 1 specifications.
- Major cracks (wider than 1 inches and deeper than 1 foot and longer than 20 feet), or cracks with vertical displacement across the crack may be indicative of slope deformation/sliding and shall be first evaluated by a registered civil engineer prior to implementing repair. The repair may include removal and recompaction of a relatively large section of the roads and adjacent slope to stabilize the area. (See also Section 4.0 of SOP 007 – Multilayer Cover Maintenance and Repair).
- In areas of chronic cracking (where cracks reappear on a regular basis) more extensive crack repair/control measures should be considered. Such measures may include but are not limited to excavating a wide area straddling the crack, constructing a reinforced foundation consisting of one or more layers of geogrid below the barrier.
- The designs for repair of major cracks, slope deformations/sliding and areas of chronic cracking as described above shall be prepared by a registered civil engineer. The engineer will develop a number of appropriate standard designs to repair such cracks and will recommend or approve use of same to repair the subject cracks.

2. Surface Depressions:

- Localized minor surface depressions, less than 1 foot deep, shall be repaired by backfilling with the compacted aggregate base per RD attachment 1 specifications.
- Large surface depressions, greater than 1-foot deep, shall be evaluated to determine if the barrier layer below this road subgrade has been impacted. A test pit may be excavated, geotextile removed, and the animal intrusion barrier inspected to determine evidence of excessive cracking or saturation. If the cover layer has been impacted, repair of the depression will include excavation of the area to the subgrade layer, preparation of cover, and replacement and reconstruction of the multilayered cover system to RD Attachment 1 specifications. If the compacted layer beneath the animal intrusion barrier is found to be intact, repair of the depression area shall include backfilling and compacting of the subgrade repair of geotextile fabric compaction of the aggregate base. At the completion of this repair, a survey of the repaired area shall be performed and recorded in the Record Drawings.

3. Erosion Damage:

- Erosion channels penetrating only the road surface materials shall be repaired by removal of material from the channel sides and bottom to competent material surface, and replacing with compacted aggregate The backfilling and compaction shall be performed in maximum 6-inch thick layers using the appropriate compactors for the size of the area being worked.

- Deep erosion channels extending to the geotextile and cover layer shall be repaired by excavation and replacement of the different layers of materials used in the original access road section. The cover layer, if affected, shall be excavated to its full depth and replaced with compacted material within design specifications.

4. When repairing the layered cover system below access roads, each layer shall be tied into existing layers of the corresponding material and constructed to project specifications. Replacement geotextile or geonet shall be overlapped a minimum of 24 inches over existing geotextile.

5. Adverse access road grades will be restored by placement of additional subgrade material and replacement of roads surfacing material over the reconstructed part.

SOP 007

MULTILAYER SOIL COVER MAINTENANCE AND REPAIR

1.0 GENERAL

The landfill multilayer soil cover consists of a minimum 6 inch compacted soil layer, an animal intrusion (geonet) barrier, an 18 inch compacted soil cover, and an 6 inch vegetative layer. The functions of the multilayer soil cover are to contain refuse, control infiltration, support vegetation, and control gas emissions. These functions are achieved if the cover is intact, free of significant cracking and erosion, maintains specified grades, and supports vegetation. This Standard Operating Procedure (SOP) describes the procedures to maintain or repair the cover.

2.0 TASK DESCRIPTION

The tasks covered by this SOP are maintenance and repair of the cover. Maintenance includes ongoing, routine, or regular activities necessary to keep the cover in a functional state. Repair includes area specific work that may be required from time to time to restore or improve the state or functioning of the cover.

3.0 TASK PERFORMANCE

Maintenance or repair of the landfill cover is undertaken as established pursuant to observations, inspections, or monitoring in accordance with one or more of the following:

- SOP 001 – Multilayer Soil Cover Inspection
- SOP 002 - Landfill Surface Gas Monitoring
- SOP 003 - Access Road Inspection
- SOP 004 - Surface Water Management System Inspection and Maintenance
- SOP 005 - Vegetative Cover Inspection and Maintenance
- SOP 006 - Access Road Maintenance and Repair

The Operations Manager shall review relevant inspection observations and monitoring data, and shall establish the need for and extent of maintenance and repair. Repairs will be done in accordance with Record Drawings and specifications. The Operations Manager may consult with licensed/registered specialists to compile alternate repair plans or specifications.

Repair that involves construction should be undertaken in conformance with construction drawings and specifications.

4.0 GUIDELINES FOR MAINTENANCE AND REPAIR

Maintenance and repair procedures vary depending on existing conditions such as cracks, depressions, erosion gullies, sloughing or slope failures. Maintenance of the cover shall be recorded in daily logs, notebooks, or other reporting formats as may be used on a regular basis.

Following repair to the cover, the repaired areas shall be revegetated in accordance with SOP 005 (Vegetative Cover System Inspection and Maintenance). Repair of the cover shall be documented on Form SOP 007-1. The DON will be notified of start and finish of major repair activities (i.e. those necessary to restore compliance with Performance Standards).

1. Vertical and Near-Vertical Cracks:
   - Surface cracks shall be evaluated for length, width, and depth of crack and evidence of any relative vertical displacement (vertical offset) across the crack. Significant cracking (cracks 1 inches or wider, deeper than 12 inches and longer than 20 feet) shall be repaired. Cracks in the cover longer than 20 feet and deeper than 1 foot and wider than 1 inches shall be examined by a registered civil engineer. The engineer will develop a number of standard designs to repair such cracks and will recommend or approve the use of same to repair the subject cracks. Other cracks, e.g., longer than 20 feet but less than 1 inches wide, will be repaired as necessary by the site forces.
   - For shallow cracks (not greater than 1 foot deep) with no vertical offset, the first response is to apply a small quantity of water (water truck application) to the cracked area and use tracked equipment to squeeze the cover materials into cracks and sufficiently repair them. If the cracks aren't repaired using this method, excavate a 2 to 3 foot wide area straddling the crack to the depth of cracking and replace with cover materials compacted to project specifications. Compaction may be achieved in horizontal lifts with hand compaction equipment or parallel to slope face with sheepsfoot rollers (winched from bench above or mounted on long-reach backhoe arm).
   - Deeper cracks (deeper than 1 foot) with no vertical offset shall be repaired as follows:
     - The lower portion of the crack below a depth of 1 foot shall be sealed by grouting.
     - The grout shall consist of a mix of fine or silty sand with approximately 5 percent by weight of bentonite mixed with water to mortar-like consistency. Grouting shall be done at 5-foot centers through a grouting pipe inserted into the crack. At each injection point, grouting shall be performed in 2-foot vertical stages proceeding from the bottom up. Grouting shall continue until a pressure of 5 psi is reached, ground surface movement is observed, the void is substantially filled, or grout is identified at the surface.
     - The upper 2 feet of cover over a 2 foot wide zone straddling the crack shall be reworked by compacting the existing cover to project specifications using compaction methods outlined above.

- Cracks and voids in the cover adjacent to concrete channels or swales shall be repaired by grouting in the same manner described above.
- Major cracks with vertical displacement across the crack, in particular on the slopes along the contours, may be indicative of slope deformation or sliding. The Operations Manager may consult with a specialist to evaluate such conditions and recommend appropriate repair measures. The repair may involve excavation of large areas of the cover material, possibly to the full depth of the multilayer cover including animal intrusion barrier replacement. The area affected shall be excavated making sure that the upper part of the slope showing cracks is excavated first to minimize potential for slope failure. The excavated area shall be backfilled with cover material in 6" thick horizontal lifts, moisture-conditioned, and compacted to project specifications using sheepsfoot compaction equipment. Animal intrusion barrier replacement should be performed according to specifications. The repair design shall be prepared by a registered civil engineer. The Operations Manager may consult with licensed/registered specialists to compile alternative repair plans or specifications.
- Surface Depressions: Surface depressions that could cause ponding shall be repaired by backfilling with cover material. Prior to backfilling, the area of the depression shall be cleared of vegetation and scarified to a minimum depth of 6 inches. Backfill materials shall be placed in 6-inch thick lifts, moisture-conditioned, and compacted to project specifications.
- Erosion Gullies:
- 0" to 6" deep: May warrant cosmetic raking or track walking prior to reseeding
- 6" to 12" deep: Remove loose soil, place cover soil in 6" thick lifts, moisture condition to project specifications, and compact parallel to slope face using sheepsfoot roller.
- >12" deep: Remove loose soil. Place cover materials moisture conditioned and compacted to project specifications in lifts ≤ 6" thick. Backfill should be benched into competent in-place fill. Compact with hand held temper or other means in horizontal lifts, tilted slightly into slope
- If the timely repair of the erosion gullies is not feasible due to continuing wet weather, temporary backfilling of erosion gullies may be performed to minimize potential for enlargement of channels. Such temporary backfilling may be performed using coarse rockfill or sandbags. The rockfill and sandbags shall, however, be removed prior to performing permanent backfilling with cover material.

4. Sloughing/Slope Failures:

- The Operations Manager may consult with a specialist to evaluate the cause of sloughing/slope failure and recommend remedial measures.
- Should sloughing of the cover be shallow (less than 12 inches thick) and occur due to saturation from rains, irrigation line or surface water facility failure, the sloughed material shall be removed and the affected area shall be repaired in a similar manner as surface depressions.

- Should sloughing occur on the slope along the contour, it may be indicative of slope failure. The remedial grading for slope failures shall be performed in a similar manner as for major surface cracks. Repair designs shall be prepared by a registered civil engineer.

SOP 008

LANDFILL GAS PROBE MONITORING

1.0 GENERAL

Landfill gas probes are monitored for both the pressure and methane gas to provide for the protection of public health and safety and the environment by demonstrating that methane migration is not occurring in the vadose zone, and that levels are in compliance within ambient air at the landfill perimeter. This Standard Operating Procedure (SOP) addresses routine probe monitoring.

2.0 TASK DESCRIPTION

Landfill gas probes will be monitored quarterly. The condition of the probes is physically inspected prior to monitoring. Probes are monitored for both gas pressure and general composition (i.e., methane – CH_4, carbon dioxide – CO_2, oxygen – O_2, and nitrogen – N_2) using the GEM-500 gas analyzer or equivalent. Probe monitoring is conducted quarterly.

Records will be taken for barometric pressure, atmospheric temperatures, and general weather conditions at the time of gas collection. It is recommended to collect landfill gas during barometric low pressures. Depending on the weather, this may be late in the morning or early in the afternoon.

3.0 REQUIRED MATERIALS

The following materials and equipment are required for this procedure:

- Landtech GEM-500 Gas Analyzer or equivalent
- Dwyer Magnehelic pressure gauge set (Ranges: 0-2 inches of water and 0-100 inches of water and 0-30 psi)
- Form SOP 008-1 (Probe Pressures)

4.0 TASK PERFORMANCE

Before conducting monitoring, inspect each probe for the following conditions:

- Confirm identity of probe.
- Laboratory stopcock or other flow restriction device is fitted and is effective.

- The laboratory stopcock appears to be leak-tight.
- Inventory of manufacturer quick connect fittings for ¼” PVC stopcock.
- Condition of tubing (holes, kinks, water, etc.).
- Condition of probe casing where present.

Adverse conditions are to be repaired if possible and reported to the Operations Manager. Maintenance actions may include the following:

- Replace or repair stopcocks or tubing that are missing or leaking. Record actions taken.
- Record probes that are filled with water. Measurements should not be collected from water-filled probes.
- Repair damaged casing.

Select the Dwyer Magnehelic pressure gauge that is appropriate for the probe by selecting the gauge with the lowest applicable pressure range based on recent pressure readings at the probe. The gauge selected should have the smallest scale range possible without exceeding the scale limit. If the observed pressure reading is outside the pressure range of the selected gauge, use the next larger scale range gauge. Connect the Dwyer Magnehelic pressure gauge to the stopcock with the appropriate tubing. Open the stopcock or flow restriction device. Read and record the pressure in the column marked **Static Pressure (in. of H_2O)** on the appropriate monitoring form when the gauge stabilizes. Record the time in the **Time (hrs)** column. Disconnect the Magnehelic gauge and close the stopcock after the reading is completed.

Calibrate the GEM-500 prior to the beginning of monitoring activities according to the manufacturers manual. Note: The GEM-500 should be recalibrated if the temperature changes 30°F from the initial calibration. Perform the following steps:

1. Turn the GEM-500 on and select the Monitoring Probe ID
2. Connect the clear tubing with the external filter/water trap assembly to the sampling port (top left corner) on the GEM-500. The shorter piece of tubing (from the water trap filter hosing) should be connected to the GEM-500. This allows visual of any liquid entering the hose, allowing time to shut the unit down.
3. Ensure inventory of quick connect fittings in order to take field readings from perimeter probes.
4. Connect the GEM-500 to the probe stopcock and turn the pump on to start analyzing for gas composition.
5. Open the probe stopcock and start the reading. The readings will be in percent CH4, CO2, O2, and balance gas. The balance gas is assumed to be N2. Typically the analyzer pump should run until the gas composition readings stabilize.

6. When the gas composition readings stabilize, record and store the data. Stabilization times should vary between 30 seconds and 2 minutes. Sampling period should not exceed 5 minutes.
7. If water is observed in the sample line during the evacuation process, record it in the comment and terminate the measurement
8. When the reading is completed, disconnect the sample line, allow the probe to purge for 30 seconds and close the stopcock valve.
9. Purge the sample train and the gas analyzer in between probe readings.

Do not shut down monitoring equipment unless sample interval between probes is more than 30 minutes.

SOP 009
LANDFILL PERIMETER GAS VENT INSPECTION AND MAINTENANCE

1.0 GENERAL

The inspection and maintenance of the passive gas control system and components, which include monitoring probes, riser vents, collection pipe and barrier trench described in this Standard Operating Procedure (SOP). The system provides for protection of public health and safety and the environment by demonstrating that methane migration is not occurring in the vadose zone, and that methane levels are in compliance at the landfill perimeter.

2.0 TASK DESCRIPTION

Inspection of passive gas control system components will take place during quarterly gas probe monitoring events.

3.0 TASK PERFORMANCE

As part of the annual survey, complete Form SOP 009-1. Any breakdown and subsequent repair of the gas control system shall be documented on Form SOP 009-2 and reported to the Operations Manager immediately. Below is a list of procedures associated with maintenance:

Gas Monitoring Probe/Vent Riser Inspection and Maintenance

Inspect and Maintain

- Inspect and maintain monitoring probe components to ensure consistent and reliable operation.
- Ensure the integrity of the PVC riser vent including paint coating and caps.

Document and Repair

- Document damage and wear and tear. Repair components to function as intended. Document and include in quarterly report.

Inspection Frequency

- Inspect monitoring probe as part of each quarterly monitoring event.

Sample Ports

- Inspect sample port(s) and o-rings for cracks and damage. Replace if damaged.
- Check for tightness and tighten as necessary.

- Ensure sample ports are free of debris and clean as necessary.
- Inspect sample port caps for damage or deterioration. Replace if damaged or deteriorated. It is important that caps are in place on sample ports to prevent deterioration of port and dirt accumulation.

Monitoring Probe Well Casing

- Visually inspect above grade well casings and surrounding areas for signs of damage, deterioration, or potential problems.
- Use below grade inspection techniques when monitoring data warrants (non-routine work).

Surface Completion

- Inspect surface completion for above grade completion details (steel probe cover, well id tag, drain holes).
- Verify that seal between well casing and cement-grout seal is intact.

Surrounding Area

- Visually inspect the surrounding cover surface integrity.
- Pay special attention to the cover located directly around each well casing or riser vent, noting signs that the soil is desiccated or pulling away from the well casing or riser vent.
- Note surface water erosion, ponding, leachate breakouts or staining.

TABLE B.1-1
Detailed Annual Operation and Maintenance Costs

Item No.	Description	Estimated Quantities	Units	Unit Price	Total Annual Cost
1	**Project Management**				$0
	Professional Labor	176	hrs	$96	$16,955
	ODC	1	ls	$3,033	$3,033
2	**Field Work**				$0
	Professional Labor	152	hrs	$119	$18,155
	Subcontractors				$0
	- Groundwater Sampling Subcontractor	1	ls	$6,863	$6,863
	- Surveying	1	ls	$6,863	$6,863
	- Equipment	1	ls	$1,373	$1,373
	- Biologist	1	ls	$8,693	$8,693
	- Analytical	1	ls	$7,032	$7,032
	- Data validation	1	ls	$2,905	$2,905
	ODC	1	ls	$7,025	$7,025
3	**Annual Report**				$0
	Professional Labor	224	hrs	$87	$19,423
	Material		ls		$0
	ODC	1	ls	$3,396	$3,396
				Total	**$101,715**

Basis of Estimate

Task No.	Assumption No.	Description
1	1	One year of PM/adminstrative support.
2	1	Twenty-two groundwater monitoring wells to be sampled annually.
2	2	The 2 replacement wells will be sampled semiannually for the first year and if the results are consistent with previous results, the well will be sampled annually.
2	3	Groundwater sampling will be completed for 5 years and a trend analysis conducted during the 5-year review.
2	4	Site inspections will be conducted quarterly and will include a biologist.
2	5	Monuments will be surveyed annually and a full survey of the site will be conducted every 5 years.
2	6	The 2 replacement wells will be surveyed during the final construction.
2	7	A biologist will conduct quarterly inspections.
2	8	Includes costs for two minor repair events.
3	1	Reports will be three versions: Pre-Draft, Draft, and Final.
3	2	The LTM contractor will adopt or modify existing basewide documents (SAP/QAPP and HSP) and procedures.
3	3	Ten copies of each version will be prepared.

1.0 EMERGENCY RESPONSE PLAN

Tetra Tech EC, Inc. (TtEC) has prepared this Emergency Response Plan to cover the Post-Closure Operations, Maintenance, and Monitoring Plan (Plan) for Installation Restoration (IR) Site 2, former Naval Air Station (NAS) Alameda, Alameda Point, Alameda, California. This Plan was prepared for the United States Department of the Navy (DON), Base Realignment and Closure Program Management Office West, under Contract No. N62473-10-D-0809, Contract Task Order No. 0009.

There are numerous emergency services nearby in the civilian community. This plan describes response activities as they apply to NAS Alameda and as required by the HAZWOPER regulations 29 *Code of Federal Regulations* 19101.120 (l) and 8 *California Code of Regulations* 5192 (l).

1.1 PRE-EMERGENCY PLANNING

Prior to performing any work, the Superintendent or Project Manager (PjM) and the Site Safety and Health Officer (SSHO) will verify emergency action plans by ensuring that planned support facilities are available and that emergency contact numbers are valid. The Alameda Fire Department will be notified of planned activities by the SSHO or the Superintendent. As work proceeds, the SSHO will continue to ensure that plans specified in this section can be implemented at all times. Furthermore, the SSHO will ensure that plans are modified as necessary to accommodate changes. The SSHO will coordinate changes with the Project Environmental Safety Manager (PESM). Upon arrival at the site, the Superintendent will ensure that personnel know the system for communication of emergency situations and how to use a radio or nearby phone to summon emergency assistance. A vehicle must be available to transport personnel to a safe location or to a hospital. All personnel on this project will know how to use a portable fire extinguisher. All personnel will know the location of emergency equipment and supplies. The SSHO will ensure that emergency equipment is available in the work areas and that the equipment is inspected for compliance with the regulations:

- Fire extinguishers – monthly, annual refill and servicing, 12-year hydrostatic test.
- First aid kits – weekly as required by the Occupational Safety and Health Administration (OSHA).
- Eyewashes, capable of delivering 0.4 gallon per minute for 15 minutes – weekly (If preservative is used, eyewash water may be changed every 4 months; otherwise, water must be changed weekly.) Only potable water may be used for eyewashes.

1.2 PERSONNEL ROLES, LINES OF AUTHORITY, TRAINING AND COMMUNICATION

The Superintendent or PjM is the primary emergency coordinator for the project. In the absence of either or both the Superintendent and the PjM, the SSHO is the emergency coordinator. The emergency coordinator will take charge and determine, direct, and delegate personnel and resources to manage the emergency. Key responsibilities of the emergency coordinator are to:

- Initiate evacuation, if needed.
- Initiate emergency response agency notification.
- Evaluate and assess emergency situations to ensure that response activities are commensurate with the level of the emergency and, as discussed in this Plan, are implemented.
- Interface and coordinate with outside agencies responding to on-site emergencies.

Project supervisors and forepersons will account for all their personnel and report their count to the emergency coordinator. They will follow the directions of the emergency coordinator. If directed by the emergency coordinator, the supervisors will direct workers to evacuate the area and report to the assembly area.

All workers will follow the instructions of the emergency coordinator.

All workers have had training for various emergency situations. For this project, workers will have had training in spill containment and control, fighting incipient stage fires, use of eyewashes, and basic rescue techniques for moving and carrying personnel in danger situations. There will always be personnel at the work site who can provide cardiopulmonary resuscitation (CPR) and first aid.

Personnel will maintain verbal communication. The following communication systems will be available during site activities:

- Cellular telephone or access to a land phone for emergency purposes
- Handheld radios, as needed
- Compressed air horn (signals emergency evacuation only)
- Hand signals (if used, will be diagrammed and posted)
- Posted location of evacuation assembly area(s)
- Posted route to the hospital located nearest the project site
- Posted emergency phone numbers

1.3 EMERGENCY RECOGNITION AND PREVENTION

All personnel have received training on the potential hazards on this project. There are hazards that are commonly expected on any project site such as adverse weather, electrical hazards, traffic, and equipment hazards, chemical exposures, physical hazards, etc. These have been addressed in theSite Safety and Health Plan. If someone has been affected by a hazard, all personnel are trained on how to respond to an emergency. The first thing anyone is told to do is notify by radio or phone as noted above. There are other procedures to prevent emergencies by following the directions below.

1.4 FIRE PREVENTION AND PROTECTION

Fire prevention and protection measures require preplanning. At least one 20-pound dry chemical ABC fire extinguisher will be located at each work area. A mounted fire extinguisher is required in every vehicle including heavy equipment. Extinguishers mounted on heavy equipment will be a minimum 5-pound ABC dry chemical type. Fire extinguishers inside the cab of pickup trucks will be 2 ½-pound dry chemical ABC. Fire extinguishers in the cabs of all vehicles must be mounted or secured. Fire extinguishers in the beds of all pickup trucks must be mounted or secured. Employees will follow safe work practices to include proper storage of flammable and combustible liquids. Smoking is permitted only in those areas designated specifically by the PjM, Superintendent, or SSHO and posted as smoking areas.

Personnel will follow hot work procedures to ensure that work is performed in a safe environment. In the event of a fire or explosion, the Fire Department will be summoned immediately, a head count will be taken, and evacuation procedures will be implemented. Smoking is not permitted inside buildings.

1.5 SPILL CONTROL AND RESPONSE

All spills, leaks, and fires involving oil or hazardous substances at former NAS Alameda must be reported to the DON Remedial Project Manager (RPM) and the PESM. The person reporting the leak or spill is required to provide the following information:

- His/her name
- Location of spill and facility number, if known
- Number of injured personnel and nature of injuries, if known
- Substance spilled
- Estimated amount spilled
- Extent of spill
- Estimated rate at which the substance is currently being released
- Estimated time the spill occurred

- Any other pertinent information

The RPM, in coordination with the PjM, will manage notifications to regulatory agencies. In addition, all spills will be reported to the Environmental Compliance Manager or the PESM. Project personnel will not report spills directly to any agency unless specifically requested by the RPM or the Contracting Officer.

A minor spill would involve no immediate threat to human health or the environment. It would cause only minimal property damage and not exceed the reportable quantity for that material. In the event of a minor spill, the appropriate response action is for the responsible person to notify the RPM and the PjM and supply the responders with as much information as possible. In the case of a spill of contaminated or hazardous materials, the following procedures will be followed:

- Notify the Superintendent, the PjM, and the PESM.
- Identify protective clothing or equipment required to respond.
- Contain the spill.
- Neutralize and/or solidify any product.
- Transfer material into 55-gallon drums.
- Document the incident.

1.6 RELEASE PREVENTION AND MINIMIZATION MEASURES

In addition to training, the following procedures will be implemented to prevent and minimize releases of hazardous materials:

- Do not conduct hazardous materials operations when the weather could cause significant risk to the surrounding area if a spill should occur.
- Transfer all materials in or over a bermed or "protected" area. A protected area is one that is covered with an impermeable material, such as polyethylene.
- Dike temporary storage tanks containing hazardous wastes or potentially hazardous wastes to contain potential releases.
- Maintain a supply of basic spill response materials and protective equipment on-site to include:
  - Absorbent sheets, pillows, booms, or other absorbent material
  - Open top 55-gallon drums or other containers with lids
  - Brooms, shovels, and other tools, such as squeegees

1.7 SIGNIFICANT VAPOR RELEASE

Any project activity that releases significant amounts of vapor must be reported immediately, as described in the spill release procedure. Every attempt to mitigate the release must be taken if it can be safely performed. For example, during excavations, vapor releases may be controlled by simply replacing the cover on the excavation. Downwind evacuation procedures may be required. These will be initiated through coordination with former NAS Alameda emergency coordinators.

1.8 EARTHQUAKE RESPONSE

If an earthquake should occur during the course of site activities, take the following action:

- Stop working. Remain calm and do not panic.
- Do not use or do anything that might be a source of ignition (smoking, cutting, or welding).
- Avoid power lines, power poles, and windows.
- If in a vehicle, stay in the vehicle until the earthquake is over.
- If in a building, take cover under a heavy piece of furniture or leave the building if possible.

After the earthquake is over:

- Prepare for aftershocks. Stay out of severely damaged buildings.
- Meet for a head count at a location designated by the Superintendent.
- Check for injuries. Do not move seriously injured personnel, unless remaining where they are would create danger of further injury.
- Check vehicles, equipment, and buildings for any obvious damage. Do not enter buildings until their structural integrity has been evaluated.
- Check utility lines for damage. Switch off power, water, and gas until a utility official has inspected the buildings and operational area and determined it is safe.
- If driving, watch carefully for hazards created by the earthquake (undermined roads, weak bridges or overpasses, fallen power lines or poles, and so forth).

1.9 SAFE DISTANCES AND PLACES OF REFUGE

On this project, after an emergency inside the building is identified, the building will be evacuated. Only personnel authorized by the emergency coordinator will be allowed to return into the building depending on the nature of the emergency and whether the personnel have the training, the ability, and the need to return to the building. As noted below, personnel will assemble in the project trailer/offices. This area is several hundred feet from the buildings.

Immediately evacuate to an area located at least 50 feet from the building as an alternate area identified by the SSHO.

1.10 SITE SECURITY AND CONTROL

There are no buildings on-site. The site is secured by fencing on the north and east sides.

1.11 EVACUATION ROUTES AND PROCEDURES

In the event of an emergency situation such as fire or explosion, the SSHO or a supervisor will activate an air horn for approximately 15 seconds indicating the initiation of evacuation procedures. All personnel in both the restricted and non-restricted areas will evacuate and assemble near the support zone or other safe area identified by the SSHO. Prior to starting work, the SSHO will identify and mark the location of an evacuation assembly area. The location should be upwind of the site.

For efficient and safe site evacuation and assessment of the emergency situation, the Superintendent or SSHO will have authority to initiate proper action if outside services are required. Under no circumstances will incoming personnel or visitors be allowed to proceed into the area once the emergency signal has been given. The SSHO must ensure that access is provided for emergency equipment and that equipment that may cause combustion has been shut down once the alarm has been sounded. As soon as possible, and while the safety of all personnel is confirmed, emergency agency notification will commence. The SSHO will brief site personnel each day as to the location of the evacuation assembly area. After gathering at the local site assembly point, and depending on the nature of the emergency, workers will be given further instructions.

Before starting work, the SSHO will establish safe egress routes from the site to the evacuation assembly area. The SSHO will prepare a drawing or map that diagrams these safe egress routes. The SSHO will use this same map to diagram egress from the evacuation assembly area to the facility gate to be used as an exit.

An evacuation exercise will be practiced within 1 week of the start of the project and randomly during the course of the project. After the practice drill or after any actual evacuation, all involved site personnel will attend a briefing to evaluate the evacuation. The employees will discuss the evacuation and anything that could be done to improve or change future evacuations. The results of this briefing will be documented on a safety meeting attendance form. A copy of the evaluation report will be sent to the PESM.

1.12 DECONTAMINATION PROCEDURES

Any personnel requiring emergency medical attention will be evacuated immediately from exclusion zones and contamination reduction zones. Personnel will not enter the area to attempt a rescue if their own lives would be threatened. The decision whether or not to decontaminate a victim prior to evacuation is based on the type and severity of the illness or injury and the nature of the contaminant.

For some emergency victims, immediate decontamination may be an essential part of life-saving first aid. For others, decontamination may aggravate the injury or delay life-saving treatment. If decontamination does not interfere with essential treatment, it should be performed.

If decontamination can be performed:

- Wash external clothing and cut it away.
- Wrap the victim in a clean blanket or towel if necessary.

If decontamination cannot be performed:

- Wrap the victim in blankets or plastic to reduce contamination of other personnel.
- Alert emergency and off-site medical personnel to potential contamination; instruct them regarding specific decontamination procedures.

Send along site personnel familiar with the incident.

1.13 EMERGENCY MEDICAL TREATMENT AND FIRST AID

The following procedures should be observed if an accident with injury occurs.

1.13.1 First Aid

Only qualified personnel will provide first aid and stabilize an individual needing assistance. Life support techniques such as CPR and treatment of life-threatening problems such as airway obstruction and shock will be given top priority. At least two persons certified in first aid techniques and CPR will be on each work site at all times; EHS 4-1, Bloodborne Pathogens, will be followed when first aid/CPR are administered. The SSHO will be current in first aid and CPR and bloodborne pathogen training. Professional medical assistance will be obtained at the earliest possible opportunity. Ensure that WorkCare® has been contacted at (800) 455-6155. The hospital and clinic located nearest to former NAS Alameda are shown on a map that is part of every Site Safety and Health Plan. A general map to the nearest clinic and hospitals is attached to this plan. Notify the PjM and the PESM.

1.13.2 Minor Injury

- Contact a supervisor or "buddy."
- Have qualified first aid personnel treat the injury.

- Record the injury and include the name of the injured person, nature of injury, and treatment given.
- Notify the PjM and the PESM.

1.13.3 Medical Emergency

In the event of a medical emergency when actual or suspected serious injury occurs, the following procedures will be implemented:

- Survey the scene and evaluate whether the area is safe for entry.
- Remove the exposed or injured person(s) from immediate danger.
- Render first aid if necessary. Decontaminate affected personnel after critical first aid is provided.
- Obtain paramedic services or ambulance transport to local hospital. This procedure will be followed even if there is no visible injury.
- Call 911 from phones at former NAS Alameda. Calling 911 from cell phones will notify California Highway Patrol who will notify county Emergency Medical Service. If using a cell phone, call Alameda (510) 337-2100. Preprogram cell phones with this emergency number.
- Identify the location by the number of the nearest building, request medical assistance, and provide a name and telephone number.
- Request assistance from emergency medical service and/or additional assistance.
- Other personnel in the work area will be evacuated to a safe distance until the Superintendent determines that it is safe for work to resume. If there is any doubt about the condition of the area, work will not commence until all hazard control issues are resolved.
- Notify the PjM and the PESM.
- Notify the Resident Officer in Charge of Construction (ROICC) of the incident and fill out accident reporting forms and associated documents.

1.13.4 Fatal Injury

If a fatal injury occurs, the following additional steps will be followed:

- Notify the Superintendent and PjM immediately.
- Notify the PESM, who will initiate contact with the California Occupational Safety and Health Administration (Cal-OSHA).
- Notify the ROICC.
- Stop all work activities on the project for 24 hours.
- Assist Cal-OSHA as directed.

1.14 EMERGENCY ALERTING AND RESPONSE PROCEDURES

This plan has identified the emergency alerting devices available to the project. While inside the buildings, the use of the air horn is most effective in alerting personnel. However, if personnel are located a distance from where the emergency occurred, the horn should be tested to ensure that personnel in all areas can hear the horn. When necessary, the on-site supervisor will give each work team an air horn. The supervisor will know the assigned area of each work team. The use of radios with each team can also provide information regarding the precise location of the emergency. Upon alarm, the first response is made by the emergency coordinators who will direct the activities required to respond to the emergency. This plan has described many potential response procedures.

1.15 PPE AND EMERGENCY EQUIPMENT

The following emergency equipment will be stationed near each work area:

- Fire extinguisher (minimum one 20-pound dry chemical ABC type in the contamination reduction corridor at the edge of the exclusion zone).
- Industrial first aid kit (outside the building entrance). The kit must be filled as required by EM 385-1-1, Table 3-1 (USACE 2008) and 8 CCR 5812.
- Portable eye wash (capable of supplying 15 minutes of water at 0.4 gallon per minute and protected from direct sunlight in the support area, at the edge of the support zone).
- Air horn (at the support area, at the edge of the support zone).
- Spill control material (absorbent pillows or absorbent material and shovels, plastic sheeting, and 55-gallon drum[s] in the support zone by the contamination reduction corridor entrance).

The following equipment will be available at the support trailer/offices for use in an emergency situation:

- Industrial first aid kit
- Blanket

The need for specialized personal protective equipment is not anticipated for this project.

1.16 PROCEDURES FOR HANDLING EMERGENCY INCIDENTS

This Plan has incorporated prevention procedures with procedures on how to handle the emergency event. After the emergency event is over, or during the course of the emergency when possible, the SSHO will notify the PESM by telephone. Should an accident or incident occur, the Superintendent or PjM and the SSHO will immediately investigate the cause, notify the PESM, and promptly complete the following:

- Incident Report Form – Details of the incident will be documented within 24 hours and copies of the report will be forwarded to the RPM and the PESM. Reports of serious incidents will also be faxed to the Program Manager by the Superintendent or PjM.
- Incident Investigation Report – The Incident Investigation Report will have the same distribution as the Incident Report Form and must be completed within 3 days of the incident.
- Contractor's Significant Incident Report – If the accident/incident involves injuries requiring more than first aid or property damage greater than $2,000, a Contractor Significant Incident Report will be prepared and submitted to the ROICC as soon as possible after the incident but no later than 5 days after. The originals will be sent to the TtEC records coordinator for maintenance and distribution. Copies will be distributed to the PESM, Superintendent, subcontractor employees, if appropriate, and the Contracting Officer. A copy of the completed forms will be kept in the project file.

Any recommended additional hazard control measures must be discussed with the Superintendent, SSHO, and PESM and meet their approval prior to implementation. Corrective actions will be implemented as soon as reasonably practical. Any occupational injuries and illnesses will be recorded, if applicable, on an OSHA Form No. 300. The SSHO will report immediately to the PESM any serious injury or illness requiring hospitalization, or death of an employee occurring in a place of employment or in connection with any employment. The PESM will immediately notify the closest CalOSHA office in Oakland at:

1515 Clay Street, Ste. 1301
Oakland, California 94612
Phone (510) 622-2916
Fax (510) 622-2908

Immediately means as soon as practically possible, but not longer than 8 hours after the incident. Records of all site accidents and first aid treatments will be maintained by the SSHO.

Emergency contact names and phone numbers will be posted. Maps showing egress routes, evacuation assembly areas, and the route to the clinic and hospitals will also be posted. The contact names, phone numbers, and maps will be placed on the dashboard of every project vehicle.

This plan also describes practice drills for emergencies. When there is an actual emergency event, similar to the practice drill, a project team debriefing will be held to review the event and discuss measures for improving or changing the response plan to correct deficiencies that may have been noted.

1.0 PURPOSE

The Land-Use Control (LUC) Remedial Design (RD) for Installation Restoration (IR) Site 2, Alameda Point, Alameda, California, addresses the institutional controls (ICs) (including land use and activity restrictions) required by Section 2.9.2 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Record of Decision (ROD) for IR Site 2 issued in August 2010. The ROD requires the implementation of land use and activity restrictions to limit exposure of future landowner(s) and/or user(s) of the property to hazardous substances, and to maintain the integrity of the remedial action until remediation is complete and remedial goals have been met.

This LUC RD is a component of the RD for IR Site 2, a primary document under the Alameda Point Federal Facility Agreement (FFA). This LUC RD was prepared in accordance with the *Navy Principles and Procedures for Specifying Monitoring and Enforcement of Land Use Controls and Other Post-ROD Actions* attached to the January 16, 2004, Department of Defense (DoD) Memorandum titled *CERCLA ROD and Post-ROD Policy*.

The Alameda Point "FFA Signatories" consist of the Department of the Navy (DON), the U.S. Environmental Protection Agency (EPA), the State of California through the Department of Toxic Substances Control (DTSC), and the San Francisco Bay Regional Water Quality Control Board (Water Board). If the FFA is amended to transfer responsibility for post-RACR Operation and Maintenance and monitoring of the remedy for IR Site 2 property from DON to another federal agency, the DON's responsibilities under this LUC RD shall be assumed by the federal transferee, and DON will no longer be responsible for them. In the event of such an amendment the term "FFA Signatories" as used in this LUC RD report shall be construed to include EPA, DTSC, Water Board, and the federal transferee.

The California Department of Public Health (CDPH) regulates activities related to remediation of radionuclides on non-federally owned property. CDPH is involved in the IR Site 2 remediation as described in the ROD.

The inspections and reporting requirements described herein will be effective immediately upon approval of this LUC RD by EPA, DTSC, and the Water Board. The IR Site 2 property ("the property") is currently owned by the DON and is not subject to a lease. The IC objectives will be met by access controls until the time of transfer of the property from DON ownership. The IC land use and activity restrictions described in this LUC RD report will be incorporated into a Memorandum of Understanding (MOU) or other agreement between the DON and the federal transferee if the property is transferred to another federal agency, or Quitclaim Deeds (deed[s]) and Covenant to Restrict Use of Property (CRUP) if the property is transferred to a nonfederal entity, and will take effect upon transfer of the property and issuance of those documents.

This page intentionally left blank.

2.0 SITE DESCRIPTION

IR Site 2 is located on the southwest corner of Alameda Point in Alameda, California (Figures 1 and 2). Alameda Point is approximately 2 miles long east-west and 1 mile wide, north-south, and occupies 1,734 acres of onshore land. IR Site 2 is approximately 110 acres in size (Figure 2-1).

The site consists of the former landfill, which occupies approximately 60 acres, and wetlands, which covers approximately 33 acres immediately south and west of the landfill. The remaining 17 acres within the IR Site 2 boundary is represented by areas known as the interior and coastal margins. The site is bounded to the south and west by the San Francisco Bay and to the east and north by runways and tarmacs. The former landfill was reportedly used for disposal of wastes generated by former Naval Air Station (NAS) Alameda activities from 1956 through early 1978. After landfill operations ceased in 1978, an earthen berm was constructed around the perimeter of the landfill site.

Previous site use has contaminated the soil with cadmium, chromium, lead, molybdenum, zinc, total DDx (sum of total dichlorodiphenyldichloroethane [DDD], dichlorodiphenyldichloroethene [DDE], and dichlorodiphenyltrichloroethane [DDT]), polychlorinated biphenyls (PCBs), benzo(a)pyrene, and radium-226 at concentrations that may pose a risk to human health and ecological receptors under a recreational use scenario, a proposed future reuse of IR Site 2. The selected remedy, a multilayer soil cover (cover) over the former landfill to isolate buried waste and soil contaminants, has been selected to protect human health and to address concentrations in soil and soil gas above the established remedial goals. The remediation strategy is described in the Proposed Plan (DON 2009) and in the Final ROD (DON 2010).

2.1 SITE BACKGROUND

Former NAS Alameda was an active military installation from the 1930s to the 1990s, which primarily provided facilities and support for fleet aviation activities. The area of present day IR Site 2 was originally open water until 1956 when a sea wall was constructed along the southern and western shorelines to confine and protect the area. Dredged fill was hydraulically placed within the seawall creating the area encompassed by IR Site 2.

The IR Site 2 landfill, also called the West Beach Landfill, was used as the main disposal area for the Alameda Point from approximately 1952 through 1978. An estimated 1.6 million tons of waste was deposited (E&E 1983). Historical waste disposal methods at the site generally consisted of trench-and-fill operations. Wastes included municipal solid waste, waste chemical drums (contents unknown), solvents, oily waste and sludge, paint waste, plating wastes, industrial strippers and cleaners, acids, mercury, polychlorinated biphenyl (PCB)-containing liquids, batteries, low-level radioactive waste (LLRW) including but not limited to radioluminescent dials and dial painting, scrap metal, inert ordnance, asbestos, several pesticides (solid and liquid), tear gas agent, biological waste from the Oak Knoll Naval Hospital, creosote, dredge spoils, and waste medicines and reagents (E&E 1983). Ordnance and explosives waste (OEW) may have also been deposited in the 2.5-acre (approximate) Possible OEW Burial Site located in the southern part of the landfill. Previously identified areas of buried waste are shown on Figure 2-1.

In 1978, the DON developed plans to close the landfill in accordance with the requirements of the Water Board's *Minimum Criteria for Proper Closure of Class II Solid Waste Disposal Sites* (Resolution No. 77-7). In 1983, the Water Board issued Order No. 83-35 to implement a final cover, leachate cutoff barrier, methane gas control, earthquake damage control, drainage control, and erosion control, and to generate compliance reports for the former landfill. Between 1983 and 1995, the DON responded by placing a partial clay-soil cover, installing an 820-foot-long, 2-foot-wide and 20- to 30-foot-deep slurry wall to restrict potential contaminant migration to San Francisco Bay. A gas venting system was installed for methane gas control, and repairs were made to the seawall also during this time period. In 1986, 20,000 cubic yards of imported fill soil was spread on the former landfill, which was insufficient in achieving a uniform cover layer of appropriate thickness over the landfill area. Also in 1986, the landfill was graded to prevent ponding, and an earthen perimeter berm was constructed around the landfill.

In August 1999, IR Site 2 was officially added to the EPA's National Priority List of Superfund sites and assigned Comprehensive Environmental Response, Compensation, and Liability Information System identification number CA2170023236.

2.2 CURRENT AND POTENTIAL FUTURE SITE USES

IR Site 2 was used as a landfill between the mid-1950s and the latter part of the 1970s. No land use occurred at the site prior to 1956 when the perimeter sea wall was constructed and the site was first formed using dredged fill. Due to its sole historical use as a landfill, no persons have resided or currently reside at the site. Because it has never been used for full-time residence or occupancy, no above- or belowground utilities (e.g., potable water, electric, or telephone) exist at the site.

As stated in the ROD, the future use of the Site is to be restricted to open space and recreational uses. Please refer to the ROD, Table 2-13, Land Use Restrictions, for specific land use prohibitions.

2.3 BASIS FOR REMEDIAL ACTION

Potentially significant risk to human and ecological receptors due to exposure to contaminants of concern (COCs) (cadmium, chromium, lead, molybdenum, total DDx, total PCBs, benzo[a]pyrene, and radium-226) for the landfill area and lead, zinc, and radium-226 in the wetland area in soil, a recreational use scenario is the basis for the CERCLA remedial action being undertaken by the DON. The FFA signatories considered the factors in accordance with the remedy selection criteria and concluded that a remedial action is necessary to minimize exposure of human receptors, sensitive habitats, and species to impacted soil at IR Site 2. The FFA signatories developed the following remedial action objectives to address the human health and ecological risk:

- Protect sensitive human receptors, avian species, and mammal species from exposure to COCs in surface soil in the landfill and wetland portions of the site
- Protect viable wetland area in the southwest portion of the site from impacts associated with the landfill
- Protect sensitive human receptors from exposure through external radiation from surface soil in the landfill and wetland portions of the site
- Protect beneficial uses of the surface water in the San Francisco Bay from the potential for discharge of site groundwater containing COCs

2.4 DESCRIPTION OF SELECTED REMEDY

The selected remedy identified in the ROD (DON 2010) consists of the placement of a cover to isolate buried waste and soil contaminants and to prevent animal burrowing. Prior to placing the cover, the surface will undergo scanning and removal of radiological hotspot material to prevent the spread of potential contamination during site grading. Engineering controls and ICs will be implemented to protect human health and the integrity of the cover; provide for any necessary wetlands mitigation, and monitor soil cleanup and wetlands mitigation; and conduct methane gas monitoring (as necessary).

The selected remedy for groundwater is monitored natural attenuation. Site groundwater will be monitored regularly using shoreline groundwater monitoring wells. Engineering controls will be in place to protect the monitoring wells from damage and/or to protect site users from harm. ICs will be implemented across the entire site, including the wetlands, to limit human exposure to contaminants in soil and to protect the integrity of the cover.

This page intentionally left blank.

3.0 INSTITUTIONAL CONTROLS

ICs are legal and administrative mechanisms used to implement land use and activity restrictions to limit the exposure to hazardous substances by current and future landowner(s) and user(s) of the property and to maintain the integrity of the remedial action. ICs are required on a property where the selected remedial cleanup levels result in contamination remaining at the property above levels that allow for unlimited use and unrestricted exposure. ICs will be maintained until the concentrations of hazardous substances in soil and groundwater are at such levels to allow for unrestricted use and exposure. Implementation of ICs includes requirements for monitoring, inspections, and reporting to ensure compliance with land use or activity restrictions.

3.1 FEDERAL-TO-FEDERAL PROPERTY TRANSFER

If the IR Site 2 property is transferred to another federal agency or department, the land use restrictions and activity restrictions set forth in Section 5.0 and the Remedy Implementation Actions set forth in Section 6.0 will be incorporated into an MOU or other agreement between the DON and the federal transferee. The MOU or other agreement will also require that 1) the transferee comply with all applicable federal and state environmental, public health, and cultural and natural resource protection laws following transfer; 2) any subsequent future transfer by the federal transferee to a federal agency shall incorporate the land use and activity restrictions set forth below into a subsequent MOU or other agreement and require the same for any further conveyances between federal agencies; and 3) if the federal transferee in turn transfers the property to a nonfederal entity, it shall comply with the requirements set forth in Sections 3.2, 5.0, and 6.0. If the FFA is amended to transfer responsibility for post-RACR Operation and Maintenance and monitoring of the remedial action selected for IR Site 2 from DON to another federal agency, the DON's responsibilities under this LUC RD shall be assumed by the federal transferee and DON shall no longer be responsible for them as provided in Section 1.0.

3.2 PROPERTY TRANSFER TO A NONFEDERAL ENTITY

If the IR Site 2 property is transferred from the DON or another federal transferee to a nonfederal entity, DON will rely upon proprietary controls in the form of environmental restrictive covenants as provided in the *Memorandum of Agreement (MOA) Between the United States Department of the Navy and the California Department of Toxic Substances Control* and attached covenant models (DON and DTSC 2000) (hereinafter referred to as the DON/DTSC MOA). More specifically, land use and activity restrictions will be incorporated into two separate legal instruments at the time of transfer as provided in the DON/DTSC MOA:

1. Restrictive covenants included in one or more Quitclaim Deeds from the DON to the property recipient

2. Restrictive covenants included in one or more "Covenant to Restrict Use of Property" entered into by the DON and DTSC as provided in the DON/DTSC MOA and consistent with the substantive provisions of *California Code of Regulations* Title 22, Section 67391.1.

The "Covenant to Restrict Use of Property" will incorporate the land use and activity restrictions into environmental restrictive covenants that run with the land and are enforceable by DTSC, EPA, and any other signatory state entity (such as CDPH) against future transferees. The Quitclaim Deed(s) will include the identical land use and activity restrictions in environmental restrictive covenants that run with the land and will be enforceable by the DON against future transferees.

ICs include land use and activity restrictions and will be applied to the property in the area requiring institutional controls (ARIC) (the entire area of IR Site 2 as described in Section 4.0). These IC's will be included in the Environmental Summary Document (for transfer to a federal agency), or a Finding of Suitability to Transfer/Finding of Suitability for Early Transfer, Covenant to Restrict Use of Property, and Quitclaim Deed(s) (for transfer to a non-federal entity).

4.0 AREA REQUIRING INSTITUTIONAL CONTROLS

The ICs, including all land use and activity restrictions selected in the ROD and described in Section 5.0, will be applied to the IR Site 2 area requiring institutional controls (ARIC). The ARIC is shown on Figure 2-1.

This page intentionally left blank.

5.0 INSTITUTIONAL CONTROL PERFORMANCE OBJECTIVES, LAND USE RESTRICTIONS, AND ACTIVITY RESTRICTIONS

The following sections describe the objectives to be achieved through land use and activity restrictions within the ARIC at IR Site 2. If the FFA is amended to transfer responsibility for post-RACR Operation and Maintenance and monitoring of the remedy for IR Site 2 from DON to another federal agency as provided in Section 1.0, the federal transferee shall also be responsible for compliance with the land use and activity restrictions set forth below after the IR Site 2 property is transferred to it.

5.1 LAND USE RESTRICTIONS

The IR Site 2 property shall be restricted to open space and recreational uses. In addition, the following land uses are specifically prohibited within the boundaries of the IR Site 2 ARIC:

- A residence, including any mobile home or factory-built housing, constructed or installed for use as human habitation
- A hospital for humans
- A school for persons under 21 years of age
- A daycare facility for children
- Any permanently occupied human habitation including those used for commercial or industrial purposes

5.2 GENERAL ACTIVITY RESTRICTIONS

The following activities are restricted within the boundaries of the IR Site 2 ARIC unless prior written approval for these activities is granted by the FFA signatories, prior to conducting them:

- Land disturbing activity is prohibited unless conducted pursuant to an approved soil management plan (SMP) (Note: Additional SMP requirements for addressing radiological activity restrictions are set forth below in Section 5.3). Land disturbing activity includes, but is not limited to, 1) excavation of soil and disturbance of the multilayer soil cover; 2) construction of roads, utilities, permanently occupied buildings, facilities, structures, and appurtenances of any kind; 3) demolition or removal of paved areas; 4) actions that may impair the multilayer soil cover or other exposure prevention barriers; 5) excavation and/or disturbance of soil or riprap areas; and 6) any other activity that involves movement of soil to the surface from below the surface of the IR Site 2 property.
- Alteration, disturbance, or removal of any component of a response or cleanup action (including, but not limited to, soil cover/containment systems); groundwater extraction, injection, and monitoring wells and associated piping and equipment; or associated utilities.

- Extraction of groundwater and installation of new groundwater wells.
- Removal of or damage to security features (e.g., locks on monitoring wells, survey monuments, signs, or monitoring equipment and associated pipelines and appurtenances).

ICs will be maintained until the concentrations of hazardous substances in the soil and groundwater are at such levels to allow for unrestricted use and exposure.

5.3 ADDITIONAL ACTIVITY RESTRICTIONS RELATED TO RADIONUCLIDES

Excavation within the IR Site 2 ARIC below a depth 1.9 feet is strictly prohibited unless approved in writing by the FFA signatories and CDPH. Any proposed excavation below this depth shall be described in a Soil Management Plan that will include but not be limited to a radiological work plan, the identification of a radiological safety specialist, soil sampling and analysis requirements, and a plan for off-site disposal of any excavated radionuclides by the transferee in accordance with federal and state law. This work plan must be submitted to and approved in writing by the FFA signatories and CDPH in accordance with procedures set forth in Section 7.0 of this LUC RD report.

The integrity of the cover must be restored upon completion of any excavation as provided in the IR Site 2 Operation and Maintenance Plan, this report, or similar document. A completion report describing the details of the implementation of the Soil Management Plan, the sampling and analysis, the off-site disposal, and the restoration of the integrity of the cover must be submitted to and approved in writing by the FFA signatories and CDPH in accordance with procedures and time frames detailed in Section 6.0 of this document.

5.4 ACCESS

The MOU or other agreement, if the property is transferred to another federal agency, or the deed(s) and CRUP(s) if the property is transferred to a nonfederal entity, shall provide that the FFA signatories and CDPH, and authorized agents, employees, contractors, and subcontractors shall have the right to enter IR Site 2 at Alameda Point to conduct investigations, tests, or surveys; inspect field activities; or construct, operate, and maintain any response or remedial action as required or necessary under the cleanup program, including monitoring wells, pumping wells, treatment facilities, and landfill cap/containment systems.

6.0 REMEDY IMPLEMENTATION ACTIONS

This section describes the responsibilities of the DON and future transferees for implementing ICs. If the DON transfers responsibility for post-RACR Operation and Maintenance and monitoring of the remedial action for IR Site 2 to another federal agency, that federal agency shall assume the DON responsibilities described in Sections 6.1 and 6.2.

6.1 RESPONSIBILITIES OF THE DON WITH RESPECT TO IC INSPECTIONS, REPORTING, AND ENFORCEMENT

The DON is responsible for implementing, maintaining, inspecting, reporting, and enforcing the land use and activity restrictions identified in Section 5.0 of this LUC RD prior to conveyance of the IR Site 2 property. The DON may later transfer these procedural responsibilities to another party (transferee) by contract, property transfer agreement, MOU, or other means. Although the DON may contractually arrange for third parties to assume responsibility for and perform any and all actions associated with ICs, the DON shall retain ultimate responsibility under CERCLA for successful implementation of ICs, including maintaining, monitoring, reporting on, and enforcing the controls as necessary to assure remedy integrity unless the FFA is amended to transfer responsibility for IR Site 2 from the DON to another federal agency at the time of transfer as described in Sections 1.0 and 6.0 above. Should any IC objectives fail, the DON, or another federal agency as appropriate, shall ensure that appropriate actions are taken to re-establish protectiveness of the remedy and may initiate legal action to either compel action by a third party(ies) and/or recover the DON's costs for mitigating any discovered IC violation(s).

6.2 DON RESPONSIBILITIES

The DON will undertake the following IC implementation actions to ensure that the aforementioned IC objectives and land use restrictions for IR Site 2 are met and maintained:

- **LUC RD Distribution:** Within 30 days of receiving EPA's, DTSC's, Water Board's, concurrence with this LUC RD, the DON will place the LUC RD in the Information Repository currently located at Alameda Point. A copy of the LUC RD will also be sent to EPA, DTSC, the Water Board, Alameda Reuse and Redevelopment Authority, and CDPH. Appendix A presents a list of agencies and mailing addresses.
- **Site Access:** Each deed (or MOU or other agreement with another federal department or agency) will contain a reservation of access to the property for the DON, EPA, DTSC, and Water Board, and their respective officials, agents, employees, contractors, and subcontractors for the purposes consistent with the Navy IR Program or the FFA.
- **Site Inspections:** Commencing upon concurrence upon this LUC RD by EPA, DTSC, and Water Board and continuing until the effective date of property transfer, the DON will undertake annual physical inspections of the site to confirm continued

compliance with all IC performance objectives and land use restrictions through the property transfer instruments described in Section 4.0. At the time of conveyance of the site, the DON and DTSC will require, via appropriate provisions to be placed in the MOU or other agreement if the property is transferred to another federal agency, or deed(s) of conveyance and CRUP if the property is transferred to a nonfederal entity, that the landowner(s) and subsequent transferees undertake continuing annual site inspections to ensure that all IC objectives and land use restrictions are complied with by all future user(s) as provided in Section 6.3 of this document.

- **Compliance Reporting:** Beginning upon approval of this LUC RD and continuing until the effective date of property transfer by the DON, the DON will provide to the EPA, DTSC, and Water Board, an annual IC Compliance Monitoring Report and Certificate for IR Site 2 consistent with the form located in Appendix B. The annual IC Compliance Monitoring Report will address, among other things, whether the land use and activity restrictions were communicated in the MOU or other agreement or deed(s) and CRUP whether the owners and state and local agencies were notified of the use restrictions and controls affecting the property, whether use of the property has conformed with such restrictions and controls, and will evaluate the status of the ICs. In addition, should any deficiencies be found during the annual inspection, the DON will provide the EPA, DTSC, and Water Board with a separate written explanation with the IC Compliance Certificate indicating the specific deficiencies found and what efforts or measures have or will be taken to correct those deficiencies. Copies of a completed and signed IC Compliance Monitoring Report and Certificate shall be sent to the EPA, DTSC, and Water Board by Certified Mail, Return Receipt Requested annually. Upon conveyance of fee title for the site to a nonfederal entity, the DON will require, via appropriate provisions to be placed in deed(s) of conveyance and CRUP, that the landowner(s) and subsequent transferees respond to IC violations as required by compliance reporting and provide to the FFA signatories an IC Compliance Monitoring Report and Certificate for IR Site 2 consistent with the form located in Appendix B unless and until all ICs are terminated at the site.
- If the transferee fails to provide an annual compliance monitoring report as described previously to the DON, the DON will notify EPA, DTSC and Water Board soon as practicable. If the EPA, DTSC, or Water Board do not receive the annual monitoring report from the transferee, it will notify the DON as soon as practicable. The DON shall ensure appropriate measures have been taken to verify the status of the ICs and that an annual compliance monitoring report is submitted to the EPA, DTSC, or Water Board within 90 days after the report's due date.
- **CERCLA 5-Year Reviews:** The DON shall conduct 5-Year Reviews of the IR Site 2 remedy as required by CERCLA Section 121(c) and the National Oil and Hazardous Substances Pollution Contingency Plan (NCP). The 5-Year Reviews will evaluate, among other things, implementation and compliance with the ICs to determine whether the remedy is or will be protective of human health and the environment in the future. The annual monitoring reports prepared by the DON and transferee will be used in preparation of the 5-Year Review reports to evaluate the effectiveness of the remedy.

- **Notice of Planned Property Conveyances:** The DON will provide notice to the EPA, DTSC, and Water Board at least 6 months prior to any transfer or sale of IR Site 2 by the DON so that all FFA signatories can be involved in discussions to ensure that appropriate provisions are included in the transfer terms or conveyance documents to maintain effective ICs. If it is not possible for the DON to provide notification at least 6 months prior to any transfer or sale, then the DON will notify as soon as possible but no later than 60 days prior to the transfer or the sale of any property by the DON. In addition to the land transfer notice and discussion provisions in this LUC RD report, the DON further agrees to provide the FFA signatories with similar notice, within the same time frames, as to federal-to-federal transfer of property. The DON shall provide a copy of executed deed(s) of conveyance or CRUP or MOU or similar agreement to the EPA, DTSC, and Water Board.

- **Opportunity to Review Text of Intended Deed Restrictions:** Prior to conveyance of the site, the EPA, DTSC, and Water Board will be given reasonable opportunity to review and comment upon the applicable deed(s) and CRUP language related to all ICs and associated rights of entry for the FFA signatories for purposes of IC oversight and enforcement. The provisions in the deed(s) or other enforceable document(s) will be consistent with the IC objectives in Section 5.0.

- **Notification should Action(s) that Interfere with IC Effectiveness be Discovered:** The DON or transferee will notify the FFA signatories as soon as practicable, but no longer than 10 working days after the DON's or transferee's discovery of any activity that is inconsistent with the IC objectives or use restrictions or any other action that may interfere with the effectiveness of the ICs. The DON or transferee will notify the FFA signatories regarding how a breach will be addressed or has been addressed as soon as practicable, but no later than 10 working days after notification of the breach. This reporting requirement does not preclude the DON from taking immediate action pursuant to its CERCLA authorities to prevent any actual or perceived risk(s) to human health of the environment.

- **IC Enforcement:** The process of addressing any activity that is inconsistent with the IC objectives or use restrictions, or any other action that may interfere with the effectiveness of the ICs will be initiated by the landowner as soon as practicable, but no longer than 60 days after the landowner becomes aware of the breach. If a violation of a land use restriction is identified and/or documented by the FFA signatories, or in an owner's annual IC Compliance Monitoring Report, the entity identifying the violation will notify the others within 10 working days of identifying the violation. The FFA signatories and CDPH will then consult to evaluate what, if any, action(s) should be taken, who shall take the action(s), and when they shall be undertaken. These actions may range from informal resolution with the owner or violator of an IC provision(s) as described in this LUC RD, to the pursuit of legal remedies or enforcement action to enforce deed or CRUP restrictions under the auspices of state property law or CERCLA if the property is transferred to a nonfederal entity. Alternatively, the DON may choose to exercise its response authorities under CERCLA and seek cost recovery from the person(s) or entity(ies) who violate a given IC objective/land use restriction set forth in the deed(s) transferring the property. Should the DON become aware that any future owner or user of the property has violated any IC requirement over which a local agency may have independent jurisdiction, the DON will notify these agencies of such violation(s) and work cooperatively with them to reachieve owner/user compliance with the ICs.

DTSC and the DON as signatories to a CRUP (and EPA as a third-party beneficiary) will have independent authority to enforce violations of restrictions, requirements, and obligations under a CRUP. While DTSC may agree to consult with other parties before taking any enforcement action under a CRUP, it will not waive its authority to take action as necessary in the event of violations.

- **Modification of Restrictions in Quitclaim Deed(s) and DTSC CRUPs:** Modifications to the ICs may be required based on changes in site conditions (e.g., reduction in ARIC) during the expected duration for the ICs. When the DON or future property owner(s) determines, with EPA, DTSC, and Water Board concurrence, that modifications to the ICs are appropriate, the IC modifications shall be documented in accordance with procedures consistent with applicable laws and regulations. The DON or future property owner(s) shall be responsible for providing pertinent information on the IC modifications to the Alameda Reuse and Redevelopment Authority and will also advise the additional interested parties listed in Appendix A. The FFA signatories, in consultation with CDPH, shall determine whether a ROD Amendment, Explanation of Significant Differences (ESD), or some other procedure consistent with the NCP is required to support the modification of the IC. The DON shall not modify or terminate LUCs, implementation actions, or modify land use without EPA, DTSC, and Water Board concurrence. The DON or transferee shall seek prior concurrence before any action anticipated by the DON or transferee that may disrupt the effectiveness of the LUCs or any action that may alter or negate the need for LUCs.
- **Termination of ICs:** When the DON determines, with EPA, DTSC, and Water Board concurrence, in consultation with CDPH, that one or more of the ICs at IR Site 2 are no longer needed for protection of human health and the environment because the property is remediated to levels of contamination that allows for unrestricted use, the DON and DTSC shall provide to the current landowner(s) of the property an appropriate release of the restriction (DON for the deed[s] and DTSC for the CRUP) in accordance with state law for recordation with the deed(s) pertaining to the site and will also timely advise the additional interested parties listed in Appendix A. Termination of restrictions contained in the ICs may be possible; however, most ICs (such as those that require protection of the soil cover) will continue in perpetuity to provide protection of human health and the environment. ICs will be maintained until the concentrations of hazardous substances in soil and groundwater are at such levels as to allow for unrestricted use and exposure.
- **Survey Plat:** Prior to transfer, the DON will survey the ARICs at IR Site 2 to define the legal metes and bounds for inclusion in the property transfer documents. The DON will forward copies of the survey to the EPA, DTSC, and Water Board and will place a copy in the Administrative Record.

6.3 RESPONSIBILITIES OF THE PROPERTY OWNER(S) AND SUCCESSORS WITH RESPECT TO IC INSPECTIONS AND REPORTING

By including appropriate provisions in the MOU or other agreement if the property is transferred to another federal agency, or in deed(s) and CRUPs if the property is transferred to a nonfederal entity, the DON will cause the future property owner(s) to assume the following IC implementation responsibilities upon the DON's conveyance of the property to ensure that the aforementioned IC objectives and land use restrictions for IR Site 2 are complied with after property transfer:

- **Site Inspections:** The property owner(s) will conduct annual physical inspections of the site to confirm continued compliance with all IC objectives and land use restrictions in the MOU, or deed(s) and CRUPs unless and until all ICs at the site are terminated with FFA signatories' and CDPH approval.
- **Compliance Reporting:** The property owner(s) will notify the FFA signatories and CDPH within 5 working days of the property owner(s)' discovery of any violation of an IC and include in the notification a written explanation indicating the specific IC violations found and what efforts or measures have or will be taken to correct those violations. The property owner(s) will also provide to the FFA signatories and CDPH an annual Compliance Monitoring Report and IC Compliance Certificate for IR Site 2 consistent with the form attached hereto as Appendix B unless and until all ICs are terminated at the site. In addition, should any IC violations be discovered during the annual site inspection, the property owner(s) will provide to the FFA signatories and CDPH, along with the required IC Compliance Monitoring Report Certificate, a separate written explanation indicating the specific IC violations found and what efforts or measures have or will be taken to correct those violations. The annual Compliance Monitoring Report and Certificate shall be sent to the DON, EPA, DTSC, Water Board, and CDPH by Certified Mail, Return Receipt Requested annually. The need to continue to provide such inspections and certifications on an annual basis will be re-evaluated by the FFA signatories and CDPH using the CERCLA five-year review process.
- **Monitoring Well Protection:** Prior to conveyance, to preclude damage to the monitoring well network at IR Site 2, the DON will provide appropriate information regarding monitoring well locations and necessary ICs to the future property owner, including, if available, any well coordinates maintained in a geographic information system (GIS) database and/or applicable maps and drawings. This will enable the future property owner and other entities responsible for planning and development of future projects within the ARIC to add the well coordinates to their GIS database and/or applicable maps and drawings.

  Whenever the DON proposes to transfer real property where monitoring wells are located, the DON shall include appropriate information regarding monitoring well locations and necessary ICs in transfer documents to assure nondisturbance of the monitoring well network and prevent interference with IC effectiveness.

The future property owner(s), or other entity responsible for review and approval of any development plans prepared for projects within the ARIC, shall identify any potential for the project to impact the IC effectiveness and coordinate with the FFA signatories to prevent interference with the IC effectiveness. The DON and other FFA signatories reserve the right to deny approval of projects within the area requiring ICs ARIC deemed to interfere with IC effectiveness. This process will be evaluated during the CERCLA 5-Year Review to determine whether any changes need to be implemented.

- **Notification of Proposed Changes in Land Use:** Prior to seeking approval from the FFA signatories and CDPH for restricted activities within the ARIC, the recipient of the property must notify and obtain approval from the DON of any proposals for a land use change at a site inconsistent with the use restrictions and assumptions described in the final ROD.

7.0 DOCUMENT REVIEWS

Various documents may be prepared by the DON or the transferee during the implementation of ICs (e.g., Soil Management Plans). These documents are subject to review and approval by the FFA signatories (and CDPH for documents required by Section 5.3, Additional Activity Restrictions Related to Radionuclides).

Draft documents will be subject to a review period of 45 days. Reviewing parties may request extension of the review period for up to an additional 45 days from the party submitting the document. The party submitting the document will have 45 days to revise the document to address the comments received.

Draft final documents will be subject to a review period of 30 days. Reviewing parties may request extension of the review period for up to an additional 30 days from the party submitting the document. The party submitting the document will have 45 days to revise the document to address the comments received. Draft final documents will be considered to be final if no comments are received within the 30-day comment period.

All parties preparing or reviewing documents will adhere to the scheduled document preparation and review times to the maximum extent practicable.

INSTITUTIONAL CONTROLS COMPLIANCE MONITORING REPORT AND COMPLIANCE CERTIFICATE

This page intentionally left blank.

Institutional Controls Compliance Monitoring Report
IR Site 2, Alameda Point, Alameda, California
EPA ID No. CA2170023236

Property Owner: ____

This evaluation is the final Navy certification immediately prior to site conveyance (Yes or No)

If for an annual inspection, this evaluation covers the period from _________ through _________

Certification Checklist

	Compliance Item	In Compliance	Non-Compliance	See Comment
1	No use of IR Site 2 for residence, including any mobile home or factory-built housing, constructed or installed for use as residential human habitation, a hospital for humans, a school for persons under 21 years of age, a daycare facility for children, a playground or any permanently occupied human habitation including those used for commercial or industrial purposes.	☐	☐	☐
2	No extraction of groundwater or installation of new groundwater wells of any type within the area requiring institutional controls.	☐	☐	☐
3	No use of groundwater for any purpose (no evidence of tampering with existing wells, no evidence of new subsurface penetrations) within the area requiring institutional controls.	☐	☐	☐
4	No alteration, disturbance, or removal of any component of groundwater response or cleanup action, including monitoring wells, groundwater extraction wells, treatment facilities, and associated equipment within the area requiring institutional controls.	☐	☐	☐
5	No removal or damage to security features (such as monitoring well locks, or signs) or to survey monuments, monitoring equipment, piping or other appurtenances.	☐	☐	☐
6	Notification provided for any unauthorized change in land use.	☐	☐	☐
7	Any violations of these LUCs were reported within 10 business days of discovery and an explanation provided of those actions taken or to be taken was provided within 10 days of notification of discovery.	☐	☐	☐
8	No surface or subsurface activity that causes or could cause the preferential movement of contaminated groundwater.	☐	☐	☐
9	No excavation unless approved by FFA signatories and CDPH.	☐	☐	☐

I, the undersigned, hereby certify that the above-described land use restrictions have been complied with for the period noted. Alternately, any known deficiencies and completed or planned actions to address such deficiencies are described in the attached Explanation of Deficiencies.

____ ____________________

RESPONSE TO COMMENTS ON THE DRAFT REMEDIAL ACTION WORK PLAN, DATED MAY 4, 2012

This page intentionally left blank.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Comments from James R. Fyfe, PE Department of Toxic Substances Control (DTSC) Project Manager California Environmental Protection Agency Comments Dated: July 13, 2012	
GENERAL COMMENT	**RESPONSE**
Comment 1. Studies indicate that due to sea-level rise, mean sea level in the San Francisco Bay is projected to be at least three feet higher in 2100 than it is today. Please provide information on how the remedial action for IR Site 2 will remain protective of human health and environment in the face of rising sea level.	**Response 1.** The Post-Closure Monitoring Plan has been revised to address the comment. The current Bay Plan promulgated by BCDC states sea level rise needs to be addressed with adaptive management and innovation. From the 2011 Bay Plan, "Approaches for ensuring public safety in developed vulnerable shoreline areas through adaptive management strategies (that) include but are not limited to: (1) protecting existing and planned appropriate infill development; (2) accommodating flooding by building or renovating structures or infrastructure systems that are resilient or adaptable over time." (Bay Plan, 3/2012, page 33, Section o) As gradual sea level rise occurs, quarterly inspections and the mandated CERCLA 5-Year Review are existing tools to monitor and report sea level. Using adaptive management, a decision can be made as to the optimum course to take for maintaining the integrity of the soil cover. Gradual inundation of the landfill itself should not increase groundwater contamination as the waste is already inundated (i.e., below the current water table).

RESPONSE TO COMMENTS
DRAFT REMEDIAL ACTION WORK PLAN
INSTALLATION RESTORATION SITE 2, ALAMEDA POINT
ALAMEDA, CALIFORNIA

James R. Fyfe, PE, DTSC Project Manager
California Environmental Protection Agency

Comment 2. DTSC shares the concerns of the public and of other agencies that the planned fence at IR Site 2 should not prevent public access to the entire site, especially to the anticipated San Francisco Bay Trail.

Response 2. The Navy has revised the RD/RAWP to remove the permanent cyclone fencing and barbed wire from the project design. Consistent with active construction projects, the site will be temporarily fenced during construction to protect equipment and ensure public safety. Once construction is complete and the soil cover has been hydroseeded, the fencing will be replaced with simple signage and symbolic fencing, examples provided below. The purpose is to protect the cover and allow the vegetation to establish.

The Navy's design and CERCLA requirements for this project do not preclude future use of the site for limited public access or passive recreational purposes. It is understood a future Bay Trail may be constructed by property recipients and/or land managers that would traverse the western and southern boundaries of the site. The Navy will not be involved in the construction or management of the proposed future Bay Trail and interposes no objection to the use of simple exclusionary or symbolic fencing as shown in the examples above to require pedestrians to remain on the established pathway or trail.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
James R. Fyfe, PE, DTSC Project Manager California Environmental Protection Agency	
SPECIFIC COMMENT	**RESPONSE**
Comment 1. Section 1.3 Points of Contact: Under the heading of "entity" on the list of key personnel, for Cal/EPA, please correct the entry as follows: Cal/EPA DTSC 700 Heinz Avenue Berkeley, CA 94710 The remainder of the entry is correct. Also, please delete the entry for Cal/EPA CDPH altogether. As a side note, CDPH is not a part of Cal/EPA.	**Response 1.** The address for Cal/EPA DTSC has been corrected and the entry for CDPH has been corrected.
Comment 2. Attachment 1 90% Remedial Design, Design Drawings, Sheet C-3: The legend shows -----XX----- as "temporary construction fence". On the drawing there is also -----X----- around the perimeter of the site that is not included on the legend. Construction notes indicate that this is the new permanent fence. Please indicate in the drawing legend what -----X----- represents.	**Response 2.** See response to DTSC General Comment 2. The symbol ----X---- has been removed from the design drawings and from the legend.
Comment 3. Attachment 1, 90% Remedial Design, Design Specifications, Section 31 11 00, Clearing, Subsection 3.1.4, Species and Habitat: Toward the end of the paragraph it is stated (based on California Fish and Game Code 3511 and 2080) "If nests are found, the birds will be allowed to fledge before excavation. If this is not possible, the eggs/chicks will be taken to a licensed wildlife rehabilitator for captive rearing. The Navy will consult with the US Fish and Wildlife. Approval of the US Fish and Wildlife is not required before proceeding with CERCLA remedy." Please also consult with California Department Fish and Game before removing any eggs or checks from their nest.	**Response 3.** The Navy will coordinate through the DFG-OSPR prior to implementation of reasonable measures that ensure adequate protection of ecological receptors during response action construction at IR Site 2.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
James R. Fyfe, PE, DTSC Project Manager California Environmental Protection Agency	
Comment 4. Attachment 4, Sampling and Analysis Plan, SAP Worksheet #3 – Distribution List, page 18 of 204: Please delete the entry for Mr. Robert Wilson, Cal/EPA DPH. Also please add the following entry: Ms. Michelle Dalrymple Engineering Geologist Cal/EPA DTSC (510) 540-3926 700 Heinz Avenue Berkeley, CA 94710	**Response 4.** The entry for Cal/EPA CDPH has been corrected to list Robert Wilson, CDPH. The CDPH is one of the regulatory agencies designated in the ROD and will remain in the contact list. Ms. Dalrymple has been added to the distribution list on SAP Worksheet #3.
Comment 5. Attachment 5, Project Contractor Quality Control Plan, Section 2.18 Points of Contact, page 2-11: Please make the same changes as in Specific comment 1, correcting the address and deleting the CDPH entry.	**Response 5.** The Points of Contact list in the PCQCP (Attachment 5), Section 2.18 has been updated to correct the CDPH entry. See Response 4 regarding the deletion request.
Comment 6. Attachment 11, Post-Closure Operations, Maintenance, and Monitoring Plan, Section 1.3 Future Use, page 1-2: It is stated: "A permanent 6-foot-high chain-linked fence with three strands of barbed wire will be placed on the eastern and northern boundary of IR Site 2 at the completion of all work activities, restricting access to the landfill. Access to the shoreline trail south and west of the landfill will remain open." This statement does not make sense. A fence on only two sides of Site 2, the northern and eastern boundary that also allows access to a shoreline trail south and west of the landfill cannot possibly restrict access to the landfill. Design drawings indicate that the permanent fence will be on the northern and eastern boundary of IR Site 2 all the way to the shoreline. This will not allow access to a shoreline trail. Please correct this inconsistency and indicate whether or not there will be access to the shoreline trail. Also, Construction Note 4 on Design Drawing D-6	**Response 6.** Please see response to General Comment #2. Attachment 11 has been revised to reflect changes.

James R. Fyfe, PE, DTSC Project Manager
California Environmental Protection Agency

states that "Barbed Wire shall be used only when specified." Is the statement above in the Post-Closure Operations, Maintenance, and Monitoring Plan specifying barbed wire on the entire fence? If so, then why not just show the barbed wire on Design Drawing Site Details?	
Comment 7. Attachment 11, Post-Closure Operations, Maintenance, and Monitoring Plan, Section 6.1, Scheduled Inspection: Please add a requirement to notify and invite regulatory agencies for scheduled site inspections.	**Response 7.** The Navy interprets this request to require a Navy invitation as a pre-condition for allowing access to the site. The Navy suggests that a better approach would be to rely upon the existing access requirements of CERCLA and Section 18 of the FFA.
Comment 8. Attachment 12, Land-Use Control Remedial Design, Appendix A, Land-Use Control Remedial Design Distribution List: Please correct the address in the second entry as follows: Department of Toxic Substances Control 700 Heinz Avenue Berkeley, CA 94710 Also, please correct the address in the fifth entry as follows: California Department of Public Health Environmental Management Branch 1616 Capitol Avenue, MS 7405 Sacramento, CA 95899-7377	**Response 8.** The entries for DTSC and CDPH in Attachment 12 have been corrected.

DRAFT REMEDIAL ACTION WORK PLAN
INSTALLATION RESTORATION SITE 2, ALAMEDA POINT
ALAMEDA, CALIFORNIA

Comments from James M. Polisini, Ph.D.
Senior Toxicologist
Office of Human and Ecological Risk (HERO)
Ecological Risk Assessment Section (ERAS)

Comments Dated: June 15, 2012

GENERAL COMMENT	RESPONSE
Comment 1. DTSC comments dated October, 21, 2011 and California Department of Fish and Game comments dated November 9, 2011 on the Intermediate Draft Remedial Design Report, Installation Restoration Site 2, Alameda Point Alameda, California transmitted through James Fyfe, DTSC Project Manager, received no response as the ‘two sets of comments were received after the comment period’ (Attachment 13, Response to comments on the Intermediate Draft, page 32 of 32). The response indicated that each comment will be evaluated and, as appropriate, the Draft RAWP will address these comments. Please indicate which specific comments were addressed and which were not addressed.	**Response 1.** Navy reviewed the DTSC comments dated October 21, 2011. Many of those comments overlap comments received for this 90% document. Resolution of October 21, 2011 comments is now superseded by the current IR Site 2 RAWP comment and response document. DFG-OSPR’s requests for Navy to reconsider ARARs and comply with more than CERCLA requirements are declined. However, DFG-OSPR will be a part of the process, as required.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
James M. Polisini, Ph.D., Senior Toxicologist HERO, ERAS	
SPECIFIC COMMENT	**RESPONSE**
Comment 1. Future use of IR Site 2 is outlined as 'includes low-impact recreational uses such as a recreational trail around the site' (Section 2.3, page 2-9). IR Site 2 has been designated for federal agency (DON) transfer to federal agency (Office of Veterans Affairs). One potential future use, discussed in the past, was as an Office of Veterans Affairs long-term care facility. Because the human health risk assessment for IR Site 2 did not include a residential use scenario, Institutional Controls should be included to preclude development of a long-term care facility and require IR Site 2 'is limited to recreational uses such as a recreational trail around the site' and specifically reference the Land Use Restrictions outlined in the Land-Use Control Remedial Design (Attachment 12, Section 5.1, page 5-1) which prohibit hospitals, day care and residences. In addition, the Environmental Protection Plan (Attachment 6; Section 3.0, page 3-1) indicates that portions of IR Site 2 have been proposed for transfer to the US Fish and Wildlife Service (USFWS) as a National Wildlife Refuge. Therefore, 'low impact recreational use' does not completely describe the potential future use. Please revise Section 2.3 of the main text to completely describe potential future uses and restrictions.	**Response 1.** The reference to USFWS has been deleted from Section 3.0 of Attachment 6. The ROD and the LUCRD (Attachment 12) both state that future use for IR Site 2 is recreational, and residential or other occupied structure development is prohibited. Refer to DTSC Response 2.
Comment 2. The Draft Work Plan indicates that mobilization is 'expected to begin in the Spring of 2012' with earthwork anticipated to begin shortly thereafter (Section 5.1, page 5-1). As this is a 90 percent completion document, and earthwork has not yet begun, HERO suggests the projected initiation date be revised.	**Response 2.** Section 5.1 has been revised to state that mobilization is expected to begin in early 2013.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
James M. Polisini, Ph.D., Senior Toxicologist HERO, ERAS	
Comment 3. The barge unloading area is described as to the north of IR Site 2 and references Figure 5-1 (Section 5.1.2, page 5-1). The referenced figure shows an additional unloading area to the south. The text and/or the figure should be amended so that they are correct and agree.	**Response 3.** The location of the barge offloading area has since been revised to the southern location only due to access limitations at the northern location. Section 5.1.2 has been revised to reference the southern offloading areas and is in agreement with the location as shown on Figure 5-1 which has been revised.
Comment 4. A biological survey conducted one week prior to earth moving activities (Section 5.2, page 5-1), will identify only terrestrial natural resources with fixed locations (i.e., plants) or small home ranges and will not be sufficient to identify all the protected, listed and/or threatened biological resources requiring protection during the entire length of the project. Later description of the biological survey (Attachment 6, Environmental Protection Plan, Section 6.3.2, page 6-6) indicates that the pre-construction biological survey will consist of four separate visits in the 30 days prior to construction. The latter description is sufficiently detailed. Please amend the main text and Attachment 6 so that they are correct and agree.	**Response 4.** Section 5.2 of the main text has been changed to be consistent with similar text in Attachment 6.
Comment 5. Demolition of the ammunition bunkers and the associated guard towers are not planned (Section 5.5, page 5-2). Ammunition bunkers on at least one other closed Department of Defense (DoD) base in the San Francisco Bay area have been locations of trespass and disturbance. Please provide the rationale for not removing all attractive nuisances in an area planned for recreational use in this section of the document.	**Response 5.** The bunkers (Bldgs 353 and 354) may be used for storage in the future by the property recipient. Section 5.5 of the RAWP has been revised to include tack-welding the bunker doors shut to ensure public safety and security until the future property recipient decides to use the buildings.
Comment 6. The Department of Fish and Game should be consulted to determine whether the 220-mil un-seamed layer of HDPE geonet with half-inch openings proposed as animal penetration control, rather than a rock cover (Section 5.6.6.2, page 5-7), is sufficient.	**Response 6.** Please see Response to Polisini Specific Comment #1 dated 12/17/12 (Attachment 14).

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
James M. Polisini, Ph.D., Senior Toxicologist HERO, ERAS	
Comment 7. Ground elevations from the final topographic survey (Section 5.11.1, page 5-12) should be entered into a Geographic Information System (GIS) to facilitate monitoring of post-remedial settling. NAS Alameda had a functional GIS in the mid-1990s.	**Response 7.** Topographic survey reports regarding monitoring for subsidence are part of the post-closure monitoring plan reporting requirements.
Comment 8. Please amend the text to reference to 'recent wetland delineation recently conducted at IR Site 2' by CH2M Hill Kleinfelder (Attachment 6, Environmental Protection Plan, Section 6.1.2, page 6-2) as included in Attachment 7, Appendix A of this Draft RAWP. This wetland delineation is described as following the Army Corps of Engineers (ACE) methodology. The California DFG and the USFWS interpret the results of the wetland survey differently from the ACE. Specifically, wetlands are identified by DFG and USFWS by the presence of any of the three (water, vegetation and soil) criteria: a) presence of water; b) presence of hydrophytic vegetation; and, soils typical of permanent or intermittent inundation, not the ACE requirement for all three for wetland designation. Use of the DFG and USFWS wetland identification process could significantly increase the area of wetlands in IR Site 2.	**Response 8.** A reference has been made to the KCH Delineation report (2011) in the RAWP, Section 5.10. The Navy will continue to rely on the ACE methodology as it has done at other CERCLA IR sites in California.
Comment 9. The DFG and the USFWS should be contacted prior to the surveys conducted by the 'specified' biological monitor to assess the presence of special status plan and animal species and the focused survey of nesting birds and nests to determine if they wish to send representatives to participate in the biological surveys (Attachment 6, Environmental Protection Plan, Section 6.3.1, page 6-5, first bulleted item; Attachment 6, Environmental Protection Plan, Section 6.3.2, page 6-6).	**Response 9.** Concur. The DFG and USFWS will be contacted prior to conducting the surveys. Sections 6.3.1 and 6.3.2 in Attachment 6 have been revised.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
James M. Polisini, Ph.D., Senior Toxicologist HERO, ERAS	
Comment 10. Any written notification of the accidental death or injury of any state-listed or Federal-listed species received by the Department of the Navy (DON) (Attachment 6, Environmental Protection Plan, Section 6.3.1, page 6-5, sixth bulleted item; Attachment 6, Environmental Protection Plan, Section 6.3.4, page 6-7) should be forwarded to the DFG or USFWS as applicable.	**Response 10.** Concur. Attachment 6, Section 6.3.1, page 6-5, sixth bullet has been revised.
Comment 11. The proposed replacement ratio for 'lost' tidal wetlands and non-tidal wetlands is 1:1 (Attachment 6, Environmental Protection Plan, Section 6.3.3, page 6-7). Wetland replacement at the former Mare Island Naval Shipyard (MINSY) was initially proposed at a replacement ratio of 1:5 to 1, but finalized at 1.15 to 1 (http://www.denix.osd.mil /awards/upload/Environmental-Restoration-Individual-or-Team-MANSY.pdf). The DFG and USFWS should be contacted to confirm agreement with the proposed 1:1 replacement ratio for IR Site 2 wetlands.	**Response 11.** Section 2.9.2.1 of the CERCLA ROD for IR Site 2 provides: "If impacts to wetlands occur, an equivalent acreage of similar wetland habitat will be constructed onsite at Alameda Point, the details of which will be presented in a Wetlands Mitigation Plan to be developed during the remedial design phase." Section 3.0 of the draft Wetland Mitigation Plan included as Attachment 7 of the draft Remedial Action Work Plan is consistent with the ROD. The Navy will respond to any comments provided by DFG and USFWS addressing this issue.

<tr><td>Comment 12. Several radiological issues have been forwarded to Valerie Chenoweth-Brown, Senior Health Physicist, HERO-CalCenter for review and potential comment:

a. All radiological components of the IR Site 2 RA will be performed under a valid NRC or California Agreement State license maintained by TtEC. Appropriate and timely notification will be given to the NRC or CDPH, as applicable, that the corresponding TtEC NRC or California Agreement State license will be invoked in support of the IR Site 2 RA (Section 3.2, page 3-2).

b. Trees, shrubs, and grasses will be cut flush with the land surface. Vegetation that has been radiologically-screened and cleared (Section 5.6.1, page 5-4) will be disposed of off-base at a local composting facility. Trucks hauling cleared vegetation will be passed through the radiological portal monitor prior to leaving the site. The radiological portal monitor will be operated in accordance with the Radiological Work Plan (RadWP; Attachment 2) and the appropriate SOPs. Vegetation that fails radiological screening will be handled and disposed of per procedures described in the RadWP and the WMP (Attachments 2 and 10, respectively).

c. Radiological survey activities (Section 5.7, page 5-9) will be conducted in accordance with the guidelines in the Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM), NRC NUREG-1575.</td><td>Response 12a–c. Noted.</td></tr>

This comment is meant for the DTSC Project Manager and no response is required from the Navy or Navy contractors. Any further HERO comment on these radiological issues will be transmitted under separate cover.	

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Comments from Xuan-Mai Tran Remedial Project Manager Federal Facilities and Site Cleanup Branch U.S. Environmental Protection Agency, Region IX Comments Dated: July 5, 2012	
GENERAL COMMENT	**RESPONSE**
Comment 1. While a tidal influence study was conducted in 2004 at Installation Restoration (IR) Sites 1 and 2 to quantify the influence of tides on water levels in Alameda Point wells, Section 2.1.3 (Hydrogeology) states that, "Wells distal from the shoreline and in the vicinity of the landfill were not included in the tidal study." As a result, it is unclear if the tidal influence study is representative of IR Site 2 conditions. Please revise the Draft Remedial Design Remedial Action Work Plan, Installation Restoration Site 2, Alameda Point, Alameda, California, dated May 4, 2012 (Draft RD/RA WP) to clarify how the tidal influence study provided is representative of IR Site 2 conditions when interior wells at IR Site 2 were not evaluated.	**Response 1.** Interior wells and wells along the eastern boundary of IR Site 2 were included as a part of the 2004 tidal study (Shaw, 2005). See Figure 7 of the referenced report. Section 2.1.3 of the RAWP has been revised to reflect this correction and the sentence in question has been removed.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 2. Maintaining the interconnection with the SF Bay is critical to the preservation of the saltwater wetlands habitat. As described in the ROD, the connection is provided by the existing pipe culvert connecting the North Pond to the San Francisco Bay. The Navy has asserted in its Response 18 in Attachment 13 (Response to Comments on the Intermediate Draft Remedial Design Report, dated August 2011), that the existing pipe culvert will be retained, however there is no evaluation of the culvert to demonstrate that the culvert is appropriately sized or constructed to minimize the potential for future blockages, nor is there any provision for the periodic inspection and maintenance. Either the connection to the Bay needs to be reconstructed to reduce the potential for blockage or an obligation to periodically inspect the culvert and clear blockages needs to be included in the O & M plan. The details for the inspection and maintenance should be reviewed with BCDC as part of the Navy's compliance with the substantive provisions of Bay Plan.	**Response 2.** The Navy agrees with the comment that the culvert is critical to the health of the tidal wetlands at IR Site 2. Text has been added to Wetlands Mitigation Plan (Attachment 7) as follows: *The Navy recognizes that the existing culvert (Figure 2) is critical to the life of these IR Site 2 tidal wetlands, as without the culvert, there would be no tidal circulation. As a part of defining successful hydrology for the tidal wetlands, the Navy will have a qualified structural engineering evaluation of the culvert (as it is known to be significantly rusted and damaged) as soon as is practical during cover construction activities. Further, the Navy will make necessary repairs, modifications or replacement to maintain tidal circulation as recommended by the structural assessment of the culvert, and do so during remedy construction if warranted. In the potential event that tidal circulation is inhibited or blocked due to culvert failure, the Navy will restore tidal circulation within 7 days of the failure).* The Post-Closure Operations, Maintenance, and Monitoring Plan (Attachment 11) has been modified to include Culvert Inspection as part of regular visual inspections defined in Attachment 11, Appendix C, SOP 001 Multilayer Soil Cover Inspections.
Comment 3. The Draft RD/RA WP does not include a plan to address munitions and explosives of concern (MEC). Since MEC was disposed in the Site 2 landfill and only the top foot has been cleared, a plan to address MEC if it is exposed during site grading or while making "cuts" into the subsurface should be included. Note that although the text refers to the MEC as "inert ordnance" (e.g., Section 2.5), this cannot be determined without physically inspecting each item. Items buried below 1 foot below ground surface have not been inspected, so it cannot be concluded that all of the items are inert. Please revise the text to delete the phrase "inert ordnance" and provide a plan to address MEC.	**Response 3.** The text has been revised to delete reference to inert ordnance. Cuts into the soil cover have been eliminated in the 90% design and the only excavation will be removal of radiological anomalies. A UXO tech will be on call in the unlikely event that MEC is encountered during excavation of radiological anomalies.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 4. The text (e.g., Sections 2.0 and 2.2.2) and Figure 2-1 use the obsolete term ordnance and explosive waste (OEW). This term should be replaced with MEC. Please revise the text and figures to replace "OEW" with "MEC."	**Response 4.** The term OEW is used to be consistent with historical references. The text of Section 2 has been revised to replace OEW with MEC.
Comment 5. Site grades are stated to be established at 1.5 percent (%) slope; however, several areas exist where steeper slopes are proposed. While the results of Table 7, Summary of Slope Stability and Permanent Seismic Deformation Analyses, of Attachment 1, Draft Geotechnical Report (DGR), to Attachment 1 (90% Remedial Design) indicate that the interior slope between the landfill and wetlands is relatively stable, the overall impact of the steeper slopes identified below on the overall slope stability analysis is not discussed. The following represent areas where steeper slopes are proposed: - A 2.5% slope is proposed on Drawing C-4 (Subgrade Plan - Northwest) of Attachment 1 (90% Remedial Design) - A 5:1 and a 2:1 slope are proposed on Drawing C-6 near the North Pond (Subgrade Plan - Southwest) of Attachment 1 - A 2:1 slope is proposed on Drawing C-7 near the North Pond (Subgrade Plan - Southeast) of Attachment 1 - A 3:1 slope and a 10% slope are proposed on Drawing C-10 (Final Grading and Cover Plan - Northeast) - A 2:1 slope, 2.5% slope, and 6% slope, and 5:1 slope are proposed on Drawing C-11 (Final Grading and Cover Plan - Southwest) - A 2:1 slope is proposed on Drawing C-12 (Final Grading and Cover Plan - Southeast) Please revise the Draft RD/RA WP to discuss the implications of steeper slopes on the slope stability analysis provided in Attachment 1 (Draft DGR) of Attachment 1 (90% RD).	**Response 5.** The 1.5% slope is a minimum slope and steeper slopes are acceptable to facilitate drainage. The critical Section C-C' considered for the interior slope between the landfill and wetlands has a slope height of approximately 12 feet and an average slope of 1.4(H):1(H), taken from the bottom of the submerged pond to where the slope breaks to being relatively flat, i.e., sloped only for drainage at 1.5% minimum. Section C-C' analyzed is considered to be critical in relation to the 5(H):1(H) to 2(H):1(V) slopes shown on the Drawings. The slope provided for drainage above the steeper slope directly adjacent to the wetlands margin is not considered to be critical with respect to stability and permanent seismic deformation predictions.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 6. The Draft RD/RA WP does not state whether the remedial design addresses the possibility of a rise in sea level, and there is no analysis of the consequences of future expected sea level changes. Please revise the Draft RD/RA WP to address these issues.	**Response 6.** Please see response to DTSC General Comment #1.
Comment 7. The Draft RD/RA WP does not discuss how penetrations of the geonet (e.g., for monitoring wells or gas monitoring probes) will be done to maintain the integrity of the geonet. If monitoring wells are installed with a hollow stem auger or rotary drill rig through the geonet, significant damage to the geonet could occur. Please provide detailed procedures to ensure geonet integrity when it must be penetrated.	**Response 7.** Detail 4 on sheet D-3 of the RD (Attachment 1) includes a detail for a typical geonet penetration if necessary. As shown in the detail, a geonet boot would be installed around a pipe penetrating the geonet layer.
Comment 8. Section 5.8.1 (Installation of Access Roads) indicates that travel on unpaved portions of the cover will be restricted to eliminate the formation of preferential drainage channels that would erode the cover in a manner that would impact the cover performance; however, Section 5.8.2 (Installation of Groundwater Monitoring Wells and Landfill Gas Monitoring Probes) indicates that replacement groundwater monitoring wells will be drilled in the interior of the cover once the cover has been completed. As such, it is unclear how travel on unpaved portions of the cover will be prevented. Please revise the Draft RD/RA WP to eliminate any travel on unpaved portions of the cover, or expand the current network of paved portions of the landfill cover to allow for full access to all monitoring locations without exiting a paved roadway and submit an updated access road and monitoring location figure.	**Response 8.** Section 5.8.1 of the main text has been revised to include gravel access roads leading to groundwater monitoring wells within the footprint of the cover. Associated sheets in the RD (Attachment 1) have been revised to add the monitoring well access roads.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 9. An outline of the contents of the Remedial Action Completion Report (RACR) has not been provided. In addition to the items typically provided in a Navy RACR, the estimated and actual costs for this remedy should be provided. Further, the RACR should state how many tons or yards of materials were disposed off-site and where the material was disposed.	**Response 9.** The RACR will follow streamlined EPA guidance and will include estimated costs and discussion of materials disposed off-site, if any.
Comment 10. Table 2-1, Summary of Previous Investigations and Reports for IR Site 2, indicates that soil cement gravity wall and stone columns were determined to be the most feasible remedial option to address geotechnical hazards at IR Site 2; however, the text does not discuss why these remedial options were not incorporated into the remedial design. Please revise the Draft RD/RA WP to specifically discuss why previous geotechnical recommendations were not incorporated into the remedial design.	**Response 10.** The Geotechnical Report included in Attachment 1 of the 90% Remedial Design (May 4, 2012) indicated that a wide range of permanent seismic deformations and liquefaction-induced flow failures were predicted for a potential MCE event at IR Site 2. This report recommended ground improvement including a soil cement gravity wall and stone columns to mitigate the predicted seismic deformation and flow failure. In order to confirm that these ground improvements provided best value for this project, the Navy performed additional analyses and focused modeling of permanent seismic deformations and flow run-outs to better and more accurately quantify the impact of an MCE event. The additional analyses indicated that ground improvements were not required because: Solid refuse is not anticipated to be released into the SF Bay by the predicted permanent seismic deformations and /or flow run-outs; and The site will remain isolated from and will not be flooded by waters of the SF Bay. The predicted nature and magnitude of the seismic displacements and deformations are quantified in the revised version of the Geotechnical Report and summarized in Section 12 of that report. Since the waste will still be isolated from the SF Bay following an MCE event and therefore the cover integrity to act as a pathway interruption between the landfill waste and human and environmental receptors is

Xuan-Mai Tran, Remedial Project Manager
Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX

	expected to remain effective; the MCE would not compromise the CERCLA remedy and ground improvements such as cement gravity walls or stone columns are not warranted. However, some level of damage to the cover and seawall should be anticipated after an MCE event, and will be repaired. It is common for landfills in southern California to have stockpiled cover soil in the event that repairs are required due to earthquake, storm water runoff, and/or subsidence. Section 5.9 Geotechnical Recommendation of the Draft RD/RAWP has been revised to include this discussion.
Comment 11. Figure 1-3, Revised Schedule, includes an "Onsite Preparation/Procurement of Concrete for Animal Intrusion Barrier (if necessary)" remedial action; however, the Draft RD/RA WP text does not discuss this remedial action. As such, it is unclear what criteria would trigger the onsite preparation/procurement of concrete for the animal intrusion barrier. Further, it is unclear how this action will impact the overall remedial design. Please revise the Draft RD/RA WP to include details related to the onsite preparation/procurement of concrete for the animal intrusion barrier and clearly show its footprint on a scale drawing to allow for full assessment of its overall impact on the design.	**Response 11.** Concrete barrier was replaced with HDPE geonet and the schedule has been revised accordingly. Plans do not currently include the use of crushed concrete for an animal intrusion barrier. The animal intrusion barrier extends to the soil cover boundary.

<tr><td>Comment 12. Sections 6.2.7 [Soil-Mixing Improvement Zone (Western Coastal Margin)] and 6.2.8 [Jet-Grouting Improvement Zone (Southern Coastal Margin)] of Attachment 1 (Draft Geotechnical Report) of Attachment 1 (90% Remedial Design) discuss cement deep soil mixing and jet-grouting in the western and southern coastal margins of IR Site 2; however, further discussion of these remedial actions is not provided elsewhere in the Draft RD/RA WP. Table 7 (Summary of Slope Stability and Permanent Seismic Deformation Analyses) of Attachment 1 (Draft Geotechnical Report) of Attachment 1 (90% Remedial Design) indicates that the southern coastal margin and the western coastal margin would liquefy under seismic conditions without ground improvement. As such, it is unclear from the Draft RD/RA WP if the Navy has determined that the risk of failure of the perimeter slopes at the western and southern coastal margins which could result in permanent seismic deformation or flow failure is an acceptable long term risk resulting in electing not to perform the ground improvement. Please revise the Draft RD/RA WP to discuss the use of cement deep soil mixing and jet-grouting as part of the remedial action, if applicable, or revise the cement deep soil mixing and jet-grouting discussion to clearly indicate that they were not selected for use and the associated risk of failure as a result of this decision.</td><td>Response 12. The Geotechnical Report has been revised and reviewed subsequent to these comments. Please see Attachment 14 for Response to Comments on the latest version of the Geotechnical Report.</td></tr>
</table>

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 13. Section 8.2 (Liquefaction Induced Lateral Spreading) of Attachment 1 (Draft Geotechnical Report) of Attachment 1 (90% Remedial Design) states that, "It should be noted that based on the presented analyses the seawall along the southern coastal margin which is founded on liquefiable hydraulic fill and coarse-grained Young Bay Mud is prone to edge failure and lateral spreading;" however, no remedial actions are proposed in the Draft RD/RA WP to address these issues. As such, it is unclear how edge failure and lateral spreading will be addressed. Further, the integrity of the seawall is used in the second paragraph of Section 8.2 of Attachment 1 of Attachment 1 to indicate that lateral spreads will be localized; however, if the seawall is prone to failure and lateral spreading, it is unclear how further lateral spreading will be localized and will not distort the cover and result in depressions, drainage reversals or similar effects. Please revise the Draft RD/RA WP to address the potential edge failure and lateral spreading of the seawall along the southern coastal margin or clarify where it will be addressed. In addition, clarify how the integrity of the seawall will impact its ability to prevent further lateral spreading at IR Site 2.	**Response 13.** The Geotechnical Report has been revised and reviewed subsequent to these comments. Please see Attachment 14 for Response to Comments on the latest version of the Geotechnical Report..

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 14. Section 10.1, Summary of Results, of the DGR indicates that the likelihood of landfill solid waste reaching the San Francisco Bay is considered to be remote given the width of the coastal margin; however, it is unclear whether the coastal margin is a thin strip of land or a stretch of land sufficiently wide to prevent landfill solid waste from reaching the San Francisco Bay should failure occur. Section 2.1 of the Draft RD/RA WP and Section 6.1.1, Upland, of Attachment 6 (Environmental Protection Plan) describe the coastal margin as a "thin strip of land." For example, Section 6.1.1 states, "A coastal margin composed of the perimeter dike and riprap seawall is present between the landfill and/or wetland, and the bay, and is characterized as a thin strip of land that acts as a buffer for the landfill and the wetland." Please clarify whether the coastal margin is a thin strip of land or a stretch of land wide enough that landfill solid wastes are unlikely to reach the San Francisco Bay.	**Response 14.** The width of the coastal margin is taken from the back of berm to the top of the seawall and is on the order of 100 feet wide at its narrowest. The likelihood of solid waste reaching the current limits of the Bay as a result of permanent seismic deformations in excess of 100 feet is considered to be remote. Section 2.1 of the main text and Section 6.1.1 of Attachment 6 have been revised to clarify that the Coastal Margin embankment is 100 feet wide at its narrowest.

<table>

ALAMEDA, CALIFORNIA</th></tr>
<tr><td colspan="2">Xuan-Mai Tran, Remedial Project Manager
Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX</td></tr>
<tr><td>Comment 15. Additional subsurface evaluation and laboratory testing were not proposed to address uncertainties related to subsurface conditions (e.g., geotechnical samples). The recommendations and opinions expressed in the DGR are based on background documents and historical field explorations and the laboratory testing. As such, it is unclear if the geotechnical recommendations presented in the DGR are representative of current site conditions as site conditions can change with time as a result of natural processes or anthropogenic activities at Site 1 or at nearby sites, as stated in Section 11 (Limitations) of the DGR. No examples of such conditions are provided. While it is understood that any site development or structural modifications would apply, the statement implies that the mere passage of time could alter conditions so as to make the recommendations provided no longer valid. Presumably, this includes subsidence that may occur as waste degrades. Please revise the Draft RD/RA WP to clarify why an updated subsurface evaluation and more recent laboratory tests results were not performed to address uncertainties related to subsurface conditions, and include examples of the range and type of natural and anthropogenic processes that would render the recommendations invalid.</td>
<td>Response 15. The subsurface site conditions have not changed enough since data collection to affect the closure design. Geotechnical recommendations have been replaced by a new analysis in a revised Geotechnical Report dated October 29, 2012 (Attachment 1). See Response 10.

The previous geotechnical field and laboratory results are sufficient to support the conclusions presented in the report. Natural processes would typically be limited to changing groundwater conditions and settlement resulting from waste decomposition, but in this case, given the predictable groundwater conditions due to the proximity to the Bay and the age of the waste, natural processes are unlikely to invalidate the conclusions presented in the report. Only human activities such as site modifications would be anticipated to appreciably impact the conclusions presented in the report.

The conclusions provided in Section 12 of the revised Geotechnical Report predict a more specific range of deformation for the berm and soil cover.</td></tr>
</table>

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 16. The soil classification properties for the coastal margin are not distinctly defined in Section 6.2.1 (Landfill Cover and Perimeter Berm Fill) of the DGR; instead the landfill cover and perimeter berm fill parameters are defined based on an assumed typical value for compacted fill characterized as sand with some fines. Based on Section 6.1.1 (Upland) of Attachment, "A coastal margin composed of the perimeter dike and riprap seawall is present between the landfill and/or wetland, and the bay, and is characterized as a thin strip of land that acts as a buffer for the landfill and the wetland. Materials identified in the coastal margin differ from those in the landfill and wetlands." Since the materials are different, it is unclear if the soils within the coastal margin have been appropriately characterized and whether the resulting slope stability analysis is representative of site conditions. Please revise the Draft RD/RA WP to specify collection of site-specific values representative of the landfill cover and perimeter berm area to be utilized in the slope stability analysis for the landfill cover and perimeter berm in place of the assumed typical values.	**Response 16.** The Geotechnical Report has been revised and reviewed subsequent to these comments. Please see Attachment 14 for Response to Comments on the latest version of the Geotechnical Report.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 17. The Draft Radiological Work Plan, IR Site 2 (RWP) in Attachment 2 states that the time-critical removal action (TCRA) previously performed at the IR Site 2 did not completely remove Radium-226 (Ra-226) contamination. The highest concentration of Ra-226 detected from collection of random soil samples at the bottom of the excavation was 7.59 picoCuries per gram (pCi/g), but the full nature and extent of contamination had not been identified. While the RWP states that a previous time critical removal action did not completely identify the horizontal and vertical extent of contamination, no reference is provided for the levels of contamination (particularly for Ra-226) that are anticipated to remain at the IR Site 2. For completeness and clarity, it is recommended that the RWP provide some information about previous sampling events that gives a reference to the potential levels of radiological contaminants remaining at the site. Please revise the RWP accordingly.	**Response 17.** Although historical documents and prior remediations performed at IR Site 2 qualitatively indicate that Ra-226 contamination concentrations are potentially greater, the RWP (Attachment 2) presents 7.59 pCi/g as the largest concentration detected during the TCRA (i.e., soils outside of the embankment and landfill cover) because that is the most elevated soil sample on record. All other sample data from that TCRA indicated contamination concentrations less than 7.59 pCi/g. The full nature and extent of contamination within the bermed and fenced bunker areas of IR Site 2 are unknown and will remain unknown as no records indicating quantity of radioactive material deposited in the area have been discovered. Sampling beneath the top 12 inches of material will not occur as the RWP states that a surface scan will be conducted to remove surface radioactive anomalies, followed by surface soil sample collection for dose and risk modeling, and the subsequent capping of the area with radiologically clean fill material. Note that the decision to provide a soil cap of the area was largely based on the fact that the nature and extent of contamination within IR Site 2 are undefined.

Xuan-Mai Tran, Remedial Project Manager
Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX

Comment 18. Section 1.0, Introduction, of the RWP does not clearly state the remedial goals or release limits are required to be achieved for the remedial action at the Site 2. Section 2.2.1 (Radiological Investigations) in the main body of the document, and Section 2.1 (Radiological History) in the RWP states that the 2009 TCRA had a primary objective "to mitigate the potential risk posed by material potentially presenting an explosive hazard and radiological contamination and threatened release of hazardous substances to the environment." Radiological removal action objectives for the TCRA were established as follows: "1) prevent ingestion, dermal contact, or inhalation of radiological anomalies with concentrations that significantly exceed background concentrations of 6.000 counts per minute; and 2) to ensure the total effective dose equivalent received through all potential pathways from the radium-impacted waste to any member of the public does not exceed 15 millirem per year." Neither the main sections of the Draft RD/RA WP nor the RWP in Attachment 2 clearly presents this information or states whether these objectives meet the requirements of the RD/RA WP. Please revise the RWP to clearly present the objective of the remedial action and associated remedial goals.	**Response 18.** A bullet in the third paragraph of Section 1.0, Introduction, of the RWP (and the Objectives section of the Executive Summary of the SAP) has been added stating the following: *Providing modeling, based on analysis of soil samples collected from the subgrade surface, to demonstrate that with the 2-foot cover installed, the maximum annual dose to an individual of 15 mrem, and the excess lifetime cancer risk (ELCR) at 3×10^{-4} for the critical group, are not exceeded.* This is consistent with Section 2.7 of the ROD (DON, 2010).
Comment 19. Sections 7 through 11 of the RWP describe the formulas and general procedural requirements of the Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM) surveys planned as part of the remedial action at IR 2, but do not provide the project-specific information which demonstrates how the surveys will be implemented. For instance, the text in Sections 7 through 11 do not state which radiation survey instruments will be selected from those listed in Table 10-1 (Portable Survey Instruments) or what the achievable minimum counts per minute (cpm) or Minimum Detectable Concentration (MDCs) will be achieved for this project based on site-specific background levels	**Response 19.** Sections 7.0 through 11.0 of the RWP describe the formulas and general procedural requirements of the Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM) surveys planned as part of the remedial action at IR Site 2. Site specific MDCs and other equipment parameters have not been calculated as site-specific reference background areas have not been sampled and analyzed. Sampling and analysis associated with IR Site 2 will not be conducted until the RWP has been approved. As stated in Section 8.3.3, Final Status Surveys: "Although the FSS of IR Site 2 is not intended to provide for radiological release of IR Site 2, the sample density is designed to ensure data commensurate with a Class 1 survey is

and the selected radiation survey instrumentation. Further, text in Section 8.3.3, Final Status Surveys (FSS), does not provide specific calculations for determining the required number of definitive/confirmation samples that will be collected in the FSS. The RWP should include this project-specific information for all planned radiological surveys. Please revise the RWP to include this information.	collected. Derived concentration guideline levels (DCGLs) for each ROC are based on the exposure pathways and parameters presented in the Final Remedial Investigation Report IR Site 2, West Beach Landfill and Wetlands (Battelle and BBL 2006), and limit the maximum annual dose to an individual to 15 mrem and the ELCR to 3×10^{-4} for the critical group." These DCGLs used in conjunction with conservative assumptions of approximate background concentrations of the radionuclides of concern result in a minimum of 9 samples from the reference area and 9 from the survey unit area. The number of calculated samples (9) was based on an assumed mean concentration for the specific radionuclides of concern based on gamma spectroscopy results from previous work at Alameda and Hunters Point Naval Shipyard. This calculation included a 20% increase in samples, as recommended in MARSSIM section 5.5.2.2, to obtain sufficient sample points to attain the desired power level with the statistical tests and allow for possible lost or unusable data. Note that losing or having unusable gamma spectroscopy data is highly unlikely, as the DON has used gamma spectroscopy data extensively in final status survey reports at Alameda Point and Hunters Point Naval Shipyard in the past 4 years, and has not had a single instance of unusable gamma spectroscopy data. Additionally, as the Rad Work Plan requires that all areas be remediated such that all samples are beneath the DCGLs for each respective radionuclide of concern, and each sample point must have a maximum annual dose to an individual less than 15 mrem and an ELCR of less than 3×10^{-4} for the critical group. As such, the power level for any statistical test will easily be met. In summary, the additional sample collected from each survey unit is a further level of conservatism above and beyond an extremely conservative calculation of required samples. In the interest of conservatism, these sample number values are increased to 10 in each respective area. The remedial action completion report will include the specific calculations

DRAFT REMEDIAL ACTION WORK PLAN
INSTALLATION RESTORATION SITE 2, ALAMEDA POINT
ALAMEDA, CALIFORNIA

Xuan-Mai Tran, Remedial Project Manager
Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX

	used to derive the number of required samples at the IR Site 2 for purposes of demonstrating defensibility in the conclusions regarding the levels of contamination remaining within the area sampled. Note that as stated in NUREG-1505, "A Nonparametric Statistical Methodology for the Design and Analysis of Final Status Decommissioning Surveys", Section 10.4, the retrospective power calculation is only necessary when the null hypothesis is not rejected. As stated above, each sample point result will demonstrate that each sample point has a maximum annual dose to an individual less than 15 mrem and an ELCR of less than 3 x 10^{-4} for the critical group, so that the null hypothesis must statistically be rejected as shown in MARSSIM Section 8.2.5, Table 8.2.
Comment 20. Attachments 2 and 3 do not provide sufficiently detailed information about project-required dosimetry. Section 5.3 (Personnel Dosimetry) on Page 5-2 in the RWP states that any personnel working in the Radiological Control Areas (RCA) will be required to wear personal dosimetry. Section 3.10 (Monitoring and Measuring External Exposure) on page 3-5 of the Radiation Protection Plan (RPP) in Attachment 3 states that a vendor accredited by the National Voluntary Laboratory Accreditation Program will be used to provide dosimetry services. However, neither section discusses which vendor has been selected or specifies the kind of dosimetry/detector(s) that will be used. This information is important for demonstrating that the types of dosimetry that will be used are appropriate for the site-specific radiological hazards. Additionally, the RWP and/or RPP should clarify whether the same vendor or project personnel will oversee the air monitoring program to demonstrate compliance with the 10% Derived Air Concentration (DAC) limits and/or in the unlikely event of an internal exposure, the bioassay program. Please revise the RWP and RPP to provide this information.	**Response 20.** The RPP commits to providing external dosimetry from a vendor accredited by the National Voluntary Laboratory Accreditation Program. A specific vendor has not been named as the contractor reserves the right to change external dosimetry contractors based on performance of the vendor. The dosimetry selected will be appropriate for quantifying dose from the beta and gamma energy spectrum for radium-226 and its progeny, as the most prominent radionuclides of concern. Additionally, project personnel will oversee compliance with the 10% DAC limits in accordance with SOP 9, "Air Sampling and Sample Analysis."

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 21. The Draft RD/RA WP includes an Environmental Protection Plan in Attachment 6 and Wetland Mitigation Plan in Attachment 7; however, sections of each of these documents present information that could be corroborated by cross-referencing the other to support these plans. For example, Section 6.0 of the Wetland Mitigation Plan identifies special status species but does not mention that ecological surveys will be performed before starting work in the project areas, nor does it discuss results of historical surveys, which are presented in Section 6.2 of the Environmental Protection Plan. Please ensure that these documents cross-reference each other to support implementation of the remedial action at IR Site 2 and environmental compliance requirements.	**Response 21.** The EPP and the Wetlands Mitigation Plan (Attachments 6 and 7, respectively) have been revised to better cross-reference each other.
Comment 22. Attachment 8 (Stormwater Pollution Prevention Plan) uses inconsistent terminology to define a rain event. For example, Section 4.3, Site Inspections, defines a qualifying rain event as 0.5 inch of rain or more per 24 hours while Section 4.5, Water Quality Sampling and Analysis, defines a qualifying rain event as at least 0.5 inch of rain. Further, Attachment 8 frequently refers to "extended storm events" but does not define or quantify the term. Please revise the Draft RD/RA WP to clearly define a qualifying rain event and an extended storm event, ensuring that the definitions are based on documented, appropriate, site-specific conditions.	**Response 22.** A qualifying rain event is defined in Appendix 5 (Glossary) of the General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities as "*Any event that produces 0.5 inches or more of precipitation with a 48 hour or greater period between rain events.*" This definition will be added to Sections 4.3 and 4.5 of the SWPPP (Attachment 8). An extended storm event is a storm that lasts longer than 24 hours. This definition will be added to the two places in the text of the SWPPP that refer to "extended storm events."

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 23. Inconsistent terminology is used in Attachments 8 and 9. For example, Section 3.3 (Dust Control Measures) of Attachment 9 states that chemical soil stabilizer will be applied to on-site storage piles of soil or sediments while Attachment 8 (Stormwater Pollution Prevention Plan) states that soil tackifier will be used to provide dust control and prevent runoff of stockpiled soils. In addition, Section 5.0 (Mitigation Contingencies) of Attachment 9 indicates that a nontoxic lockdown material will be used to suppress dust. It is unclear if these references are to the same product. In addition, a material safety data sheet (MSDS) should be included for this (these) product(s). Please revise the Draft RD/RA WP to use consistent terminology throughout the document and include a MSDS for the intended dust mitigation media.	**Response 23.** The terminology in Attachments 8 and 9 has been revised to consistently reference a "soil tackifier (SoilTac or equivalent)" when discussing stabilization of stockpiled soil/sediments or dust control measures. A MSDS has been included in Attachment 9.
Comment 24. The integrity of the cover system is dependent upon the cover system profile and the ability of the cover components to work together; however, Section 3.6 (Access Roads) of Attachment 11 (Post-Closure Operations, Maintenance, and Monitoring Plan) states that inspection and repair of the access roads is not critical to the integrity of the cover system. However, the potential exists for standing water to accumulate in access road ruts resulting in an increased potential for surface water to infiltrate the cap. Alternatively, the access road could allow surface water runoff to transverse the cap surface at greater flow rates potentially inducing a higher scour threat along roadways. Please revise the Draft RD/RA WP to clarify how the condition of the access roads is not critical to the integrity of the cover system, especially since it appears that the roadway will be treated as a part of the cap.	**Response 24.** Access roads will be easier to maintain than the remainder of the cover as they will be the easiest to inspect and the easiest to repair. That being said it is an important part of the cover system and Section 3.6 of Attachment 11 has been revised to indicate that access roads will be maintained.

Xuan-Mai Tran, Remedial Project Manager
Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX

Comment 25. Appendix A of the Sampling and Analysis Plan (SAP) in Attachment 4 of the Draft RD/RA WP indicates that laboratory specific standard operating procedures (SOPs) will be provided in the Final SAP, but laboratory SOPs should be submitted for regulatory review and approval prior to finalizing the SAP so that the adequacy of the information contained in the SOPs can be assessed. For example review of the laboratory SOPs is necessary to evaluate the information presented in the SAP Worksheet 19. During the June 2012 BCT meeting, in order to address the same concern that has been raised for every SAP, the Navy has agreed to add clarification language to current and future SAPs that the laboratory will meet the EPA's analytical methods or the Navy's SAP, whichever is more stringent. Please add this clarification language to the SAP. Laboratory SOPs should be submitted once every two years for each analytical method for each laboratory being used at Alameda for regulatory review and approval. This submittal would be sufficient so that the Navy does not have to submit the SOPs for each SAP.	**Response 25.** The following has been added to Worksheet #19 under the notes section: *The laboratory will meet the analytical requirements in the EPA methods listed above or the requirements in this SAP, whichever is more stringent.* The laboratory SOPs for this SAP will be submitted to the agencies along with the Draft Final RD/RA WP.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 26. The objectives listed in the Executive Summary of the SAP are not consistent with the scope of work presented in Section 1.2 of the Draft RD/RA WP. Section 1.2 of the Draft RD/RA WP indicates that soil samples will be collected from the subgrade surface for radiological dose and risk modeling and a radiological surface scan will be performed on the finished cover to document effectiveness of the remedy. The objectives in the SAP indicate that the radiological survey of the cover will be used to establish final risk and dose estimates and does not mention the collection of samples for radiological testing. Please revise the Draft RD/RA WP to resolve this discrepancy.	**Response 26.** Two bullets in the Objectives section of the Executive Summary of the SAP have been added stating the following: • *Collecting of soil samples from the subgrade surface for radiological dose and risk modeling* • *Providing modeling, based on analysis of soil samples collected from the subgrade surface, to demonstrate that, with the 2-foot cover installed, the maximum annual dose to an individual of 15 mrem, and the excess lifetime cancer risk (ELCR) at 3×10^{-4} for the critical group, are not exceeded* Additionally, the final bullet has been changed to: *Performing a final radiological survey of the cover to document effectiveness of the remedy*
Comment 27. The items and questions listed on pages 14 and 15 of the Workbook for Unified Federal Programs for Quality Assurance Project Plans (UFP-QAPP Workbook) are not addressed in these worksheets. Please revise Worksheets 10 and #11 to address each of the items and questions listed on pages 14 and 15 of the UFP-QAPP Workbook.	**Response 27.** The information provided in Worksheets #10 and 11 are meant to be used in conjunction with each other according to the NAVFAC SW SAP template. The "If…, then…" statements are provided in Worksheet #11. However, Worksheet #11 has been revised to include answers to questions in the UFP-QAPP workbook that were not addressed.
Comment 28. The SAP does not discuss manual integrations for chromatographic analyses. If manual integration is required, please ensure that supporting information for manual integrations (i.e., chromatograms before and after manual integration as well as a brief explanation for the manual integration) will be included in the data package deliverables and evaluated during data validation.	**Response 28.** SAP Worksheet #29 has been revised to clarify that if manual integration is required, supporting information for all manual integrations (i.e., chromatograms before and after manual integration as well as a brief explanation for the manual integration) will be included in the data package deliverables and evaluated during data validation.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 29. There are several analytes for which a project action limit (PAL) has not been established. It is unclear how results for analytes without defined PALs will be assessed. For example, the table for alpha spectroscopy in soil in Worksheet #15.1 does not provide a PAL for any of the analytes listed except for Uranium-238. Please revise the SAP to define PALs for all analytes, or alternatively, discuss how these analytes will be assessed.	**Response 29**. Chemical analytes in SAP Worksheet #15.1 that have "Not Established" for the Project Action Limits (PALs) will be reported along with the analytes that have non-hazardous criteria or ROD criteria and this will be sufficient for evaluating analytical results to determine 1) if material is suitable for use as subgrade or cover material or 2) waste classification prior to disposal. The laboratory results will be provided to the regulatory agencies as soon as they are available. The chemical analytes in Worksheet #15.2 that have "Not Established" for the PAL have been deleted and the analytes that remain have STLC or TCLP CCR Title 22 criteria listed which will be sufficient for determining waste classification of material prior to disposal. If a compound with no PAL is reported, the data will be evaluated to determine if additional screening is warranted. The Table in Worksheet 15.1 will have a footnote to that effect. As Uranium-238 is the only radionuclide of concern listed for alpha spectroscopy, all other analytes have been deleted from the alpha spectroscopy table in SAP Worksheets #15.1 and 15.2. In addition, the following has been added to SAP Worksheet #17: Uranium-238 is the only analyte of interest to be analyzed by alpha spectroscopy, because all other radionuclides of concern are easily quantified through gamma spectroscopy.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 30. The SAP does not provide copies of the data validation checklists. Since the SAP references multiple sources for data validation procedures in Worksheet #36, a checklist describing the criteria that will be used to evaluate the quality control (QC) measures, how samples will be qualified (e.g., the qualifiers that will be used, when samples will be qualified as estimated/rejected, and if individual or all samples in a batch will be qualified) should be provided. Please revise the SAP to provide data validation checklists.	**Response 30.** SAP Worksheet #36 has been revised to include a reference to the data validation checklists for each method that will be provided as Appendix C and that all samples in a batch will be qualified based on the checklists. In addition the following text has been added after the reference to Appendix C in Worksheet #36: *In addition to the checklists in Appendix C, the following criteria will be evaluated by the validator and flagged as indicated:* • *Manual integration will be evaluated during data validation for the organic methods (i.e., volatiles, semivolatiles, pesticides, PCBs and herbicides). If the manual integration is not calculated appropriately, the validator will flag the associated results with a "J" for estimated.* • *Second column confirmations for pesticides and herbicides analyses and DDT/Endrin breakdown for pesticides will be evaluated during data validation. If results between primary and second column confirmations have an RPD ≥ 40%, the associated results will be flagged with a "J" for estimated. If the DDT/Endrin breakdown is ≥ 15%, the associated results will be flagged with a "J" for estimated.* • *For radiological methods, if the calibration criteria listed in SAP Worksheet #24 is not met, the associated results will be flagged with a "J" for estimated.*
Comment 31. The SAP does not indicate that EPA will be notified of any significant corrective action or changes to the SAP, or provide the timing for notification. Please revise the SAP to provide this information as well as the method of communication that will be used to notify EPA.	**Response 31.** SAP Worksheets #6 and 32 have been revised to include that the Navy will communicate with the EPA regarding corrective actions or significant changes and a timeframe has been provided for this notification in SAP Worksheet #32.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 32. The SAP discusses document control procedures but does not provide sufficient detail regarding the management of all project files. It is unclear where field documents, such as logbooks, surveillance reports, and change requests will be stored (i.e., address), who will manage them, how long they will be stored, and that the records will be offered to the Navy prior to disposal. Please revise the SAP to provide this information.	**Response 32.** Worksheet #29 has been revised to include the following: *Project files are maintained at the project site under the oversight of the PQCM until completion of the project. Files are then sent to the TtEC San Diego for storage. Once the CTO is complete and closed out, the files are sent to an off-site archive for 10 years.*
Comment 33. The SAP discusses background levels of radiological analyses but does not provide sufficient detail indicating how background levels will be determined. For example, step five in Worksheet #11 indicates that if the initial gamma survey identifies areas greater than twice background, then each of these areas will be excavated. No further information is provided for how background will be determined. Additionally, the notes for the tables located in Worksheet #15.2 indicate that background levels are used to determine project quantitation limits and minimum detectable activities for radiological analyses. Please revise the SAP to discuss background levels and their sources for radiological analyses.	**Response 33.** Background levels will be determined by conducting gamma scan surveys of a reference area approximately 1,000 square meters, as agreed upon by the project team. The mean of all readings for the respective survey instrument (Vehicle Towed Array or Ludlum 2350-1 survey meter with 44-10 2" by 2" NaI detector) will be used to calculate the mean reference area gamma background rate. Verbiage describing this process has been added to the first paragraph in Step 7 of Worksheet #11 of the SAP. Background levels from footnote a) in both Worksheet #15.1 and 15.2 refer to instrument background radiation in the area of the detectors. This background value is distinct from the reference area background and is unique to the radioanalytical laboratory radiological background resulting from naturally occurring radioactive materials that are inherent in the laboratory. Footnote a) in Worksheets #15.1 and 15.2 has been changed to refer to "instrument" background.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 34. The SAP does not provide all of the QC samples and criteria as detailed in Section 3.4.2 of the Uniform Federal Policy for QAPPs Manual, dated March 2005 (UFP QAPP Manual). Examples include: - Internal standards should be included for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and polycyclic aromatic hydrocarbons (PAHs). - Dichlorodiphenyltrichloroethane (DDT)/Endrin breakdown check and second column confirmation for pesticides. Please revise the SAP to include all of the required QC samples.	**Response 34.** Worksheets 28.1 and 28.2 have been revised to include applicable laboratory QC samples and criteria.
Comment 35. During the review of this Draft RD/RA WP, the public has identified issues about the installation of permanent fencing. The Draft RD/RA WP states, "At the completion of all work activities, a permanent 6-ft high chain-linked fence with three strands of barbed wire will be placed on the eastern and northern boundary of the IR Site 2." Although fencing is an important element for the protection of the landfill soil cover and associated components (e.g., monitoring wells, settlement monuments, landfill gas probes), other alternatives could also serve similar purpose in lieu of proposed chain-link fence (topped with three strands of barbed wire) around the property boundary which would be consistent with its indented use as open space/refuge. Protection of human health and the environment is the primary goal of CERCLA actions; however, we request that other alternatives should be evaluated to address public concerns regarding the appearance of the landfill.	**Response 35.** See Response to DTSC General Comment #2.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 36. Similar public concerns have also been raised regarding the visual impact of the proposed height and number of vertical gas venting pipes. The number of vertical gas venting pipes could be reduced through the use of horizontal wells, which are capable of redirecting/conveying landfill gas to larger vertical venting pipes. An evaluation of the current landfill gas conditions should be completed prior to finalizing the passive landfill gas system. Again, we request the Navy look into other alternatives so public concerns can be addressed.	**Response 36.** The existing methane venting system was constructed to comply with California Air Quality Management District requirements for protection of human health and the environment. Design and construction of a different replacement system is cost prohibitive. The existing system will be left in place to the maximum extent possible. If vent risers or other venting system components are required to be removed during cover construction, the components will be replaced. Then after cover construction, as a part of Operations and Maintenance, methane monitoring will be performed to determine the minimum venting system required, which may reduce the number and height of vents. Visual impacts will also be reduced to the extent possible by using materials and colors that blend with vegetation and landscape.
SPECIFIC COMMENT	**RESPONSE**
Comment 1. Section 2.2.2 Ordnance Explosives Waste Investigation, Page 2-7: This section notes that a "20 millimeter (mm) target practice projectile" was found during the surface characterization. It then notes that, "the 20mm round was subsequently demilitarized…" As a projectile is a component of a round, and a round is all of the components necessary to fire the associated weapon once (i.e., projectile, cartridge case, propellant, primer, and fuze), the two items noted appear to be different munitions. Please review the cited verbiage and determine if the term "round" is being used incorrectly to refer to a projectile. If that is the case, please correct the term "round" to read "projectile."	**Response 1.** The word "round" was cited in error and has been replaced with the word "projectile" in Section 2.2.2.

RESPONSE TO COMMENTS
DRAFT REMEDIAL ACTION WORK PLAN
INSTALLATION RESTORATION SITE 2, ALAMEDA POINT
ALAMEDA, CALIFORNIA

Xuan-Mai Tran, Remedial Project Manager
Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX

Comment 2. Section 5.1.1, Field Support Facilities, Page 5-1: The location where potable water will be acquired is not specified. The text states that, "Potable water will be acquired from a nearby water hydrant," but the location is not described or shown on a figure. Please revise Section 5.1.1 to specify the location and distance from IR Site 2 where potable water will be acquired and provide a figure with the location of the hydrant.	**Response 2.** Water for site construction activities will be provided by running a temporary pipeline from a water hydrant located to the southeast of IR Site 2. Drinking water will be supplied by a water service. Section 5.1.1 has been revised to discuss the location of the hydrant.
Comment 3. Section 5.3, Utility Location, Page 5-2: The criteria that will be utilized to determine a geophysical utility survey is necessary to confirm the depths and location of utilities is not provided. It is unlikely that Underground Service Alert of Northern California has much information about the Site 2 subsurface utilities. Further, since subsurface utilities have been identified in the vicinity of the former ammunition bunkers, it appears a geophysical utility survey will be necessary. Please revise the Draft RD/RA WP to require a geophysical utility survey or to clarify the criteria that will be utilized to determine that a survey is necessary to confirm the depths and location of utilities.	**Response 3.** Geophysical utility surveys have been conducted in association with the numerous historic site investigations at the site and that data, along with generator's knowledge, confirm the area free of energized utilities. Underground Service Alert of Northern California have been notified regarding fieldwork by TtEC in 2002, 2004, and 2007 and for each notification they have confirmed that there are no municipal services in the area. Additionally, the Caretaker Site Office for Alameda has also confirmed that there are no energized Navy utilities in the area. Aboveground vaults and exposed conduits in the area have been investigated in the past and confirm the lack of energized systems. Although historic geophysical investigations by others may have identified lineaments suspected to be utility lines, these likely represent abandoned utility conduits. TtEC will not perform additional geophysical surveys prior to excavations based on historic findings and the fact that the site is a former landfill area and abundant documentation exists indicating the site contains metal debris that interferes with geophysical surveys. There are known aboveground and subsurface stormwater conveyance channels in the area that have been identified by past surveys. These systems will be protected and maintained during the construction period. Section 5.3 has been revised to reflect this response.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 4. Section 5.5.1, Soil Gas and Groundwater Monitoring Well Destruction, Page 5-3: To maintain data continuity, monitoring wells M-024A and M-024E should be retained. Replacement wells rarely provide the same data as the original wells. Also, the text and project schedule do not state when the existing wells will be destroyed or how long it will be before groundwater samples can be collected in replacement wells (i.e., when stabilization occurs after well development). Please revise the Draft RD/RA WP to require preservation of monitoring wells M-024A and M-024E. In addition, please specify the timeframe between destruction of the other wells and the time samples could be collected.	**Response 4.** The RAWP has been revised to include preservation of all existing monitoring wells pending potential changes based on the results of the Groundwater Monitoring Evaluation (GME). Any changes to the existing groundwater monitoring network will be identified in the Remedial Design Addendum which will include the GME and associated recommendations. The first sampling event post-cover construction is anticipated to be in January 2014.
Comment 5. Section 5.6.4, Barge Delivery and Stockpile of Soils, Page 5-5: The text does not indicate that soil and rock material imported from off-base will be tested for geotechnical properties and compared with the design specifications to confirm suitability as fill. As such, it is unclear if the materials are appropriate for use. Please revise Section 5.6.4 to provide and/or reference the design specifications that the fill material will meet to show that the materials are appropriate for this use.	**Response 5.** Section 5.6.4 will be revised to indicate moisture density (ASTM D 1557), sieve analyses (ASTM D 1140), Atterberg limits (ASTM D 4318), and soil classification (ASTM D2487) will be performed daily or for every 8,000 cubic yards for the first week, and weekly or every 40,000 cubic yards after the first 5 consecutive passing tests (except for continuous Visual Inspection per ASTM D 2488) thereafter per Article 3.11 of Specification Section 31 00 00. Visual inspection will be conducted continuously.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 6. Section 5.6.5, Reuse of Material from Previous Alameda Projects, Page 5-6: The text states that fill material from previous Alameda projects will be available for use and will be tested for geotechnical properties and compared with the design specifications to confirm suitability as fill; however, design specifications for fill materials are not provided or referenced. Without a comparison of geotechnical properties, it is unclear if the reuse of material from previous Alameda projects is appropriate, especially given the magnitude of the slope stability concerns. Please revise Section 5.6.5 to provide and/or reference the design specifications for the fill material and provide a comparison of the fill materials to show that the materials are appropriate for use and consistent with the material properties of the layers evaluated during the slope stability analysis.	**Response 6.** Section 5.6.5 will be revised to reference Article 3.11 of Specification Section 31 00 00 in the RD. All fill material will undergo testing to determine the suitability for use at the site. Material from previous Alameda or other projects will be compared to this specification.
Comment 7. Section 5.6.6, General Site Grading and Multilayer Soil Cover Construction, Page 5-6: The second paragraph indicates that grading in the ammunition bunker area will occur around the structures without any modifications being made to the structures themselves; however, it is unclear if the grading and compacting in the vicinity of the structures will have any structural impact. As such, it is unclear if any reinforcement measures should be made prior to grading and compacting in the vicinity of the structures. Please revise Section 5.6.6 to clarify that an assessment will be made to determine whether any structural reinforcement measures will be necessary prior to grading and compacting in the vicinity of the structures.	**Response 7.** Section 5.6.6 has been revised to state that the structural integrity of the structures in the ammunition bunker area will be assessed prior to commencing site grading in that area.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 8. Section 5.6.6.4, Vegetative Layer, Page 5-8: The text states that the vegetative layer will be protected from erosion by hydroseeding the surface with native vegetation and indicates that the hydroseed mixture will be applied during the rainy season; however, the rainy season is not formally defined. As such, it is unclear when the hydroseed mixture will be applied. Further, it is unclear what temporary erosion measures will be implemented should the vegetative layer be completed prior to the rainy season. Please revise Section 5.6.6.4 to clearly define the rainy season and clarify how the vegetative cover will be protected from erosion should the cap construction be completed during the dry season (i.e. before the vegetation has been established).	**Response 8.** Rainy season is generally November through April. Based on the schedule, hydroseeding will occur during rainy season. Erosion mats or other appropriate controls will be used as necessary. In addition erosion damage, if it occurs, will be monitored and repaired as part of O&M. Section 5.6.6.4 will be revised to add text as such.
Comment 9. Section 5.8.2 Installation of Groundwater Monitoring Wells and Landfill Gas Monitoring Probes, Page 5-11 and Figure 5-2, Groundwater and Soil Gas Monitoring Wells Proposed for Destruction: The locations of replacement wells for M-037A, M-37E, and M-039A have not been provided. The locations of these replacement wells should be optimized to monitor for potential discharges to the wetlands. Please provide a figure that depicts proposed optimized locations for these wells.	**Response 9.** The RAWP has been revised to include preservation of all existing monitoring wells pending potential changes based on the results of the Groundwater Monitoring Evaluation (GME). Any changes to the existing groundwater monitoring network will be identified in the Remedial Design Addendum which will include the GME and associated recommendations. Figure 5-2 has been updated to show the existing monitoring well network.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 10. Section 5.11.2, Site Inspection, Page 5-12: The Regulatory Agencies should be invited to attend the site inspection. Please revise the text to include the Regulatory Agencies in the Site Inspection.	**Response 10.** The text has been revised to include regulatory agency participation.
Comment 11. Section 6.4, Water Conservation, Page 6-2: Although the source moisture conditioning (i.e., at the quarry that will provide backfill materials), moisture will be lost if soil is stockpiled on site prior to use. "Just-in-time delivery" to minimize the number of stockpiles and the time they are on site should be attempted. Please revise the text to explain how stockpiling can be minimized.	**Response 11.** Section 6.4 has been revised to add that stockpiling will be minimized by matching delivery rates with production rates to the extent practicable.
Comment 12. Attachment 1, Drawing C-4, Subgrade Plan - Northwest: Drawing C-4 indicates that the ammunition bunker door will be welded shut; however, details regarding this action are not included elsewhere in the Draft RD/RA WP. As such, it is unclear when and how the door will be welded. Please revise the Draft RD/RA WP to include details and specifications to accomplish the welding of the ammunition bunker door.	**Response 12.** Section 5.5 of the RAWP has been revised to include tack welding of the bunker doors. Tack welding will be one or two spot welds to provide security without fencing until the VA chooses to use the bunkers.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 13. Attachment 1, Draft Geotechnical Report, Section 8.1, Liquefaction Induced Settlements, Page 25: The text appears to be inconsistent with the Tetra Tech Foster Wheeler (TT FW) Report and may not accurately predict the settlement potential. Section 8.1 states that, "The KCH report predicts liquefaction induced settlements of generally less than 4 inches, with the exception of the southern coastal margin and the center of the landfill where 10 to 12 inches of liquefaction induced settlements are predicted, respectively." However, the TT FW report indicates that transverse cracks up to 4 inches wide and 3 to 4.5 feet deep were reported as a result of liquefaction during the 1989 Loma Prieta earthquake. Therefore, it is unclear if the predicted liquefaction induced settlements accurately predict the settlement potential given the wide variation between calculated and actually documented liquefaction induced settlements. Please revise the Draft RD/RA WP to clarify how the predicted liquefaction induced settlements are appropriate given their wide variation from actual recorded liquefaction induced settlements, ensuring that the Draft RD/RA WP documents and supports any site-specific conditions which changed as a result of the 1989 Loma Prieta earthquake so as to limit the anticipated settlement.	**Response 13.** The Geotechnical Report has been revised and reviewed subsequent to these comments. Please see Attachment 14 for Response to Comments on the latest version of the Geotechnical Report.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 14. Attachment 1, Draft Geotechnical Report, Section 10.1, Summary of Results, Page 27: The text states that, "The proposed final cover includes a geonet as a biotic barrier, which effectively acts as soil reinforcement. The surficial manifestation of liquefaction will be therefore somewhat reduced;" however, information to support this statement is not provided and/or referenced. Thus, it is unclear how effective the geonet will be for reducing surficial manifestation of liquefaction. Further, specifications for the geonet to show the material's property capabilities are not provided. Also, it is unclear how the geonet will be tied into soil at the base of slopes surrounding the landfill and whether liquefaction could extrude materials beneath the edge of the geonet. Please revise the Draft RD/RA WP to provide and/or reference information to substantiate that geonet will be effective at reducing surficial manifestation of liquefaction. In addition, please revise the Draft RD/RA WP to include specifications for the geonet and calculations to show the material will be effective as soil reinforcement. Also, please clarify how the geonet will be tied into soil at the base of slopes surrounding the landfill and whether liquefaction could result in extrusion of soil beneath the edge/bottom of the geonet.	**Response 14.** The geonet is intended to function as a biotic layer. Any other benefits incidental to use of a geonet as a biotic layer described in the report were not considered in the design analysis. The geonet biotic layer is not intended to provide soil reinforcement, as such, they have not been evaluated for performance in a liquefaction scenario. Specifications for the geonet have been prepared, but do not include any parameters for soil reinforcement, as this was not part of the selection criteria for the geonet layer. The geonet is a component of the multilayer soil cover and its sole function is an anti-burrowing barrier. As such the geonets lateral limits coincide with the lateral limits of the soil cover which typically do not extend to the toe of the perimeter berm slopes. The geonet has no function to mitigate or control the effects of liquefaction.

Xuan-Mai Tran, Remedial Project Manager
Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX

Comment 15. Attachment 2, Section 5.4, Air Monitoring, Page 5-3: The text states that 10% of the DAC values for Thorium 232 (Th-232) and Strontium 90 (Sr-90) will be used to determine whether the area is no longer safe to work in, but does not specify the air volume that must be collected. While Table 5-1, Derived Air Concentration, has been provided, neither the text nor the table state how much air volume will need to be collected to correspond to achievable detection limits for identifying the 10% DAC limit for these radionuclides. The amount of air volume required will affect how long the air sampler must run before a sample can be counted. This information is important in identifying the length of time a worker may be exposed to unacceptable air concentrations before the radiological hazard is identified. Please revise Section 5.4 to provide this information.	**Response 15.** Section 5.4 has been revised to reflect that a minimum volume of 1.4×10^8 milliliters must be collected to ensure the 10% DAC value for Th-232 is met.
Comment 16. Attachment 2, Section 5.5, Bioassays, Pages 5-3, 5-4: The text states that in the unlikely event that the results of air monitoring suggest an intake of radiological contamination has occurred, bioassay measurements will be collected as necessary to determine the potential dose to the affected personnel, but procedures should be in place to address this situation should it arise. Text in this section does not state what contingency plan or procedures are in place in such an event. This would include information pertaining to what lab the samples will be sent to, who will be responsible to ensure the proper bioassay samples are collected, how the data will be reported, and others. Please revise this section to reference the SOP or contingency plan that will guide actions in the event of an internal exposure or to state how the program will be administered through an outside vendor.	**Response 16.** NRC regulation 10CFR20.1502 does not require internal monitoring unless (at a minimum for minors or declared pregnant workers) an individual is likely to receive an annual committed effective dose equivalent of 0.1 rem (which is equivalent to 40 DAC-hrs). For other radiation workers, this limit is 10% of the ALI (which is equivalent to 200 DAC-hrs). As continuous air monitoring will be provided, internal monitoring is not required, and since previous TCRA work did not indicate elevated airborne concentrations of radionuclides, the need for bioassay is highly unlikely. As such, committing to a bioassay provider and detailed bioassay procedure is unnecessary. However, the RSO will ensure the proper dosimetry samples are collected, and the data reported for required individual personal dosimetry reports.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 17. Attachment 2, Section 6.3, Initial MARSSIM Survey of Subgrade Prior to Installation of Cover, Page 6-2: The criteria for final cover installation are not specified in this section. The text states that subgrade areas will be surveyed with a sodium iodide scintillation detector and areas that exceed twice the background during the survey will be remediated to a depth of 1 foot. The text subsequently states that once the gamma surveys and any remediation are performed, a number of samples will be collected so as to perform a baseline dose and risk assessment using the RESRAD model prior to installation of the cover. However, it is unclear what dose or risk level will be considered acceptable for proceeding with the installation of the cover. This should be based on a risk of 1x10-6. Please revise this section to state what acceptance criteria for ceasing soil removal and installing the final cover have been established.	**Response 17.** The remedial goal is to remove radioactive anomalies greater than twice background within the first 12 inches of the surface and to demonstrate that, with the 2-foot cover installed, the maximum annual dose to an individual of 15 mrem, and the excess lifetime cancer risk (ELCR) at 3×10^{-4} for the critical group, are not exceeded. No subgrade surface release criteria or remedial goals are specified. Note that the intent of the 2-foot cover design was to adequately shield and contain radionuclides of concern such that the cover surface remediation goals are met regardless of the concentrations of the radionuclides of concern beneath the cover.
Comment 18. Attachment 2, Section 6.5, Final MARSSIM Survey of the Cover, Page 6-3, and Table 2-1 (Release Criteria): The text states that the cover material will meet the release criteria in Table 2-1. Table 2-1 lists the release criteria for Ra-226 as 1.0 pCi/g, with a footnote indicating that the remediation goal is 1 pCi/g above background. However, neither the text in Section 6.5 nor Table 2-1 provides the background concentration of Ra-226 in pCi/g. This information will be required in the final reporting of the data so that quantitative value from the laboratory (as total Ra-226) can be evaluated to determine if the 1 pCi/g above background criteria has been met.	**Response 18.** A reference area and background concentration for Ra-226 based on gamma spectroscopy analysis (EPA Method 901.1M) of soil samples collected from the reference area will be established when the work plan has been approved. This information will be provided in the final reporting of the data to demonstrate that the quantitative value for the cover material from the laboratory (as total Ra-226) is less than 1 pCi/g above background concentrations.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 19. Attachment 4, Worksheet #3, Distribution List, Pages 17 to 19: This worksheet is missing key personnel including the TtEC field crew and Ms. Sabina Sudoko, TtEC Project Chemist. Since these roles involve responsibilities related to adherence with the SAP, they should be included in the distribution list. Please revise Worksheet #3 to include these key personnel.	**Response 19. SAP** Worksheet #3 has been revised to include the Project Chemist. A footnote has been added to SAP Worksheet #3 that states: *The PQCM, Vincent Richards, who is listed above, will have multiple copies of the final SAP on-site for field crews to reference while sampling.*
Comment 20. Attachment 4, Worksheet #11, Step 5, Develop the Analytic Approach, Pages 44 and 45: Under step 5c, the calculated total excess lifetime cancer risk (i.e., from all constituents, not just radionuclides) should not exceed 1x10-4 as EPA is moving away from a dose-based approach to a risk-based approach. Please revise the text to specify that the calculated total risk should not exceed 1x10-4.	**Response 20.** The calculated total risk of 3×10^{-4} as listed in the SAP is based on recommendations from OSWER 9200.4-18, "Establishment of Clean Up Levels for CERCLA Sites with Radioactive Contamination" from August 22, 1997. This calculated total risk value limit has been accepted for recent radiological remediations of Navy properties. As such, no change to the SAP will be made.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 21. Attachment 4, Worksheet #11, Step 7, Develop the Plan for Obtaining Data, Pages 45 and 46 and Worksheet #17, Sampling Design and Rationale, Page 96: The SAP does not explain why 10 samples are sufficient for a survey unit or define the survey unit size (in square feet); this information should be provided under Worksheet #11, Step 7 and in Worksheet #17. Further, it is unclear whether 10 samples is sufficient under MARSSIM. Also, Step 7 and Worksheet #17 do not explain why 2 samples per 40 cubic yards is sufficient after excavation has been done or if this was based on MARSSIM calculations. Finally, the basis for 10 backfill samples per source has not been provided. Please revise Worksheet #11, Step 7 and Worksheet #17 to explain why 10 samples per survey unit, 2 samples per 40 cubic yards of excavated soil and 10 backfill samples per source are sufficient, including whether these sample numbers were based on MARSSIM calculations. Also, please provide the survey unit size in square feet.	**Response 21.** Information regarding the survey unit size of a maximum of 2000 square meters or 21,780 square feet and number of samples collected per survey unit is described in the RWP (Attachment 2), specifically in Section 8. As such, this information need not be included in the SAP. The basis for the collection of 10 samples in the survey unit and the reference area is from using MARSSIM calculations for a statistically significant number of samples for free releasing a Class 1 survey unit, despite the fact that these are not free release surveys and is therefore conservative. Also, conservative assumptions about the radionuclide of concern median values and standard deviations were used in the calculation of sample numbers. Note that the number of samples to be collected will be re-calculated based upon actual radionuclide of concern medial values and standard deviations from soil samples collected in the selected reference area. As 10 samples per survey unit were calculated for each survey unit and the reference area, 10 backfill soil samples were deemed appropriate. Although not based on a MARSSIM calculation, the 2 samples per 40 cubic yard sampling of soil excavated as the result of exceeding twice the background level, and subsequent to an additional survey in 6-inch lifts has been standard practice for previous Navy radiological survey and removal actions. (Note that this is approximately 1 sample per 100 square meters.) No changes were made to the SAP based on this response.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 22. Attachment 4, Worksheet #11, Step 7, Develop the Plan for Obtaining Data, Page 46: There is an apparent contradiction between the requirements described in the first and second paragraphs on page 46. The first paragraph states that 1 of 10 samples will be analyzed for total strontium and/or Sr-90, but the second paragraph states that samples that exceed the release criterion for Cesium-137 (Cs-137) will be analyzed for total strontium and/or Sr-90. The first paragraph does not appear to require analysis for Cs-137 and it is unclear if the analysis for total strontium and/or Sr-90 will be done for 1 of every 10 samples, if it will be done for additional samples if the release criterion for Cs-137 is exceeded, or if it will only be done for samples when the release criterion for Cs-137 is exceeded. Please revise the text to clarify when analyses for total strontium and/or Sr-90 will be done. In addition, please include Cs-137 in the discussion about the 10 samples that will be collected per survey unit.	**Response 22.** Paragraphs 3, 4, and 5 in Step 7 on SAP Worksheet #11 were deleted and replaced with the following: *Details on collection and analysis of samples are in SAP Worksheet #14.*
Comment 23. Attachment 4, Worksheet #13, Secondary Data Criteria and Limitations Table, Page 49: Worksheet #13 states that no secondary data for this project will be used; however, the Work Plan references other documents for previous site work that appear to be relevant to the current investigation. Additionally, Worksheet #11 indicates that previous chemical and radiological analytical results for soil stockpiles that may be used for fill material will be reviewed against criteria in this SAP. Please revise Worksheet #13 to include all secondary data that will be used for decision making for this project.	**Response 23.** Worksheet #13 has been revised to included references to previous documents that are relevant to the current investigation.

Xuan-Mai Tran, Remedial Project Manager
Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX

Comment 24. Attachment 4, Worksheet #14, Summary of Project Tasks, Page 51: The second paragraph states that "Radiological control technicians (RCTs) will periodically scan the cut areas," but it is unclear what criteria will be used to determine when these scans are necessary. For example, scans could be done once a day, once a week, once a month, when a 6-inch lift is excavated, when a 12-inch lift is excavated, randomly, etc. Specific criteria to determine when these scans will be done are necessary. Please revise Worksheet #14 and any other text discussing the periodic scans of cut areas to provide specific criteria that will be used to determine when the scans are necessary.	**Response 24.** The third sentence in the second paragraph under the Building Up to Subgrade section of Worksheet #14 in the SAP has been revised as follows: *Radiological Control Technicians (RCTs) will periodically scan the cut areas on a frequency based on the professional judgment of the RSOR taking into consideration the previous survey results, accessibility of the affected areas, and soil movement in the area. At a minimum, the affected area will be surveyed each time a lift is excavated, a new surface area is exposed, or when personnel entry is required into the affected area.* *These radiological scans will be performed for health and safety reasons during soil moving operations to ensure that radiological contaminants are not disturbed. The radiological scans will be documented in the field and in the remedial action completion report if a radiological scan identifies an area greater than twice background using a Ludlum 2350 meter with a Ludlum 44-10 NaI detector or equivalent.* Establishing a firm periodicity for all radiological surveys is not recommended, as each "cut area" may present varying degrees of radiation safety hazards.
Comment 25. Attachment 4, Worksheet #14, Summary of Project Tasks, Pages 52 and 53: The numbered soil sampling procedures do not specify the sampling equipment that will be used to collect the samples so it is unclear if disposable equipment (e.g., scoops or trowels) or equipment that requires decontamination between samples will be used. The sampling equipment is specified in the procedures for fill material sampling. Please revise the soil sampling procedures to specify the sampling equipment that will be used to collect the samples, including whether decontamination will be necessary.	**Response 25.** The numbered soil sampling procedures have been revised in Worksheet #14 to include the following: *A disposal scoop or equivalent may be used to fill the containers.*

Xuan-Mai Tran, Remedial Project Manager
Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX

Comment 26. Attachment 4, Worksheet #14, Summary of Project Tasks, Page 55: The SAP does not discuss how qualifiers uploaded to the database will be verified. Please revise the SAP to discuss how data qualifiers will be verified in the database.	**Response 26.** Worksheet #14 under Data Management Tasks has been revised as follows: *After receipt of the validated data, the validation qualifiers will be uploaded into the TtEC database and will be checked against the hardcopy validation report for accuracy.*
Comment 27. Attachment 4, Worksheet #15.1, Reference Limits and Evaluation Table for Soil Samples, Page 71: Footnotes "e" and "f" provide conflicting information and need further clarification. Footnote "e" states that if a result exceeds the PAL, the toxicity characteristic leaching procedure (TCLP) must be performed. Footnote "f" states that if a result exceeds the PAL, the waste will be considered "non-RCRA hazardous" and sent off-site for disposal; if the results do not exceed the PAL, the results will be evaluated to determine if soluble threshold limit concentration (STLC)/TCLP testing is required. It is unclear why samples with results exceeding PALs are considered "non-RCRA hazardous" according to footnote "f", or if these samples will be shipped to a hazardous waste disposal facility. If the results do not exceed the PAL, it is unclear why STLC/TCLP analyses need to be considered. Further, it is unclear if both tests will be performed. Finally, for both footnotes, it is unclear how the PALs were established. Please revise Worksheet #15.1 to clarify how the PALs were established and provide the decision criteria for sending the material to a hazardous waste facility for disposal or performing STLC and/or TCLP testing.	**Response 27.** TCLP criteria is used to classify waste as RCRA hazardous. STLC criteria is used to classify waste as non-RCRA (or state of California) hazardous. According to the regulations, some analytes only have TCLP criteria and no STLC criteria and some analytes have both TCLP and STLC criteria. Footnote e) lists a PAL for analytes that only have TCLP criteria. Hence, if that PAL is exceeded, then TCLP analysis will be performed to determine if the waste is RCRA hazardous. If the PAL is not exceeded, the rest of the analytical data must be evaluated against the information listed in footnote f) before proceeding to use material as backfill. Footnote d) has been revised as follows to clarify this: *Limit listed is the value at which if exceeded then TCLP analysis must be performed. TCLP results will then be evaluated against CCR Title 22 criteria. If the TCLP results are below the CCR Title 22 criteria, then the material may be suitable for backfill pending evaluation of the rest of the analytical data against criteria in footnote f below. Otherwise, the material will be disposed of off-site.* The PAL values listed in conjunction with footnote f) are the Total Threshold Limit Concentrations (TTLC) that if exceeded the material is automatically considered non-RCRA hazardous but will need to be further evaluated for TCLP analysis. If the TTLC values are not exceeded, then the data will be evaluated for further STLC or TCLP analysis as required. Footnote g) has been revised as follows to clarify this:

Xuan-Mai Tran, Remedial Project Manager
Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX

	Limit listed is the Total Threshold Limit Concentration value at which if exceeded the material is automatically considered non-RCRA hazardous and will be evaluated for TCLP analysis. If the value is not exceeded, results will then be evaluated to determine if STLC/TCLP analysis is required in accordance with CCR Title 22. If STLC/TCLP analysis is required, those results will be evaluated against criteria in CCR Title 22. If the STLC/TCLP results are below the CCR Title 22 criteria, then the material may be suitable for backfill pending evaluation of the rest of the analytical data against criteria in footnote e above. Otherwise, the material will be disposed of off-site.
Comment 28. Attachment 4, Worksheet #15.2, Reference Limits and Evaluation Table for Water Samples, Page 92: It is unclear what regulatory limits for hazardous waste criteria will be used to assess results from wastewater samples (i.e., federal, state, etc.). Further, these limits should be listed in the SAP to ensure that the laboratory limits are less than, or equal to, the regulatory limits. Please revise Worksheet #15.2 to provide numerical PALs and indicate the specific source of these values.	**Response 28.** Project action limits and their reference have been added to SAP Worksheet #15.2 for analytes that have STLC or TCLP CCR Title 22 criteria. Chemical analytes that do not have criteria have been deleted from Worksheet #15.2.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 29. Worksheet #17, Sampling Design and Rationale, Pages 95 and 96: Worksheet #17 should provide the sampling design and rationale for the number of samples and analyses (e.g., why the specified number of samples of each type is sufficient, how sample locations will be chosen, etc.), but this information is not provided. In addition, the text under the subsections titled "Building Up to Subgrade" and "Initial MARSSIM Survey of Subgrade Prior to Installation of Cover," is unnecessary and repeats the text provided in Worksheet #14. Further, Worksheet #17 is missing a table that lists each type of sample, the number of samples that will be collected, and the required analyses. Required QC samples should be included in this table. Please delete the text under the subsections titled "Building Up to Subgrade" and "Initial MARSSIM Survey of Subgrade Prior to Installation of Cover" and revise the Worksheet to provide the sampling design and rationale for the number of samples and analyses. Also, please include a table that lists each type of sample, the number of samples that will be collected, required QC samples, and the required analyses.	**Response 29.** Worksheet #17 of the SAP has been revised to include sampling design and rationale for the number of samples and analyses. Furthermore, text that was repetitive from Worksheet #14 has been removed from Worksheet #17. In regards to a table with the number of samples and required analyses, that information is provided in Worksheet #18. QC samples are discussed in Worksheet #12. No changes were made to the SAP based on this part of the response.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 30. Worksheet #17, Final MARSSIM Survey of the Cover, Page 96: This section discusses the potential need for remediation (excavation) of portions of the cover in the unlikely event that radiological contamination is found after the cover is constructed, but does not specify surveys or sampling to determine that sufficient soil has been removed. Please revise the text to specify whether a gamma survey of the excavation will be done and the number of samples that must be collected. In addition, please include this information in other worksheets of the SAP as necessary. Further, the text states, "Soil samples will be collected for waste characterization purposes at a frequency defined by the disposal facility," but the disposal facility should be contacted so that the number of required samples and analyses can be specifically included in the SAP. Please revise the SAP to include the number of and analyses for required waste characterization samples.	**Response 30.** Worksheet #17 was completely revised as indicated in Response 29 above. As already indicated in Worksheet #14 regarding the Final MARSSIM Survey of the Cover, "If remediation is warranted, then the area will be excavated as directed by the project team, then filled in to bring the surface back up to grade, and another gamma survey will be conducted." Sampling the area after excavation will not be conducted; however, the material that is excavated will sampled as described in Worksheet #14. Regarding the second statement about the text and frequency of sampling by the disposal facility, that section has been revised as follows: *Any soil that is excavated during this time will be placed in six inch lifts. The soil will be surveyed again and soil samples will be collected at a rate of two samples per 40 cubic yards. All samples will be analyzed for gamma isotopes. Ten percent of the samples will be analyzed for total strontium and/or ^{90}Sr, and alpha isotopes (^{238}U). Additionally, any sample result exceeding the release criterion for ^{137}Cs will also be analyzed for total strontium and/or ^{90}Sr. These results will be used to determine if the material is LLRW or non-LLRW. LLRW material will be transported to the waste broker for subsequent disposal. Non-LLRW will be sampled at a minimum of one sample per 500 cubic yards for chemical analyses as listed in Worksheet #18. These chemical results will determine if the any of the material can be reused as fill material for IR Site 2 or if off-site disposal of the material is required.*

Xuan-Mai Tran, Remedial Project Manager
Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX

Comment 31. Attachment 4, Worksheet #18, Sampling Locations and Methods/SOP Requirements Table, Page 99: Footnote "c" and "d" indicate that the number of waste soil and wastewater samples is unknown since the amount of waste is unknown; however, the SAP should indicate the frequency for collecting waste samples (e.g., 1 sample per 40 cubic yards). Please revise Worksheet #18 to indicate the frequency for collecting waste samples.	**Response 31.** Footnote "c" and "d" have been deleted from Worksheet #18 and instead the following has been added to Worksheet #18: Minimum of 1 per 500 cubic yards for the excavated soil waste samples and a minimum of one sample per container for the wastewater samples
Comment 32. Attachment 4, Worksheet #28.1/28.2, Laboratory QC Samples Table - Soil/Water, Pages 144 and 159: The acceptance limits for the post digestion spike (PDS) (75 - 125%) do not meet the acceptance limits in method 6020A (80 - 120%). Please revise SAP to utilize the PDS acceptance limit requirements in Method 6020A.	**Response 32.** Worksheets #28.1 and 28.2 have been revised to list the 80-120% criteria for the post-digestion spike for method 6020A.
Comment 33. Attachment 4, Worksheet #29, Project Documents and Records Table, Page 173: Worksheet #29 states that the Quality Control Program Manager (PQCM) will use an Initial Inspection Checklist during inspections; however, a copy of this inspection checklist has not been provided. Please revise the SAP to provide a copy of this inspection checklist.	**Response 33.** This quality form can be found in Attachment 5 of this Work Plan and is called the Initial Phase Inspection Form. No changes were made to the SAP based on this response.
Comment 34. Attachment 5, Section 7.5, Additional Inspections, Page 7-3: The third bullet states that if activity on a definable feature of work (DFW) is resumed after a substantial period of inactivity, an additional inspection may be conducted; however, a "substantial period of inactivity" is not defined. As such, it is unclear what amount of time this constitutes (e.g., week, month). Please revise Attachment 5 to clearly define the period of inactivity that would result in an additional inspection being conducted.	**Response 34.** The third bullet of Attachment 5, Section 7.5, Page 7-3 has been revised to replace "substantial period" with "2-month period of inactivity."

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 35. Attachment 5, Table 3-1, Definable Features of Work, Page 9 of 15: The Follow-Up column for the Biotic Barrier (Geonet Layer) Placement row states that, "Inspect operation and ensure that material cures properly." However, no concrete is utilized for the installation of the geonet based on Drawing D-5 (Site Details) of Attachment 1 (90% Remedial Design). As such, it is unclear what component of the geonet layer "cures". Further, it is unclear what criteria are utilized to determine curing has occurred properly. Please revise Table 3-1 to clarify the component of the geonet layer which cures. In addition, please clarify what criteria will utilized used to determine curing has occurred properly.	**Response 35.** Comment noted. Table 3-1 of Attachment 5 has been revised to remove this bullet.
Comment 36. Attachment 6, Section 2.1, Agency/Client/Contractor Interface and Contractual Responsibilities, Page 2-1: The EPA is not listed as a regulatory agency overseeing this project. Please revise Section 2.1 to include all key parties overseeing this project.	**Response 36.** Attachment 6, Section 2.1 has been revised to list the regulatory agencies providing oversight through the Base Closure Team (BCT).

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 37. Attachment 6, Sections 6.3.2 and 6.3.6, Pages 6-6 and 6- 8: It is unclear why only plants and birds will be monitored. Based on information presented in Attachment 6, ecological surveys and construction monitoring proposed at IR Site 2 appear to be limited to protecting special status plant and avian species. However, Attachment 7, Wetland Mitigation Plan indicates the presence of pickleweed (Salicornia virginica), which provides a food source and habitat for the endangered salt-marsh harvest mouse (Reithrodontomys raviventris). Further, a remedial action objective specified in Section 2.4, page 2-9, is to protect mammal species, as well as human receptors and avian species. Table 6-1 shows that mammals have been observed at IR Site 2. Please justify why only plants and birds, but not mammals will be monitored in the future. In addition, these sections state that a "qualified biologist" will conduct ecological surveys of the plants and animals at Site 2 to collect information on species present in or near the intended project areas and to monitor construction activities in areas of suitable habitat to avoid the take of individual animals and to minimize habitat disturbance. The current text does not describe the qualifications of the biologist. Please discuss the qualifications of the biologist that will be required for these activities.	**Response 37.** Special status plants and avian species are indicated because they are more likely to be present. Two Salt Marsh Harvest Mouse surveys have been conducted at Alameda Point, including IR Site 2, one in 1995 and one in 2009. Both concluded the Salt Marsh Harvest Mouse was not present. (PRC Environmental Management Inc. 1995), (H.T. Harvey & Associates, Inc. 2009). 2,397 and 1,600 trap nights of effort were performed as a part of the 1995 and 2009 studies, respectively. A "qualified biologist" will have experience monitoring and identifying the special status species mentioned in the report, as well as experience monitoring in tidal wetlands, and be able to set up and execute a monitoring program for these species.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 38. Attachment 7, Section 5.0, Page 5-2: This section states that habitat for the salt-marsh harvest mouse, consisting of dense pickleweed, is present in seasonal wetlands and tidal wetland. Yet, the text does not discuss any mitigation measures to address this species. The salt-marsh harvest mouse is a Federal endangered species and has fully protected status in California and needs to be addressed in the Wetland Mitigation Plan. Please discuss mitigation measures for the salt-marsh harvest mouse and other small mammals, as appropriate, in the Wetland Mitigation Plan. Additionally, please include mitigation goals, success criteria, implementation activities, and long-term monitoring and maintenance requirements for small mammals as part of the creation of compensatory wetlands. The second paragraph states, "Due to their patchy and isolated nature, the seasonal wetlands at the north end of the site, which are the seasonal wetlands that would be filled, offer minimal habitat value." This concept is reiterated in Section 9.0 on Page 9-1; however, the text does not discuss whether filling these seasonal wetlands may eliminate potential amphibian breeding habitat by replacing freshwater wetlands with tidal wetlands. Please discuss whether the ecological surveys, proposed in Attachment 6, Section 6.3.2, will include the identification of amphibian populations.	**Response 38.** This section indicates that "marginal" habitat for the SMHM is present, and lists reasons why it is not likely to occur there, as stated in the previous response (Response #37). Requiring mitigation measures for the SMHM at this point is unwarranted because it assumes that they are present and would be affected by construction. In response to the second paragraph, we concur that amphibian surveys should be performed to identify whether a listed species is present, in substantive compliance with the California Endangered Species Act, Section 2080, and 2081(b). The surveys would be conducted during the amphibian breeding season, typically December to March. The EPP and Wetlands Mitigation Plan (Attachments 6 and 7) have been revised to reflect this change.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 39. Attachment 7, Section 10.0, Implementation, Section 10.1, Page 10-2: The Navy has not proposed revegetating the Tidal Wetland Mitigation Area with pickleweed (the desired plant species) and instead, proposes to let the excavated areas revegetate themselves naturally. However, the text does not discuss contingencies in the event that invasive plant species, which seem to be present in the surrounding area, revegetate the newly-created wetlands. It would appear that planting pickleweed as part of the restoration phase will increase the chances that the mitigated wetlands will support the desired plant and animal species. Please propose planting pickleweed or explain the reason(s) for not replanting the area with pickleweed following development of the new marsh.	**Response 39.** Planting pickleweed is not recommended since it will revegetate quickly without replanting. The rationale for this, as explained in Section 10.1, is that at other tidal marsh restoration sites, notably at Piers 94 and 98 in San Francisco, pickleweed revegetated quickly without any plantings. Section 10.1 also indicates that the two main invasive plant species that threaten tidal wetland plant communities (*Spartina alterniflora* and *Lepidium latifolium*) were not observed at the site. The only observed invasive plants that would compete with pickleweed were NZ spinach and Salsola soda, neither of which are particularly aggressive. In addition, the text does discuss contingencies in the event of colonization by invasives, and sets a very low threshold (essentially 0% Spartina or Lepidium) before control measures are implemented (Section 11.1). Section 11.1 also proposes planting pickleweed plugs if the performance goals for Years 2 and beyond are not met.
Comment 40. Attachment 7, Section 11.0, Monitoring and Maintenance, Section 11.2 Success Criteria for Wildlife, Page 11-2: The last sentence of this section defines success criteria for wildlife as increased bird use over a 5-year period as the invertebrate community in the substrate increases yet no plan is discussed in case the success goals are not met. Please provide more details to address actions that the Navy will implement if the 5-year wildlife goals are not met.	**Response 40.** Additional details regarding actions that would be implemented if the 5-year wildlife success goals are not met would be speculative and are beyond the scope of the remedial design.

Xuan-Mai Tran, Remedial Project Manager
Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX

Comment 41. Attachment 8, Section 3.2.3, Management of Contaminated Soil, Page 3-2 and Attachment 9, Section 3.3, Dust Control Measures, Page 3-2: The text indicates that stockpiled soil will be treated with a soil tackifier to provide dust control and prevent runoff; however, the specific soil tackifier is not named and the application rate is not specified. Similarly, Section 3.3 (Dust Control Measures) of Attachment 9 (Dust Control and Air Monitoring Plan) indicates that chemical soil stabilizer will be applied in sufficient quantities to disturbed areas; however, the specific chemical soil stabilizer is not named and the application rate is not specified. Further, it is not clear if the soil tackifier and chemical soil stabilizer are the same product, and if not, it is unclear if the chemical soil stabilizer and the application rate are appropriate to provide dust control and prevent runoff. Please revise Attachments 8 and 9 to clarify if the soil tackifier and chemical soil stabilizer are the same product. Further, please include a product specification sheet for all applicable media as well as the associated application rate which will provide dust control and prevent runoff.	**Response 41.** Please see response to EPA Comment #23.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 42. Attachment 8, Section 3.2.5.1, Diesel Fuel, Page 3-2: The text states that fueling will occur in designated areas; however, the designated areas are not specified. In addition, the text states that, if a spill occurs as equipment is being fueled, the spill will be immediately contained with an earthen berm and an excavation retention trap will be provided; however, the materials to construct an earthen berm are not listed in Section 1.6 (Release Prevention and Minimization Measures) of Appendix A (Emergency Response Plan) of Attachment 11 (Post-Closure Operations, Maintenance and Monitoring Plan) as basic spill response materials on-site. As such, the source of the materials to construct an earthen berm is unspecified. Please revise Attachment 8 to clarify where materials to construct an earthen berm will be obtained and where the berms will be placed relative to the designated areas for fueling.	**Response 42.** Attachment 8, Section 3.2.5.1 has been revised to specify that fueling will occur on the pavement inside the radiological control area (see Figure 5-1 in the work plan) and that import cover material will be used to construct the earthen berm.
Comment 43. Attachment 8, Section 3.3.4, Soil Stockpile Areas, Page 3-4: The text states that large stockpiles will be sloped to reduce the infiltration of rainwater; however, the slope is not specified. As such, it is unclear what approximate angle the large stockpiles will be sloped at to prevent infiltration of rainwater, but not support erosion. Please revise Attachment 8 to specify the angle or a range of appropriate angles at which the large stockpiles will be sloped at to prevent infiltration of rainwater while not inducing erosion.	**Response 43.** Stockpile angles will be at the angle of repose for the material. This is to say, as the material is stockpiled higher, it naturally settles to a slope angle related to the moisture content, grain size, and coefficient of friction between the grains. Stockpiles are covered with a tackifier and bermed so that erosion concerns are mitigated. Specifying a slope angle for the stockpiles is not required.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 44. Attachment 8, Section 3.5, Non-Stormwater Management, Page 3-6: The text states that inspections to identify any non-stormwater discharges will be performed quarterly; however, it is unclear why inspections will not be performed more frequently than quarterly, especially during active construction when the potential for non-stormwater discharge is greatest. Please revise Attachment 8 to specify more frequent inspections or to clarify why inspections to identify any non-stormwater discharges will not be performed on a more frequency basis than quarterly.	**Response 44.** The frequency for the Non-Stormwater Discharge Inspections is specified in Section I. 10. a. ii. of Attachment D (Risk Level 2 Requirements) of the General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities.
Comment 45. Attachment 8, Section 4.5, Water Quality Sampling and Analysis, Page 4-4: Section 4.5 states that a minimum of three effluent samples will be collected per day during each qualifying rain event; however, it is unclear how a minimum of three samples is appropriate to assess water quality. Further, these samples are not included in the Attachment 4 SAP. The objectives for these samples, sampling procedures, required analytes, etc. must be included in the SAP. Please revise Attachment 8 to clarify how a minimum of three samples is appropriate to assess water quality, and the lines of evidence which support this frequency. Also, please ensure that these samples are included in the Attachment 4 SAP.	**Response 45.** The frequency for water quality sampling is specified in Section I. 4. b. of Attachment D (Risk Level 2 Requirements) of the General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities which is provided in Appendix B. The effluent samples are collected for field measurements only and are not submitted to a laboratory for analysis. Attachment 8 Section 4.5 has been revised to clarify that effluent samples will be measured in the field using hand-held instruments. Field measurement information would be included in a SAP if the measurements pertained directly to decision criteria associated with the CERCLA remedial action for the site. However, for this project, the field measurements pertain to storm water discharge requirements associated with a permit. Furthermore, field measurement information is not applicable to SAP Worksheets #15, 20, and 28 as those worksheets only pertain to samples sent to a laboratory for analysis. In addition, Attachment 8 Section 4.5 already states a) the criteria for the field measurements (which would be applicable to information required for SAP Worksheets #10 and 11); and b) the sampling frequency requirements and which parameters to measure (which would be applicable to information required for SAP Worksheets #14, 17, and 18). In

Xuan-Mai Tran, Remedial Project Manager
Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX

	order to address information that would be provided in SAP Worksheets #21 (Sampling SOPs) and 22 (Field Calibration), Attachment 8 Section 4.5 has been revised as follows: *Effluent sampling will be performed during each qualifying rain event (i.e., at least 0.5 inch of rain or more within a 48-hour or greater period). Prior to collecting samples for measurement, the hand-held field meter will be calibrated in accordance with manufacturer's instructions, and the calibration information will be recorded on the effluent sampling field form provided in Appendix D. A sample will then be collected at each location where storm water is discharged off-site. A minimum of three samples will be collected per day during each qualifying rain event. An 8-ounce glass jar or equivalent will be used to collect a sample at each location. The jar will be filled with water at least ¾ full. The samples will then be measured for pH and turbidity using the calibrated hand-held field meter by inserting the meter probe into the water container. The readings will be recorded on the same effluent sampling field form that the calibration information was recorded on. The numeric action level (NAL) for pH is lower than 6.5 pH units or greater than 8.5 pH units, and the NAL for turbidity is greater than 250 nephelometric turbidity units. Section I.15 of Attachment D in Appendix B describes actions to take in the event a measurement exceeds these NALs. Completed effluent sampling field forms will be inserted at the end of Appendix D of the IR Site 2 SWPPP Master Copy to be located in the Field Engineer's office.*

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 46. Attachment 9, Section 2.1, Climate, Page 2-1: The sources for the average daily temperature, mean annual precipitation, and windrose diagram are not provided and/or referenced. As a result, it is unclear if the information is representative of conditions at IR Site 2. Please revise Attachment 9 to provide and/or reference the sources for the average daily temperature, mean annual precipitation, and windrose diagram.	**Response 46.** A reference to the IR Site 2 TCRA (FWENC 2002) has been added to Attachment 9, Section 2.1.
Comment 47. Attachment 9, Section 3.3, Dust Control Measures, Page 3-2: The second bullet indicates that active construction areas outside the dewatering and radiological screening pads will be watered at a minimum of twice daily and more often during windy periods; however, what constitutes a windy period is not defined. Similarly, the third bullet indicates that active excavation areas will be wetted every two hours during periods of dry weather or in windy conditions; however, windy conditions are not defined. As a result, the quantifiable conditions that are associated with windy periods and windy conditions are unclear. Please revise Attachment 9 to quantitatively define windy periods and windy conditions.	**Response 47.** Attachment 9, Section 3.3, second bullet and third bullets have been revised to replace “windy period” with “windy conditions that generate visible dust.”
Comment 48. Attachment 9, Section 8.0, Data Evaluation, Page 8-1: The criterion for elimination of data is not specified. The text states that, “Field records and logbook entries of calibration results will also be reviewed and verified, as appropriate, and final calculated data values will be entered into the data file. Any data known to be erroneous will be edited out of the data file.” It is unclear if this elimination of data is appropriate. Please revise Attachment 9 to specify the criterion that will be used to eliminate data.	**Response 48.** The reference to elimination of data has been removed from Attachment 9, Section 8.0.

RESPONSE TO COMMENTS
DRAFT REMEDIAL ACTION WORK PLAN
INSTALLATION RESTORATION SITE 2, ALAMEDA POINT
ALAMEDA, CALIFORNIA

Xuan-Mai Tran, Remedial Project Manager
Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX

Comment 49. Attachment 11, Section 2.2.2, Proposed Monitoring Network and Sampling Frequency, Page 2-3: a) The text indicates that replacement wells M024R-A, M024R-E, M037R-A, M037R-E, and M039R-A will be sampled semiannually for the first year then annually thereafter; however, it is unclear why the results from the semiannual sampling will not be evaluated after the first year to determine the ongoing frequency of sampling. Further, Section 6.1.1 of Attachment 11 states that only replacement wells M024R-E and M024R-E will be sampled semiannually for the first year. Please revise the Draft RD/RA WP to provide flexibility to adjust the sampling frequency based on the results of the initial sampling. In addition, please ensure that the monitoring wells which will be sampled semiannually for the first year are clearly defined and that the sampling plan reflects all newly installed replacements wells.	**Response 49a.** The RAWP has been revised to include the preservation of the existing groundwater monitoring well network. The Navy has continuous quarterly to annual GW data from the wells in this network from 2002. The DTSC, in a written communication dated March 1, 2013, requested that the Navy submit a separate Groundwater Monitoring Evaluation (GME) as a Remedial Design Addendum document. Groundwater monitoring requirements, including sampling frequency, will be detailed in the evaluation. Section 2.0 of Attachment 11 has been revised to reflect this change.
b) Further, it is unclear why semiannual baseline sampling is warranted given that the wells to be sampled are replacement wells to assess the viability of the landfill remedy. EPA’s Unified Guidance states in Section 5.1, that, “High quality background data is the single most important key to a successful statistical groundwater monitoring program.” Please revise Attachment 11 to include the lines of evidence which support the proposed frequency or revise the frequency to reflect the available lines of evidence.	**Response 49b.** Please see Response 49a above.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 50. Attachment 11, Section 2.2.3, Data Analysis, Page 2-4: Internal wells are not proposed for use in the trend analysis. The first sentence states that, “Wells at the site perimeter and along the bay will be used for the trend analysis, as required by the ROD [Record of Decision].” It is unclear if this trend analysis will be representative of IR Site 2 conditions. Please revise the text to clarify why interior wells are not proposed for trend analysis to provide a more representative evaluation of IR Site 2 conditions and changes in plume composition and make boundary assessments more meaningful since interior wells could be used to predict boundary changes.	**Response 50.** Specifics regarding groundwater trend analyses will be discussed in the Remedial Design Addendum which will be prepared pursuant to the GME.
Comment 51. Attachment 11, Section 6.1, Scheduled Inspection, Page 6-1: The text states that, “IR Site 2 will be inspected quarterly and after major weather or seismic events for damage, and maintenance will be performed as necessary;” but the text does not define a major weather or seismic event making it unclear when inspections will occur. Similarly, Section 6.1.2 (Cover Settlement) of Attachment 11 states that the landfill cover condition and the slopes of the landfill inspections will occur on a quarterly basis and after significant events; however, significant events are not defined. Please revise Attachment 11 to clearly define a major weather, seismic event and significant event so that inspection triggers are clearly understood and the appropriate inspections can be completed.	**Response 51.** Attachment 11, Section 6.1 has been revised to include specific descriptions of significant weather and seismic events. Significant weather events would include any rain event with 0.5 inch of rain occurring in a 24-hour period. A Modified Mercalli Intensity (MMI) of VII as reported in the USGS intensity maps for recent earthquakes in California is an appropriate threshold to trigger an engineering site inspection, corresponding to the reported intensity of the Loma Prieta earthquake in Alameda when lateral spreads but no slope failures were reported for the site. MMIs are available almost immediately after an earthquake at the following website: http://earthquake.usgs.gov/earthquakes/dyfi/. The benefit of this scale for the purposes of triggering an inspection is that the value is readily available and understandable by site personnel.

Xuan-Mai Tran, Remedial Project Manager
Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX

Comment 52. Attachment 11, Section 6.1.4, Site Structures, Page 6-1: The section indicates that settlement monuments will be surveyed annually; however, it is unclear why settlement monuments will not be surveyed on a more frequent basis initially after construction to establish an appropriate baseline data set or following seismic events. Without a more structured monitoring frequency, it is unclear how robust the data set will be upon which landfill settlement assessment will be based if the settlement monuments are only surveyed on an annual basis. Please revise Attachment 11 to clarify how annual surveying of the settlement monuments is appropriate to assess settlement and why a seismic event should not trigger a settlement monument monitoring event.	**Response 52.** It is important to keep the purpose of this landfill cover in context, which does not include limiting infiltration of ponded groundwater that can be increased in areas of the cover that have settled. The ROD is clear that this is a multilayer cover, and not a landfill cap. Therefore, the type of landfill settlement assessment and the associated robust data set appropriate for landfills with infiltration requirements are not applicable for IR Site 2, and the prescribed annual surveys are sufficient. After a seismic event, the entire site would be inspected to ensure integrity of the final cover and that the environmental control systems are functioning. Any damage to the cover, including areas of localized settlement, would be repaired by importing soil and grading. After a seismic event, settlement monuments would be inspected for damage and localized differential settlement.
Comment 53. Attachment 11, Appendix B, Plan Itemized Cost Estimate, Table B.1-1, Detailed Annual Operation and Maintenance Costs: The level of detail provided in Table B.1-1 is not sufficient to support the annual costs. For example, all the costs for work not to be performed by Tetra Tech are provided as lump sums. Detailed cost estimates for the proposed activities have not been presented and, as such, the individual costs and associated assumptions for individual components of the proposed activities are unclear and the costs cannot be evaluated. Please revise Table B.1-1 to include detailed "roll-up" costs used to develop the lump sum costs so that an evaluation of the components of the lump sums may be conducted.	**Response 53.** Level of detail to be provided is the same as in the ROD when presenting remedy costs. The estimate in Appendix B is based on similar O&M costs at Navy CERCLA Sites in the Bay Area. A separate contract will awarded for the O&M at Site 2, and the government will develop a more detailed estimate at that time for bid evaluation purposes.

Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 54. Attachment 12, Section 4.0, Area Requiring Institutional Controls, Page 4-1: The text states that the institutional controls (ICs) which will be applied to IR Site 2 are shown on Figure 2-1 (Site Location Map) of Attachment 12; however, no ICs are shown on Figure 2-1 of Attachment 12. As such, it is unclear where the limits of the ICs are, and how the corresponding land use limitations and activity restrictions specified in the ROD will be applied. Please revise Figure 2-1 of Attachment 12 to include all ICs.	**Response 54.** The text of Attachment 12, Section 4.0 has been revised to reference Section 5.0 and the boundary of the area of required institutional controls for IR Site 2 is shown on Figure 2-1.
MINOR COMMENT	**RESPONSE**
Comment 1. Section 5.6.8, Settlement Monuments, Page 5-9: Section 5.6.8 includes details related to the settlement monuments that will be installed on the final grade of the multilayer soil cover system; however, details related to the monitoring of the settlement monuments is not provided and/or referenced. Please revise Section 5.6.8 to reference Section 3.5 (Settlement Monuments) of Attachment 11 (Post-Closure Operations, Maintenance, and Monitoring Plan).	**Response 1.** Section 5.6.8 of the main text has been revised to add reference to Section 3.5 of Attachment 11 for settlement monitoring.
Comment 2. Section 8, References, Page 8-2: Please reference the Final TCRA Post-Construction Report, IR Sites 1, 2, and 32, dated August 2009 instead of the Draft TCRA.	**Response 2.** Section 8 of the main text has been revised to correct the reference from Draft to Final.
Comment 3. Attachment 1 (90% Remedial Design): Attachment 1 does not include any text to introduce or summarize the contents of the attachment. Please revise Attachment 1 to include text to introduce or summarize the content of the attachment.	**Response 3.** A flysheet with a brief description of each component of the RD has been added to Attachment 1.

Comments from John R. West
Remedial Project Manager
Groundwater Protection Division
California Regional Water Quality Control Board, San Francisco Bay Region

Comments Dated: June 13, 2012

COMMENT	RESPONSE
Comment 1. Wetlands. Wetland delineations of the seasonal, intermittent, and tidal wetland areas at the site are currently pending verification by the Army Corps of Engineers. Because the verification of the delineation of jurisdictional wetlands is a critical component in decision making related to wetland destruction and creation design, we cannot approve or support the design and mitigation proposals until the Army Corps has verified the wetland delineation. In Attachment 7, page 5-2 the report states: *"although extensive pickleweed habitat was found at the site and was not identified as wetland, the areas identified as tidal wetlands in the wetland delineation report appear to be those areas that receive frequent tidal inundation. All other pickleweed habitat does not meet hydrology criteria needed for a wetland designation to be applied. The tidal wetland portion of the proposed project area, which comprises part of the area that would be filled, is of relatively low value to the waterfowl and shorebird species that use the general area, but it may offer good foraging habitat for raptors."*	**Response 1.** Navy has prepared wetlands delineation reports for IR Site 2 in accordance with the ROD agreement. CERCLA response actions are exempt from federal and state permits (Section 121[e] of CERCLA). However, substantive provisions of the ACOE's Section 404 regulations have been accepted and identified as federal ARARs in the ROD. Refer to Attachment 7, Appendix A, Section 2.0 of the IR Site 2 RD/RAWP for compliance. The comment does not cite to any law or regulation that requires ACOE verification of wetlands delineations. However, if there were such statute provision in a law or regulation, it would not qualify as an ARAR because administrative /procedural provisions do not qualify as CERCLA ARARs.

John R. West, Remedial Project Manager
Groundwater Protection Division, California Regional Water Quality Control Board, San Francisco Bay Region

We disagree with two components in these statements and have discussed our concerns below: a-1) We find inadequate information supporting the premise that wetland indicators have not been met at portions of the site. What evidence has been collected indicating that other wetland indicators, (e.g., having adequate hydrology, vegetation, etc.) have not been met? a-2) What is the basis for calling the tidal wetland portion of the project to be of relatively low value? Ecologically speaking as a whole, we consider tidal wetlands to be quite valuable and pickleweed as a species is generally considered to be a valued habitat throughout the Bay. b) We are very concerned about the age and integrity of the culvert that is the sole source of Bay water to the tidal wetlands. It is our understanding that the aged culvert is in very poor shape and may collapse any time. The value of this culvert became painfully apparent a year ago when some driftwood or other material clogged it up and impeded all tidal flow of brackish water to the wetland. In a matter of days the tidal wetland started drying up. Should that culvert collapse, the delays in rebuilding, from getting contracts to actual physical work, could be devastating and even fatal to the wetland flora and fauna.	**Response to comment a-1:** Pickleweed is the key issue here and its presence is usually considered evidence of wetland conditions, given that it's an obligate wetland species (occurs in wetlands >99% of the time). However, the delineators did explain why they called some areas with pickleweed "upland," and had a discussion of problematic vegetation in Section 3.5.3 of the delineation report (See Appendix A, Attachment 7). In this section, they indicated that pickleweed can spread rhizomatously from wetland areas into upland areas, where it was found comingling with upland species such as coyote brush, ice plant, and ripgut brome. The pickleweed was present at densities less than 5% in locations that the delineators referred to as upland, and was generally a small component of an otherwise upland plant community. This is particularly likely to occur in areas filled with dredge spoils that may still have a high salt content, which would favor pickleweed and salt grass over the upland species. **Response to comment a-2:** The passage says the tidal wetland portion of the project area (meaning the pickleweed area that was identified as jurisdictional wetland, not the open water/mudflat area) is of relatively low value *to the waterfowl and shorebirds that use the general area.* The pickleweed marsh at the site is not sufficient to support waterfowl and shorebirds breeding requirements, nor is pickleweed their primary choice for foraging habitat. However, we do recognize that pickleweed marsh contributes detritus to the mudflat area and helps to sustain the benthic community that in turn sustains the shorebirds. Attachment 7 will be revised to clarify this distinction. **Response to comment b:** See Response to EPA Comment #2.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
John R. West, Remedial Project Manager Groundwater Protection Division, California Regional Water Quality Control Board, San Francisco Bay Region	
Comment 2. Proposed Groundwater Monitoring Program and Well Network. It is unclear from Attachment 11, Section 2.2.2 of the report if the proposed monitoring well network will be adequate to demonstrate protection of surface waters in the two onsite wetlands and areas adjacent S.F. Bay. Will there be an adequate number of wells effectively placed to monitor landfill leachate concentrations that might adversely affect the adjacent wetland species? Groundwater monitoring information will be especially important after the proposed site activities are completed (e.g., re-grading, capping) to assess hydrological changes and any associated increases in contaminant concentrations that may have occurred due to the site work. Therefore, please provide a comprehensive Groundwater Monitoring Program including a monitoring well network evaluation for the entire site so that we can better assess if the proposed monitoring well network will be sufficient.	**Response 2.** The DTSC, in a written communication dated March 1, 2013, requested that the Navy submit a separate Groundwater Monitoring Evaluation (GME) as a Remedial Design Addendum document. Groundwater monitoring requirements will be detailed in the evaluation.
Comment 3. Exclusionary Fencing and Gas Vent Pipes. There has been considerable public concern regarding the proposed 6' high chain link barbed wire fence to circumscribe the landfill and the thirty, 10-feet high, methane gas vents at the Site. The main public concern is that this location is extremely unique and arguably offers one of the best Bay views in Alameda. The Public has also expressed the desire to avoid the stigma of leaving the landfill as a toxic waste dump. Also, it is unclear why the methane vents need to be so high. Although protection of human health and the environment is our primary goal, we request that alternatives be evaluated for the fence line and methane gas venting so that public concerns and environmental health might more naturally coexist with the other beneficial uses that are planned for the area.	**Response 3.** Please see Response to DTSC General Comment #2 regarding the site fence and Response to EPA General Comment #36 regarding the vents.

Russell Resources, Inc.

Comments Dated: May 31, 2012

COMMENT	RESPONSE
Comment 1. Perimeter Fence: The August 2010 ROD for IR Site 2 specifies Institutional Controls (ICs, Table 2-13), which include Land Use Restrictions and Activity Restrictions. Briefly, the Land Use Restrictions restrict IR Site 2 to open space and recreational uses, and prohibit residential and other specified sensitive land uses. The Activity Restrictions restrict land disturbing activities, extraction of groundwater, disturbing infrastructure, etc. Note that the ROD's ICs explicitly do not prohibit recreational uses. The RD/RA Work Plan contemplates recreational use once remedial action is complete: "The proposed future use at IR Site 2 includes low-impact recreational uses such as a recreational trail around the site." (Section 2.3) "The proposed future use at IR Site 2 is 'undeveloped' with potential for recreational uses such as a perimeter hiking trail. ... Access to the shoreline trail south and west of the landfill will remain open." (Attachment 11, Section 1.3) However, Design Drawing C-9 of Attachment 1 of the RD/RA Work Plan indicates that the new 6' high chain link fence is to join the existing fence and that a chain link gate is to be constructed near the northwest corner of IR Site 2. The other end of the chain link fence (at the southeast corner of IR Site 2) is not shown on any drawings: it is outside the limits all of the RD's drawings.	**Response 1.** Please see response to DTSC General Comment #2.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Peter Russell, PhD, PE Russell Resources, Inc.	
To ensure that access to the shoreline trail south of the landfill will remain open, please add a note to Design Drawing C-12 that specifies a gate in the perimeter fence at the southeast corner of IR Site 2. Further, please add "Access to the shoreline trail south and west of the landfill will remain open" to Section 2.3 of the RD/RA Work Plan. This is the same sentence appearing in Attachment 11, Section 1.3, a less prominent location.	
Comment 2. Design Drawing C-17 of Attachment 1 of the RD/RA Work Plan specifies that the newly installed 4-inch PVC vertical landfill-gas vent pipes are to extend a minimum of 10 feet above the ground surface. The vent pipes are a replacement and expansion of the landfill gas control system installed following the 1983 Water Board Order No. 83-35. However, tall vertical vent pipes may not be needed for landfill gas control at the IR Site 2 landfill. Typically, vent pipes are engineered with two objectives: (1) to prevent the buildup or migration of landfill gas and (2) to protect the health of recreational users. The vertical vent height may be important for the second objective, because it promotes atmospheric mixing of the emitted gases before they might reach the breathing zone of recreational users. The tall vent pipes would be visually conspicuous and may detract from the esthetic experience of future recreational users of the shoreline perimeter trail and other recreational users. Thus, alternatives to the tall vent pipes may be preferable. For example, the vent pipes could be shortened to a few feet above ground surface, where they would be concealed in vegetation and less conspicuous. With this option, a posted and fenced exclusion area could be installed around each vent to prevent users from approaching the vents. Please modify the design of the vent pipes. If modifications to the	**Response 2.** Please see response to EPA General Comment #36.

Peter Russell, PhD, PE
Russell Resources, Inc.

vertical vent pipes' design is not adopted in the RD/RA Work Plan, please explicitly recognize in the RD/RA Work Plan that, in the future, the vents' design may be altered, with Water Board approval.	
Comment 3. The August 2010 ROD for IR Site 2 specifies non-radiological Soil Remediation Goals (RGs) in Tables 2-4 and 2-5. However, the RD/RA Work Plan's Reference Limits and Evaluation Table for Soil Samples (Attachment 4, SAP Worksheet #15.1) contains multiple instances where the Project Action Limit (PAL) exceeds the RG by at least one order of magnitude. For example, the ROD's RG for cadmium is 6.5 mg/kg, but the PAL is 100 mg/kg. For chromium, the values are 48.5 mg/kg and 2500 mg/kg, respectively; for molybdenum, 1.9 mg/kg and 3500 mg/kg; and for zinc, 263 mg/kg and 5000 mg/kg. For benzo(a)pyrene, the ROD's RG is 0.24 mg/kg, but the PAL is "Not established". Finally, for total DDx and total PCBs, the ROD specifies numerical RGs, but SAP Worksheet #15.1 provides no PAL. The PALs specified for the individual chemicals that comprise total DDx and total PCBs exceed the RGs for the respective sums of their concentrations. This appears to allow use of cover soil at IR Site 2 that exceeds RGs selected to be protective of recreational users and ecological receptors. Please clarify this apparent discrepancy.	**Response 3.** For those compounds with RGs, the PALs should be the same as the RG, and SAP Worksheet #15.1 will be revised accordingly.

RAB COMMENTS

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Comments from Carol Gottstein, MD, George Humphreys, James D. Leach, Kurt Peterson, Dale Smith, Michael John Torrey Naval Air Station Alameda Restoration Advisory Board Comments Dated: July 2, 2012	
COMMENT	**RESPONSE**
Comment 1. It seems cynical to claim that a thinner cap supports a sustainability goal, when the document states that in the event of a maximum credible earthquake (MCE), the site is projected to turn into "soup" and that permanent displacement has been calculated to range from 0.2 to 11 inches and transverse cracks up to 4.5 feet deep are expected. The document also states that a full seismic stability analysis has never been completed, either by TetraTech or CH2M Hill, whose contract was cancelled. The Navy representative, Mr. Jacques Lords, announced at a planning meeting that "there is already enough information about seismic hazards and it's time to design something rather than study it further". He also stated that with this cap design, the site doesn't have to withstand a MCE and repairs can be performed when cracks appear and the cap slides towards the bay. These all lead to a lack of confidence that this remedy will endure. This is the first time limits of liability have been included by a consultant, indicating a lack of certainty as to the efficacy of the solution and an attempt to limit liability.	**Response 1.** A thinner soil cover means less mass, and that reduced soil mass is placed at lower slope angles, all of which reduces the potential energy for mass displacement during an earthquake. Three rounds of Seismic Stability analysis were performed over the course of Site 2 assessment, and the Navy has reviewed and reassessed the response to comments regarding seismic stability presented in the RD/RAWP RTCs. Prior recommendations for ground improvements were based on default assumptions in the modeling. The Navy has performed a new analysis of existing data using site-specific model parameters to predict a tighter range of deformation of the soil cover and the berm. See Response to EPA General Comment #10.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Carol Gottstein, MD, George Humphreys, James D. Leach, Kurt Peterson, Dale Smith, Michael John Torrey Naval Air Station Alameda Restoration Advisory Board	
Comment 2. Because hazardous materials, including munitions and explosives of concern and radioactive material, are interred on site and are not very deeply buried, it can be assumed they will move towards the surface during a seismic event, even one less than an MCE, such as the Lorna Prieta earthquake. The Bay Area is constantly subjected to small "shudders", causing buried hazards to migrate to the surface. This will be an ongoing problem and will require constant monitoring and remediation. We would prefer a more permanent solution that did not present the possibility of unnecessary exposure.	**Response 2.** The assumption that waste will migrate to the surface during an event that is marginally less than the MCE was not observed during the Loma Prieta event. The soil cover has been selected as the remedy precisely because it will function as a barrier between waste and receptors, and it is required by the ROD to accommodate a maximum credible earthquake while maintaining cover integrity. The vegetative cover and HDPE biobarrier also provide stability through the establishment of a root system and uniform horizontal geonet in the cover, providing barriers to waste possibly migrating to the surface. The reviewer is correct that the site represents an obligation on the part of the property owner of monitoring. The RAWP Attachment 11, Post-Construction Maintenance and Monitoring Plan, details the Navy's obligations once the cover is installed.
Comment 3. The document states that the vertical pipes along the inside eastern and northern perimeter fencing are for the purpose of venting gas generated in the landfill. Based on the site tour they appear to be offsite migration monitoring devices, rather than part of a gas collection system. This infrastructure was installed to meet a 1982 Bay Area Water Quality Control Board requirement to detect offsite migration of soil gas. Why are new pipes being installed when there is a functioning set of pipes already in existence?	**Response 3.** Please see Response to EPA General Comment #36.
Comment 4. As is the case with almost every project on Alameda NAS, the number of monitoring wells is less than adequate and does not cover the entire site sufficiently to ensure contaminant migration is not occurring, especially since the design anticipates soil movement.	**Response 4.** The DTSC, in a written communication dated March 1, 2013, requested that the Navy submit a separate Groundwater Monitoring Evaluation (GME) as a Remedial Design Addendum document. Groundwater monitoring requirements will be detailed in the evaluation.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Carol Gottstein, MD, George Humphreys, James D. Leach, Kurt Peterson, Dale Smith, Michael John Torrey Naval Air Station Alameda Restoration Advisory Board	
Comment 5. If Site 2 is to be fenced, how will mosquito abatement and other safety personnel gain access to the site in a timely manner? The document describes razor or barbed wire in association with the fence, but this not shown as part of the design drawings.	**Response 5.** Please see Response to DTSC General Comment #2.
Comment 6. The choice of Decker Island sand is a fine choice for habitat remediation. However, we would prefer to see the replacement ratio for lost habitat be greater than one to one. Site 34 and 32 also lost wetlands habitat and that does not appear to have been replaced. Thus, overall the Navy is not leaving as much wetland area as existed before, in spite of its poor quality. There is an endemic *lupinus* in the northeast side of the site that should be protected during construction, either by removal and tending or shielding from damage. There is also *distichlis* present that should be protected and used for propagation purposes. The restoration with native grasses is much appreciated.	**Response 6.** Wetlands mitigation strategy was agreed to in the ROD. The endemic *lupines* will be protected during construction to the extent practicable. Navy is working with the construction Contractor to hydroseed the soil cover with a native grassland plant community that is as closely associated with Alameda and the East Bay habitat as practicable. This specific seed mix was proposed by the RAB, at the request of the Navy.

ALAMEDA, CALIFORNIA

Comments from Richard Bangert
Restoration Advisory Board member

Comments Dated: June 11, 2012

COMMENT	RESPONSE
Comment 1. The security fence should not be used as an institutional control. By incorporating design changes for the soil gas vents, the security fence will not be necessary. The risks to soil gas probes, groundwater monitoring wells, and the soil cap itself are close to nonexistent. The only institutional control should be a digging restriction. An example of a park on top a landfill that illustrates the lack of need for a fence is Byxbee Park in Palo Alto, California. The park is open from 8 am until sunset. There is no fence to keep anyone off of the landfill. And on a recent visit, I saw no evidence of any supervision or any damage to equipment located in the ground. Soil gas monitoring equipment is located inside of concrete casements with cast-iron covers with no padlock. They are easily visible and accessible and show no signs of damage. I did not see any visible groundwater monitoring wells, but I did see a different type of equipment that the public had unsupervised access to: high voltage underground transmission lines. The park trails had active use on a Sunday, and there were no signs of damage to the grasslands caused by humans. The only ground disturbances were from ground squirrels. The only fence is around the soil gas flare equipment.	**Response 1.** Please see Response to DTSC General Comment #2.
Comment 2. New 10-foot-tall soil gas vent pipes on top of the soil cap will be a blight on views of the Bay and San Francisco.	**Response 2.** See Response EPA Comment #36.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Comments from Richard Bangert Restoration Advisory Board member	
Comment 3. Landfill methane gas is typically captured and burned off in compliance with Bay Area Air Quality Management District regulations. Explain why methane gas is being vented into the atmosphere. If this were not a CERCLA site, would a permit for flaring off methane gas be required?	**Response 3.** Per the ROD (DON 2010), "The operator shall ensure that landfill gases generated at a disposal site are controlled. Methane must not exceed 1.25 percent by volume in air within on-site structures, concentrations of methane gas migrating from the landfill must not exceed 5 percent by volume in air at the property boundary, and trace gases shall be controlled to prevent adverse acute and chronic exposure to toxic and/or carcinogenic compounds." Annual monitoring has demonstrated compliance with the ROD requirement, as documented in the Basewide Groundwater Monitoring Reports.
Comment 4. Groundwater monitoring wells should remain permanently in place and operable. Regardless of how clean the groundwater ever becomes, or whether monitoring is discontinued, the inevitable earthquake on the Hayward Fault will require investigation to determine if the geotechnical assumptions about the site remain valid. Exercising the work plan's option of destroying the groundwater monitoring wells in five years would be shortsighted. This option should be removed from post-closure options in the plan.	**Response 4.** Geotechnical data does not come from groundwater sampling. Groundwater monitoring wells are an asset so long as the information collected is useful. But they are also a liability as a potential pathway for an accidental spill to get to the aquifer. Potential spills include liquids associated with the vehicles that perform the monitoring. Text will remain but wells are not removed without a review and concurrence from the BCT
Comment 5. The North Pond culvert connecting to San Francisco Bay is the lifeline for this high value tidal wetland. The steel culvert is old and will someday need replacement. If it rusts out and succumbs to the weight of overlying soil and collapses, the cutoff of water interchange would have a devastating effect on the North Pond. The culvert is also subject to clogging by driftwood. The Remedial Action Work Plan should include a pre-approved design and authorization for replacement/upgrade to this culvert so that work by the new owner can be executed in a timely fashion without cumbersome CERCLA post-closure administrative procedures. Optionally, the Navy should consider replacing the culvert during the current remedial work project through a	**Response 5.** Please see Response to EPA General Comment #2.

collaborative funding effort with other agencies. Preservation, as well as expansion, of wetlands around San Francisco Bay is a key part of Bay ecosystem health.	
Comment 6. Soil cap testing – The following statement in the Remedial Action Work Plan does not provide adequate assurance that the soil for the soil cap will be free of mercury or other harmful chemicals: "This import material (Decker Island Aggregates) has been chemically and radiologically tested for use on other Navy projects including Hunters Point Naval Shipyard, and testing results will be provided prior to use." *5.6.4 Barge Delivery and Stockpile of Soils.* Since the soil for Site 2 (at least 400,000 cubic yards) has not yet been excavated, describe the tests that were conducted on the area from which this soil will be excavated. The soil cap will shed water onto the wetlands, including the North Pond that is connected to San Francisco Bay, and must not pose a risk to the marine environment or waterfowl. Are screening requirements higher for soil that drains to a wetland, as opposed to use at Hunters Point Naval Shipyard as cited in *5.6.4 Barge Delivery and Stockpile of Soils*?	**Response 6.** The excavated soil from Decker Island is *in situ* delta sediment and is known to be free of mercury or other harmful chemicals at concentrations above screening levels. The Soil from Site 17 currently stockpiled at IR Site 2 is also profiled and acceptable for use as subgrade material, but not for the 2-foot-thick cover layer.

OTHER COMMENTS

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Comments from Jaime Michaels, Coastal Analyst and Andrew Winetroub, Legal Intern San Francisco Bay Conservation and Development Commission Comments Dated: July 9, 2012	
COMMENT	**RESPONSE**
Comment 1. Commission's Authority Under the Coastal Zone Management Act and ARARs. Section 3.2 of the RAWP correctly states that the IR-2 remediation activity is not subject to the Commission's permitting authority, yet also asserts: "wherever relevant, substantive provisions of permits that would be required for a non-CERCLA action will be adhered to." Additionally, the RAWP cites the permit exemption in CERCLA Section 121(e) as being applicable, while failing to address the consistency review process authorized under the federal Coastal Zone Management Act (CZMA) (RAWP Attachment 6, § 5.3.3) (stating that the Navy will submit project information to the Commission to support "an informal federal consistency determination").[1] [Footnote 1: The CZMA imposes on federal agencies both the substantive requirement to be consistent to the maximum extent practicable with the enforceable policies of the Commission's federally-approved Coastal Management Program as well as the procedural requirement to undergo a consistency review process (CZMA § 307(c)(l)(C)). The Commission previously outlined in a letter to the Environmental Protection Agency dated May 3, 2010, the legal basis for its view that in conducting onsite remediation activities under the CERCLA the DON is subject to both the substantive and the procedural requirements of the CZMA. Furthermore, while the Commission agrees that its permit requirements do not generally apply to the activities of federal agencies (see 15 CFR § 930.39(e)), it is not correct to state,	**Response 1.** Comment acknowledged. In order to clarify the language of the RAWP, the last sentence of the third paragraph of Section 3.2 shall be revised to say "However, substantive provisions of federal and state applicable or relevant and appropriate requirements (ARARs) will be adhered to as required by CERCLA and the NCP. Section 121(e) of CERCLA provides that no Federal, State or local permit shall be required for on-site remedial actions." In addition, the fourth paragraph of Section 3.2 will be deleted. As explained in the June 10, 2010, letter from Mr. Keith Forman of the Navy to Mr. Jaime Michaels of BCDC regarding the Hunter's Point Naval Shipyard, the Navy's CERCLA remedial actions are not subject to permit requirements based on the CERCLA permit exemption at Section 121(e) of CERCLA and are not subject to federal and state administrative/procedural requirements (see National Oil and Hazardous Substances Pollution Contingency Plan [NCP] preamble at 55 Federal Register 8756, March 8, 1990). The Navy has prepared a "CERCLA Substantive BCDC Bay Plan Consistency Evaluation for IR Site 2, Former Landfill, Alameda Point California," which is included in the RAWP in Attachment 6, Table 5-2. This document is the substantive CERCLA equivalent to a CZMA "consistency determination" for IR Site 2 on-site activities and evaluates and demonstrates

Jaime Michaels, Coastal Analyst, and Andrew Winetroub, Legal Intern
San Francisco Bay Conservation and Development Commission

as section 5.3.3 does, that projects "that require federal approval," or "that are supported by federal funds" are for these reasons alone also exempt from the Commission's permit requirements.]	the Navy's compliance with the substantive provisions of the San Francisco Bay Plan.
Further, the ROD states that the Navy intends to carry out the remediation activities in a manner that meets the Commission's applicable or relevant and appropriate regulations (ARARs) (ROD Appendix A, pp. A-18 & A-32). Importantly, for the Commission's jurisdiction, the North Pond is connected to the bay by-a culvert installed in the seawall, which connects the Bay to waters within IR-2 (RA WP § 2.1). Specifically, the *Comments* section regarding the CZMA in the ROD states, "To the extent that during the remedial design phase it is determined that some minor filling of the North Pond is *required* to place the multilayer soil cover, the Navy will ensure [ARARs] are followed to protect the beneficial uses of San Francisco Bay in compliance with the CZMA" (ROD Appendix A, p. A-18). Lastly, Attachment 12 of the RA WP indicates that future transfer of property would involve the preparation of a Memorandum of Understanding or other agreement between the Navy and transferee to ensure that it would comply with all federal and state environmental, public health, and cultural and natural resource protection laws (RAWP Attachment 12, § 3.1).	Comment noted.
While the RA WP' s inclusion of "Chemical-Specific" ARARs (RAWP Attachment 6, Table 5-1) and exclusion of "Location-Specific" ARARs *(see* ROD Appendix A, p. A-18 & A-32) is not adequately explained, we interpret the applicable or relevant regulations to include the federal Coastal Zone Management Act (16 U.S.C. § 1451 *et seq.),* the McAteer-Petris Act (Cal. Gov. Code§ 66600 *et* seq.),the *San Francisco Bay Plan* (Bay Plan), and the Commission's federally-approved Coastal Management Program for San Francisco Bay.	The IR Site 2 ROD identifies specified substantive provisions of the CZMA and McAteer–Petris Act as relevant and appropriate ARARs. See Attachment 6, Table 5-2 for an evaluation of the DON's compliance with the substantive provisions of the Bay Plan. Table 5-1 of Attachment 6 will be revised to include all ARARs identified in the ROD.

RESPONSE TO COMMENTS
DRAFT REMEDIAL ACTION WORK PLAN
INSTALLATION RESTORATION SITE 2, ALAMEDA POINT
ALAMEDA, CALIFORNIA

Jaime Michaels, Coastal Analyst, and Andrew Winetroub, Legal Intern
San Francisco Bay Conservation and Development Commission

Therefore, we recommend that future revisions to the RAWP, including Attachment 6, Table 5-1, refer to the above-referenced Commission requirements and any specific policies identified in sections below. While the Commission's laws and regulations are recognized in the ROD, their identification is incomplete due to the lack of details regarding relevant policies. The Commission's ARARs, as they appear in the ROD, should be supplemented with references to how specific provisions relate to the proposed project and, further, should appear in the next document drafted for remedial design/remedial action at IR-2. The revised RAWP should also note that the Commission's substantive requirements likely relate to other remediation activities described in the RAWP, including (1) the implementation of a mitigation plan at the northern pond's southern boundary; (2) the temporary establishment of any off-loading facilities for barges either in the water or at the shoreline; (3) the removal of weir structures, venting systems, and fencing, and the abandonment of monitoring facilities; and (4) the installation of monitoring and security facilities, including a six-foot-high permanent fence at the eastern and northern site boundaries, monitoring wells, and venting systems (RAWP §§ 5.1-5.12).	Please see responses to the specific comments that follow and Table 5-2 of Attachment 6. The evaluation addresses how the remedial design and remedial action will comply with the substantive provisions of the coastal zone ARARs identified by the Navy in the CERCLA IR Site 2 Record of Decision (ROD) and BCDC in these comments. The DON has reviewed the Bay Plan policies to determine how they relate to (1) implementation of a mitigation plan at the northern pond's southern boundary; (2) temporary establishment of any off-loading facilities for barges either in the water or at the shoreline; (3) removal of weir structures, venting systems, and fencing, and abandonment of monitoring facilities; and (4) installation of monitoring and security facilities, including a 6-foot-high permanent fence at the eastern and northern site boundaries, monitoring wells, and venting systems. The relevant Bay Plan policies relate only to implementation of the mitigation plan. The DON does not plan to establish off-loading facilities for barges in the water or at the shoreline. Removal of weir structures, venting systems, and fencing and abandonment of monitoring facilities are not expected to affect the bay and, therefore, these policies do not apply. The remedial design has been revised and currently there is no plan for the 6 foot fence referred to in the comment; therefore, the Bay Plan policies similarly do not apply.
Comment 2. San Francisco Bay Plan and McAteer Petris Act – Tidal Wetlands, Bay Fill, and Mitigation. According to the RAWP, the proposed placement of cover material at the IR-2 site would result in a loss of 0.89 acres of tidal wetlands at the North Pond (RAWP Attachment 7, § 3.0). Attachments 6 (Draft Environmental Protection Plan) and 7 (Wetland Mitigation Plan) of the RAWP provide information about existing habitat, potential impacts of remediation, and a mitigation plan, which states that on-site tidal	**Response 2.**

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Jaime Michaels, Coastal Analyst, and Andrew Winetroub, Legal Intern San Francisco Bay Conservation and Development Commission	
wetlands provide resting and foraging areas for migrating waterfowl and habitat for other resident bird species. The plans further state that special-listed species, including California least tern, California clapper rail, and western snowy plover, could potentially locate at the site, but that the remediation project is *not* anticipated to adversely affect such species (RAWP Attachment 7, §§ 6.1-6.1.3). Proposed mitigation measures include staff training and education programs, wildlife surveys and appropriate construction schedules, the creation of a pickleweed marsh—using a replacement ratio of 1:1— at the North Pond's southern boundary, and the implementation of a monitoring and corrective action plan for the mitigation site (RAWP Attachment 7). In general, the mitigation and monitoring plan outline an approach that is typical of successful restoration programs. However, we have a number of questions about the details of the program. To fully evaluate the program, it is essential to know the following:	
1) the range of elevations that support pickleweed in the immediate vicinity (i.e. within the north pond). Page 11-1 states that above -0.2 feet NGVD 29, the restored areas will support primarily pickleweed. However, this elevation is much lower than normally supports picklweed elsewhere in San Francisco Bay. Please explain this discrepancy;	**Response to comment 1):** Elevations were reported in NGVD29, rather than NAVD88. Converting the elevations to NAVD88 indicates that pickleweed first appears at elevation 2.34 feet, which is just below the MHHW. The main pickleweed community appears starting at MHHW. The RAWP will be revised to show elevations in NAVD88.
2) the range of tides experienced at the site and the elevation of Mean Sea Level (MSL), Mean High Water (MHW), Mean Higher High Water (MHHW), and the highest expected tide within the north pond;	**Response to comment 2):** Navy can estimate MSL, MHW and MHHW based on the closest USCG tidal gauge. The Navy will also use published data including the 2004 tidal study at Site 2 to estimate the highest expected tide, although none of the goals or design elements are tied to that elevation, so it is not clear why that data are needed.
3) the target habitat types and their respective square foot coverage within the restored wetlands;	**Response to comment 3):** The Navy will insert this data into the revised report.

Jaime Michaels, Coastal Analyst, and Andrew Winetroub, Legal Intern
San Francisco Bay Conservation and Development Commission

4) the composition of the uncovered substrate after excavation (e.g. is it bay mud?);	**Response to comment 4):** A test pit that was excavated in the marsh as part of a previous investigation is still usable and reveals a homogeneous composition of mud from the surface to at least 4 feet in depth (well below the level of excavation proposed for this project). No additional soil sampling is proposed.
5) rates of sedimentation within the pond, if any;	**Response to comment 5):** It is not anticipated that sedimentation would occur as a result of tidal processes, but erosion of the upland areas may contribute sediment to the ponded areas. Preparation of a sediment budget is beyond the scope of this study and is not required to implement a CERCLA remedy**.**
6) a grading plan showing the range of elevations proposed at the restored area, slopes and any channels. If the uncovered substrate is not bay mud, and little sedimentation is expected, overexcavating the restored area and backfilling with a thin (six inch) layer of Bay mud has been proven the improve plant colonization of the restored site.	**Response to comment 6):** The final grading plans are included as Sheets C9-C13 of the Design Drawings included in Attachment 1.
The approach outlined in the event that success criteria are not met is also typical of successful restoration programs. While we appreciate that no invasive cordgrass or pepperweed are currently found at the mitigation site, the Commission generally requires that all nonnative, invasive species be controlled to five percent or less of the vegetative cover to assure that the target species have the best chance of establishment. Also, restoration in areas that experience muted tidal action (which may be the case for the north pond) have sometimes irrigated restored areas until the plants become established. It is not clear if monitoring would continue until the success criteria are met, for the specified give year period only, or extended for an additional five years if the restoration goals for Year 2 are not met.	**Response to comments regarding success criteria:** The Navy concurs that invasive species should comprise no more than 5 percent of vegetation; Section 11.1 already incorporates a threshold lower than this percentage for the main species. Plan documents will be revised to reflect this comment. Tidal action may be somewhat muted compared with areas with no levee, but full tidal exchange appears to occur on a diurnal basis in the north pond. The newly excavated marsh area will be inundated under most tidal conditions; therefore, no irrigation is needed. The Navy is obligated to monitor annually and report observations and recommendations at a minimum of every 5 years as long as necessary to provide adequate protection of human health and the environment.

Jaime Michaels, Coastal Analyst, and Andrew Winetroub, Legal Intern
San Francisco Bay Conservation and Development Commission

Comment	Response
As stated above, the ROD recognized that placing cover material at the North Pond may be necessary, in which case "the Navy will ensure applicable substantive requirements are followed to protect the beneficial uses of San Francisco Bay in compliance with the CZMA" (ROD Appendix A, p. A-18). The Commission's applicable or relevant requirements include the Bay Plan policies on: (1) Fish, Other Aquatic Organisms and Wildlife, particularly Policy No.1, which states, in part: "... the Bay's tidal marshes, tidal flats, and subtidal habitat should be conserved, restored, and increased;" (2) Tidal Marshes and Tidal Flats, particularly Policy No.1, which states: "Tidal marshes and tidal flats should be conserved to the fullest possible extent. Filling, diking, and dredging projects that would substantially harm tidal marshes or tidal flats should be allowed only for purposes that provide substantial public benefits and only if there is no feasible alternative;" and (3) Mitigation, particularly Policy No.1, which states, in part: "Projects should be designed to avoid adverse environmental impacts to Bay natural resources such as ... tidal marshes or tidal flats. Whenever adverse impacts cannot be avoided, they should be minimized to the greatest extent practicable .... Mitigation is not a substitute for meeting the other requirements of the McAteer-Petris Act," as well as Mitigation Policies 2 through 8. Additionally, Section 66605 of the McAteer-Petris Act sets forth criteria for Commission authorization of fill in the Bay (including wetland areas). Specifically, to satisfy statutory requirements, the water area to be filled must be the "minimum necessary" (McAteer-Petris Act § 66605(c)). As such, the Navy should explain why the 0.89 acres of fill are necessary to achieve the purpose of the fill. Other standards that must be satisfied include, but are not limited to, the fill being for a water-oriented use,	**Response to specific comments regarding Bay Plan policies.** The discussion below summarizes how the Navy has complied with each of the Bay Plan policies specified in this comment. Refer to Table 5-2 of Attachment 6 for a complete evaluation of how the existing RAWP documents demonstrate compliance with the substantive requirements of the CZMA and San Francisco Bay Plan ARARs as identified in the ROD. **(1) Fish, Other Aquatic Organisms and Wildlife Policy** Policy No. 1 states: To assure the benefits of fish, other aquatic organisms, and wildlife for future generations, to the greatest extent feasible, the Bay's tidal marshes, tidal flats, and subtidal habitat should be conserved, restored, and increased. Implementation of the remedy will comply with the substantive provisions of this policy. The remedy is designed to minimize damage to the tidal marshes, tidal flats, and subtidal habitat and to protect fish, other aquatic organisms, and wildlife. The wetland areas at Site 2 do not support a high diversity or density of invertebrates or mammals, and although the wetland ponds may be used by a variety of avian species, they do not support aquatic vegetation or significant invertebrate and fish populations. However, the DON will implement reasonable measures to ensure adequate protection of ecological receptors during excavation and cover placement, and the remedy will ultimately result in improved habitat. The DON will also comply with the additional Fish, Other Aquatic Organisms and Wildlife policies. Policy No. 2 states that specific habitats that are needed to conserve, increase, or prevent the extinction of any native species, species threatened or endangered, species that the California

Jaime Michaels, Coastal Analyst, and Andrew Winetroub, Legal Intern
San Francisco Bay Conservation and Development Commission

the fill benefits exceeding the public detriment from the loss of water, and the fill being such that is minimizes harmful effects to the Bay (McAteer-Petris Act § 66605(a), (d)). In making this request, we also recognize that "public health, safety or welfare" is a statutorily established justification for fill placement (McActeer-Petris Act § 66632(f)(1)). In light of impacts to 0.89 acres of tidal wetlands, the Commission staff recommends that the Navy consider how the above-cited Commission ARARs would be followed in capping the former landfill as described in the RAWP. We also recommend that, if feasible, consideration be given to an alternative cover approach that minimizes impacts to existing tidal wetlands.	Department of Fish and Game has determined are candidates for listing as endangered or threatened under the California Endangered Species Act, or any species that provides substantial public benefits, should be protected. The DON has identified the California Endangered Species Act as an ARARs and will comply with the substantive provisions of the requirements identified. The habitats of listed species will be protected during remediation and after it is completed through the mitigation measures identified in Attachment 7. The DON will coordinate with the USFWS and California Department of Fish and Game during remedial design and construction to ensure compliance with the substantive provisions of these ARARs. As described in Attachment 6, the DON will implement measures to avoid, minimize, and mitigate for potential impacts from remedial activities. **(2) Tidal Marshes and Tidal Flats Policy** Policy No. 1 states: > Tidal marshes and tidal flats should be conserved to the fullest possible extent. Filling, diking, and dredging projects that would substantially harm tidal marshes or tidal flats should be allowed only for purposes that provide substantial public benefits and only if there is no feasible alternative. As described immediately above, tidal marshes and tidal flats will be conserved to the fullest extent possible and the remedy complies with the Tidal Marshes and Tidal Flats policies. Tidal marshes and tidal flats will be conserved to the fullest possible extent and the filling of 0.89 acres of tidal wetland will provide substantial public benefits as explained below. The evaluation presented in Section 5.6.6.1, and Attachment 1, and Section 3, Attachment 7, of the Remedial Design/Remedial Action Work Plan (RD/RAWP) establishes that there is

Jaime Michaels, Coastal Analyst, and Andrew Winetroub, Legal Intern
San Francisco Bay Conservation and Development Commission

	no feasible alternative to installing a soil cover that will anchor into the margin of the intertidal zones and wetlands at IR Site 2. Bulldozing the landfill back from the wetland margin in an effort to consolidate the footprint eliminates destruction of the wetland margin, in theory, but the re-grading and placement of contaminated material creates unnecessary risk for releases. The larger mass being moved during consolidation has a similar potential to disturb the surrounding wetlands, there is unnecessary potential for worker exposures, and the consolidation approach had significant cost and schedule increases. The approved remedy incorporates appropriate actions to minimize adverse impacts to San Francisco Bay such as erosion controls (Attachment 8), and on-site mitigation of lost wetlands with equal or better value. The total affected wetland area is 0.89 acre of tidal wetland. The success criteria are outlined in Section 11 of Attachment 7. The remedy also complies with the other Tidal Marshes and Tidal Flats policies, which include: • Thoroughly evaluating any proposed filling, diking, or dredging project to determine the effect of the project on tidal marshes and tidal flats, and designing projects to minimize, and if feasible, avoid any harmful effects • Designing projects to avoid or minimize adverse impacts on any transition zone present between tidal and upland habitats • Including clear long- and short-term biological and physical goals, success criteria and monitoring of ecosystem restoration projects

Jaime Michaels, Coastal Analyst, and Andrew Winetroub, Legal Intern
San Francisco Bay Conservation and Development Commission

	Through the CERCLA process, and particularly through the feasibility study, the DON thoroughly evaluated the remedy and considered the impact on tidal areas. The DON, with the approval of the regulatory agencies, selected this remedy, which has been designed to minimize any harmful effects. In addition, the DON will monitor the success of the mitigation as outlined in Attachment 7, Section 11. **(1) Mitigation Policy** Policy No.1 states: Projects should be designed to avoid adverse environmental impacts to bay natural resources such as to water surface area, volume, or circulation, and to plants, fish other aquatic organisms and wildlife habitat, subtidal areas, or tidal marshes or tidal flats. Whenever adverse impacts cannot be avoided, they should be minimized to the greatest extent practicable. Finally, measures to compensate for unavoidable adverse impacts to the natural resources of the bay should be required. Mitigation is not a substitute for meeting the other requirements of the McAteer-Petris Act. The evaluation presented in ROD verifies that there is no feasible alternative to addressing site contaminants within the intertidal zones and wetlands at IR Site 2 in a manner that completely avoids disturbance. The Navy proposed on-site mitigation for the tidal marshes in the IR Site 2 ROD. Damage to other natural resources of the bay, including on-site tidal flats, would be avoided because excavation would not extend into shoreline areas located below mean sea level. The Navy will perform mitigation in accordance with the substantive provisions of Part IV of the San Francisco Bay Plan.

Jaime Michaels, Coastal Analyst, and Andrew Winetroub, Legal Intern
San Francisco Bay Conservation and Development Commission

	Included in the RAWP as Attachment 7 is a detailed wetlands mitigation program intended to address any adverse impacts. Approximately 2.27 acres of seasonal wetland and 0.89 acre of tidal wetland will be filled during construction and will be replaced with an equivalent area of similar or higher quality wetlands outside of the landfill cover but within the Site 2 boundary. The wetlands have been avoided to the extent possible, but given the capacity and design requirements of the landfill, the remaining wetland impacts are considered unavoidable. In addition, Attachment 6, Section 6.3 sets forth additional project mitigation measures, which include: • Training all personnel who will work at the site during construction • Ecological surveys that will be conducted by a qualified biologists • Documentation and reporting including a preconstruction survey report Policy No. 2: Individual compensatory mitigation projects should be sited and designed within a bay-wide ecological context, as close to the impact site as practicable to: (1) compensate for the adverse impacts; (2) ensure a high likelihood of long-term ecological success; and (3) support the improved health of the bay ecological system. Determination of the suitability of proposed mitigation locations should be guided in part by the information provided in the Baylands Ecosystem Habitat Goals report.

Jaime Michaels, Coastal Analyst, and Andrew Winetroub, Legal Intern
San Francisco Bay Conservation and Development Commission

	The compensatory mitigation is sited within Site 2 in an area as close as practicable to the impact area. The mitigation will compensate for adverse impacts, and monitoring will be implemented to ensure a high likelihood of long-term ecological success (See Attachment 7, Section 11). Policy No. 3: When determining the appropriate location and design of compensatory mitigation, the Commission should also consider potential effects on benefits provided to humans from bay natural resources, including economic (e.g., flood protection, erosion control) and social e.g. aesthetic benefits, recreational opportunities. The remedy has been designed to address erosion control (see Attachment 8) and to accommodate potential recreational uses of the site as a trail. Policy No. 4: The amount and type of compensatory mitigation should be determined for each mitigation project based on a clearly identified rationale that includes an analysis of the probability of success of the mitigation project; the expected time delay between the impact and the functioning of the mitigation site; and the type and quality of the ecological functions of the proposed mitigation site as compared to the impacted site. Section 11 of Attachment 7 addresses this policy.

Jaime Michaels, Coastal Analyst, and Andrew Winetroub, Legal Intern
San Francisco Bay Conservation and Development Commission

	Policy No. 5: To increase the potential for the ecological success and long-term sustainability of compensatory mitigation projects, resource restoration should be selected over creation where practicable, and transition zones and buffers should be included in mitigation projects where feasible and appropriate. In addition, mitigation site selection should consider site-specific factors that will increase the likelihood of long-term ecological success, such as existing hydrological conditions, soil type, adjacent land uses, and connections to other habitats. Section 11 of Attachment 7 addresses this policy. Policy No. 6: Mitigation should, to the extent practicable, be provided prior to, or concurrently with those parts of the project causing adverse impacts. Mitigation will be conducted as part of the remediation process and is expected to be conducted concurrently. Policy No. 7: When compensatory mitigation is necessary, a mitigation program should be reviewed and approved by or on behalf of the Commission as part of the project. Where appropriate, the mitigation program should describe the proposed design, construction and management of mitigation areas and include: (a) Clear mitigation project goals (b) Clear and measurable performance standards for evaluating the success of the mitigation project, based on measures of both composition and function, and including the use of reference sites

Jaime Michaels, Coastal Analyst, and Andrew Winetroub, Legal Intern
San Francisco Bay Conservation and Development Commission

(c) A monitoring plan designed to identify potential problems early and determine appropriate remedial actions. Monitoring and reporting should be of adequate frequency and duration to measure specific performance standards and to assure long-term success of the stated goals of the mitigation project

(d) A contingency plan to ensure the success of the mitigation project, or provide measure to ensure alternative appropriate measures are implemented if the identified mitigation cannot be modified to achieve success. The Commission may require financial assurances, such as performance bonds or letters of credit, to cover the cost of mitigation actions based on the nature, extent and duration of the impact and/or the risk of the mitigation plan not achieving the mitigation goals

(e) Provisions for the long-term maintenance, management and protection of the mitigation site, such as a conservation easement, cash endowment, and transfer of title.

Attachment 7 complies with the substantive provisions of this policy. Because the DON is not required to comply with the procedural requirements under CERCLA, the DON is not required to obtain formal approval of the mitigation plan.

Policy No. 8:

> Mitigation programs should be coordinated with all affected local, state and federal agencies having jurisdiction or mitigation expertise to ensure, to the maximum practicable extent, a single mitigation program that satisfies the policies of all the affected agencies.

The mitigation program has been coordinated with all appropriate local, state, and federal agencies through the CERLCA process.

DRAFT REMEDIAL ACTION WORK PLAN
INSTALLATION RESTORATION SITE 2, ALAMEDA POINT
ALAMEDA, CALIFORNIA</th></tr>
<tr><td colspan="2">Jaime Michaels, Coastal Analyst, and Andrew Winetroub, Legal Intern
San Francisco Bay Conservation and Development Commission</td></tr>
<tr><td></td><td> California Government Code Section 66605 (McAteer-Petris Act):
The Legislature further finds and declares:
(a) That further filling of San Francisco Bay and certain waterways specified in subdivision (e) of Section 66610 should be authorized only when public benefits from fill clearly exceed public detriment from the loss of the water areas and should be limited to water-oriented uses (such as ports, water-related industry, airports, bridges, wildlife refuges, water-oriented recreation, and public assembly, water intake and discharge lines for desalinization plants and power generating plants requiring large amounts of water for cooling purposes) or minor fill for improving shoreline appearance or public access to the bay;
(c) That the water area authorized to be filled should be the minimum necessary to achieve the purpose of the fill;
(d) That the nature, location, and extent of any fill should be such that it will minimize harmful effects to the bay area, such as, the reduction or impairment of the volume surface area or circulation of water, water quality, fertility of marshes or fish or wildlife resources, or other conditions impacting the environment, as defined in Section 21060.5 of the Public Resources Code;
Attachment 7 explains in detail the wetlands mitigation program. It explains that the wetlands that will be filled during the project total 0.89 acre and will be replaced with an equivalent area of similar or higher-quality wetlands. The justification for filling the wetlands has been documented throughout the CERCLA process and has been approved by the regulatory agencies.
The filling of the 0.89 acre satisfies the substantive requirements of Section 66605(a) and (d) and is necessary to implement the remedy. Ultimately, the fill will result in increased protection of human health and the environment because the site will be remediated and the wetlands will be of higher quality. </td></tr>
</table>

Jaime Michaels, Coastal Analyst, and Andrew Winetroub, Legal Intern San Francisco Bay Conservation and Development Commission	
	The fill is necessary to implement the remedy. Remediating the contamination at the site is a public benefit that exceeds the public detriment from the loss of water. The DON has considered the McAteer-Petris Act as an ARAR throughout the CERCLA process, and the remedy was designed to comply with the substantive requirements. The selected remedy was developed and selected with the approval of the regulatory agencies and, at this time, the DON does not plan to develop an alternative cover approach. **California Government Code Section 66632(f)(1):** (f) The commission shall take action upon an application for a permit, either denying or granting the permit, within 90 days after it files the application. The permit shall be automatically granted if the commission shall fail to take specific action either denying or granting the permit within the time period specified in this section. A permit shall be granted for a project if the commission finds and declares that the project is either (1) necessary to the health, safety or welfare of the public in the entire bay area, or (2) of such a nature that it will be consistent with the provisions of this title and with the provisions of the San Francisco Bay Plan then in effect. Because permits are not required for CERCLA actions, the DON is not required to comply with the permit requirement of this section. The DON recognizes that the public health, safety, or welfare is one of the statutory justifications for fill placement. The DON believes that it has established through the CERCLA process the justification for the remedy.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Jaime Michaels, Coastal Analyst, and Andrew Winetroub, Legal Intern San Francisco Bay Conservation and Development Commission	
Comment 3. San Francisco Bay Plan and McAteer Petris Act – Aquatic Resources, Dredging, and Water Quality. According to the RAWP, landfill cover material would be transported to IR-2 site via barges (RAWP § 5.6.4). The RAWP illustrates the general locations for temporary barge and material off-loading, but does not provide details about the establishment of any related facilities (RAWP Figure 5-1). If dredging, pile-driving, or in-water excavation of material are needed to facilitate such operations, we recommend that the Navy consider how the Commission's requirements would be followed with particular focus on the following Bay Plan policies: (1) Fish, Other Aquatic Organisms and Wildlife Policy No. 1 (cited above) and No. 4, which states, in part, that the Commissions should consider project-related recommendations of the state and federal agencies for protecting resources; (2) Water Quality Policies Nos. 1 and 2, which, respectively, provide, in part: "Bay water pollution should be prevented to the greatest extent possible" and "The policies, recommendations, decisions, advice and authority of the State Water Resources Control Board and the Regional Board should be the basis for carrying out the Commission's water quality responsibilities;" and (3) Dredging Policy No. 1, which states, in part: "Dredging and dredged material disposal should be conducted in an environmentally and economically sound manner," and, if applicable, Dredging Policy Nos. 2 through 4.	**Response 3.** Barges and soil transportation and off-loading operations associated with IR Site 2 will not involve dredging, pile driving, or excavating. The barges will drop two anchors (e.g., concrete blocks on ropes) to temporarily stabilize the craft during off-loading, a safety necessity. Therefore, the Fish, Other Aquatic Organisms and Wildlife Policy No. 1 and No. 4, Water Quality Policies Nos. 1 and 2; and Dredging Polices 1- 4 are not relevant and appropriate.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Jaime Michaels, Coastal Analyst, and Andrew Winetroub, Legal Intern San Francisco Bay Conservation and Development Commission	
Comment 4. San Francisco Bay Plan and McAteer Petris Act – Public Access and Views. The RAWP states that the proposed remediation plan would involve the removal and/ or abandonment of existing facilities, including a weir, fencing, venting and monitoring structures, and the installation of new monitoring wells, probes and venting facilities, and a six-foot-high fence at the former landfill (RAWP §§ 5.5-5.8.4). The document also states that, in planning for site remediation, a future shoreline public path for low-impact recreation activities is envisioned *(see* RAWP §§ 2.3, 5.8.1). When planning for this recreational path, please be aware that Section 66602 of the McAteer-Petris Act establishes "maximum feasible public access" as the applicable standard for projects along the shoreline. Ensuring public access to the Bay is a cornerstone of the Commission's law, so we look forward to the development of further plans that satisfy this standard. Additionally, the Bay Plan Appearance, Design, and Scenic Views Policy No. 2 states, in part: "All bayfront development should be designed to enhance the pleasure of the user or viewer of the Bay." Also relevant is the Bay Plan Public Access Policy No. 4, which requires, in part: "Public access should be sited, designed and managed to prevent significant adverse effects on wildlife." Lastly, the Bay Plan Public Access Policy No. 5 states, in part: "Public access should be sited, designed, managed and maintained to avoid significant adverse impacts from sea level rise and shoreline flooding." We understand that the future shoreline trail at the IR-2 site is in the early stages of development and that the RAWP is not intended to provide detailed information about trail design. However, The Commission staff recommends that, if feasible, the Navy consider locating the remediation facilities proposed for abandonment or installation outside of the area	**Response 4.** Please see response to DTSC General Comment #2 in reference to the fencing design, the response to EPA General Comment #36 in reference to the vent design, and the response to DTSC General Comment #1 in reference to sea level rise. Please also see response to BCDC Comment #1 referencing the weir and monitoring structures and wells. Also see Table 5-2 of Attachment 6. The Navy, in this remedial design, has removed fencing, other than symbolic, and has been responsive to community concerns regarding access. The Navy has complied with the cited substantive provisions of the Bay Plan in addressing the fence issue.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Jaime Michaels, Coastal Analyst, and Andrew Winetroub, Legal Intern San Francisco Bay Conservation and Development Commission	
envisioned for the shoreline path. In addition, if feasible, we recommend that any planned adjacent remediation facilities, including fencing or monitoring structures, be located so as to minimize their impact—visually and physically—on the experience of those using the trail. Additionally, we recommend that, as illustrated in Figures C-9 to C-13 of the RAWP, proposed fencing at the former landfill area be installed with openings at the northwest and southeast corners of the IR-2 site for appropriate connections with future neighboring open space areas and with areas managed to sustain habitat or sensitive wildlife, including the special-listed California least tern. Lastly, we recommend that the area and dimensions envisioned for a shoreline trail be adequate to adapt to anticipated sea level rise. Therefore, we recommend that future revisions to the RAWP (or related documents) provide greater specificity about the future shoreline trail boundaries, remediation structures (including height, dimensions, and construction materials) proposed for placement within or adjacent to those boundaries, and strategies for minimizing physical or visual impacts of permanent remediation facilities on those using the future shoreline trail.	

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Comments from Leora Feeney, Co-chair of Friends of the Alameda Wildlife Refuge and Mike Lynes, Conservation Director, Golden Gate Audubon Society Comments Dated: July 9, 2012	
COMMENT	**RESPONSE**
Draft Remedial Action Work Plan – May 2012	
Comment 1. 5.8.3 Installation of Landfill Gas Passive Vent System /referenced Sheets C-16 and C-17. It is strongly hoped that there are other ways to vent methane at Site 2 rather than using 30 PVC pipes "a minimum of ten feet above the ground surface" along the north and east sides of the property. The pipes will serve as roosts for raptors which already use similar structures at the site. Are there other solutions that would not provide high perches? In addition, the pipes provide a significant blemish on a natural setting, impairing unique and beautiful views with a reminder of its Superfund status.	**Response 1.** Please see Response to EPA General Comment #36. Anti-perching devices have been added to the vent specification, as required.
Comment 2. 5.8.4 Installation of Permanent Fencing and Institutional Controls/referenced Sheet D-6 It is not clear how the refuge properties where Least Terns nest and adjacent lands and ponds, including Site 2, will be finally defined. Fencing will be needed to provide a barrier to public access along the northern border of Least Tern habitat running east and west, in addition to the fence currently on the east side running north and south. These barriers should provide the "institutional controls" needed for Site 2. A fence within a fence shouldn't be necessary. Once again, Site 2 design is hoped to reduce raptor perches and minimize visual interruption to Alameda's most spectacular views.	**Response 2.** Please see Response to DTSC General Comment #2.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Leora Feeney, Co-chair of Friends of the Alameda Wildlife Refuge and Mike Lynes, Conservation Director, Golden Gate Audubon Society	
Attachment 6, Environmental Protection Plan	
Comment 3. 6.1.1 Upland. Plants mentioned in this habitat description are minimal. A table of plants would have enhanced the ability to identify habitat values for the site. The multi-species acacia stand (northwest corner) and willows (east of tidal pond) adds another dimension to the uplands habitats of Site 2 that are not described here. Delineations are not described.	**Response 3.** The RAB has worked with the Navy to re-define the hydroseed mix to be applied to the soil cover. Rather than a generic California native plant list, the RAB has participated in selecting native grassland species endemic to the East Bay and Alameda for the cover. In addition, a *lupinus* species currently living outside the fence on the east side of the site (2 specimens) will be identified, flagged, and protected to encourage its propagation, to the extent practicable. The area of the Site that will be covered with the soil cover will be cleared (vegetation will be removed by cutting them at the ground surface, and mulching the detritus) so all plants currently on site that will be under the soil cover will be removed.
Comment 4. 6.1.2 Wetlands and Ponds. A description of wetlands, as in the prior section regarding uplands, does not occur which left this reader confused. It is important to identify at least the types of wetlands found in each of the ponded areas, salinities, and associated vegetation. Delineations are important, but should not be the entire focus.	**Response 4.** The wetlands delineation report was in Attachment 7 in CD form. It describes the wetlands. Navy complied with the substantive requirements of the ACE wetlands identification procedures.
Comment 5. 6.1.3 Vegetation. Limited discussion mentions no wetland species. An organized pattern of reporting would be helpful in a document of this dimension and importance.	**Response 5.** See the Wetlands Delineation Report, Attachment 7 of the RAWP, CD.

Leora Feeney, Co-chair of Friends of the Alameda Wildlife Refuge
and Mike Lynes, Conservation Director, Golden Gate Audubon Society

Comment 6. 6.2 Fish and Wildlife/Threatened, Endangered, and Sensitive Species.	**Response 6.**
The statement that "[n]o avian foraging at ponds was observed during the DON's RI sampling activities of 2004/2005 (Battelle and BBL 2006)," is very misleading. The document does not provide date(s) or methods for observation, length of time or specific purpose of visit. Foraging is almost always observed on waters or along waters of both ponds, which serve as a valued wildlife resource. Site 2 currently hosts a complex food chain, which includes foraging and nesting of significant number of species along the wetland and in upland areas.	The reference to the RI report, Battelle and BBL, 2006, directs the reader to the backup details requested by the commenter. Foraging almost certainly takes place at the Site, but it was not observed at the time of the study.
A short list in the text of four very common avian species is not helpful and misleading. Site 2 is important habitat for numerous species and breeding habitat for Red-winged Blackbirds, Black-necked Stilts, ducks, Savannah Sparrows, American Goldfinch (using trees), and more. Both Sora and Virginia Rail have been detected from the high berm along wetlands without using tapes. We suspect many birds are undetected even by twice monthly surveys since April 2004 made from inside a vehicle on the berm. DON receives annual data. FAWR surveys offer a much more comprehensive view of Site 2 avian activity and the data are available upon request.	The full list of birds observed on site is given in Table 6-2 of the EPP, Attachment 6. Text has been revised to include a reference to Table 6-2.
The document states that "[t]he habitat also is suitable for the red fox, but this species has not been specifically observed at this site," a year or two ago, a refuge biologist did observe a red fox run under the fence from the eastern perimeter road into Site 2.	During the referenced studies, no foxes were observed. Navy is aware of the anecdotal observations (including Least Tern Colony predation) and will be sensitive to the potential presence of Red Fox.
Without extensive trapping it should not be assumed that Salt Marsh Harvest Mouse (SMHM) is absent from Site 2. Small mammals can survive being water-borne for some time; rafting (riding floating debris) is possible; and it is likely that marshes in West Alameda historically	Surveys for the Harvest Mouse including trapping have been conducted at IR Site 2 in 1995 (PRC Environmental Management, Inc.) and 2009 (H. T. Harvey and Associates). In both cases none were identified. See EPA response 37.

Leora Feeney, Co-chair of Friends of the Alameda Wildlife Refuge
and Mike Lynes, Conservation Director, Golden Gate Audubon Society

hosted SMHM, being pushed ever westward as fill was added. We understand that small mammal trapping was done at Site 2. If this is the case, please confirm whether trapping is occurring and the methods used. If trapping is occurring, why weren't results included in the document? The document states that "[s]cheduled remedial activities planned for the site are not anticipated to have an adverse effect on the listed species." Species mentioned here are California Least Tern, California Clapper Rail, Western Snowy Plover. The Salt Marsh Harvest Mouse is not mentioned. We strongly challenge the statement regarding all but the Western Snowy Plover.	
1. **California Least Tern**: Avian and mammalian Least Tern predators that rely on Site 2 will be displaced by the important and necessary work. The consequences to Least Terns will require additional management. Site 2 currently offers foraging to Northern Harrier, Red-tailed Hawk, White-tailed kite, American Kestrel, Peregrine Falcon, Sharp-shinned and Cooper's Hawks. With the removal of vegetation and expected prey, these predators will be forced to put heavier foraging on outlying areas, including the Least Tern colony. Red fox has been seen at Site 2 once. Gray fox has been observed nearby at least twice. Mitigation could be additional Wildlife Service funding. The impact should be a topic of discussion. Fox presence is documented in Least Tern annual reports.	Please refer to page 6-4 of Attachment 6 to understand the Navy's current agreement with USFWS to provide Least Tern Colony Management and protection, including from predation.
2. **Salt Marsh Harvest Mouse**: The document does not show that the Salt Marsh Harvest Mouse does not exist at Site 2 which offers excellent and adequate habitat. If it does occur on the site,	See previous response regarding Harvest Mouse.

Leora Feeney, Co-chair of Friends of the Alameda Wildlife Refuge
and Mike Lynes, Conservation Director, Golden Gate Audubon Society

impacts will occur and mitigation could be required. 3. **California Clapper Rail** This rail has not been heard or seen during twice monthly surveys, and may not be impacted because of its absence and that habitat is not perfect. That most of local invasive cordgrass has been removed and that most local Clapper Rail habitat lost, this species should be given some consideration. A small effort to detect it specifically would be appropriate. Dawn listening or tapes played are methods available. It is an omission to exclude any discussion of aquatic vertebrates and invertebrates. Fish are mentioned only in the headline, but not in the text. Invertebrates and reptiles of the uplands are an omission also.	Prior surveys have yet to report a Clapper Rail on site, though they have been reported within 3 to 4 miles away. The Navy is aware of the shy nature of Rails and that they are rarely seen, so the pre-construction survey activities will be sensitive to this protected bird An amphibian survey has been included as part of the pre-construction activities. Attachment 6 text is revised to refer to prior aquatic studies done at Site 2.
Comment 7. 6.3.2 Ecological Surveys Reference to a "qualified biologist" does not say what the qualifications are. We hope that it means that the biologist(s) will have training in multiple areas of Bay Area biology and ecology, and years of local field investigation experience for all habitats found at Site 2. The biologist(s) should also have training on appropriate methods for collecting and reporting data to bring the best possible results and understanding of habitat use and ecological function of the valuable site. It is sometimes the case that the DON brings scientists from other areas and even out of state. In the case of ecological surveys, this does not offer the best results. We suspect it is more costly, as well.	**Response 7.** Comment noted. A "qualified biologist" will have experience monitoring and identifying the special status species mentioned in the report, as well as experience monitoring in tidal wetlands, and be able to set up a monitoring program for these species.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Leora Feeney, Co-chair of Friends of the Alameda Wildlife Refuge and Mike Lynes, Conservation Director, Golden Gate Audubon Society	
Comment 8. 6.3.6 Construction Monitoring. It is hoped that the biologist(s) will have qualification stated in 6.3.2. Having a "clearance survey" done 1 day "prior to the onset of each phase of construction activities" is short sighted. One to 7 days is stated. As a courtesy to workers and hiring equipment, 3 or 4 to 7 days prior to activities seems more reasonable in case cancellation is needed. It would also likely take more than one day to conduct and report all suggested surveys.	**Response 8.** The requirement is one week prior to the start of the first phase, and one day before each subsequent phase. Because the first phase involves vegetation clearing most if not all of the upland habitat, the schedule is not unreasonable.
Comment 9. Table 6-1 Mammalian Species Observed at IR Site 2. That the list of mammals does not include California vole, house mouse, opossum, Salt Marsh Harvest Mouse given perfect habitat for this endangered species, gray fox, red fox, mule deer, and dog is a considerable omission. Site 2 could potentially host all of these mammals. A deer has lived on Alameda Point for over a year, but not seen recently. The table should be accompanied with methods for detection and dates of field work.	**Response 9.** Assessment for the Harvest Mouse has been conducted and reports published that conclude the SMHM is not present. Please see Response to EPA Comment #37.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Leora Feeney, Co-chair of Friends of the Alameda Wildlife Refuge and Mike Lynes, Conservation Director, Golden Gate Audubon Society	
Comment 10. Table 6-2 Avian Species Observed at IR Site 2. Neither the table nor text (6.2) has information about "sampling" methods. Text (6.2) refers to avian sampling during "the DON 's IR sampling activities of 2004/2005 (Battelle and BBL 2006)", but numbers of Caspian Terns (1086 birds in 6 visits) on the Table is not in line with FAWR twice monthly surveys. These high numbers averaging 181 Caspian Terns per visit (with none in 4 visits?) would not likely happen unless there is a breeding colony. If surveys were done when Caspian Terns nested at Site 2 these numbers would make more sense. Succession caused habitat changes that forced them elsewhere. It appears that there are 10 "sampling" dates, but that isn't stated clearly. Numbers and species in the table raise a few questions. For example seeing 20 Brandt's Cormorants in 2 visits is unlikely. They are not often seen. We are happy to see one in a year or two. California Gulls are showing very high numbers on this table. Even when this gull had a sizeable colony at the south end of the north/south runway near the pier, Site 2 would not attract 2741 birds in 8 visits. It did not provide appropriate habitat or foraging resources. Unfortunately, these numbers without an explanation raise questions about the data that causes concern for the whole body of work. The table should be accompanied with methods and dates of field work.	**Response 10.** The information regarding sampling methods and dates of field work that the reviewer requests to be included in Table 6-2 are cited by referral to the Battelle and BBL, 2006 IR document.

Leora Feeney, Co-chair of Friends of the Alameda Wildlife Refuge
and Mike Lynes, Conservation Director, Golden Gate Audubon Society

Attachment 7, Draft Wetland Mitigation Plan

Comment 11. 5.0 Habitat Types and Values, Open Water/Mudflat. It is appreciated that the non-tidal South Pond is seen as a "high tide refugia for wading shorebirds and low tide refugia for ducks and geese." And that the pond "is available as foraging habitat year-round." And "…in late October (2011?), an estimated 500 birds representing eight species were observed foraging in this pond and mudflat." This corrects the impression of no foraging created in Attachment 6.	**Response 11.** Comment noted.
Comment 12. 5.0 Habitat Types and Values, Seasonal Wetlands. There are assumptions made about the patchy and isolated seasonal wetlands on the north and northeast corner of the site, suggesting "access to them by small mammals is very restricted; therefore their value as habitat is similarly restricted. It is important to consider them as accessible and valuable seasonal wetlands for avian fauna. No matter how access is limited by development and fencing, ducks and shorebirds do use these waters in winter. Patches of inland water appear without rainfall, during some high tides along the Perimeter Road adjacent to Site 2, just west of the curve heading north and then west. The small ponds are used by breeding Killdeer and American Avocets which nest on the shores. The hydrology of this water raises curiosity. Is there an explanation?	**Response 12.** Comment noted. Wetlands have been delineated using U.S. Army Corps of Engineers protocols.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Leora Feeney, Co-chair of Friends of the Alameda Wildlife Refuge and Mike Lynes, Conservation Director, Golden Gate Audubon Society	
Comment 13. 5.0 Habitat Types and Values, Tidal Wetland. We do not understand the sentence, "All other pickleweed habitat does not meet hydrology criteria needed for a wetland designation to be applied." Isn't *Salicornia* spp. a "wetland indicator". The Long-billed Dowitcher mentioned is unusual to rare at Site 2. Identification of dowitchers is very difficult and is traditionally made by vocalization in the field. Table 6.2 Avian Species Observed at IR Site 2 lists Short-billed Dowitcher, which is expected in Central SF Bay, but it is safest to call it dowitcher spp. unless clearly heard.	**Response 13.** Please see response to Water Board comment a-1, page 66, for clarification regarding the pickleweed. Comment noted regarding Dowitcher spp.
Comment 14. 6.1.1 California Clapper Rail. Again, the presence or absence of Clapper Rails at Site 2 should not be assumed. Loss of habitat locally due to invasive cordgrass removal has forced rails to seek other sites for survival. The Elsie Roemer Bird Sanctuary in recent years hosted breeding Clapper Rails and no longer serves them well. The size of the sanctuary is not any bigger than Site 2, and Site 2 would be nearest habitat. Young Clapper Rails seeking new territories can be found in lesser habitats, including rip-rap. **6.1.2 Western Snowy Plover** Not expected at Site 2. **6.1.3. California Least Tern** Not expected to use Site 2 under current conditions except in transit.	**Response 14.** Comment noted.

Leora Feeney, Co-chair of Friends of the Alameda Wildlife Refuge
and Mike Lynes, Conservation Director, Golden Gate Audubon Society

Comment 15. 6.1.4 Salt Marsh Harvest Mouse. For reasons stated above (Attachment 6, section 6.2), there should be an effort to confirm the absence of the Salt Marsh Harvest Mouse before making assumptions. Once again, habitat is suitable; these mice can raft and swim, and could have existed historically and moved just ahead of westward filling activity.	**Response 15.** Please see Response to EPA Specific Comment #37.
Comment 16. 10.1 Seasonal Wetland Mitigation and Figure 2. It is suggested that the South Pond or Seasonal Wetland is comprised of fresh water both in text and Figure 2. It is more to be salt water or at least brackish water as the primary associated vegetation is pickleweed, a salt water indicator. No fresh water wetland flora indicators have been named. Have salinity tests been made? If not, the salinity of this pond is essential before habitat type can be identified. There may be a hydrological explanation for brackish conditions in this pond that appears to have no tidal influence.	**Response 16.** Comment noted. No further testing is required**.**
Comment 17. The Project Schedule in the first part of the document appears to be aimed at finishing in April 2013 before the Least Tern season begins, but healing of Site 2 and maturation of habitat to serve predators will take longer, if not years. We want to express concern for migrating raptors as well as other species, White-tailed Kites, Say's Phoebe, Western Meadowlark, and more which rely on Site 2 for the winter. We have no suggestion for mitigation, but wish that biologists would have offered some discussion of the loss to these species and resident animals during the work. Without reintroduction, it isn't clear how small mammals, for instance, will reestablish themselves. It would be helpful for science and future projects of this kind to conduct pre project small mammal-sampling testing and annual post small mammal sampling until it matches the pre-sampling rates.	**Response 17.** The Salt Marsh Harvest Mouse Survey in 2009 (H. T. Harvey and Associates, 2009) trapped over 130 house mice in a 10-day period in wetland areas outside of the IR Site 2 construction area. This is a good indication the areas around IR Site 2 have mammal populations to supplant what is lost during construction and to migrate to IR Site 2 once construction is complete.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Leora Feeney, Co-chair of Friends of the Alameda Wildlife Refuge and Mike Lynes, Conservation Director, Golden Gate Audubon Society	
Comment 18. There is a rare opportunity to see how long it takes for a mature and complex habitat to return to this disturbed area. Can biological recovery be a component, measured and reported in the final documents by the DON? Can this be done with DON funding, grant funds? Or volunteers?	**Response 18.** The definition of success is discussed in the Wetlands Mitigation Plan, Attachment 7, Section 11.
Comment 19. The spring of 2013 may find ground nesting colonial species of birds such as Caspian Tern, California Gull, Snowy Plover or even Least Tern attracted to breed at Site 2. Has any thought been given to this possibility; how this might impact the project; and what steps would be made?	**Response 19.** EPP and WP require a biologist to monitor conditions. The appropriate response will be taken once the situation is observed. State and regulators will be notified when appropriate.
Comment 20. The culvert that now serves the tidal pond (North Pond) at Site 2 has suffered a log/debris jam, which took considerable effort to correct using heavy equipment forcibly pulling large and rigid items through the culvert. WE wonder about its current condition and strength. Does this culvert have a functioning tide gate? Is one needed? Will the culvert's condition maintain long term tidal action to the North Pond sustaining tidal wetlands? Will the culvert, over time, support the berm that runs over it. If necessary wouldn't it be best to repair or replace the culvert during the extensive efforts of the Remedial Action Work?	**Response 20.** Please see Response to EPA General Comment #2.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Comments from Paul Stanton Kibel Center on Urban Environmental Law (CUEL) Co-Director Golden Gate University School of Law Comments Dated: July 7, 2012	
COMMENT	**RESPONSE**
Comment 1. Chain Link/Barbed Wire Fencing for Site 2 and Above-Ground Gas Vents Network. In CUEL's previous submissions to the City of Alameda, including our September 2011 booklet referenced above, CUEL emphasized that the planning for the federal portions of Alameda Point and the City portions of Alameda Point are necessarily inter-related. That is, if the federal portions of Alameda Point are planned as beautiful and scenic landscapes, with grant vistas, waterfowl habitat and recreational opportunities, this will contribute greatly to the prospects for a successful redevelopment of the City Portions of Alameda Point. People will want to live and work in and visit Alameda Point to take advantage of these magnificent open space amenities. Conversely, however, if the federal portions of Alameda Point are perceived as polluted, as dangerous, as ugly, as an eyesore -- the federal portions will remain a stigma for Alameda Point. The federal portions will embody and perpetuate perceptions that Alameda Point is a toxic wasteland and a blight. At the late May 2012 Alameda Point RAB meeting, the Navy unveiled a series of proposed permanent cleanup remedies that would unfortunately create the eyesores and stigma that threaten the City's redevelopment plans. More specifically, in the most scenic area of the federal portions, along the edge of San Francisco Bay and immediately adjacent to wetlands in the area known as Site 2, the Navy proposed to install a 6-foot high chain link exclusionary fence with barbed wire on top around 110 acres. In addition, the Navy has proposed installing a network of 30	**Response 1.** See Response to DTSC Comment #2 regarding the fencing. Please see Response to EPA General Comment #36 regarding the venting.

Paul Stanton Kibel, CUEL Co-Director Golden Gate University School of Law	
10-foot high methane gas vents. This fence and these gas vents would obstruct and degrade the viewsheds and landscapes on the federal portions of Alameda Point. To provide the Navy, BCT staff and the public with a sense of the adverse scenic/viewshed impacts that would result from these proposed structures, CUEL's colleagues at the UCLA Landscape Architecture Department have prepared full color landscape depictions of views across Site 2 with and without the proposed fencing and vents. These landscape depictions are attached as **Exhibit C** to this letter. CUEL's analysis suggests an absence of technical support for the Navy's claim that the current proposed fencing and gas vents network are needed because these 110 acres were previously a landfill. Throughout the San Francisco Bay Area there are many examples of former landfills that have been re-purposed for open space and habitat that do not include exclusionary fencing and that do not include 10-foot high gas vents (such as Shoreline Park in Mountain View, Oyster Point Park in San Leandro and Cesar Chavez Park in Berkeley). Further, and specifically in regard to the proposed network of gas vents, there is the alternative of installing a below grade/subsurface piping network to collect and transport methane gas to a single (or limited number) of venting locations (instead of littering the landscape with 30 towering above-ground gas vents). To explore these alternatives, CUEL retained its own environmental consultants, Pangea Environmental Services Inc. (Pangea), to evaluate the Navy's proposed fencing and vents and compare this approach with other landfill-to-open space sites in the region Pangea's report, a copy of which is attached as **Exhibit D** to this letter, identifies several alternatives to what the Navy has proposed that are protective of public health and the environmental..	

Paul Stanton Kibel, CUEL Co-Director
Golden Gate University School of Law

In regard to Shoreline Park in Mountain View, Oyster Point Park in San Leandro and Cesar Chavez Park in Berkeley, Pangea noted: "The interviewees all reported that they could not recall encountering any vandalism or other damage associated with public use to either monitoring wells/vapor probes, landfill cover materials or landfill gas venting systems during the periods (generally exceeding a decade) for which they had roles in managing the landfills."	
In regard to the configuration of the gas vents, Pangea found: "Although [the Navy's initial proposal] is likely the cheapest solution to venting Site 2, it would have a significant negative visual impacts that conflicts with the proposed future land use of open space and recreational uses at a location where scenic vistas are a substantial aspect of that land use ... The current passive vent configuration design should be reviewed and revised based on proposed landfill geometry and current gas generation estimates to ensure that the venting is optimized to employ the minimum number of vents necessary ... For example, could the system be re-engineered to run slanted subsurface vent pipes upslope to common outlets, using the topography of the landfill berm slope to disguise part of the vents and adjusting spacing and vent diameters to compensate for such design and still allow for adequate venting. Passive venting could be enhanced with a wind-activated roof turbine fan or similar (or a solar-powered fan) to place a small vacuum on the piping network. Such a vacuum may allow further consolidation or modification of the venting network." In regard to the height of the vents, Pangea observed: "If methane and other constituents have concentrations that are sufficiently low to not constitute fire or breathing hazards, then pipe heights should be reduced as much as permitted by applicable regulations."	Please see Response to EPA General Comment #36.

Paul Stanton Kibel, CUEL Co-Director
Golden Gate University School of Law

Pangea's analysis evidences that there is not substantial evidence from a public health/safety perspective to support the need for the proposed exclusionary fencing, and that feasible alternatives approaches are available to significantly reduce both the number of gas vents and as well as the height of such gas vents.	
Comment 2. Federal Consistency under the CZMA and California State Coastal Policy of Maximum Shoreline Public Access to San Francisco Bay. As reflected in state legislation establishing the San Francisco Bay Conservation and Development Commission (BCDC), it is a longstanding California state policy to provide maximum public access to areas along our shorelines (including those along San Francisco Bay) and avoid the siting of structures in shoreline areas that would degraded the views and experience of persons using such shoreline areas. Moreover, pursuant to such laws as the federal Coastal Zone Management Act (CZMA), it is the general policy of federal agencies such as the Navy to avoid federal actions that are inconsistent with State coastal policies and to consult closely with state coastal agencies (such as BCDC) regarding such federal consistency. In the case of the Navy's proposed fencing and gas vents network in the shoreline area of Site 2 at Alameda Point, BCDC staff have provided comments to the Navy outlining concerns about the consistency between California state coastal policies (regarding public shoreline access) and the exclusionary fencing and gas vents network currently proposed. These federal consistency considerations again suggest that alternatives to what the Navy has proposed should be more fully explored.	**Response 2.** See response to DTSC General Comment #2.

RESPONSE TO COMMENTS

INSTALLATION RESTORATION SITE 2, ALAMEDA POINT
ALAMEDA, CALIFORNIA

Paul Stanton Kibel, CUEL Co-Director
Golden Gate University School of Law

Comment	Response
Comment 3. Maintaining Site 2 Culvert to Preserve Tidal Flow Between Wetlands and San Francisco Bay. In the vicinity of Site 2 there are extensive wetland resources (and waterfowl dependent on such wetland resources). These wetlands maintain their tidal connection to San Francisco Bay via a culvert that runs beneath Site 2. The maintenance and functioning of this culvert is essential to the wetlands as without this tidal influence such wetlands will be destroyed. According to members of the Friends of the Alameda Wildlife Refuge, there have been previous incidents in which this culvert has collapsed and/or become clogged, with serious resulting adverse impacts on the wetlands. These wetlands are subject to protection pursuant to Section 404 of the Clean Water Act (Section 404). These culvert-related concerns were highlighted in the San Francisco Bay Regional Water Quality Control Board's June 13, 2012 letter to the Navy commenting on the Draft Site 2 RAW. The Regional Water Board stated: "We are very concerned about the age and integrity of the culvert that is the sole sources of Bay water to the tidal wetlands. It is our understanding that the aged culvert is in very poor shape and may collapse at any time. The value of this culvert became painfully apparent a year ago when some driftwood or other materials clogged it up and impeded all tidal flow of brackish water to the wetland.. In a matter of days, the tidal wetlands started drying up. Should that culvert collapse, the delays in rebuilding, from getting contracts to actual physical work, could be devastating and even fatal to the wetland flora and fauna." For the reasons noted above in the letter from the Regional Water Board, it is critical that the Navy properly delineate the Section 404 wetlands (both at Site 2 and elsewhere at Alameda Point) and that the Navy thoroughly evaluate the condition of the Site culvert to determine	**Response 3.** The Navy agrees with the comment that the culvert is critical to the health of the tidal wetlands at IR Site 2. The culvert is currently functioning adequately, and based on work done to unclog debris from the culvert in 2008, it is not in need of repair. The Post-Closure Operations, Maintenance, and Monitoring Plan has been modified to include Culvert Inspection as part of regular visual inspections defined in Attachment 11, Appendix C, SOP 001 Multilayer Soil Cover Inspections.

RESPONSE TO COMMENTS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Paul Stanton Kibel, CUEL Co-Director Golden Gate University School of Law	
whether replacement and/or reinforcement is needed to maintain this critical tidal flow between the wetlands and the Bay. If such replacement and/or reinforcement work is deemed necessary, the provision for such work should be included in the RAW so that the federal government's obligations (of the Navy or of the Veterans Administration if ownership of Site 2 is transferred) going forward are clear to the regulators and the public.

Comments Dated: December 17, 2012

SPECIFIC COMMENT	RESPONSE
Comment 1. Response to Specific Comment number 6: HERO commented that the Department of Fish and Game (DFG) should be consulted to determine whether the 220-mil un-seamed layer of HDPE geonet with half-inch openings proposed as animal penetration control (Section 5.6.6.2, page 5-7 of Draft RI Work Plan) would be sufficient rather than a rock cover. The response indicates that DFG received the Draft RI Work Plan, had no comments, and included a statement on the uniformity of HDPE geonet over crushed concrete rubble as the basis for selection of geonet. Second, HERO never mentioned 'crushed concrete rubble' and is more familiar with compacted crushed rock of varying size as cover to prevent animal penetration. For a detailed explanation of the DFG objection to use of geotextile alone as a biological barrier to prevent penetration by burrowing animals please see the attached pages of the October 31, 2012 DFG memorandum to Ryan Miya, DTSC Remedial Project Manager, regarding the Draft Final Record of Decision for Parcel E-2, Hunters Point Shipyard, San Francisco, California. Specifically the section titled *DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's General Comments on the PP* (page 4 of 24 through page 18 of 24), outlines the DFG position on use of geomembranes alone as a control on burrowing animals. This DFG memorandum is referenced as it contains DFG responses to the Navy's original responses to a November, 18, 2011 DFG memorandum outlining their objections to geomembrane alone as a biological barrier at Parcel E-2. While this DFG memorandum is lengthy, a summary of DFG concerns regarding the susceptibility of	**Response 1.** The comment referenced a 2011 DFG response memo to the Hunter's Point Parcel E-2 landfill which states that "designing a landfill cap to only meet the minimum regulatory requirements for a landfill cover does not guarantee it will be effective against damage from burrowing animals in perpetuity…The Navy had not presented sufficient technical information to support its assertions that a geomembrane would deter or control animals from burrowing under the cover…" Section 5.6.6.2 of the RAWP has been revised to list the reasons that HDPE geonet was selected as follows: *The HDPE geonet was selected as an alternative to a rock layer for the following reasons:* • *High strength and durability* • *An approximately half-inch opening size, which is too small for burrowing animals* • *Consistent barrier quality—no variety in rock or crushed concrete size or thickness as with a rock layer, uniformity in installation and at seams and penetrations* • *Reduced mass for increased seismic stability of cover* • *Lower profile* • *Sustainability (lower fuel use, less to transport, no compaction necessary)* • *USEPA's Technical Guidance Document: Final Covers on*

geomembranes alone, based on installed landfill covers is on page 14 of 24 (underlining is presented as in the original text):
 	
"Designing a landfill cap to only meet the <u>minimum</u> regulatory requirements for a landfill cover does not guarantee it will be effective against damage from burrowing animals in perpetuity. The Navy has installed landfill covers without biotic barriers at other locations in California (i.e., Port Hueneme Site 14 and Moffett Field Site 1). As a result of inadequate cover design at these locations, the Navy has resorted to poisoning gophers in perpetuity to prevent these animals from damaging the landfill cap. DFG-OSPR does not believe that a remedy that proposes to clean up one type of chemical of ecological concern (COEC) (i.e., lead and mercury) only to substitute them with another type of COEC (i.e., pesticides), complies with CERCLA and the requirement that the remedy be protective of the environment."
 	
Just from the description, geonet, with half-inch openings, would appear more susceptible to penetration by burrowing mammals than unbroken geomembrane. Agreement should be reached on the type of biological barrier to be implemented prior to finalization of the IR Site 2 Work Plan.
	Hazardous Waste Landfills and Surface Impoundments, July 1989 indicated "There also is little evidence that insects or burrowing animals destroy polymer liners or cover materials. In tests done with rats placed in lined boxes, none of the animals were able to chew their way through the FMLs [flexible membrane liners]. Thus, degradation from a wide spectrum of biological sources seems highly unlikely."
	• *Specification sheets from a geonet manufacturer (Tenax) circulated in January 2009 indicated that the example geonet materials had a hardness of about 68 on "Shore D" scale. This hardness is in the same class as some soft, non-ferrous metals, or the covering on a golf ball, or a typical hard hat (approximately 75).*
	• *Precedents and technical basis exist for the use of geonets and other polymeric materials to impede animals in cover systems for solid waste containment:*
	  ◦ *HDPE geonet was the USEPA-recommended design for Casmalia Resources Disposal Site , and was agency-approved for use at the Concord Stie 1 landfill*
	  ◦ *HDPE geonet was approved for a burrowing animal barrier in 2010 by DTSC in a landfill cover at Naval Air Weapons Station China Lake (TtEC 2010)*
	  ◦ *HDPE geonet used for a CERCLA action at the Site 300 landfill located at the U.S. Department of Energy facility, Lawrence Livermore National Laboratory (U.S. Department of Energy 1997)*

GENERAL COMMENT	RESPONSE
Comment 1. Section 2, Basis of Design, of Attachment 1, Final Report, Geotechnical Recommendations, Installation Restoration Site 2, Alameda Point, Alameda, California, October 29, 2012 (the Geotechnical Report) indicates that the integrity of the Site 2 cover is considered to be maintained if there is no release of solid refuse to the San Francisco Bay beyond the perimeter seawall, the site will remain isolated from and will not be flooded by the San Francisco Bay water, and the function of the cover to act as a pathway interruption between landfill content and human and environmental receptors will not be rendered ineffective; however, Section 9.1, Slope Stability and Newmark-Type Displacement Interpretation and Conclusions, indicates that some incidental refuse beneath the perimeter berm may be exposed at the western coastal margin and Section 12, Summary of Analyses, indicates that substantial remedial grading will be required to repair damage following a maximum credible earthquake (MCE). As such, the integrity of the Site 2 cover appears to be rendered ineffective following a MCE because the potential exposure pathway between landfill content and human and environmental receptors will be complete. Please revise the Geotechnical Report to clarify how the function of the cover to act as a pathway interruption between landfill content and human and environmental receptors is expected to remain effective when the potential exposure pathway between landfill content and human and environmental receptors following a MCE will be complete.	**Response 1.** The proposed design concept assumes that relatively large displacements may take place during an MCE event. Although refuse is not predicted to be released into the Bay (lateral direction), substantial disturbance (cracking, separations, offsets) of the cover is anticipated that might expose the refuse to the human and environmental receptors (vertical direction). This exposure is expected to be localized due to 1) localized distribution of the refuse beneath the berm 2) localized nature of cover disturbance. The overall cover disturbance will require substantial remedial grading (Section 12, p.33). This remedial grading will re-establish the barrier between the human and environmental receptors. It is understood that this comment is concerned with the exposure of refuse under the berm along the western coastal margin. The cover along the western coastal margin will be subject to deformations from perimeter slope movements and/or possibly also from lateral spreading. It is expected that the larger of the two effects will govern, i.e., the effects are not additive. The Final report includes rationale/basis for determination that the refuse along the western coastal margin is localized and therefore its exposure to the open environment following an MCE event is also expected to be localized. The performance concept for the site anticipates that significant repair will need to be implemented following a design seismic event.

Xuan-Mai Tran, Remedial Project Manager
Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX

Comment 2. Given the size of the coastal margin along the western portion of Section D-D' compared to Section A-A' and Section B-B', it is unclear why a slope stability and Newmark-type seismic deformation evaluation was not conducted on Section D-D'. Please revise the Geotechnical Report to clarify why an evaluation of slope stability and Newmark-type seismic deformation was not conducted at Section D-D'.	**Response 2.** Section D-D' is presented in the Report to illustrate the interpreted subsurface conditions. . Section D-D' is neither suitable nor intended for engineering analyses due to its oblique angle to the governing engineering mechanisms. It is presented mainly to illustrate the variability of the thickness of the fine-grained Young Bay Mud under the project site. The vertical dimensions of the cross-section are exaggerated to capture this variability. Instead, Sections A-A', B-B', and C-C' were developed as representative of the critical subsurface conditions along the southern coastal margin, western coastal margin, and interior wetland margin, respectively, and perpendicular to the margin to be suitable for engineering analyses. Sections A-A', B-B', C-C' were developed for the specific purposes of engineering analyses as they are all deemed representative and critical. Another cross-section not directly inferred from cross-section D-D' would need to be prepared for any additional analyses. However, it is our professional opinion that the provided cross-sections A-A', B-B', C-C' adequately and sufficiently characterize the site and provide basis for engineering analyses.
Comment 3. The Geotechnical Report does not discuss the impact of the existing slurry wall, shown on Plate 4, Geologic Section B-B', on the geotechnical analysis for cross section B-B'. For example, it is unclear if it was assumed that no slurry wall existed or if it was factored into the slope stability and Newmark-type seismic deformation evaluation. Please revise the Geotechnical Report to discuss the existing slurry wall. If the existing slurry wall was factored into the slope stability and Newmark-type seismic deformation evaluation, please clarify how the integrity of the existing slurry wall was incorporated into the evaluation.	**Response 3.** The existing slurry wall is considered to be a typical bentonite-soil cut-off wall to impede groundwater connection between the landfill and the Bay. Due to its size (2 feet wide) the slurry wall does not have any engineering impact on the deformation and stability analyses of Section B-B' and was not rigorously considered in the analyses. Given the predicted seismic deformations along the western coastal margin of 10 feet, the integrity of the slurry wall is expected to be commensurately disturbed.

RESPONSE TO COMMENTS ATTACHMENT 1, FINAL REPORT, GEOTECHNICAL RECOMMENDATIONS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 4. The Geotechnical Report does not discuss how Sections A-A', B-B', C-C', and D-D' are representative of site conditions along the coastal margin areas and areas between the landfill and wetlands. As such, the validity of the geotechnical evaluation is uncertain. Please revise the Geotechnical Report to discuss how Sections A-A', B-B', C-C', and D-D' are representative of site conditions along the coastal margin areas and areas between the landfill and wetlands.	**Response 4.** The cross-sections were developed based on geologic interpretation of the data collected during subsurface investigations described and presented in the report. All four sections were developed to illustrate the subsurface conditions interpreted from the previous field investigations discussed in Sections 4 and 5 of the Report and logs and lab testing results included in Appendices A and B. Sections A-A', B-B', and C-C' were considered critical and utilized for the engineering analyses. Section D-D' was deemed necessary to present the thinning of the fine Young Bay Mud prone to seismic softening and appearance of the liquefiable coarse Young Bay Mud between the western and southern coastal margins.
Comment 5. Section 7.1, Slope Stability and Newmark-Type Deformation Evaluation Methodology, indicates that a simplified method, based on a database of similar simulations, rather than the SHAKE2000 software, was used to predict permanent seismic deformations at Section C-C' because the interior slope between the landfill and wetlands is not critical due to the width of the buffer zone between the landfill boundary and the seawall. While the width of the buffer zone between the landfill boundary and the seawall is larger than along the coastal margin areas, seismic deformations at Section C-C' are still critical as waste could enter the ponds or wetlands. It should be noted that the North Pond is connected to San Francisco Bay through the existing culvert pipe so the potential for refuse to reach San Francisco Bay exists. Please revise the Geotechnical Report to utilize SHAKE2000 software to assess Section C-C'.	**Response 5.** Simplified seismic deformation method by Bray & Travasarou (2007) was utilized for Section C-C' in accordance with the Standard of Practice and as recommended by Special Publication 117A (California Geological Survey, 2008, Guidelines for evaluating and mitigating seismic hazards in California). This method is considered to yield adequate results compared to more rigorous methods, i.e., SHAKE2000. On this basis, the seismic deformation predictions presented in the Report for Section C-C' are considered appropriate and adequate. The simplified method also allows to quantify the probability of exceedance of a given resulting seismic deformation, whereas SHAKE2000 yields a deterministic value calculated based on a given time history or average for a design time history set. The simplified method result presented in the Report for Section C-C' was a mean value, i.e., probability of exceedance of 50%. Results for other risk levels (probability of exceedance of 84% and 16%) were provided in Appendix E.

Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 6. Section 8.2, Approximate Energy Method, indicates that a flow model for simplified geometries was utilized for the southern coastal margin; however, the text does not discuss the simplified geometries at the southern coastal margin or discuss why the geometries at the western coastal margin and interior slope between the landfill and wetlands were not appropriate for use in a flow model for simplified geometries. Please revise the text to discuss the geometries for the coastal margins and interior slope between the landfill and wetlands to substantiate the use of a flow model for simplified geometries for the southern coastal margin.	**Response 6.** The Approximate Energy Method is applicable to all geometries subject to plastic flow. As such this model is applicable to both the western and southern coastal margins. The text of the Report is not clear by implying that the method is *applicable* only to the southern coastal margin, whereas the intent was to state that the method was *used* only for the southern coastal margin. This is because the southern coastal margin was still unstable at the end of the design MCE event and therefore subject to further deformations evaluated using the Approximate Energy Method. For the western coastal margin the configuration was determined to be stable at the end the design MCE event and therefore the Approximate Energy Method did not need to be utilized.

Comment 7. The conclusions presented in Sections 9.2, Flow Model Interpretation and Conclusions, and 12, Summary of Analyses, require additional discussion. For example, the conclusions imply that the perimeter berm remains intact following a MCE and only appears to settle four feet; however, the text does not explain why the perimeter berm does not flow. Similarly, the perimeter berm is not predicted to be overtopped by rising water yet there is no discussion of tides/rising water in the Geotechnical Report. Please revise the Geotechnical Report to provide additional discussion of each conclusion, including associated assumptions.	**Response 7.** The perimeter berm is not subject to liquefaction because it is above groundwater, nor is the compacted fill of the berm considered sensitive and prone to significant seismic weakening. As a result, the berm is considered to translate as a rigid body as the underlying liquefied hydraulic fill flows plastically. Based on borings KCHSB-1, -2, and -3 advanced on top of the perimeter berm, the berm is primarily composed of LEAN CLAY (CL) with plasticity index and liquid limit of 28 and 46, respectively. As such this material is not liquefiable because the prerequisite condition for liquefaction is 1) saturated and 2) contractive (loose, metastable) granular soils or silts. Although under some extreme conditions and certain tides the toe of the berm could get saturated, the material that comprises the berm is primarily cohesive clay, which is not usually considered liquefiable. Recent advances in soils mechanics indicated that under certain conditions fine-grained soils may be subject to either to liquefaction-like behavior (built-up of pore pressures and reduction of effective stress) or a significant loss of strength due to thixotropic response of the soils grains during earthquake shaking, i.e., sensitivity. This propensity was evaluated based on the following criteria: 1. Fine-grained soils with Plasticity Index < 12 and moisture content greater than 85 percent of the liquid limit are classified as fine-grained soils susceptible to liquefaction (typically silts); 2. Fine-grained soils with Plasticity Index > 18 are classified as soils potentially susceptible to significant loss of strength during seismic shaking and require additional evaluation. The sensitivity of the on-site fine-grained soils is then evaluated based on the water content, Atterberg limits, and

Xuan-Mai Tran, Remedial Project Manager
Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX

	effective vertical stresses using the procedures suggested by Holtz and Kovacs (1981) and Mitchell and Soga (2005). 3. Fine-grained soils falling outside the two categories above are considered to behave like clays and are not considered susceptible to liquefaction. As indicated above, the materials that compose the berm are typically lean clays with plasticity index and liquid limit of 28 and 46, respectively, and fall into the 2nd category defined above. Considering the assumed saturated moisture content of about 35 percent, the Liquidity Index is about 0.6 and the associated sensitivity is about 3 (Mitchell and Soga, 2005). Soils with sensitivity less than 4 are considered low sensitive (Holtz and Kovacs, 1981) and therefore the potential for significant loss of strength of fine-grained materials and ensuing failure during seismic shaking is not considered likely. However, the seawall and perimeter berm will be inspected immediately after the MCE event, and repaired or raised as necessary to maintain acceptable freeboard above the King tide as part of post-MCE remedial grading already deemed necessary to repair cover damage from lateral spreading. Rising sea level on the order of 0.1 feet over a period of time measured in decades is considered relevant to long term maintenance. If sea level rise is appreciable in the coming decades, the seawall and berm should be raised to keep pace with rising mean sea level as part of long term maintenance.

SPECIFIC COMMENT	RESPONSE
Comment 1. Section 2, Basis of Design, Page 2: The second paragraph references the Applicable or Relevant and Appropriate Requirements (ARARs) presented in the Final Record of Decision (ROD) for IR Site 2; however, a specific reference to the ROD is not included in Section 2 or Section 15, Selected References. Please ensure that the ROD is referenced.	**Response 1.** Agreed. The ROD reference will be included as follows: Final Record Of Decision IR Site 2; Former Naval Air Station Alameda, California, BATL-6009-0007-0010, August 2010.
Comment 2. Section 7.1, Slope Stability and Newmark-Type Deformation Evaluation Methodology, Page 18: The text indicates that the mean predicted seismic deformation was taken as representative of anticipated permanent deformation during the MCE for Section C-C'; however, information to substantiate the use of the mean predicted seismic deformation is not provided. It is unclear if the mean predicted seismic deformation represents a conservative assessment of seismic deformation. Please revise the Geotechnical Report to clarify how the use of the mean predicted seismic deformation is a conservative assessment of seismic deformation.	**Response 2.** The mean predicted seismic deformation of 1.0 foot is intended to be the likely deformation, with a 50% probability of being less and a 50% probability of being greater. That is, it is not intended to be a conservative assessment. A conservative estimate may be taken from the result presented in Appendix E as 1.9 feet, with only a 16% probability of being exceeded. For the purpose of evaluating the permanent seismic deformation of the interior slope adjacent to the wetland, either 1.0 foot or 1.9 feet are effectively comparable indexes of permanent deformation with respect to impact to the cover and in relation to other deformation magnitudes including liquefaction induced lateral spreading. Nonetheless, the Report will be revised to use a conservative value of 1.9 feet.
Comment 3. Section 7.1, Slope Stability and Newmark-Type Deformation Evaluation Methodology, Pages 18-19: The text indicates post-earthquake movement was anticipated for Section A-A' and no post-earthquake displacement was anticipated for Section B-B'; however, the text does not discuss Section C-C'. Please revise Section 7.1 to discuss the post-earthquake movement at all cross sections.	**Response 3.** Post-earthquake displacement is not predicted for Section C-C' because the post-earthquake Factor of Safety is 1.36. Section C-C' has been included in the discussion presented in Section 7.1 of the Report.

Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 4. Section 8, Flow Run-Out Analyses, Page 23: The text states that, "Although most slides behave largely like rigid bodies as the involved materials soften, the deformation character transitions more towards the flow-type movement. This flow-type movement is considered applicable to the type of slide movements anticipated along the southern coastal margin, where potential for liquefaction of the coarse-grained Young Bay Mud sands is determined;" however, information to substantiate this statement is not provided. Please revise the Geotechnical Report to provide information to substantiate why this flow-type movement is only applicable for the southern coastal margin.	**Response 4.** This flow-type movement is applicable to all geometries subject to plastic flow. As such this model is applicable to both the western and southern coastal margins for seismic wakening and liquefaction type failures, respectively. The text of the Report is not clear by implying that the method is *applicable* only to the southern coastal margin, whereas the intent was to state that the method was *used* only for the southern coastal margin. This is because the southern coastal margin was still unstable at the end of the design MCE event and therefore subject to further deformations evaluated using the Approximate Energy Method. For the western coastal margin the configuration was determined to be stable at the end the design MCE event and therefore the Approximate Energy Method did not need to be utilized.
Comment 5. Section 8.1, Flow Constitutive Model, Page 23: Based on Section 8.1, flow resistance is utilized rather than viscous resistance for plastic flow; however, no information is provided to substantiate that viscous resistance is not occurring. Please revise the Geotechnical Report to clarify why viscous resistance is not utilized in the plastic flow constitutive model.	**Response 5.** Viscous flow where resistance is a function of flow velocity will likely occur. However, plastic flow model where resistance to flow is provided by a constant residual shear strength was selected for the analyses to utilize a closed-form solution based on the conservation of energy to determine the resultant run-out distance. The choice of a plastic flow rheological constitutive model was a matter of convenience, but deemed appropriate for an order of magnitude estimate of the run-out distance. The selection of the plastic flow model is also consistent with conventional modeling of liquefied materials using a single shear strength parameter (undrained shear strength). Given the positive confining contribution of the rock seawall is ignored, the plastic flow model to estimate of the run-out distance is deemed to be conservative.

RESPONSE TO COMMENTS ATTACHMENT 1, FINAL REPORT, GEOTECHNICAL RECOMMENDATIONS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Xuan-Mai Tran, Remedial Project Manager Federal Facilities and Site Cleanup Branch, U.S. Environmental Protection Agency, Region IX	
Comment 6. Section 9, Results of the Slope Stability and Permanent Seismic Deformation Analyses, Pages 26 to 30: The text does not discuss the results of the slope stability and permanent seismic deformation analysis conducted on Section C-C'. Please ensure that the results of the slope stability and permanent seismic deformation analysis conducted on Section C-C' are discussed in the Geotechnical Report.	**Response 6.** Agreed. The results of the slope stability and permanent seismic deformation analysis conducted on Section C-C' are described in Reponses 3 and 2 above, respectively.
Comment 7. Table 7, Summary of Slope Stability and Permanent Seismic Deformation Analysis, Page 28: The vertical translation of the crest, as shown in Figure D-8, Post-Seismic Stability Analysis (Section B-B'), is not discussed. Please ensure that the vertical translation of the crest is discussed in Table 7 and the text of the Geotechnical Report.	**Response 7.** Agreed. The vertical translations shown on the figures in Appendix D were considered supplementary to the lateral deformations, which were the focus of the analyses. For completeness, the vertical translations has been added on Table 7 and discussed in the text.
Comment 8. Section 12, Summary of Analyses, Page 33: The text indicates that lateral spreads of the cover throughout the interior of the landfill are on the order of a few feet; however, information to support this statement is not provided. Please revise the Geotechnical Report to provide information to substantiate that lateral spreads of the cover throughout the interior of the landfill are on the order of a few feet.	**Response 8.** The basis for this conclusion is provided in Section 10.2 while Section 12 is intended to provide only a summary of the conclusions. The rationale includes discussion that liquefaction induced lateral spreads are intrinsically difficult to predict, and in particular for a case of edge constraint provided by a large seawall. As a result, the historic lateral spreads observed at the site during the 1989 Loma Prieta Earthquake are considered to provide the best estimate and are believed to be on the order of a few feet (California Geological Survey, 2003, Seismic Hazard Report for the Oakland West 7.5-Minute Quadrangle, Alameda County, California).The requested reference and discussion is included in the Draft Final report

Comments Dated: January 25, 2013

COMMENT	RESPONSE
Comment 1. Section 1.0, Introduction. The text in the first paragraph indicates that a multilayer cover system consisting of a biotic geonet barrier and a minimum two-foot thick layer of soil, including a minimum six-inch vegetative layer, will be installed over the landfill. The report does not indicate the properties/type of soil, such as low permeability clay, to be used in the landfill cover. The described system does not include a mechanism to keep water out of the waste other than the two foot soil layer. Although the Report appears to be focused on preventing release of solid waste into or flooding of the site by waters of San Francisco Bay during a seismic event, preventing infiltration of water into the waste which is in contact with groundwater that is subject to tidal influences should be considered.	**Response 1.** The proposed cover is intended to provide a physical barrier between the refuse and the surrounding environment. The parameters of the geotechnical design do not include qualification, quantification, or control of precipitation water infiltration into the refuse or groundwater movement and interaction. The selected remedy for groundwater is monitoring and natural attenuation as described in the ROD. . The landfill content is already sitting in the groundwater, so the cover does not need to be designed to prevent infiltration. According to the ROD, engineering controls for groundwater remedy are not an issue because active remediation of groundwater will not be conducted.
Comment 2. Section 6.1 Causative Faults. The text in the first sentence states that Caltrans' ARS Online v.1.0.4, a web based tool was used to select the causative faults for the deterministic Maximum Credible Earthquake (MCE). We note that a newer version of the web based tool is currently available. Please determine if using the latest version of the web-based tool changes the current results and make adjustments as necessary.	**Response 2.** ARS Online (version 2.0.4) was implemented on November 14, 2012 and has since been updated to the current version 2.1.05. The ARS tool was utilized to develop the deterministic response spectra for the governing faults (Hayward Fault and San Andreas Fault). The comparison of the deterministic response spectra generated by the ARS Online Tool v.1.0.4 and v.2.1.05 for the governing faults indicates no difference. As such the results of the ARS Online Tool v.1.0.4 presented in the Report remain fully applicable.

Peter Gathungu, GE, Hazardous Substances Engineer Engineering and Special Projects Office, California Department of Toxic Substance Control	
Comment 3. Section 6.5 Design Peak Ground Acceleration. The text in the second paragraph states that the design peak ground acceleration (PGA) is taken as the average result for the seven input acceleration time histories, but no rationale is provided for using the average values. Please expand the text in this paragraph and include a rationale for using the average PGA values.	**Response 3.** The reference to the PGA in the Report is provided only for reference purposes and for comparison with the PGA values presented in the previous reports (if desired). This value is not used for any subsequent deformation analyses, except to verify that liquefaction is triggered and the liquefaction induced settlements presented in previous reports remain applicable. Furthermore, the use of average values is conventionally utilized when several input time histories are utilized, e.g., PEER Center target spectrum matching procedure or AASHTO Guide Specification for Seismic Isolation Design, 3rd Edition, prescribes using the maximum response when 3 time-histories are used and the average when 7 or more time-histories are used. 7 time-histories are used in our analysis.
Comment 4. Section 7.1 Slope Stability and Newmark-Type Deformation Evaluation Methodology. The text in the third sentence states that two typical sections representing the western and southern coastal margins were selected for analyses. The text in the second paragraph indicates that a third section was also considered. However, it would appear that because the North Pond communicates with San Francisco Bay via a 36-inch diameter pipe, a section through the pond including the landfill and seawall likely would present greater vulnerability than Section C-C'. Please include analyses for an additional section through the north pond.	**Response 4.** The third section, Section C-C’, was developed to evaluate the stability of the landfill perimeter in the wetland area. Because of the large setback of the landfill from the Bay (well in excess of 400 feet) by inspection this section is not expected to be critical and did not need to be extended to the Bay and analyzed. The presence of the pond at the toe does not affect the stability and deformation calculations and the calculated deformations indicate only minor potential seismically induced deformations, which are not expected to impact the refuse confinement. From that perspective analyses on an additional section are not considered necessary.
Comment 5. Section 7.1 Slope Stability and Newmark-Type Deformation Evaluation Methodology. The text in the last sentence of the third paragraph states that post-earthquake flow failure is considered imminent for factors of safety less than 1. However, it would appear that in common usage a factor of safety less than 1 indicates failure/instability and not imminent failure. Please clarify and revise the text accordingly.	**Response 5.** The text of the report refers to the imminent post-earthquake flow failure. This is an important distinction since even with the Factor of Safety of less than 1, further analysis is needed to evaluate if a flow failure associated with large displacement or “conventional” failure with much more limited displacements would take place.

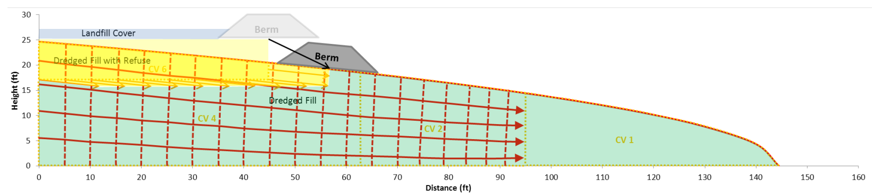
DRAFT REMEDIAL ACTION WORK PLAN
INSTALLATION RESTORATION SITE 2, ALAMEDA POINT
ALAMEDA, CALIFORNIA

Peter Gathungu, GE, Hazardous Substances Engineer
Engineering and Special Projects Office, California Department of Toxic Substance Control

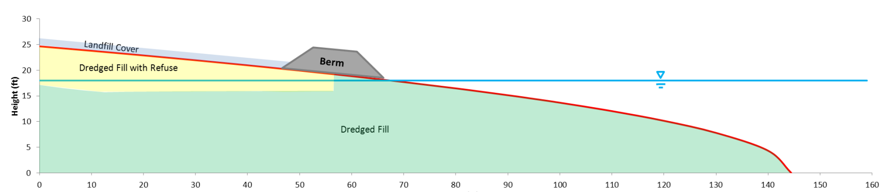
Comment 6. Section 8.2 Approximate Energy Method. The text in the third sentence states that the final geometry is taken as a parabolic profile, and the initial and final geometries are shown in Figure 9. However, it is not clear whether the berm and sea wall will remain intact, and their location and configuration, after movement. In addition, the sea wall along the southern coastal margin appears to be based on liquefiable hydraulic fill. Please clarify the final post-earthquake configuration of the sea wall, berm, and landfill cover, and indicate whether the waste would still be isolated from bay waters taking into account the presence of the North pond (see Comment 4), and anticipated future sea level rise.

Response 6. The berm is expected to remain as a block because it is composed of compacted fill not susceptible to liquefaction or seismic weakening. Consequently the berm is expected to deform as a rigid block on a foundation susceptible to plastic flow, illustrated below:



In the model, the seawall is conservatively assumed to be non-existent, instantaneously whisked away and replaced with a 25-foot vertical face of liquefiable sand subject to plastic flow without being constrained by a rigid shell (sea wall). Actual seawall will limit deformation to less than shown above.

The final post run-out configuration shown below predicts the berm will not be overtopped by the waters of San Francisco Bay and freeboard of about 5 feet above mean sea level will remain and so the refuse will remain isolated:



RESPONSE TO COMMENTS ATTACHMENT 1, FINAL REPORT, GEOTECHNICAL RECOMMENDATIONS DRAFT REMEDIAL ACTION WORK PLAN INSTALLATION RESTORATION SITE 2, ALAMEDA POINT ALAMEDA, CALIFORNIA	
Peter Gathungu, GE, Hazardous Substances Engineer Engineering and Special Projects Office, California Department of Toxic Substance Control	
Comment 7. Section 9.1 Slope Stability and Newmark-Type Displacement Interpretation and Conclusions. The text in the first bullet states that the perimeter slope at the southern margin is prone to liquefaction and may flow as evidenced by the calculated post-earthquake factor of safety. The conclusions in this section should be expanded to discuss liquefaction and flow effects on the berm, perimeter wall and whether post-earthquake overtopping of the deformed berm and/or sea wall is likely to occur.	**Response 7.** Liquefaction and flow effects on the berm and perimeter seawall are described in Response 6 above.
Comment 8. Section 9.2 Flow Model Interpretation and Conclusions. The text in the last bullet states that the cover is predicted to settle a maximum of four feet adjacent to the perimeter berm. This bullet appears to be incomplete as it does not draw any conclusions on the effect of the predicted settlement on the adjacent berm and whether if similar settlement of the berm occurs it could lead to flooding of the landfill from the bay. Please expand the text to include any conclusions regarding berm performance in light of the predicted settlement of the adjacent cover.	**Response 8.** Agreed. Translation and settlement of the berm and the potential flooding of the landfill as shown in Response 6 have been discussed in Section 9.2 of the Report.
Comment 9. Section 10.2 Liquefaction Lateral Spreading. The text in the first paragraph states that previous studies have predicted liquefaction induced lateral spreads ranging from a few inches to flows of many tens of feet and goes on to state that lateral spreads are poorly constrained and uncertain. However, the text in the second paragraph states that lateral spreads in some areas may be on the order of several feet. The statements appear to be overly vague and we would suggest refining the predicted lateral spreading values to provide a better sense of the anticipated lateral spread and related effects.	**Response 9.** The anticipated and most likely estimate of lateral spreading deformations is the reference to the experience from the 1989 Loma Prieta earthquake, i.e., "order of several feet". Given the nature of the empirical relationship by Youd (2002), in particular the impediment to lateral spreading provided by the seawall, refinement of the analytical predictions is not considered practical or reliable.
